EARLY PLANTING.—The ground should shortly be prepared for the planting of fruit trees, as many of the earlier kinds of Apples and Pears will be ready for transplanting by the end of the present month, or the early part of October. A distinct advantage is gained by planting early in autumn; the roots, if supplied with plenty of moisture, develop fresh fibres, and the tree becomes so well established before winter that the effects of the disturbance are scarcely noticeable in spring. The earlier varieties of Peach and Plum may also be planted, and, if the work is done carefully, a crop is almost certain to be forthcoming the following season; whilst trees that require root-pruning may be attended to at once. Aspect is a great factor in successful fruit culture. In some localities a certain variety may require a south aspect, whilst in other districts the same sort may do equally as well in either an eastern or western exposure. Never plant tender varieties in cold, exposed situations, where the sun's warmth is not felt during the greater part of the year. Trees that blossom early in the spring should not be planted in an east aspect, as, in such cases, the blossom will be almost sure to be injured or destroyed by cold winds and frosts. Apples, Morello and May Duke Cherries, and late-blooming varieties of Plums, may be planted facing east. Pears, Apples, Cherries, and Plums generally prefer a west aspect; some of the choicer varieties of early Pears and Plums a south aspect; Peaches, Nectarines, Figs, Vines, and Apricots sheltered positions, having a south aspect; whilst *Magnum Bonum*, *Czar*, and *Victoria* Plums, also Morello Cherries may be planted in a north border. Where there is a great extent of wall, it may be advisable to plant trees of the same kind against

different aspects, as, by doing this, a succession of the same variety of fruit may be ensured, and the duration of the supply thereby lengthened. Where space permits, always endeavour to plant the early-blooming varieties near to each other for protection; if early and late sorts are mixed together in planting, the late sorts are unduly hastened into bloom by the protection afforded for the earlier trees. These remarks are not intended to apply so much to gardens in the southern and warmer parts of the country as in colder districts. The distance apart at which the trees should be planted will depend entirely upon the variety, height of the wall, and the quality of the soil. I will deal more fully with this particular point in another calendar.

GENERAL REMARKS.—Follow out the instructions given in preceding calendars as to the gathering and storing of ripening fruits. All shoots on wall and other trees that are not required should be promptly removed, so that the remaining wood and buds may have the full benefit of all the sunlight and air possible. Continue to train the shoots of wall, espalier, pyramid, and other trained trees, removing all fore-right shoots from Pears, Apples, Plums, and Cherries. Train the shoots of Peaches and Nectarines well apart.

THE FLOWER GARDEN.

By R. P. BROTHERSTON, Gardener to the Earl of HADDINGTON, K.T., Tynninghame, East Lothian.

CHINA ASTERS.—Besides the well-known *Victoria* and *Chrysanthemum*-flowered sections of China Asters, the large-flowering, single sorts, with azure blue, deep blue, pink, rose, and salmon colours, lend themselves to the decoration of the flower garden. The best of the double-flowered varieties for decorative effect is *Ostrich Plume*, especially in its salmon, white, and light-blue shades. In addition to these, we cultivate at Tynninghame, several hundreds of the quilled type, of which the deep purple and lemon-coloured varieties please me most. They are very valuable for furnishing vacant places in succession to earlier-flowering plants, and afford useful supplies of cut blooms. Usually, China Asters are treated too much as tender annuals, and are sown too early to be of use in the autumn.

BEDDING SCHEMES.—Although the fashion has changed so completely in flower bedding, geometrically-shaped beds and rectilinear borders may be made to provide a good effect, if a general colour scheme governing the whole is embodied. There may be one dominating colour or two harmonising tones, such as are obtained with various shades of pink and pale blue, or pink and mauve. Contrasting colours also may be employed, such as dark blue and yellow ranging from sulphur to orange. If the beds are very large in size, the main part may be planted with a distinct colour, and finished on the edge with a broad band of a colour which harmonises, but of a different shade. Small beds may be planted with one colour only, or with two shades of the same colour. A good effect is produced by planting a low-growing subject as a carpet with taller plants intermingled, the colour of both being either the same or different shades of the same colour, in which case the taller plants should be of the lighter tone. In small beds the colours may be mixed, or they may be planted wholly with one colour. Ribbon borders should not be admitted into a scheme of this kind. Another good effect may be obtained by employing a border that harmonises with the main block as well as with the other flowers in the several beds. In attempting to improve dwarf arrangements tall plants are frequently employed, in which case, as I have already pointed out, the taller plants should be of the same tones as the dwarfer ones. The larger kinds should not be used so sparsely as to convey a lack of material; *Lobelia cardinalis*, for instance, is often interspersed so widely apart that it loses its decorative value. The better plan is to arrange such subjects fairly closely together, so that from whatever point the bed is examined, several of the spikes catch the eye. Oftentimes a well-designed scheme in flower bedding is marred or spoiled by the introduction of unsuitable edging plants. An

edging is not by any means essential. It would be a good plan before the season is over to make notes of any good flower-bedding observed.

THE SEASON.—In the absence of rain, the effects of the cooler nights are apparent in the flower garden, which, after a brief period of dullness, has resumed its former gay appearance. Some plants, notably *Clarkia elegans* and pink *Godetias*, have been quite spoiled by the great heat. The *Clarkias* I have replaced by orange coloured African Marigolds, and the *Godetias* by *Aster Amellus bessarabicus*, which will continue in flower till well into October. They are associated with flowers ranging from pink to carmine and pale blue; replacing the pink with the blue has not produced the jarring note in the scheme which might have been expected. The Marigolds also have proved a good substitute for the *Clarkias*; they are associated with rose-coloured Hollyhocks, deep blue Larkspurs, and tall *Lobelias* with vivid colour, a rather strong colouring, but one suitable for the environment.

GENERAL REMARKS.—Remove seed vessels from Scabious, Lupines, annual *Chrysanthemums*, and similar plants. A few weeds may still be found in the mixed borders, but if these are destroyed, there should be no more this season. The variegated Ice Plants (*Mesembryanthemum*), Canary Creeper (*Tropæolum canariensis*), and other trailing subjects will require checking to prevent them obtruding on other plants.

THE APIARY.

By CHLORIS.

FEEDING.—The bees which will be concerned with brood-raising next spring are those which are raised now and later, therefore, a strong brood now is a good start for next year. Where the brood chamber has plenty of sealed stores, feeding should be resorted to, to stimulate the queen, because, the honey flow having ceased, she will soon cease egg-laying unless fed artificially. Slow feeding should be practised, affording only sufficient food to meet the daily wants of the bees. For this purpose, a graduated feeding bottle is needed, so that one or two holes only may be exposed, otherwise the bees will appropriate large quantities of the syrup, and store it. Where the brood frames do not contain 30 pounds of sealed food, then it will be necessary to feed more quickly, so that the bees may get that quantity stored and sealed before the very cold weather arrives.

SYRUP MAKING.—Since disease has been common, and the cause unknown, it would be well to run no further risk of trouble, and so use only pure cane sugar. There are numbers of dealers who undertake to supply suitable cane sugar in 7 lb., 14 lb., 28 lb., 56 lb., or 112 lb. bags. The usual food for autumn feeding is made with white (cane) lump sugar 10 lb., water 5 pints, salt $\frac{1}{2}$ ounce, and vinegar 1 ounce. Let the whole boil for a few minutes, taking care it does not burn. Place the food in the hive in the evening, and do not spill any of the syrup, as this will incite robbing. Fill the bottles to the brim with warm syrup, and cover the hive warmly, using plenty of quilts. As soon as the bottles are empty, replace them with full ones. Some beekeepers believe that 7 pints of water may be used, as in summer and spring feeding, but this is a great mistake, because the syrup is too watery, it does not ripen, therefore the bees do not seal it, and early in the new year there are signs of dysentery. Last year several cases of watery food came to my notice, and in one apiary it set up the worst attack of dysentery I have seen.

WASPS.—These insects are causing beekeepers much anxiety. The best methods, failing the destruction of their nests, is to partially close the entrance so that one bee only may pass at a time; this enables the bees to control the wasps and effectually keep them at bay.

WAX-MOTH.—Now that beekeepers are constantly opening their hives for feeding purposes, they should examine the quilts and tops of the frames along the saw cut for the grubs of the wax-moth. The pest can be completely eradicated.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, as well as specimens of plants for naming, should be addressed to the EDITORS, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Local News.—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY, SEPTEMBER 18—
International Conference on Genetics at Paris (6 days).
Nat. Chrys. Soc. Executive Com. meet.
WEDNESDAY, SEPTEMBER 20—
Nat. Dahlia Soc. Exh. at Royal Botanic Gardens,
Regent's Park (2 days).

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last Fifty Years at Greenwich—56° 2°.

ACTUAL TEMPERATURES:—

LONDON.—Wednesday, September 13 (6 P.M.): Max. 64°; Min. 58°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—Thursday, September 14 (10 A.M.): Bar. 30° 2°; Temp. 61°; Weather—Sunshine.

PROVINCES.—Wednesday, September 13: Max 59° St. Albans; Min. 52° Scotland N.

SALES FOR THE ENSUING WEEK.

MONDAY, TUESDAY, WEDNESDAY, THURSDAY AND FRIDAY—
Dutch Bulbs, at 67 & 68, Cheapside, by Protheroe & Morris, at 10.30.

MONDAY, WEDNESDAY, AND THURSDAY—
Dutch Bulbs and Lilies, at Stevens's Auction Rooms, 88, King Street, Covent Garden, at 12.30.

WEDNESDAY—
Trade Sale of Miscellaneous Bulbs and Plants, at 2; Palms and Plants, at 5, at 67 & 68, Cheapside, by Protheroe & Morris.

A consignment of Palms, Bay Trees, Aspidistras, &c., from Belgium, at Stevens's Auction Rooms.

FRIDAY—
Orchids, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 12.45.

The Sweet Potato. Ipomœa batatus, the Sweet Potato, used as a vegetable in so many parts of the world, forms the subject of an interesting monograph by Mr. B. H. A. Groth (*Contributions from the Botanical Laboratory of the University of Pennsylvania*) in which the origin and history, economic importance and structure, and the varieties are described. With respect to the origin of Ipomœa batatus, which has spread over the entire tropics and sub-tropical regions of the world, two opinions have been advanced. One that it is of American, and the other that it is of Asiatic origin. Mr. Groth concludes, from the available historical evidence, that the plant is a native of tropical America. In the section dealing with the history of the Sweet Potato, citations are made from Clusius (1601), who had seen roots in London in 1581, from Bauhin (1623), Gerarde (1636), and Parkinson (1640), who gives a fairly full account of the "Virginia Potato," as he calls it. The species was probably first recorded from Cuba in 1492, and introduced into Spain in 1526. In its natural tropical habitat, Ipomœa batatus is a perennial, and when cultivated by native races for food, it is

usual for the tubers to be dug and removed from the plant, which is left to grow till replanting is deemed advisable. Though cultivated to an enormous extent, it is impossible to form an accurate estimate of the quantity produced. In Mexico, Central and South America, the Sweet Potato is a staple crop as far south as Argentine and Chili. It is cultivated largely in Africa, and in the Mediterranean region of Europe. It is used as food in Persia, India, Malaya, China, Japan, and has been so used in many of these countries from time immemorial. In Japan the tubers, cut into pieces and roasted, are sold in the streets like baked Potatoes or roasted Chestnuts are sold in England. As is natural, considerable attention is devoted by Mr. Groth to the cultivation of the Sweet Potato in the United States, where, owing to the tropical summers it is grown as far north as New Jersey. In this State a crop of 150-200 bushels per acre yields a good margin of profit. Far larger crops than this are obtainable, however, and in a good season 400-600 bushels may be harvested, though the published averages give figures far below that amount. As is the case with so many plants under cultivation, the number of varieties of Ipomœa batatus is very considerable, and these varieties Mr. Groth endeavours to classify, a work which is as important economically as it is difficult. The monograph is illustrated by a large number of photographs, which illustrate the remarkable range of variation met with in the cultivated forms of this species.

Australian Plants.*

This book treats specially of the cultivation of Australian plants in Australia, and its publication appears to have been made possible by a number of "Original Subscribers," whose secretary contributes an introductory note. We make the following extract:—"Thirty-six years ago Mr. Guilfoyle brought to Victoria the very genius of landscape gardening, and a fulness of knowledge concerning botany and the habits and adaptability of plants and trees that cannot be excelled. He has left our botanic garden a place of the most animated and impressive beauty, as well as a living school of profit and delight to all who visit it."

The author opens with an enthusiastic appreciation of the Australian flora, and its value in gardens, instancing the botanic gardens of the different States of the Commonwealth. This is followed by practical directions for sowing and raising Australian seeds and on the treatment of Australian plants. The illustrations include a selected view in each of the Botanic Gardens of Melbourne, Sydney, Adelaide, Brisbane and Hobart; the last being not the least beautiful. The remaining illustrations are apparently all photographs of trees and shrubs in the Botanic Garden of Melbourne. They afford a good idea of the habit and effect of a large number of species belonging to

* *Australian Plants Suitable for Gardens, Parks, Timber Reserves, &c.*, by W. R. Guilfoyle. (Whitcombe and Tombs, London and Melbourne.) Octavo, pp. 478, with about 300 illustrations. Price: 15s. net.

genera of the characteristic families of Australian plants. Thus, about 50 species each of Eucalyptus and Acacia appear, and representatives of other genera of Myrtaceæ and Leguminosæ. There are species of Proteaceæ, Rutaceæ, Casuarinaceæ, Myoporaceæ; and such genera as Xanthorrhœa, Castanospermum, Doryanthes and Macrozamia. Mr. Guilfoyle has also attacked the difficult problem of "common names." It is, of course, impossible to obtain anything approaching uniformity in popular names in large genera like Eucalyptus and Acacia, which are spread over the whole country. Here, at home, we have our Oak, Ash, Beech, Birch, Elm, and so on, and it is quite easy in comparison, as against 150 species of Eucalyptus and 300 species of Acacia. But it is only the botanist here who distinguishes over 70 species of Carex, which hardly possess a common or popular name, beyond Sedge. The bulk of Mr. Guilfoyle's book is a botanical, alphabetical list of Australian plants with authorities, natural orders, habitats and popular names, but there are no descriptions. It is not a complete list, and it is not clear what was the guiding principle in the selection. What seems to be required is a classification of the plants for practical purposes; for different soils and situations, and for ornamental and economic uses.

R.H.S. SPRING BULB SHOW.—The Royal Horticultural Society will hold a special exhibition of forced spring bulbs on March 5 and 6, 1912. The object of this show is to demonstrate the varieties best suited for gentle forcing, and exhibits of small and large collections are invited from amateurs and traders. R.H.S. medals will be awarded according to merit. The council also offer, subject to the general rules of the Society, prizes, presented to them by the General Bulb Growers' Society of Haarlem, in six classes. There are two divisions, for amateurs and traders respectively. The classes are (amateurs) for 18 Hyacinths, distinct; 12 Hyacinths, distinct; six Hyacinths, distinct; and four pans containing 10 bulbs of one variety of Hyacinth in each pan; the blooms of each pan to be distinctly different in colour from those of the other three pans; and (trade growers) a collection of 100 Hyacinths in 20 named varieties, five blooms of each variety, and a collection of 120 Hyacinths in 12 varieties in pans, 10 roots of one variety in each pan. In the two last classes the Gold Medal of the General Bulb Growers' Society of Haarlem is offered for the best exhibit. At the same meeting, subject to the general rules of the Society, the council offer prizes, presented to them by ROBERT SYDENHAM LIMITED, for Bulbs grown in moss fibre or similar material (not earth) and without drainage.

NATIONAL DAHLIA SOCIETY.—The Metropolitan Show of this Society will be held on the 21st inst. in the Royal Botanic Garden, Regent's Park. Particulars may be obtained from the secretary, Mr. E. F. HAWES, Royal Botanic Garden, Regent's Park.

CHILDREN'S POT-PLANT COMPETITION.—The North British Academy of Arts instituted, two years ago, a pot-plant and window competition among the children of Newcastle and Tyneside generally. Nearly 4,000 children competed for the prizes this year at the annual competition, which took place on the 1st inst.

(See p. 203.)

ROYAL AGRICULTURAL SOCIETY.—The 73rd annual show of the Royal Agricultural Society of England will be held on the racecourse, Doncaster, from Tuesday, July 2, till Saturday, July 6, 1912.

FESTIVAL OF EMPIRE AWARDS.—The following awards have been made to horticultural exhibits at the Festival of Empire and Imperial Exhibition held at the Crystal Palace:—Grand Prize to THE KING'S ACRE NURSERIES, LTD., Hereford, for a model orchard and a general garden exhibit of fruit trees in pots. Diploma of Honour to Messrs. TOOGOOD & SONS, Southampton, for garden and seeds exhibit, and to the BROMSGROVE GUILD for garden ornaments. Gold Medals to Mr. HEMSLEY, Crawley, for a rock and water garden and fernery; Messrs. CHEAL & SONS, Crawley, for a garden and rock-work exhibit; Messrs. B. MAGGS & Co., for garden seats, &c.; Messrs. ALEX. SHANKS & SON, for lawn mowers, and Messrs. BARFORD & PERKINS for rollers. Silver Medals to THE HARROW NURSERY Co., for Roses; Messrs. B. HORTON & SONS, for garden fencing; THE BEACH CHAIR Co., for garden chairs; and THE ACME PATENT LADDER Co., for ladders. Bronze Medals to YE TUDOR ROSE SHOPPE, for a garden and flower shop; and Messrs. TURRELL & HOLLOCK, for garden seats.

CARBON BISULPHIDE FOR RATS.—An American Consular report gives the following method of destroying rats adopted by M. DE KRUYFF, of the Agricultural Bureau of the Dutch Indies at Buitenzorg, Java. All visible rat holes were first stopped with earth to ascertain which holes were inhabited, for the inhabited holes were found re-opened on the following day. Half a teaspoonful of carbon bisulphide was poured in each of these holes, and after a delay of a few seconds to allow the liquid to evaporate, the mixture of vapour and air was ignited. The result was a small explosion, which filled the hole with poisonous gases and killed all the rats almost instantly. A pound of bisulphide is sufficient for more than 200 rat holes; 131 dead rats were found in 43 holes which were opened after the operation. It is further stated that satisfactory results in exterminating porcupines have been obtained by this method. *Times*.

GARDENING IN CEYLON.—According to the *Tropical Agriculturist*, local gardens in Ceylon have much improved during the past 15 years, although the general standard is still a low one. A circumstance that militates against good gardens, says the writer, is the fact that residents in Ceylon are continually on the move, but the chief trouble is that many garden owners employ only a coolie and not a trained gardener.

PLANT COLLECTING IN MEXICO.—A trip extending over 10 months in the tropical jungles of Tehuantepec in search of new plants has just been completed by Mr. EDWARD HOWARD, a native of Los Angeles, on behalf of Mr. E. L. DOHENEY. The vegetation of this South American State is remarkably luxuriant; an illustration in the *Florist Exchange* for August 19 shows the collector seated beneath magnificent plants of *Dioon spinulosum* in the midst of other tropical plants.

THE TEACHING OF GARDENING.—According to a Blue Book just issued by the Board of Education, gardening instruction for boys was given during the year 1909-10 at 1,796 public elementary schools and 7 centres in England, as compared with 1,505 schools in 1908-9 and 1,204 in 1907-8. The registered number of scholars was 32,276, as compared with 27,553 and 20,372 in the two previous years. The number of scholars who qualified for grant and attended for at least 40 hours was 18,225, while 9,612

scholars qualified for grant and attended for at least 20 hours, but less than 40 hours. Girls received instruction in gardening at 111 schools in England, as against 10 in the previous year, the total number of registered scholars being 1,022, as against 555. Of the number who qualified for grant, 336 attended for at least 40 hours, and 421 for at least 20 hours, but less than 40 hours. In Wales, gardening for girls was taught at 9 schools, as against 7 the previous year, the number of registered scholars being 71, as compared with 37. Of the number who qualified for grant, 22 attended at least 40 hours, and 32 between 20 and 40 hours. The number of Welsh schools for boys whose scholars received instruction in gardening was 80, as against 82 in 1908-9, and 56 in 1907-8. The total number of registered scholars was 1,307, as against 1,289 and 867 in the previous years. Of the number who qualified for grant, 569 attended at least 40 hours, and 542 at least 20, but less than 40. Gardening for girls was not recognised until 1908-9.

THE SAN JOSÉ SCALE IN THE TRANSVAAL.—Orchardists and farmers will regret to know that the most dreaded of all fruit pests—San José Scale—has been discovered in the Transvaal. Such an occurrence in any young country would be regretted, but in view of the weak-kneed and abortive efforts of the Department of Agriculture to prevent the spread of the Codling Moth, we can only characterise it as a misfortune. If San José Scale is ever to be wiped out, it will need more pluck, energy and determination than any other insect pest has yet required. If it is not stamped out it will spread. It is not yet known in how many places it exists. Will the pest be allowed to cripple, firstly, the Citrus orchards of the Transvaal, then to do similarly in Natal, and also to ruin the orchards of the Western Province? *South Africa Gardening and Agriculture*.

VEGETABLE SHOW AT MANCHESTER.—A vegetable exhibition was held by Messrs. DICKSON & ROBINSON, at Manchester, on the 13th inst., prizes being offered in 17 classes. There were three classes for "Premier" Onion, one being for four bulbs open to growers in all parts of the country, the second for four bulbs open to growers north of and including Birmingham, and the other for the heaviest bulb. The 1st prize in the open class was won by Mr. WEST, Hackwood Park Gardens, Hampshire; 2nd, Mr. W. H. DAVIES, Castle Hill Gardens, Dorchester. Mr. T. JONES, Penylan, excelled in the class open to northern growers, whilst Mr. A. J. COBB, Duffryn Gardens, Cardiff, showed the heaviest bulb in a specimen weighing 3 lb. 2 oz. The 1st prize in the class for a bunch of "Moneymaker" Tomato was won by Mr. ABBOTT, The Holme Gardens, Regent's Park, exhibiting 21 fruits. 2nd, Mr. HEAMEN, Poynton Towers Gardens. The best dish of exhibition Runner Beans was shown by Mr. TOMLINSON, Whitegate. Mr. OAKES, Flixton, was placed first for Market Favourite Beet. The finest exhibit of three heads of Sugar Loaf Cabbage was exhibited by Mr. ASHLEY. There were two classes for Carrots, one for the variety Perfection, in which Mr. W. T. JEEVES, Holbeach, was awarded the 1st prize and the other for Matchless, the 1st prize being awarded to Mr. JACKSON, Gregynog, Monmouthshire, who also excelled in the class for three heads of Snowdon Cauliflower. Mr. WINCHESTER, Rubery, showed the best Celery, the variety being Prize Pink. The winners of 1st prizes in other classes were (a) Exhibition Leek, Mr. TYSON, Bedford; (b) Hollow Crown Parsnip, Mr. BISHOP, Birch Hall Gardens; (c) Early Favourite Savoy, Mr. GUY, Ormskirk; and (d) Manchester Market Turnip, Mr. WALKER.

CHINESE PRIMULAS.

PRIMULA MEMBRANIFOLIA AND P. DRYADIFOLIA.

PRIMULA MEMBRANIFOLIA (see fig. 100) is a charming little plant, peculiar to the Tali Range, where it was first discovered by Père Delavay in the early 'eighties. It grows amongst rocks, and somewhat resembles, at a first glance, *Primula yunnanensis*, with foliage of a pleasing light shade of green. The flowers are large, delightfully fragrant, and coloured a soft shade of violet-rose with a yellow eye. The altitudinal range where it is met with is not great, being from 9,000 to 11,000 feet. Amongst the many *Primulas* found on the Tali and adjacent mountains, *P. membranifolia* is unique in having the most prolonged flowering season; in favoured situations this extends over four months, the earlier plants showing bloom towards the end of April or beginning of May, the later ones flowering well into August.

Even on the Tali Range the species is extremely local, though it grows abundantly in some parts, forming large colonies. It is most plentiful on the cliffs, forming the restricted entrances to the narrow side valleys which break up the eastern flank of the range, lat. 25° 40' N. There it thrives well in the mossy crevices of wet limestone rocks, almost invariably in shady northern exposures. The roots do not penetrate the rock, but are embedded in the moss, and where the supply of moisture is greatest the plants are most luxuriant. The best and largest specimens I noticed were growing in an inaccessible position on a cliff under a small waterfall, where the plants were continuously and heavily sprayed with moisture.

The species forms a small, glabrous perennial with delicately membranous, light-green leaves that are broadly ovate or obovate; 2 to 5.4 centimetres long and 1 to 2.2 centimetres broad. They taper towards the base, and have equally biserrate margins. The under surface of the foliage is densely coated with a light sulphur-coloured farina. The flower-scapes are slender, 1 to 5 centimetres high, and covered with farina, forming a simple umbel bearing one to five flowers. The bracts are short and linear-lanceolate in shape. The campanulate calyx is densely farinose and deeply divided. The corolla tube is greenish-yellow, narrowly funnel-shaped, 1 to 1.5 centimetre long, much exceeding the calyx; the limb is of a soft violet-rose colour, slightly concave and 14 to 16 millimetres broad. The capsule is ovoid, small and slightly exceeds the calyx.

PRIMULA DRYADIFOLIA (see fig. 100).—Of the numerous Alpine species of *Primula* indigenous to North-west Yunnan, *P. dryadifolia* occurs at the greatest altitude, being only approached by one other species, *P. bella*. In the summer of 1905 I found small quantities of *P. dryadifolia* on the Mekong-Salwin dividing range, about latitude 28° N., but Père Delavay first collected it on the Lichiang Range, which may be considered its real habitat.

There, surpassing almost all vegetation in hardness, the plant flourishes abundantly on huge limestone screes close to the limit of perpetual snow, at from 15,000-16,500 feet altitude. It is the latest species to flower, and the earliest to mature its seeds; not until June is it free of its icy covering, and, as early as October, it is again buried under many feet of snow. During the brief season between it is severely exposed to the elements. Frequently it is covered with snow and exposed to bright sunshine in the same hour; day after day it may be swathed in heavy mists or drenched by blinding showers of icy rain; other hardships include being frozen by night, and buffeted continuously by chilly blasts. Yet it survives all these troubles, beautifying spots that would otherwise be barren wildernesses.

It is essentially a rock-loving plant, and is well adapted, by means of its long, woody root-stock,

for penetrating the crevices of the rocky ledges and loose formation of the screes amongst which it grows. The plant is a lover of moisture, especially during the flowering season. The plant shown in fig. 100 represents a typically branched specimen growing in a favourite situation. In order to obtain seed at the end of the season, I had to dig through a layer of snow 1 to 2 feet deep. The growth reaches a height of from 2 to 4 inches, the rootstock being more or less woody, and much branched towards the apex. The branches are densely clothed with the dried remains of the foliage of previous years. The leaves are small, 1 to 1½ centimetres long, 8 to 12 millimetres broad, ovate in shape, with revolute, crenated margins. The base of the leaf is more or less cordate and contracted into a broad wing running the full length. 10 millimetres, of the petiole. The upper surface of the foliage is dark green and glabrous, whilst the under side is coated with a dense yellowish farina. The scapes are stout, two to three times the height of the foliage, puberulous, and coloured purplish towards the apex. The flowers, which are faintly fragrant, are very shortly pedicellate, and produced in compact heads of three to five. The bracts are broadly ovate, tridentate, 10 millimetres long, sparingly farinose and coloured a ruddy green. The calyx is broadly campanulate, and divided almost to the middle. The lobes of the sepals are ovate, obtuse, and either entire or slightly crenate. The corolla is a bright crimrose-rose, eye yellowish-white, tube slightly longer than the calyx limb spreading 1½ to 2 centimetres broad. The lobes are very broadly ovate, with the apices deeply four-dentate. The capsule is oblong, slightly greater than the calyx. Seeds large and light-brown. The flowering season is in July-August.

Of all Primulas there is none more adapted by natural habits for the rock garden, nor, by constitution, for our climate. If it fails it will rather be because the climate is too genial. *George Forrest.*

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

ADMISSION PRICES TO THE ROYAL INTERNATIONAL EXHIBITION, 1912.—Apart altogether from the Royal Horticultural Society, gardeners as a class should be treated with the utmost consideration, and be afforded the earliest opportunity to inspect the exhibition at a nominal entrance fee. The International Flower Shows which have been held in Edinburgh were open to gardeners at a charge of 1s. before the general public were admitted. Is it impracticable that something of a like nature should be arranged at the Chelsea Show? The conditions as published are prohibitive; they shut the doors close and fast against gardeners living at a distance. Could not a few hours be set apart for gardeners between the termination of judging and the opening of the show. The distribution of tickets to gardeners and nursery employees would present no great difficulties. *R. P. Brotherston.*

FOG AND POTATO DISEASE (See p. 192).—The fogs which Mr. Clark states followed a thunderstorm from the sea during one or two nights are, no doubt, the cause of the disease appearing so suddenly amongst his Potatoes. Whilst the atmosphere and Potato tops were quite dry, the disease spores were incapable of germinating, but they only needed moisture to render them active, and that the thunderstorm supplied. In previous years the worst and most sudden attacks of the disease have always been found immediately following thunderstorms, the vapour arising from the warm soil rendering the foliage sufficiently moist for the fungus to spread by means of its spores. The greater the heat of the soil the denser is the vapour that arises after rains. In previous years the soil was not warm, and although the rains wetted the leaves and stems it dried quickly. It is the atmospheric vapour which does the mischief. *A. D.*

"RINGING" OF CHRYSANTHEMUMS.—Apropos of Mr. Nobbs's letter (see p. 154) with reference to obtaining dwarf Chrysanthemums in small pots by "ringing," no doubt many of your readers are deterred from practising this useful method—not only in the case of Chrysanthemums, but many other plants—on account of the difficulties presented by the pot. It is no easy matter to saw a clay pot in half (to say nothing of the "unkindness" to the saw), and the two halves are by no means easy to fix in position. To overcome this difficulty I have this season tried the patent waterproof leatherboard pots—which I believe can be obtained from most seedsmen—and have found them to answer admirably. They are fitted with a loose bottom, which can be removed while the pot is being slipped over the shoot to be "treated," a slit is then made in the base, from the edge to the hole in the centre, to enable the stem to pass through, and the base is then fixed in position, the whole operation taking no more than a couple of minutes. An additional advantage is afforded by the fact that the weight of the leatherboard pot is only a fraction of that of the ordinary clay pot, and a single bamboo cane is sufficient to secure it in position. *H. F. Taylor, Valkyrie, Cheshire.*

FRUITING OF THE POMEGRANATE.—A Pomegranate growing on a south wall here is bearing a fruit about the size of a small Orange, and the fruit is still swelling. It is an object of interest to all who see it. The tree is a very old specimen, and this is the first time it has ever been known to fruit. Is it a rare thing for the tree to fruit in this country? *A. Jeacock, Sharpham Gardens, Totnes, South Devon.* [The Pomegranate (*Punica granatum*), although such an old garden plant, very seldom fruits out-of-doors in this country.—Eds.]

FRUITING OF THE CATALPA.—A specimen of *Catalpa bignonioides*, 30 to 35 feet high, growing on a lawn in a Sussex garden, is carrying a large number of its beanlike pods, which are already about 12 inches in length and are still growing. The pods are assuming a purplish-brown colour, and are hanging in clusters as thickly as pods of Canadian Wonder Bean. The tree has only fruited occasionally, and has never before produced more than a very few pods. The Catalpa will flower from 10 to 12 years after planting, and few trees are more certain to bloom annually afterwards. *A. P., Uckfield, Sussex.*

ROSA HEMISPHERICA.—In reply to Mr. Taylor (see p. 174), Parkinson is the authority for John de Franqueville re-introducing the above-named Rose. He calls it *Rosa lutea multiplex sine flore plena*. *R. P. Brotherston.*

LAGERSTROMIA INDICA.—Amongst other rare species which have flowered in the open in these gardens during this exceptional season is a plant of *Lagerstromia indica* growing against a south-east wall, slightly shaded by other trees. The panicles of daintily poised and prettily-serrated pink flowers are very interesting. I wonder if this species has flowered out-of-doors in other gardens this season? *R. W. Norman, Heligan Gardens, St. Austell.*

LARGE PEACHES.—I am sending you a fruit of *Alexandra noblesse* Peach that weighed just over 1 lb. when it was gathered. We had several other fruits that weighed 14 ounces each. *J. C. McP.* [The fruit had lost a little by evaporation when it reached us, as it turned the scale at 15 ounces, although it was not quite ripe. On reference to our "Record" Book, we find that Mr. A. T. Goodwin in *Gardeners' Chronicle*, August 27, 1881, p. 272, mentions a fruit of Dr. Hogg Peach that weighed 23½ ounces. The next heaviest fruits recorded are Gladstone, 15½ ounces, Noblesse 15½ ounces, and an unnamed variety, 11½ ounces.—Eds.]

WASPS.—I have found "Scott's Wasp Destroyer" an excellent preparation for destroying wasps. If the wasps attack, say, a bunch of Grapes, smear a little of the preparation over the berries attacked, and label the bunch, as the substance is poisonous. A few other bunches may be smeared in different parts in the vinery. The wasps will instantly fly to the bunches that

have been treated, and will also settle eagerly on the bottle and stick with which the material has been applied. The bunches should be smeared several times during the first two days. The insects eat the poison, and most of them fall dead on the floor; those that are able to get away never return, whilst others cease to visit the vinery altogether. Three days will suffice to clear a vinery of wasps after commencing to use this preparation. Figs and Peaches may be treated in the same way by smearing occasional fruits with the destroyer. *S. A. C., Wisley.*

—We have destroyed 32 nests this season, and in the last one taken I was surprised to find 42 young queen wasps, which I send with this note. It was a very large nest, and measured 31½ inches in circumference, being about 8 inches high. There were seven tiers of comb. Can any reader inform me if it is the habit of the wasp to breed so many queens in one colony? It shows how important it is that every nest should be destroyed, for every queen that survives the winter might be responsible for a fresh colony next season. *Arthur Bartlett, Lea Green Gardens, Matlock.*

SOCIETIES.

ROYAL HORTICULTURAL.

SEPTEMBER 12.—A meeting of this society took place in the Vincent Square Hall, Westminster, on the above date. A good display was made for the present season, and many plants of great interest were exhibited, but the attendance was below the average. The Orchid Committee recommended a First-class Certificate to a beautiful variety of *Sophro-Laelio-Cattleya* named *Jeannette*, shown by Messrs. CHARLESWORTH & Co., this being the only award made to an Orchid on this occasion, save a cultural commendation for a splendid plant of *Dendrobium glomeratum* cultivated by Sir TREVOR LAWRENCE (gr. Mr. W. H. White).

There were large quantities of Dahlias for the consideration of the Floral Committee, including representative collections from Messrs. CARTER, PAGE and Co., Messrs. HOBBIES, LTD., and other firms. Two novelties secured Awards of Merit, one a Collaretti variety and the other a single-flowered Dahlia. A pure-white variety of the Perpetual-flowered Carnation was given a similar award. This was shown by Messrs. ALLWOOD BROTHERS. The remaining awards recommended by the Floral Committee were made to hybrids of *Amaryllis Belladonna*. The variation exhibited in the hybrids of *Brunsvigia* and *Amaryllis* and in the forms of *Amaryllis Belladonna* itself possessed unusual interest. Three Awards of Merit were recommended, namely to *Amaryllis Parkeri* (which is almost identical with the plant formerly known as the Kew variety of *Amaryllis Belladonna*), *Amaryllis Parkeri alba*, and a hybrid from *Brunsvigia* and *Amaryllis Belladonna* exhibited by Messrs. SANDER & SONS, under the somewhat awkward name, *Brunsdonna Sanderæ alba*.

The Fruit and Vegetable Committee recommended an Award of Merit to a first-class culinary Apple named *Charles Eyre*, shown by Mr. WILLIAM POPE. This award adds one more to those already given for seedling Apples raised by Mr. CHARLES ROSS.

In the afternoon a lecture was given by Mr. Thomas Smith on "Small Holdings."

Floral Committee.

Present; Messrs. W. Marshall (Chairman); Henry R. May, Wm. J. James, Arthur Turner, George Paul, John Green, G. Reuthe, Jas. Hudson, John Dickson, Charles Dixon, Herbert Cutbush, C. R. Fielder, Wm. Howe, J. F. McLeod, Chas. E. Pearson, John Jennings, J. W. Barr, A. Kingsmill, and R. Hooper Pearson.

On no previous occasion have so many varieties of *Amaryllis Belladonna* been exhibited at a R.H.S. meeting. Messrs. SANDER & SONS, St. Albans, showed a very distinct form, in which the colour was characteristic of the best type of *A. Belladonna*. Mr. H. J. ELWES, V.M.H., Colborne, Gloucester, sent several well-defined varieties, of which *A. Belladonna blanda* was one of the best, especially a variety with this name received from Cornwall which had very bright

Messrs. H. CANNELL & SONS, Swanley, Kent, staged large batches of *Begonia Washington*, an exceedingly free-flowering, double-red, tuberous-rooted variety, which is especially valuable for flower gardening, and a still larger collection of *Begonia Rex* in variety. These plants were all splendidly grown, and the foliage Begonias possessed delicacy of form and colouring rivaling some of the show *Caladiums*.

E. H. BROWN, Esq., Highwood, Roehampton, Surrey (gr. Mr. R. Bradford), arranged a fine group of useful-sized *Codiaeums*, interspersed with *Palms*, *Adiantum cuneatum*, small groups of *Liliums*, and one of *Plumbago capensis*. The plants of *Codiaeums*, in great variety, were exceedingly well grown, and the leaves bore rich colours. The group was relieved with tall stems of the variegated *Dracaena Sanderi*. (Silver-gilt Banksian Medal.)

Messrs. WM. CUTBUSH & SON, Highgate, London, staged a collection of fine-coloured *Codiaeums* flanked with Palms, *Liliums*, *Ericas*, and other plants. *Phoenix Roebelinii* was represented by a healthy, well-grown plant. The *Ericas* included the white *E. nivalis* and the purple-flowered *E. gracilis*, very freely flowered. At one end of the exhibit there were some healthy plants of *Cordylina Bruantii* variegata with brightly-coloured leaves, whilst near the other end there were several good spikes of *Vallota purpurea*. (Silver Banksian Medal.)

Messrs. H. B. MAY & SONS, Upper Edmonton, again staged a mixed collection of Ferns and shrubby Veronicas, similar to their exhibit at the last meeting. *Nephrolepis exaltata Marshallii* compacta, which this firm exhibited so well at the Olympia Show, was shown in all its delicate beauty. (Silver Banksian Medal.)

Mr. L. R. RUSSELL, Richmond, provided a pleasant change with a large batch of *Gesnera* Orange King, the plants being in 5-inch pots. The plants were bearing fine flowers and had large, rosy-purple-tinted leaves. Nearly opposite the *Gesneras* Mr. RUSSELL arranged a semi-circular group of *Clematis*, bordered with dwarf *Fuchsias* and having an outer row of variegated *Ivies* in small pots. Of the well-flowered *Clematis*, we were especially pleased with *President*, deep blue; *Gem*, Oxford blue; *Lady Northcliffe*, a very fine, free-flowering blue variety; *Ville de Lyon*; *Lady Caroline Neville*, a large Cambridge-blue flower with darker band of colour along the middle of the petals, and *Coccinea* with small red flowers, showing yellow at the tips. The hardy *Fuchsias* included *F. globosa*, a useful rockery shrub; *F. Brightonensis*, a profuse bloomer; and *Riccartonii Elysée*. (Silver Banksian Medal.)

Messrs. STUART Low & Co., Bush Hill Park, Middlesex, flanked their Apple and Pear exhibit with a fine standard plant of *Metrosideros floribunda*, enclosed with a group of *Chironia exifera*.

Messrs. CARTER, PAGE & Co., 52 and 53, London Wall, London, filled the end of the hall with a collection of cut Dahlia blooms, arranged in a bold and very attractive manner. This most comprehensive exhibit amply demonstrated that while the record dry season has been injurious to most plants, the Dahlia is a striking exception. Many of the Cactus varieties were arranged 20 or more blooms together in shallow baskets, well demonstrating their colour values. The best white Cactus varieties were Mrs. Shoosmith, White Lady, and Snowdon. Of the bright colours, the most attractive were Nisi Prius, Amos Perry, Coronation (miniature Cactus), and Mary Panier. Mrs. MacMillan, Frances Graham, Kriemhilda, Mrs. Marshall and Sweet Briar are excellent varieties of the lighter shades, whilst Caradoc is a first-class yellow variety. (Silver-gilt Flora Medal.)

Messrs. HOBBS, LTD., Dereham, exhibited a very gracefully-arranged collection of cut Dahlias. Representative collections of Pæony-flowered and collarette varieties were displayed with sprays of *Kochia scoparia* in tall stands, and the spaces between the stands were filled with smaller receptacles containing fine Cactus blooms, also arranged with *Kochia* and *Asparagus* sprays. This fine collection contained many excellent varieties, and was attractively bor-

dered with pieces of cork, which was overhung with *Isolepis gracilis*. (Silver-gilt Flora Medal.)

Mr. J. T. WEST, Tower Hill, Brentford, arranged a bright display of cut Dahlias, in which the Pompon varieties were the outstanding feature. These little flowers were shown in a great variety of colours and in good form. Daisy (a pretty terra-cotta variety), Little Joe (brown), Sunny Daybreak (chestnut and yellow), Darkest of All and Adelaide (pale heliotrope) were very good of their shades of colour. Amongst the Cactus varieties we noted Mrs. Brandt with broad florets, the bloom being 7 inches across. There was also a good selection of decorative and Pæony-flowered Dahlias, the chief being Le Colosse, Liberty, Lord Milner and Rembrandt. (Silver-gilt Banksian Medal.)

Messrs. T. S. WARE, LTD., Feltham, Middlesex, staged a collection of Dahlias, in which prominence was given to the Pæony-flowered and the Pompon varieties. The former type was represented by very large, stout-stemmed blooms, arranged in bamboo stands, with coloured sprays of hardy shrubs. Mrs. Ainslie (pink), Admiration (buff, flushed with carmine), and Mrs. G. Gordon (a very large, Primrose-yellow with orange-coloured centre) were exceedingly good. Comedy, a yellow Cactus variety, striped and spotted with orange-red, was shown in good form, as also were Primrose Queen, H. L. Brousson (deep pink), and Joan of Arc (sulphur-yellow deepening to flesh pink). (Bronze Flora Medal.)

Mr. CHARLES TURNER, Slough, arranged a collection of cut Dahlias, consisting chiefly of the Pæony-flowered varieties. Eleanor (a large, deep-rose flower), Olivia (amber and rose), Princess Ida (white with the tips of the florets reflexed), Bayard (scarlet), and Sheila (a very erect-flowered deep rose) were the more recent sorts. (Silver Banksian Medal.)

Messrs. J. CHEAL & SONS, Crawley, exhibited fresh and good blooms of Dahlias in a novel and striking manner. These flowers were set up on semi-circular stands in their various sections. The miniature Cactus varieties at the end nearest the centre pathway were especially good, and the stand of single-flowered Dahlias also found admirers. The Cactus flowers, which occupied two stands, were all noteworthy, particularly Buttercup, Nellie Riding, Crepuscule, and Lydia. Half-a-dozen new single varieties were placed in a box at one end. These were Albatross (white), Madhi (deep maroon), Minerva, Theresa, Killarney, and Bridesmaid. (Silver Banksian Medal.)

Messrs. BAKER'S, LTD., Wolverhampton, had a tall stand filled with cut blooms of Pæony, flowered Dahlias, which contained the finest blooms of this decorative class. The most showy varieties were Paul Kruger, Red Indian, Geisha, Mrs. H. C. Holder, Romolo Piazzani (a delightful mixture of apricot and salmon), and the velvety-crimson Warrior.

MESSRS. JAS. STREDWICK & SON, St. Leonards-on-Sea, showed several new Cactus Dahlias, of which the variety Miss Stredwick received an Award of Merit. Richard Box is a very fine, soft, yellow bloom, having long, incurved florets and great depth of bloom.

Mr. JAMES BOX, Lindfield, Sussex, arranged an exceedingly fine floral group on the floor against the side wall of the hall. The centre of the exhibit was composed of fine trusses of herbaceous Phloxes in rich, distinct colours. G. A. Strohlein was the brightest of them all; Frau A. Buchner and Friefraulein Lassberg are two good white sorts; whilst General von Henstet, F. T. Maure, and Fort de France would be telling colours in the garden. The new varieties were Europe (white, with pink eye), America (large-flowered salmon-pink, with deep-pink eye), and Asia (a smaller flower of a heliotrope shade). There were fine stems of *Helianthus sparcifolius*, a plant which received an Award of Merit seven years ago. (Silver-gilt Banksian Medal.)

Mr. AMOS PERRY, Enfield, Middlesex, in their Water Lily exhibit, illustrated the unusual length of the hardy *Nymphaea* season. At the end of the Water Lily pool, a couple of large seed-bearing spikes of *Gunnera scabra* attracted considerable attention. (Silver Banksian Medal.)

Mr. G. REUTHE, Fox Hill Nurseries, Keston, Kent, staged a small collection of grey-foliaged and other Alpine plants. A pot plant of *Sternbergia macrantha*, *Satureia montana* (a tiny Rose

mary-like plant), *Gypsophila sundermanniana* (a dense-growing Alpine), *Hypericum ægypticum* (a valuable little St. John's Wort, just now commencing to bloom), *Dryas lanata* (still in bloom), and *Pratia latifolia* (a very prostrate plant bearing narrow-petalled, white flowers) were amongst the uncommon plants exhibited.

Messrs. GEO. BUNYARD & Co., LTD., Maidstone, Kent, staged cut sprays of Michaelmas Daisies, chiefly of the blue shades of colour. *Aster Amellus macrantha* major, and *Amellus bellarabicus* were the finer varieties.

The Misses HOPKINS, Shepperton-on-Thames, exhibited a few Alpine plants, chiefly in flower, arranged in shallow, cork-covered boxes.

AWARDS OF MERIT.

Amaryllis Parkeri (hyb.).—This is assumed to be a hybrid between *Brunsvigia Josephinae* and *Amaryllis Belladonna*. It differs in the form of the umbel from *A. Belladonna*, being quite circular and carrying some 30 flowers and buds. The flowers are of a deep rose shade, with white and orange at the base and orange-coloured on the exterior of tube. It is distinct from the ordinary *A. Belladonna*, possesses greater vigour, and has a stem some 3 feet in length. It was shown by LEOPOLD DE ROTHSCHILD, Esq., C.V.O., Gunnersbury House, Acton, W. (gr. Mr. James Hudson; V.M.H.). This plant is almost identical with the plant known as the Kew variety of *A. Belladonna*, which is also *A. Parkeri*, being from the same cross and varying only in being a better rose colour with less orange shade. Mr. Hudson informed us that his *Amaryllis* was shown as *A. Belladonna* "Kew variety" (see fig. 101), because it was received under this name from an amateur cultivator in New Zealand some six years ago. This is the first season of its flowering at Gunnersbury House. It may prove to be Mr. Van Tubergen's plant, which he obtained from crossing *Brunsvigia* with *Amaryllis Belladonna*. Mr. Tubergen's hybrid formed the subject of a Supplementary Illustration to *Gardeners' Chronicle*, January 23, 1909.

Amaryllis Parkeri alba.—This plant is evidently a variety of *A. Parkeri*. It possesses a fine umbel, a large number of flowers, almost pure white but with the same orange shading at the base as in the flower described above. It is a most striking and distinct novelty. The origin was not stated, but everything points to the same cross. This was shown as *A. Belladonna Kewensis alba* by Mr. WORSLEY, Mandeville House, Isleworth.

Brunsdonna Sandera alba.—In this case the umbel resembled typical *A. Belladonna* in formation, being one-sided rather than globular. This plant is also the result of a cross between *Brunsvigia* and *Amaryllis Belladonna*, but there is not sufficient information to determine whether the parentage is the same as in the case of *A. Parkeri*. Exhibited by Messrs. SANDER & SONS, St. Albans. Only on one occasion has any award been previously made to any form of *Amaryllis Belladonna*; this was made to *A. Belladonna maxima* on August 13, 1901.

Dahlia Maurice Rivoire (collarette) (see p. 214).—Shown by Messrs. HOBBIES, LTD., Dereham.

D. Union Jack (single).—A scarlet and white bloom, shown by Mr. CHAS. TURNER, Slough.

Carnation "White Wonder."—A pure-white, perpetual-flowering variety, with stout, healthy foliage and long flower-stems, and possessing a very pleasant perfume. Shown by Messrs. ALLWOOD BROS., Wivelsfield Nurseries, Haywards Heath.

Present: Harry J. Veitch, Esq. (in the Chair); and Messrs. Jas. O'Brien (hon. sec.), Sir Jeremiah Colman, Bart., F. Sander, R. G. Thwaites, A. A. McBean, W. Cobb, J. Charlesworth, J. Cypher, W. H. Hatcher, C. H. Curtis, W. H. White, Gurney Wilson, W. Bolton, de B. Crawshaw, and H. G. Alexander.

Messrs. SANDER & SONS, St. Albans, were awarded a Silver-gilt Flora Medal for a very fine group, including a showy batch of *Lælio-Cattleyas*. In the centre were three fine specimens of *Vanda Sanderiana*, one of them with three spikes, and another with exceptionally good rose-tinted flowers. *Lælio-Cattleya* Damon (L.-C. *callistoglossa* \times L. *crispa*); L.-C. Walter Gott, of which 15 pretty forms were shown; L. C. *Phyllis*, all

Greenwood \times aurea), L.-C. Colmanii, L.-C. exquisita (C. Shakespeare \times L.-C. Elstediana), a charming flower with greenish-primrose sepals and petals and reddish-violet front to the lip, were all attractive flowers. Lælio-Cattleya Britannia (L.-C. Canhamiana \times C. Mossiæ) was a handsome flower, the broad-frilled, rose-veined lip being a distinct feature.

Messrs. CHARLESWORTH & Co., Haywards Heath, were awarded a Silver Flora Medal for a small but select group of showy Orchids, including their new Sophro-Lælio-Cattleya Jeanette (see Awards), Lælio-Cattleya Anthela, and other Lælio-Cattleyas; several good Brasso-Cattleya Digbyano-Warscewiczii, Brasso-Lælio-Cattleya Thompsonii with large, white flowers tinged with lilac, the lip having a green disc with a purple line in front; Cattleya Rhoda, a remarkably fine C. Gaskelliana alba, a fine specimen of Miltonia Bleuana nobilior, and Cynoches maculatum.

SAMUEL LARKIN, Esq., The Ridgways, Haslemere (gr. Mr. Hales), was awarded a Silver Bank-

awarded a Silver Banksian Medal for an effective group, in which a number of their pretty Cattleya iridescens (bicolor \times Eldorado) were the principal feature. The fragrant flowers, formed like C. Iris, varied in tint from rose with purple lip to bronzy rose and yellow with crimson lip, one yellow form being specially good.

Mr. E. V. Low, Vale Bridge, Haywards Heath, was awarded a Silver Banksian Medal for a group of good things, among which were noted Cattleya Ena var. E. V. Low, a pretty flower with yellow sepals and petals with a bronzy veining, and purple lip; a good form of C. Thurgoodiana Vale Bridge variety, resembling C. Hardyana; some good forms of C. Adula, C. Gaskelliana alba, the singular Bulbophyllum grandiflorum, B. guttatum, Cirrhopetalum appendiculatum and others.

R. G. THWAITES, Esq., Chessington, Streatham (gr. Mr. J. M. Black), showed an interesting selection of pretty hybrids, including several good Cattleya Adula, one having the sepals and petals of old-gold tint, the pure-white Cattleya

Sir JEREMIAH COLMAN, Bart., V.M.H., sent a very remarkable Bulbophyllum of the B. mandibulare section, with reddish-brown flowers, said to have been imported from the Philippines, and resembling B. orthoglossum.

AWARDS.

FIRST-CLASS CERTIFICATE.

Sophro-Lælio-Cattleya Jeanette (L.-C. Martinetti \times S. grandiflora), from Messrs. CHARLESWORTH & Co., Haywards Heath.—A very brilliant and beautiful flower, comparable to the handsome Sophro-Cattleya Doris "Cobb's variety," in size and shape, and with broad petals like the handsome S.-C. Queen Empress (C. Mossiæ \times S. grandiflora) of Messrs. Veitch, flowered in 1899. The present hybrid shows the influence of the C. Mossiæ parent of L.-C. Martinetti, the other agent, L. tenebrosa, being almost suppressed. The flower is of a bright vermilion red, with a darker veining slightly tinged with rose, a faint flush of the same colour appearing on the margins of the petals. The base of the lip is pale yellow, the front veined with ruby-red.

CULTURAL COMMENDATION

to Mr. W. H. White, Orchid grower to Sir TREVOR LAWRENCE, Bart., K.C.V.O., for a strong specimen of Dendrobium glomeratum with over 30 rose-coloured flowers with orange-coloured labellums.

Fruit and Vegetable Committee.

Present: Owen Thomas, Esq. (in the Chair); also Messrs. W. Bates, H. H. W. William, G. Woodward, W. Pope, A. Dean, G. Reynolds, J. Harrison, A. R. Allan, W. Pourpart, H. S. Rivers, and A. W. Metcalfe.

The Superintendent, Mr. S. T. WRIGHT, exhibited from the Society's gardens at Wisley bunches of Alnwick Seedling and Directeur Tisserand Black Grapes for the Committee's opinion, as the two sorts seemed to be identical. No mention is made of Directeur Tisserand in the *Fruit Manual* or in Barron's *Vines and Vine Culture*, and no description is available. The vines will be inspected by a sub-committee on the 19th inst.

Mr. G. WOODWARD, Barham Court Estate Gardens, Maidstone, submitted for taste very large fruits of Dr. Jules Guyot Pear. The fruits were juicy, but lacked flavour.

LEOPOLD DE ROTHSCHILD, Esq., Gunnersbury Park, Acton (gr. Mr. J. Reynolds), showed a collection of 10 varieties of Nectarines. They were not large fruits, although of excellent quality. The ripest were Spenser, Byron, Humboldt, Darwin, Stanwick, Elruge, and Pineapple. (Silver Banksian Medal.)

H. B. BRANDT, Esq., Capenor, Nutfield (gr. Mr. T. Heron), staged 27 bunches of Grapes. They included (white) Muscat of Alexandria and Golden Queen, and (blacks) Appley Towers (very excellent bunches), Alnwick Seedling, Black Alicante, and Lady Downes. (Silver Knightian Medal.)

Messrs. W. PAUL & SON, Waltham Cross, set up a collection of some 30 admirably-grown and well-fruited Apple, Pear, and Plum trees in pots. Of Apples there were good specimens of Sandringham, Newton Wonder, Chelmsford Wonder, and Cox's Pomona. Pears were represented by Beurré Alexandre Lucas, and Catillac. The Plums included Jefferson, Coe's Golden Drop, Magnum Bonum, Greengage, Grand Duke, Prince Englebert, Victoria, Monarch, and Pond's Seedling. (Silver Knightian Medal.)

Messrs. STUART LOW & Co., Bush Hill Park, Enfield, showed a collection of fruit trees in pots, embracing Apples, Pears, and Figs, as a background to a collection of Apples in dishes. The finest of these were Peasgood's Nonesuch, Newton Wonder, Lord Derby, Jolly Beggar, Bramley's Seedling, Cellini Pippin, Royal Jubilee, Charles Ross, Rival, Gascoyne's Scarlet Seedling, Cox's Orange Pippin, Bismarck, and Lane's Prince Albert. (Silver Banksian Medal.)

Mr. STAPLETON, headmaster and garden instructor at the Purfleet Council Schools, Essex, staged a very interesting collection of hardy fruits grown on a special fruit plot at the schools by the boys under his instruction. The trees were planted in the autumn of 1909, hence they had fruited in their second year. There were 21 dishes of Apples and nine each of Plums and Pears. The finest Apples were those of Lord Derby, New Hawthornden, Beauty of Kent,

FIG. 101.—AMARYLLIS PARKERI.

Showing the difference between A. parkeri to the right and A. belladonna to the left (much reduced). (See p. 210)

sian Medal for a well-arranged group of Lælio-Cattleyas, Cattleyas, and others. Specially noteworthy were Phaius Ashworthianus, with bright-yellow flowers, both plant and flowers closely resembling Phaius Cymbidium chardwarensis; the rare Dendrobium MacCarthiae, and a fine plant of Phalaenopsis violacea.

Messrs. STUART LOW & Co., Bush Hill Park, secured a Silver Banksian Medal for a group with many good specimens of the yellow Oncidium varicosum arranged at the back. Cattleya Pittiana, several C. Iris and C. Adula, C. Forbesii, C. Luddemanniana, Cypripedium Elatior of fine quality; Dendrobium MacCarthiae, D. sanguinolentum and its rare white variety; a selection of Vanda coerulea, Cynoches maculatum, Miltonia Roezlii album, Cirrhopetalum Amesianum, and the pretty little Sigmatostalix Eliae were also noted.

Messrs. HASSALL & Co., Southgate, were

Dusseldorf Undine, several C. Euphrasia, and a finely-coloured Lælio-Cattleya Bletchleyensis.

W. P. BURKINSHAW, Esq., Hesse, sent Cypripedium Venus Hesse variety, with a snow-white, wax-like flower of great beauty.

Lady AUDLEY NEELD, Grittleton, Chippenham, showed Cypripedium Fascination (Fascinator \times insigne Harefield Hall), a large and well-formed flower with the general aspect of C. Leeannum, but with very broad petals; also C. Dallas (Curtisii exquisitum \times Fairrieanum).

Messrs. JAS. VEITCH & Sons, Royal Exotic Nursery, King's Road, Chelsea, sent Cattleya Carmen (Luddemanniana \times Warscewiczii), a showy, light-rose flower of good shape, with a ruby-purple front to the lip.

H. S. GOODSON, Esq., Fairlawn, Putney (gr. Mr. G. E. Day), sent Lælio-Cattleya Colmanii Goodson's variety, and a good example of Cypripedium Lord Derby.

Lady Sudeley, Bismarck, Allington Pippin, and Sturmer Pippin. The best Plums were Admiral, Jefferson, Grand Duke, and Washington, whilst the best Pears were Glou Morceau, Durondeau, Souvenir du Congrès, and Emile de Heyst. (Silver Banksian Medal.)

LADY COWPER, Panshanger, Hertford (gr. Mr. R. Staward), exhibited a singularly comprehensive collection of Onions in 50 baskets. These were fine, well-matured bulbs of Ailsa Craig, Sutton's A.I., Giant Rocca, Sutton's Perfection, Magnum Bonum, Red Tripoli, Trebons, Improved Reading Globe, The Queen, Early Gem, Crimson Globe, and others. Some of the plants were raised out-of-doors, and these were the smallest. (Silver-gilt Knightian Medal.)

AWARD OF MERIT.

Apple Charles Eyre.—A seedling variety raised at Welford Park by Mr. CHARLES ROSS. The variety is evidently one of his earlier seedlings. The tree is a robust, sturdy grower, large in leaf and with short-jointed wood. The pale-green fruit is of large size; the shape is conical, and the flesh firm. The specimens shown weighed from 12 to 14 ounces each, and they were grown on trees that had been neither watered nor manured this season. The variety promises to provide one of the finest culinary Apples in cultivation. Shown by Mr. W. POPE, Welford Park Gardens, Newbury.

GLASGOW AND WEST OF SCOTLAND HORTICULTURAL.

SEPTEMBER 6, 7, 8.—The 99th annual exhibition of this society was held on the foregoing dates in the grounds of the Scottish National Exhibition at Kelvingrove, Glasgow. This year's show marks an improvement over anything previously held in Glasgow; in all departments the exhibits were of great excellence. Cut flowers were shown in large numbers. In the fruit and vegetable classes there was a keen competition from some of the leading growers. Trade exhibits were numerous. Five large marquees were erected, but they provided insufficient room. The entries numbered 1,650, as compared with 1,100 last year. This satisfactory state of affairs is the result of the wonderfully fine summer experienced in the west of Scotland this season, coupled with the additional prize money offered. The pathways between the stages were narrow, and the visitors were much inconvenienced, whilst it was almost impossible to critically examine the exhibits. It is to be hoped that, on the occasion of the Centenary Show next year, the council will make more suitable arrangements.

GROUPS OF PLANTS.

Four entries were forthcoming in the class for a miscellaneous group of plants, arranged in a space 15 feet by 10 feet. No particular originality was noted in either of the groups. The 1st prize was awarded to W. BEATTIE, Esq., Milngavie (gr. Mr. Andrew Kelly), for an arrangement which appeared somewhat heavy and crowded. The plants consisted of Begonias Gloire de Lorraine and Caledonia, together with Celosias and Gloxinias, these being interspersed with Palms and Junipers. The 2nd prize was awarded to T. MACDONALD, Esq., Bearsden (gr. Mr. T. Muir), for a well-arranged group of Lilliums, Celosias, Cordylines, and Codæums. Mrs. ALEX. ROSE, Dowanhill (gr. Mr. J. Templeton), was placed 3rd with an arrangement of Lilliums and Begonias.

Important prizes were offered for a group of stove or greenhouse plants, arranged on the ground to occupy a space of 10 feet by 6 feet. Col. J. OUTRAM, Craigend Castle, Milngavie (gr. Mr. A. Davidson), was placed 1st for a collection consisting principally of Palms, Codæums, Cordylines, and Ferns.

SPECIMEN PLANTS.

For four stove or greenhouse plants and for four ornamental foliage plants Mr. A. HARDY, Glasgow, was placed 1st. In addition to the prizes for 12 plants for table decoration, a medal was also offered by the Highland and Agricultural Society of Scotland. A very pretty arrangement by MALCOM CAMPBELL, LTD., Glasgow, was awarded the 1st prize; 2nd, Professor BARR, Milngavie (gr. Mr. Jas. MacKinnon); and 3rd by Col. J. OUTRAM, Craigend Castle. Ferns, Pelargoniums, Begonias, and Petunias were all good specimens.

CUT FLOWERS.

There were nine classes for Sweet Peas, the entries ranging from 9 to 22 in the various classes. In that for a collection of Sweet Peas to occupy a space of 9 feet by 5 feet there were exhibited splendid collections. Mr. JOHN FLETCHER, Auchenheth, Lanark, won the 1st prize easily; his exhibit included magnificent examples of Sunproof Crimson, Masterpiece, and Mrs. Hugh Dickson. Messrs. THYNE & SON, Dundee, were placed 2nd, and Mr. JAMES BROWN, Catrine, 3rd. In the class for 12 vases Mr. JOHN SMELLIE, nurseryman, Busby, was the 1st prize-winner, the flowers appearing to be on the coarse side; 2nd, Mr. GEORGE BOWNESS, nurseryman, Busby, for a very even lot.

Gladioli were exceptionally well shown, the flowers being in perfect condition. The 1st prize for 24 spikes was won by Messrs. GEORGE MAIN & SON, Prestwick. They showed Galliene, Snow-wreath, and Helen in grand form; 2nd, Messrs. A. CAMPBELL & SON, Gourrock. Chrysanthemums were another strong feature, numerous classes being provided for these flowers. In the principal class for a collection (not disbudded), arranged in a space of 9 feet by 5 feet, Mr. JOHN SMELLIE, Busby, was placed 1st, Mr. G. BOWNESS 2nd, Messrs. M. CAMPBELL & SONS 3rd, and Messrs. RICHARDSON & STEWART, nurserymen, Giffnock, 4th.

Exhibits of hardy herbaceous flowers were numerous and fine. In the principal class for a display 10 feet by 5 feet there was a strong competition. The 1st prize was awarded to W. C. STUART, Esq., Rutherglen (gr. Mr. James Miller), for fresh blooms; 2nd, Messrs. J. COCKER & SONS, nurserymen, Aberdeen. Important prizes, including a medal, were offered for a collection of flowers cut from the open border and arranged on a space 8 feet by 5 feet. Here, again, there was a strong competition, and the 1st place was secured by Mr. CHARLES PATTISON, Linwood; 2nd, Mrs. F. HAMILTON, Kirkcovan (gr. Mr. W. Young).

There were numerous classes for Dahlias, Carnations, Phloxes, Marigolds, Pansies, Violas, Asters, Annuals, and Begonias, also for bouquets, wreaths, and other floral arrangements.

Roses were a weak feature of the show; although there were 13 classes for these flowers and all were exceptionally well contested, the blooms were hardly up to the high standard met with in the other sections. For a collection of Roses Messrs. COCKER & SONS, Aberdeen, were placed 1st, their blooms of Lyon Roses being particularly well coloured. Mr. W. FERGUSON, Dunfermline, was awarded the 2nd prize, Mme. Abel Chatenay being the most outstanding variety in this collection.

The best collection of 36 Rose blooms was shown by Mr. HUGH DICKSON, Belfast.

Decorative Roses were best shown by Messrs. DAVID ROBERTSON & SON, Helensburgh.

DECORATED DINNER TABLES.

There were 10 exhibits in the class for a decorated dinner table, and each displayed tasteful arrangement. The 1st prize was awarded to the Earl of HOME, Bothwell Castle (gr. Mr. W. P. Bell), who had a very graceful arrangement of pink Carnations and lavender-coloured Sweet Peas, coupled with trails of Selaginella. The 2nd prize was won by T. G. BISHOP, Esq., Helensburgh (gr. Mr. J. Hood), who employed Roses and sprays of Francoa ramosa.

FRUIT CLASSES.

DESSERT TABLES.—The schedule called for a table of dessert fruit, 10 feet by 4 feet 6 inches, decorated with plants in pots not exceeding 5 inches, cut flowers and foliage being optional, the table to contain not more than 16 dishes in all, and four bunches of Grapes (one bunch constituting a dish), at least one of these to be white. Prizes of £6 for 1st and £3 10s. for 2nd place were offered in this class, with £2 and £1 10s. respectively for decoration. The 1st prize for fruit was won by the Duke of PORTLAND, K.G., Welbeck Abbey, Nottinghamshire (gr. Mr. J. Gibson), with a magnificent collection; splendid examples of Melons, Grapes, Pears, and Apples were staged. The 2nd prize was awarded to Lord ELPHINSTONE, Carberry Tower, Musselburgh (gr. Mr. D. Kidd), who showed particularly good Grapes. For the decorations employed Lord ELPHINSTONE was placed 1st and the Duke of PORTLAND 2nd. The premier decoration was of pink Carnations relieved with sprays of Selaginella.

COLLECTIONS OF FRUIT.—The principal class was for 12 dishes of fruit, in 12 distinct varieties, not more than two varieties of any kind. There were four entries, and the principal award was won by the Duke of PORTLAND for a most meritorious collection. The 2nd prize was won by A. A. H. SPEIRS, Esq., Houston (gr. Mr. James Brown), and the 3rd by J. G. THOMSON, Esq., Norwood, Alloa (gr. Mr. Jas. Small). The 1st prize, in addition to the cash award of £3 3s., carried with it the "Hunter Memorial Medal," presented by Messrs. Austen and M'Aslan, seedsmen, Glasgow. The next important prize in this section was offered for a collection of six dishes of fruit, one bunch of Grapes to constitute a dish. The Duke of PORTLAND again secured the 1st prize, being followed by A. R. BROWN, Esq., Shandon (gr. Mr. John Finnie), and Sir C. FERGUSON, Bart., Dailly (gr. Mr. A. T. Harrison) in this order. There were eight competitors in this class.

GRAPES.—The leading class in Grapes was for eight bunches, not more than two bunches of any variety, each exhibit to be decorated with plants and flowers. The 1st prize consisted of a silver cup, with £8 in cash. This was awarded to the Right Hon. Lord ROWALLAN, Kilmaurs Castle (gr. Mr. James Dixon), who was awarded 60½ points. 2nd, the Trustees of the late Miss CAMPBELL, Ascog, Bute (gr. Mr. David Halliday), with 54½ points.

Black Hamburg.—The best two bunches of Black Hamburg Grapes were shown by A. R. BROWN, Esq., Shandon (gr. Mr. J. Finnie), W. T. MACLELLAN, Esq., Helensburgh (gr. Mr. H. MacSkimming) and F. C. STEWART, Esq., Skelmorlie (gr. Mr. Peter Young) being 2nd and 3rd respectively.

Muscat of Alexandria.—In this class the premier prize was awarded to Mr. W. T. MACLELLAN, Esq.; 2nd, A. R. BROWN, Esq.

Black Grapes other than Black Hamburg.—There were numerous exhibits in this class; the 1st prize was secured by J. G. THOMSON, Esq., Alloa, with Madresfield Court of superb quality; 2nd, the Trustees of the late Miss CAMPBELL.

The best collection of 12 varieties of Apples, four fruits of each, was shown by the Duke of PORTLAND, Mr. THOS. SMITH, Kilmarnock, being placed 2nd, and R. H. FLOWDEN, Esq., Strachur (gr. Mr. John Campbell), 3rd. There were seven entries in this class. The Highland and Agricultural Society of Scotland offered three prizes for a collection of 12 dessert Apples in three varieties, four of each sort. The Duke of PORTLAND again secured the premier place with grand examples of Allington Pippin, Cox's Orange Pippin, and Worcester Pearmain. The Trustees of the late Miss CAMPBELL were placed 2nd, and J. NEILSON, Esq., Castle Douglas (gr. Mr. J. M. Stewart), secured 3rd. For 12 culinary Apples, in three varieties, four fruits of each sort, the Duke of PORTLAND was again the 1st prize-winner. The varieties staged were Peasgood's Nonesuch, Gascoyne's Scarlet Seedling, and Emperor Alexander. 2nd, J. NEILSON, Esq.

The most important class for Pears was for a collection of six varieties, four fruits of each. The Duke of PORTLAND was an easy 1st prize winner, and he was followed by Miss HAMILTON, Royelle, Ayr (gr. Mr. Andrew Harvey) and H. J. YOUNGER, Esq., Kilmun (gr. Mr. R. Greenlaw), in this order. For 12 Pears in two varieties, six of each, Mr. JOHN RUSSELL, Prospect House, Newton Mearns, was an easy 1st.

COLLECTIONS OF VEGETABLES.

There were no fewer than four groups of prizes, each consisting of 1st, 2nd, and 3rd, for collections of vegetables, and there were numerous entries in each class, with the result that the exhibits of vegetables were the finest seen at any previous show in Scotland this season. For Messrs. Sutton and Sons' prizes of £5, £3, and £2, for a collection of 13 kinds, there was strong competition. The Duke of PORTLAND was placed 1st, his Onions, Leeks, and Celery being specially noteworthy. The 2nd prize was awarded to STEPHEN MITCHELL, Esq., Kippen (gr. Mr. Chas. Shaw). The 3rd prize was secured by Mr. JOHN MILLAR, Stranraer.

Similar prizes were offered by the Society for an almost identical collection. The winners were STEPHEN MITCHELL, Esq., 1st; Lady ORR, EWIN, Port Patrick (gr. Mr. Henry Jowett),

2nd; and the Earl of Howe, Bothwell Castle (gr. Mr. W. P. Bell), 3rd. Messrs. Ed. Webb & Sons, Stourbridge, offered prizes for a collection of nine varieties. In this case the 1st prize was won by A. A. H. SPEIRS, Esq., Houston.

There was a good competition in the classes for Potatoes, some admirable tubers being shown. Many prizes were provided for all classes of vegetables, and the principal awards were all secured by exhibits of high quality.

NON-COMPETITIVE EXHIBITS.

Messrs. SUTTON & SONS, Reading, displayed a magnificent collection of Melons, vegetables, Gloxinias, and cut flowers. They showed splendid specimens of Ailsa Craig Onions, some of the bulbs weighing 3 lb. each. Several varieties of Melons, not yet in commerce, and evidently of great merit, were also shown. Gloxinias raised from seeds sown on 11th April were very fine. (Gold Medal.)

Messrs. DOBBIE & Co., Edinburgh, put up a splendid display of all sections of Dahlias, comprising Cactus, Show, Pompon, Pæony, Single, Decorative, and Collarette varieties, many of these being seedlings raised in their nurseries. Sweet Peas and early-flowering Chrysanthemums completed a grand collection of cut flowers. (Gold Medal.)

Messrs. W. CUTBUSH & SON, Highgate, London, exhibited a collection of their specialities in vegetables, all the specimens being remarkably well grown. (Gold Medal.)

Messrs. ED. WEBB & SONS, Stourbridge, also showed a splendid display of vegetables, attractively arranged and staged. (Gold Medal.)

Messrs. MALCOLM CAMPBELL, LTD., of Glasgow, staged a table of fruit, all of superb quality. Grapes, Peaches, and Melons were remarkably fine. (Gold Medal.)

Messrs. GIBSON & Co., Leeming Bar, put up an exhibit of cut herbaceous flowers, Roses, and Phloxes. (First-class Certificate of Merit.)

Messrs. BLACKMORE & LANGDON, Bath, showed splendid Begonias. (Gold Medal.)

Mr. HUGH DICKSON, Belfast, exhibited Roses.

Messrs. YOUNG & Co., Cheltenham, had a stand of perpetual-flowering Carnations.

Mr. WILLIAM LEIGHTON, Glasgow, exhibited a table of flowering and foliage plants in variety. (Gold Medal.)

Messrs. AUSTIN & McASLAN, Glasgow, also displayed a collection of flowering plants arranged splendidly. (Gold Medal.)

Messrs. CLIBRANS, Altrincham, showed a collection of their various strains of vegetables. (Gold Medal.)

Mr. D. G. PURVIE, Glasgow, staged a collection of flowering plants.

Messrs. WILLIAMSON, GEMMELL & Co., Glasgow, also staged pot plants in variety.

Messrs. CUNNINGHAM, FRASER & Co., Edinburgh, exhibited hardy herbaceous plants.

Mr. CHAS. YOUNG, Kennishead, showed a group of Liliums, Hydrangeas, and Begonias.

Messrs. ALEX. LISTER & SON, Rothesay, exhibited Violas in all the best varieties.

Mr. QUINTIN MACFAYDEN, Low Junction, also showed Violas, French Marigolds, and Chrysanthemums.

NATIONAL DAHLIA.

SEPTEMBER 7, 8.—The first of the two shows arranged by the National Dahlia Society for this year was held at the Crystal Palace on these dates. On the opening day upwards of 110,000 persons visited the Crystal Palace, but this large attendance was far from being a cause of congratulation to the Dahlia Society. Nearly all day there was a dense stream of visitors passing through the building, rendering a critical examination of the exhibits a matter of extreme difficulty. At times the attendants at the various trade stands were carried along with the crowds. As was only to be expected in this year of drought, the quality of the blooms was below the standard of the preceding years; yet there was much to admire, and if many of the blooms were somewhat lacking in size this was compensated for by brilliance of colour.

In the amateurs' classes the competition was below the average, but the entries in the trade section had increased 50 per cent. By awarding a certificate to a Collarette Dahlia the Society has now officially recognised this type of the flower. Many other novelties were shown, but only two other blooms received awards. With

the exhibitors the most popular Cactus blooms were the brightly-coloured H. H. Thomas, and Glory of Wilts, the splendid yellow variety; these are undoubtedly the finest blooms of their respective colours. The Society was again indebted to Mr. Caselton, the Superintendent of the Palace grounds, for foliage plants, which materially assisted in decorating the large conservatory where the exhibition was held. The secretary, Mr. Hawes, supervised the arrangements, which were carried out in an admirable manner.

NURSERYMENS' CLASSES.

SHOW AND FANCY VARIETIES.—Mr. JOHN WALKER, Thame, Oxford, was the only exhibitor in the class for 48 blooms of Show Dahlias, distinct, and was awarded the 1st prize for fresh, well-coloured flowers, though slightly uneven in size. The largest blooms measured 4½ inches across, and were proportionately deep. The best varieties were William Powell (rich yellow), J. T. Saltmarsh (yellow, tipped with chestnut), J. Nicholson (lilac, shaded with pink); F. W. Girdlestone (dark self), Prince of Denmark (still darker), Mrs. C. Noyes (terra cotta), Perfection (deep orange), Imperial (claret), Bloodhound (of quite a sanguinary shade), and Harrison Weir (yellow fading to buff). This was a fine collection, and in this year of drought it would have been a difficult matter to stage a better exhibit of 48 blooms.

There was no competition in the class for 24 Show Dahlias, whilst in the class for 18 blooms, distinct, of Fancy Dahlias Mr. JOHN WALKER, Thame, Oxon, was again the only competitor. This exhibitor's collection was a very fine one, the back row blooms being almost perfect. From this exhibit we selected John Forbes (fawn, striped with maroon), William Sheldon (lemon-yellow, tipped with blush), Mrs. J. Downie (orange, striped with scarlet), Matthew Campbell (apricot, striped with crimson), Dandy (orange, striped with crimson), and Plutarch as being the most noteworthy varieties.

Exhibitors in the foregoing classes were not permitted to enter in the class for 12 blooms of Show and Fancy Dahlias, intermixed. Messrs. C. CARRINGTON & SON, Vicarage Avenue, Derby, obtained the 1st prize with a dozen very fine blooms. Perfection (orange), Shottisham Hero (pale purple, fading to a very light shade), Duchess of York (lemon, veined with flesh-pink), William Keith (maroon), Emperor (large florets of similar colour), Thomas Saunders (yellow), Harry Keith (claret), and R. J. Rawlings (a very fine yellow) were the finest varieties. 2nd, Messrs. J. CHEAL & SONS, Crawley, with fresh, small blooms, Crimson King, Thos. Pendered (yellow), and Mrs. W. Slack (heliotrope tints), being especially good.

CACTUS VARIETIES.—A Silver Challenge Cup was offered in the class for 18 varieties of Cactus Dahlias in bunches of six blooms. There were only two exhibitors, and Messrs. JAS. STREDWICK & SON, St. Leonards-on-Sea, again won the handsome trophy. Their splendid display included Mrs. Douglas Fleming (a creamy-white bloom with numerous narrow incurving florets) raised by the exhibitor, which is the finest white Cactus Dahlia to date, Miss Stredwick (see Awards), Red Admiral (a very large bloom of a rich scarlet colour), Mrs. Mills (bright purple with long, pointed florets), Dr. Roy Appleton (a fine, straight petalled bloom of pale lemon colour maturing to salmon), Marquis, Uranus (see Awards); splendid flowers of a type notoriously difficult to grow to perfection, the red stripe seems bound to appear, Ivernia, and Mrs. Stephens. The 2nd prize was awarded to Messrs. J. CHEAL & SON, Crawley, whose collection contained some exceedingly fine blooms of the popular dark kinds.

Messrs. C. CARRINGTON & SON, Chippenham, were awarded the 1st prize in the class for 24 Cactus Dahlias for a really good collection of rich and distinct coloured blooms. Their best varieties were Dreadnought, William Marshall, Advance (a very large bloom), Brigadier, Glory of Wilts, Marathon, and the large crimson Nelson.

There was only one competitor in the class for 12 garden Cactus Dahlias, to be arranged in a natural manner in vases with any hardy foliage. Messrs. J. CHEAL & SONS, Crawley, showed such varieties as Victory, Mrs. Landale, Mrs. Paton, Mrs. F. H. Cook, and Goldcrest, nicely arranged amidst sprays of Golden Privet and Asparagus.

POMPON VARIETIES.—To lovers of these delightful little flowers the Pompon Dahlias made a very interesting feature of the show. The number of blooms (10) required of each variety is sufficient to make a good display, and due regard was shown to the arrangement of the colours. Probably growers of this class of Dahlia have not experienced the difficulty of former years of keeping the blooms sufficiently small, but in any case Messrs. CHEAL & SONS, of Crawley, set up a group of model flowers. The varieties which pleased us most were Nora (yellow, tipped with bronze), Elsa (white), Ideal (yellow), Emily Hooper (pale buff), Girlie (a pretty shade of mauve), Ganymede, Galatea (claret), Nerissa (soft rose, tinted with silver), and Darkest of All.

The Pæony-flowered Dahlias were shown with long, stout stalks, and attractively arranged with fruiting sprays of Barberry and Snowberry, Asparagus, Golden Privet, and various grasses. The 1st prize for six varieties, distinct, was won by Messrs. J. CHEAL & SONS. The lighter shades predominated, and the collection consisted of such varieties as South Pole (white), Bertha von Sutton (tinted flesh pink), Geisha (yellow and red), and King Leopold (yellow).

AMATEURS' CLASSES.

Many of these classes, from which trade growers were excluded, were contested much better than was the case in the previous section. The five guinea Silver Challenge Cup, offered for the best 24 blooms of Show or Fancy Dahlias, was awarded to Mr. G. DENSLEY, Nag's Head Hill, Bristol, for fine flowers which were harmoniously arranged. The finest specimens were Warrior (red), R. T. Rawlings (yellow), M. Hobbs (yellow), T. S. Ware (maroon), and J. T. West (pale buff, tipped with purple). 2nd, Mr. S. H. COOPER, The Hamlet, Chippenham. 3rd, Rev. W. MARKS, Rownhams, Southampton.

There were five entries in a class for 12 Show Dahlias, and here Mr. DENSLEY also won the 1st prize; Maud Fellowes, H. Clark, Colonist, and Victor (very dark) were his finest blooms. 2nd, Mr. A. P. IRONSIDES, The Hamlet, Chippenham, with J. Stephens, especially fine. 3rd, Mr. S. H. COOPER, who obtained the 1st prize in the class for 12 Fancy Dahlias, where he was the only competitor.

The £20 Silver Challenge Cup, presented by the Crystal Palace Company, is offered for the best six varieties of garden Cactus Dahlias, to be arranged with any suitable hardy foliage. The number of blooms of each variety permitted is not sufficient to enable the competitors to make any real decorative effect in the large vases provided by the Society, and, as a result, there was a too great predominance of foliage and grasses. The holder of the cup this year, the Rev. A. BRIDGE, Worth Rectory, Crawley, Sussex, arranged some exceedingly fine blooms, Hon. Mrs. Greville (yellow centre fading to buff), Arthur Pickard (pale yellow to flesh pink), and Snowdon, White Ensign, and Golden Eagle, the names denoting the colours, were especially good.

A Silver Challenge Cup was offered for the best exhibit of nine varieties of Cactus Dahlias to be shown in bunches of threes. Mr. F. GRINSTEAD, Beauport Park, Battle, Sussex, was the successful competitor, with some magnificent blooms. A seedling variety named Beauport Beauty was finely shown. This bloom is after the style of Golden Eagle, but has longer florets, and is lighter in the centre. 2nd, Mr. F. W. FELLOWES, King's Walden, Hitchin.

Mr. H. PEERMAN, Glencross, Nantwich, was awarded the 1st prize and the Crystal Palace Company's Silver Medal for the best collection of 24 Cactus Dahlias. This very fine collection contained Thos. Parkin, Joan of Arc, Gwendoline Tucker, New York, and Harold Freeman in especially good form. 2nd, Mr. JAMES BRYANT, Salisbury.

There were 10 exhibits in the class for 12 Cactus Dahlias, and here again Mr. H. PEERMAN deservedly obtained the premier award; 2nd, Mr. F. GRINSTEAD.

The single Dahlias, as shown in class 24, afforded but a poor impression of the grace and beauty of this type of Dahlia; the conventional style of showing them seems to be to strain each set of flowers to wires so that the blooms are rigidly equidistant. The Rev. A. BRIDGE, Crawley, was awarded the 1st prize with blooms which would have delighted the old-style

Cineraria grower; they were so formal and perfect in shape.

The section restricted to amateurs who do not employ a regular gardener was, for the most part, keenly contested, and many fine blooms were to be seen. The Crystal Palace Company's medal, offered for a vase of 12 Dahlia blooms arranged with any hardy foliage, was won by Mr. Geo. Dyson, Plumstead.

OPEN CLASSES.

Messrs. J. CHEAL & SONS, Crawley, won the 1st prize in the Pompon Cactus class with a splendid collection of these delightful little flowers. This firm's best blooms were Sovereign, The Bride (a fine white flower), Mrs. H. B. Brandt (a lovely salmon-pink variety), Coronation (bright scarlet), Little Fred (greenish-yellow), and Gracie. 2nd, Mr. M. V. SEALE, The Nurseries, Sevenoaks.

Mr. H. PEERMAN, Glencross, Nantwich, won the 1st prize for six blooms of one variety of Cactus Dahlia with the brightly-coloured H. H. Thomas; Mr. M. V. SEALE followed closely with Glory of Wilts.

Mr. J. WALKER was awarded the 1st prize in the class for six blooms of a Show or Fancy variety with the primrose-yellow William Powell.

Mr. SEALE was the only competitor in the class for a shower bouquet of Cactus Dahlias. He set up a very tasteful arrangement with the miniature Cactus "Gracie," Codium leaves and Asparagus. The same exhibitor was also the only competitor in the class for a basket of Dahlias; it would be difficult to conceive anything finer in its class than Mr. SEALE's splendid exhibit.

Mr. A. BROWN set up a light and tasteful vase of Pompon Dahlias, which received the Silver Medal. The Bronze Medal was won by Mr. SEALE.

The 1st prize, including a Bronze Medal offered for a collection of Fancy Single Dahlias, was awarded to Messrs. J. CHEAL & SONS, Crawley; 2nd, Mr. SEALE.

The collection of Fancy Cactus Dahlias, which won the 1st prize for Messrs. JAMES STREDWICK & SON, was exceedingly good, Orion, Uranus, and Magpie being especially noteworthy.

AWARDS.

FIRST-CLASS CERTIFICATES.

Cactus Dahlia "Miss Stredwick."—A splendid bloom with long incurved florets, rosy-pink in colour with a lemon centre. Shown by Messrs. JAS. STREDWICK & SONS, St. Leonards-on-Sea.

Cactus Dahlia "Uranus."—A very large bloom of exceedingly good form; creamy-white ground, splashed with rosy-pink, and unusually free from thick colour stripes. Also raised by Messrs. JAS. STREDWICK & SONS.

Collarette Dahlia "Maurice Rivoire."—With reddish purple petals and white collar. Shown by Messrs. HOBBIES, LTD., Dereham.

NON-COMPETITIVE EXHIBITS.

MESSRS. HOBBIES, LTD., Dereham, set up a magnificent display of Dahlias of all kinds interspersed with Kochia scoparia and bordered with pieces of cork. Besides the best of the standard varieties this collection contained many novelties, the Collarette type being very prominent. (Large Gold Medal.)

MESSRS. H. CANNELL & SONS, Swanley, Kent, displayed a very fine assortment of Dahlias, which were arranged in vases of their different classes with foliage of Aster ericoides. This firm's new Pæony-flowered Dahlias included a huge bloom, 7 inches across, of Madame J. Coissard, a showy crimson variety with a white base to the florets. (Gold Medal.)

Mr. M. V. SEALE, Sevenoaks, had a very attractive display, in which prominence was given to this season's novelties. Amongst the garden varieties we especially noted Masterpiece (salmon-pink with brighter tips; a stout-stemmed bloom), Magnum Bonum (a very large salmon-scarlet variety). (Gold Medal.)

Mr. JOHN WALKER, Thame, Oxon, arranged a fine collection of representative blooms; the best flowers were Dr. Roy Appleton (lemon-yellow, shading to salmon), New York (a huge bronzy-yellow), and C. E. Wilkins (pink overlaying yellow). (Gold Medal.)

Mr. J. T. WEST, Tower Hill Nurseries, Brentwood, showed many fine blooms of the different sections, including Pride of Essex (a splendid

yellow Cactus), Mary Purrier (crimson), Elf (rose, striped with crimson), and Sherlock (bronze). (Gold Medal.)

Mr. CHAS. TURNER, Slough, had a small but very select display. Prominent positions were given to such new Pæony-flowered varieties as Eleanor (deep rose), Bayard (red), Sunstar (red and orange), and Lambert (bright red). (Silver-gilt Medal.)

Mr. JAS. B. RIDING, Chingford Nurseries, Essex, had a very comprehensive collection which filled one length of staging. The cut blooms were well arranged in bamboo stands of various heights. (Silver-gilt Medal.)

Messrs. KEYNES, WILLIAMS & Co., Salisbury, displayed a number of seedling single varieties in a general collection. The best of their seedlings were Cornet (yellow Cactus), Cavalier (deep red), and Sunray (large yellow fading to buff). (Silver Medal.)

Messrs. JAMES CARTER & Co., Raynes Park, sent many fine blooms, amongst which we noted Geisha, Bertha von Sutton, Hampton Court (white, overlaid with rose), Colonel Cody (bronze), and Mrs. W. L. Ainslie (pink); of the Pæony-flowered kinds, and Ruby Grinstead, Indomitable, and Snowdon of the Cactus section. (Silver Medal.)

ROYAL CALEDONIAN HORTICULTURAL.

SEPTEMBER 13, 14.—The autumn show of the above Society was held in the Waverly Market, Edinburgh, on these dates. Compared with the previous year's show, the entries showed an increase of 200. Exhibits of hardy fruit especially were very fine, and not for many years past has there been such a good display of finely-coloured Apples as on this occasion. The numerous non-competitive exhibits contributed largely to the success of the exhibition. Taken collectively, few finer September shows have been held in Edinburgh.

FRUIT CLASSES.

(Gardeners and Amateurs.)

In the class for a table of dessert fruit, 10 feet by 4 feet 6 inches, not more than 16 dishes selected from a list published in the schedule, there were three exhibits. The prizes were presented by the Corporation of Edinburgh, and there were separate prizes for fruit and for decorations. The 1st prize of £5 for fruit was awarded to the Earl of HARRINGTON, Elvaston (gr. Mr. J. H. Goodacre), the 2nd of £3 10s. to the Earl of WEMYSS, Gosford (gr. Mr. W. Galloway), and the 3rd of £2 to WHITELAW REID, Esq., West Park (gr. Mr. Geo. McKinley). The 1st prize exhibit included Muscat of Alexandria, Muscat Hamburg, Black Hamburg, and Madresfield Court Grapes, Nectarine and Princess of Wales Peaches, Victoria and Albert Victor Nectarines, Washington and Cox's Orange Pippin Apples, Marguerite Marrillat and Pitmaston Duchess Pears, The Peer and Taunton Hero Melons, Brown Turkey Figs, and Reine Claude de Bayay Plums. The number of points awarded to the respective dishes was as follows:—

	Maximum No. of Points.	Points Awarded.
Grapes, Black ...	9	7
Grapes, Black ...	9	7½
Grapes, Black ...	9	7½
Grapes, White ...	10	7
Peaches (1) ...	8	6
Peaches (2) ...	8	6½
Nectarines (1) ...	8	5
Nectarines (2) ...	8	5½
Apples (1) ...	7	6½
Apples (2) ...	7	5½
Pears (1) ...	8	6
Pears (2) ...	8	7½
Plums ...	6	5
Melons (1) ...	8	6
Melons (2) ...	8	5
Figs ...	7	5½
Totals ...	128	99

The Earl of WEMYSS obtained 85 points out of a possible 124, and WHITELAW REID, Esq., 74.

The Earl of WEMYSS was awarded the 1st prize for decoration with 20 points out of a possible 28; the Earl of HARRINGTON had 19½, and WHITELAW REID, Esq., 13 points, and were awarded the 2nd and 3rd prizes respectively.

COLLECTIONS OF FRUIT.

In the class for a collection of 12 dishes of fruit, decorated with flowers, to include not more than two dishes each of Grapes, Peaches, Nectarines, Apples, and Pears, and one dish each of other fruits, the Earl of HARRINGTON was the only exhibitor, and he was awarded the 1st prize. He showed: Grapes Madresfield Court and Muscat of Alexandria; Peaches, Lady Palmerston and Princess of Wales; Nectarines, Victoria; Apples, Gascoyne's Scarlet Seedling and Cox's Orange Pippin; Pears, Louise, Bon of Jersey and Williams' Bon Chrétien; Plums, Pond's Seedling and Diamond; and Melon, Ring-leader.

There were two competitors in the class for a decorated collection of 12 dishes of fruit grown indoors; to include not more than two dishes of each kind (Grapes excluded), the Earl of HARRINGTON being placed 1st, and WHITELAW REID, Esq., 2nd.

GRAPES.

The Scottish Challenge Trophy, valued at 50 guineas, presented by Mr. W. H. Massie, Edinburgh, was offered for eight bunches of Grapes, to include not more than two bunches of any variety. There were four exhibitors, three of whom had won the Trophy once. In addition to the Cup (which has to be won three times before it becomes the property of the competitor), the 1st prize included £6 in cash and a gold badge; the 2nd prize was £5, the 3rd £3, and the 4th £2. A decorated exhibit was required, and superior cultivation and finish in the fruits were of the greatest importance. Lord ROWALLAN, Rowallan, Kilmaurs (gr. Mr. Jas. Dixon), the winner last year, was placed 1st, the Earl of HARRINGTON 2nd, Sir HERBERT MAXWELL, Bart., Monreith (gr. Mr. S. Gordon), 3rd, and Lady ARMITAGE, Castle Huntly (gr. Mr. Jas. Besant), 4th. The bunches in the 1st prize collection and the points awarded were as follow:—

	Maximum No. of Points.	Points Awarded.
Muscat of Alexandria (1) ...	10	8
Muscat of Alexandria (2) ...	10	6
Madresfield Court (1) ...	9	8
Madresfield Court (2) ...	9	8
Black Hamburg (1) ...	9	7
Black Hamburg (2) ...	9	7
Muscat Hamburg (1) ...	9	7½
Muscat Hamburg (2) ...	9	7

Totals ... 74 ... 58½

The Earl of HARRINGTON obtained 54 points out of a possible 74; Sir HERBERT MAXWELL 50 out of 70; and Lady ARMITAGE 44 out of 70.

In the class for four bunches of Grapes, distinct, in which competitors in the champion class were not allowed to compete, Lord ELPHINSTONE, Carberry Tower (gr. Mr. D. Kidd), was awarded the 1st prize; CHAS. COWAN, Esq., Dalhousie Castle (gr. Mr. W. G. Pirie), the 2nd; and WM. FORBES, Esq., Callander Park, Falkirk (gr. Mr. J. Middleton), the 3rd.

The Earl of MAR and KELLIE (gr. Mr. W. J. Buchanan) was placed 1st for two bunches of Muscat of Alexandria; Colonel J. A. STEWART MACKENZIE OF SEAFORTH, Brahan Castle (gr. Mr. W. Campbell), being 2nd; and the Earl of WEMYSS 3rd.

The Earl of WEMYSS showed the best two bunches of Black Hamburg; 2nd, the Earl of HARRINGTON; 3rd, Sir HERBERT MAXWELL, Bart.

In the single-bunch classes, the 1st prize winners were as follows:—(a) Muscat of Alexandria, the Earl of MAR and KELLIE; (b) Black Hamburg, the Earl of HARRINGTON; (c) Black Alicante, H. NUNGALL, Esq., Melrose (gr. Mr. F. M. Urquhart); (d) Alnwick Seedling, Colonel GORDON, Castle Douglas (gr. Mr. J. Duff); (e) Gros Colman, Lady ARMITAGE; (f) Lady Downes, Lord ELPHINSTONE; (g) Madresfield Court, Lord ROWALLAN; (h) any other variety introduced since 1900, WM. FORBES, Esq., with Diamond Jubilee. Lord BALFOUR OF BURLEIGH (gr. Mr. J. J. Wann), won the 1st prize in the class for any black Grape not named above with the variety Gros Maroc. H. NUNGALL, Esq., was placed 1st for any white Grape not named above with Buckland Sweetwater; and Major THORBURN, Craigerne, Peebles (gr. Mr. J. McNeill), was 1st for the black Grape with finest bloom with Appley Towers.

The Earl of HARRINGTON won the 1st prize in the class for a green or white-fleshed Melon with

the variety Countess, and he was also 1st for a scarlet-fleshed Melon with the variety Manchester Red.

CLAUD HAMILTON, Esq., Larbert (gr. Mr. J. Wood), showed the best dish of 12 Figs, staging the variety Brown Turkey.

The Earl of HARRINGTON excelled in the class for Peaches, having Sea Eagle; and he was also 1st for Nectarines with Albert Victor.

The Earl of STAIR, Oxenford Castle (gr. Mr. B. Ness), showed the best dish of 12 Apricots, the variety being Moor Park.

HARDY FRUIT.

Lord HOWARD DE WALDEN, Saffron Walden, Essex (gr. Mr. Jas. Vert), won the 1st prize in the class for 12 Gage Plums with the variety Reine Claude de Bavay; Col. GORDON, Threave House, Castle Douglas (gr. Mr. J. Duff), was placed 1st for 12 yellow Plums with the variety Jefferson, and he was also 1st for 12 red Plums, the variety being Pond's Seedling. H. NUNGALL, Esq., showed the best 12 purple-skinned Plums in the variety Monarch. Lord HOWARD DE WALDEN excelled in the class for a collection of dessert plums in four varieties, nine fruits of each sort, R. H. ELLIOT, Esq., Clifton Park, Kelso (gr. Mr. A. McKinnon), being 2nd, and WHITELAW REID, Esq., 3rd. In the similar class for a collection of culinary Plums Lord HOWARD DE WALDEN was again 1st, WHITELAW REID, Esq., being placed 2nd, and Mr. R. G. SINCLAIR, Congalton, Drem, 3rd. The best collection of Apples in 12 varieties, five fruits of each, ripe or unripe, was shown by Mr. J. LEE KINGSROFT, Cheshire; 2nd, Mr. R. G. SINCLAIR; 3rd, Mr. E. CADDICK, Caradoc, Ross, Hereford. In the class for a collection of Apples grown in Scotland in 12 varieties, five fruits of each variety, Col. GORDON was placed 1st, Mr. R. G. SINCLAIR 2nd, and Messrs. BELL, Rossie (gr. Mr. W. Nicoll), 3rd. The best collection of Apples in six varieties was shown by Mr. E. CADDICK, the 2nd prize being awarded to Mr. J. LEE, and the 3rd to Mr. WHITING, Cudenhall, Hereford. For six dessert Apples in two varieties, Lord HOWARD DE WALDEN was placed 1st, the 2nd prize being awarded to Col. GORDON, and the 3rd to Mr. R. G. SINCLAIR.

For a collection of Pears in 12 varieties, four fruits of each variety, Mr. WHITING was placed 1st, the Earl of WEMYSS 2nd. The best collection of Pears in six varieties grown in Scotland was shown by the Earl of WEMYSS, Mr. R. G. SINCLAIR being awarded the 2nd prize, and M. T. FLETCHER, Esq., Saltoun Hall (gr. Mr. R. Pow), the 3rd prize.

For four dishes of Apples grown in an orchard house Messrs. BELL, Rossie, were the 1st-prize winners; 2nd, the Earl of HARRINGTON; 3rd, Lord HOWARD DE WALDEN. Miss HAMILTON, Ayr, showed the best four dishes of Pears grown indoors, I. NELSON, Esq., Castle Douglas (gr. Mr. I. M. Steward), being 2nd, and Mrs. KAY, Dumfries, 3rd.

PLANT CLASSES.

The only competitor in the class (open only to gardeners and amateurs) for a group of miscellaneous plants arranged on the floor within a circle measuring 18 feet in diameter was JOHN HERDMAN, Esq., Murrayfield, Edinburgh (gr. Mr. James Hermiston), and he was awarded the 2nd prize. For four stove or greenhouse plants in flower, Major THORBURN was awarded the 1st prize, Mr. ALLAN SMITH, Peebles, the 2nd, and Mr. G. MCKINNA, Rathe, the 3rd prize. Major THORBURN excelled in the class for one stove or greenhouse plant in flower. A. DRYBURGH, Esq., Gogar Park (gr. Mr. A. Findlay), won the 1st prizes in the Orchid classes. The Earl of HOME (gr. Mr. A. McMillan) showed the best four Ferns of exotic species, and J. HERDMAN, Esq., the best four Adiantum Ferns and the best Tree Fern. ALEX. COWAN, Esq., Penicuik (gr. Mr. J. Turnbull), was awarded the 1st prizes in the classes for four British Ferns and for nine dwarf hardy Ferns. Mr. J. BLACK, East Calder, showed the best Scolopendriums in a class for six plants.

The 1st prize-winners in the other classes for specimen plants were as follow:—(a) Six foliage plants (Palms excluded), the Earl of HOME; (b) six foliage plants in pots not exceeding 9 inches, Sir WILFRED LAWSON, Brayton (gr. Mr. A. Knight); (c) four Palms, Sir A. B. MILNE, Bart., Musselburgh (gr. Mr. A. McAndie); (d) two Palms, the Earl of HOME; (e) two Dracaenas, Mrs. HUTCHISON, Carbourne (gr. Mr. J. Thom); (f) two

Codiaeums the Earl of HOME; (g) two Aralias, Mrs. HUTCHISON; and (h) two Coleuses Sir J. MURRAY, Edinburgh (gr. Mr. J. McIntyre).

In the classes for tuberous-rooted Begonias, Mr. R. BROWN, Dalkeith, won 1st prizes for six single-flowered varieties, three single-flowered varieties, and one single-flowered variety. He also won the 1st prizes for three double-flowered varieties and for one double-flowered variety. Mr. A. THOMSON, Dalkeith, won the 1st prizes in the classes for two Fuchsias and for one Fuchsia. Mr. G. MCKINNA showed the best three plants of Zonal-leaved or plain-leaved Pelargoniums, and Mr. J. HERDMAN was 1st for three Ivy-leaved Pelargoniums. The Earl of HOME excelled in the class for six Chrysanthemums not disbudded. Sir J. MURRAY staged the best three pot plants of Lilliums.

CUT FLOWERS.

For 12 Gladioli, distinct, the 1st prize was awarded to Mr. J. C. FORDY, Markworth, and the 2nd to Mr. A. BRYDON. Mr. J. STEWARD, jun., Alloa, excelled in the class for six Gladioli. Mr. J. WILSON, Leven, showed the best six spikes of Hollyhock. In the Dahlia classes, Mr. CHAS. SHAW, Kippen, won the 1st prize for 12 Cactus blooms; Mr. F. W. WOOD, Kinross, the 1st prize for six Paony-flowered blooms; Mr. J. PEARSON, Corstorphine, had the best six bunches of single varieties, and Mr. W. JENKINS the best six bunches of Pompon Dahlias.

SWEET PEAS.

Exhibits of Sweet Peas made a fine show. In the class for the 12 bunches, distinct, arranged with Sweet Pea foliage, 30 spikes in a bunch, there were 12 competitors. Mr. THOS. M. KIRKWOOD, Crieff, was placed 1st; Mr. JOHN HITCHER, Auchenheth, 2nd; and J. LOAN, Coldstream, 3rd. Seventeen growers entered in a class for six bunches, distinct, decorated with any kind of foliage. Mr. JAS. GARDINER, Duns, was awarded the 1st prize, Mr. K. H. COMRIE being placed 2nd.

There were six exhibits in the class for one bunch of 18 spikes of any variety not in commerce. The 1st prize was awarded to Mr. GEO. REID, Floral Cottage, Downfield, for a light rose seedling; 2nd, the Hon C. F. H. SCOTT, Maidenhead St. Boswells, for a deep mauve seedling; and 3rd, Mr. T. SMART, for a seedling of a crimson colour with a shade of orange.

Roses made a good display. In the class for 24 blooms, in not fewer than 18 varieties, Mr. L. BLACK, Kinglassie, was awarded the 1st prize; 2nd, Mr. WM. VIRTUE, Lanark.

Mr. BLACK was also placed 1st for 12 H.T. blooms, distinct, whilst Mr. SIMPSON excelled in the class for 12 Teas, in not fewer than six varieties. Mr. RUSSELL, Rosegarth, won the 1st prize in the class for six blooms of a scarlet or crimson variety shown in a vase. Mr. HOLMS, Helmsburgh, excelled in the similar class for a pink variety; whilst Mr. BLACK showed the best six blooms of a white variety. Mrs. RUSSELL was placed 1st and Mr. D. FRAWER 2nd in the class for six vases of Roses, one variety in each vase.

In the Carnation classes, Gold and Silver Medals were offered by Mr. D. C. Wright, Dumbane, for three vases of border Carnations or Picotees, six blooms of one variety in each vase, and three vases of mixed border Carnations or Picotees, six blooms in each vase. The 1st prizes in these classes were won by Mr. ANDREW BENNET, Tweedmouth, and Mr. PETER ROBERTSON, Junr., respectively. Mr. I. WILSON exhibited the finest three vases of perpetual-flowering Carnations.

In the Pansy and Viola classes, Mr. C. KAY, Bargunmock, was placed 1st for 12 Fancies, and also for 12 Show varieties. Mr. I. WAITE, Edinburgh, showed the best 12 sprays of Violas.

In the early-flowering Chrysanthemum classes, Mr. K. RICHARDSON, Manor, was placed 1st for six vases; Mr. T. ROBERTSON gained the premier position for 12 vases, the flowers not disbudded, and also for one vase of a white variety. Mr. P. SKELTON showed the best vase of a yellow variety, Mr. W. ROBERTSON the best vase of a crimson variety, and Mr. P. SKELTON the best variety of any other colour.

Mr. D. MCLEAN, Raith, was awarded the 1st prize for Michaelmas Daisies. Mr. I. RICHARDSON exhibited the choicest Montbretias and six bunches of hardy perennials. Mr. F. M. URQUHART was placed 1st for 12 vases of hardy or half-hardy annuals.

There were only two exhibits in the class in which a Silver Cup was offered by Mr. J. W. McHattie, Edinburgh, for the best display of hardy perennials arranged on a table. The cup was won by Mr. A. BRYDON, Innerleithen; 2nd, Mr. A. DICKSON, Glenormiston. Mr. E. MCLEAN had the best single, and Mr. E. PICKWELL the best double Asters.

VEGETABLES.

(Open Classes.)

For a display of vegetables in 18 dishes, not fewer than 12 kinds, and not more than two dishes of any kind, arranged on a space not exceeding 6 feet by 4 feet, there were only two entries. The 1st prize was won by the Earl of LAUDERDALE, Thirlestane (gr. Mr. R. Stuart); 2nd, Colonel E. S. RICHARDSON, Ballathie (gr. Mr. J. E. Davies).

There were three exhibits in a class for a display of vegetables in 12 distinct kinds, grown in Scotland, arranged on a space not exceeding 4 feet by 4 feet. Sir H. MAXWELL, Bart., was placed 1st; H. NUNGALL, Esq., 2nd; and Mr. A. MORRISON, Melrose, 3rd.

AWARDS.

FIRST-CLASS CERTIFICATE.

Collarette Dahlia Holyrood, shown by Messrs. DOBBIE & Co., Edinburgh.

AWARDS OF MERIT.

Pansy Jessie Lister (Fancy), shown by Messrs. A. LISTER & SON, Rothesay.

Begonia Lady Cromer, shown by Messrs. T. S. WARE, LTD., Feltham.

NON-COMPETITIVE EXHIBITS.

Mr. JOHN PROCTOR, Portobello, exhibited a circular group of early-flowering Chrysanthemums arranged with Palms, Ferns, and Lapagerias, the whole being edged with dwarf Zonal-leaved Pelargoniums and Adiantum Ferns. (Bronze Medal.)

Messrs. JAMES VEITCH & SONS, LTD., Chelsea, put up a splendid display of fruit trees in pots. Pears Triomphe de Vienne and Doyenné du Comice were specially noteworthy. A few choice examples of Figs were also shown, and also some excellent baskets of Apples, including splendid fruits of the Rev. W. Wilks and Rival. The exhibit was interspersed with sprays of Thalictrum dipterocarpum. (Gold Medal.)

Messrs. R. B. LAIRD & SONS, LTD., Edinburgh, showed a collection of Conifers in pots, also Roses and Dahlias.

Mr. JOHN DOWNIE, Edinburgh, staged a group of foliage plants all admirably grown and displayed to good advantage. Dracaenas, Codiaums, and Alocasias were shown in good colour, and there were also fine examples of Adiantum Farleyense gloriosa, Gymnogrammes, and Nephrolepis Ferns. On a separate stage this firm arranged a fine exhibit of double-flowered Begonias. (Silver-gilt Medal.)

Messrs. DOBBIE & Co., Edinburgh, staged a large collection of their specialities. They showed Dahlias in splendid condition, the new Collarette varieties being specially fine. Early-flowering Chrysanthemums in all the best and most popular sorts had a bright appearance, and some of the best Fuchsias were displayed in pots, together with Begonia Prima Donna. A collection of Sweet Peas embraced such excellent varieties as Melba, Edrom Beauty, and Dobbie's Sunproof Crimson. This firm also showed Potatoes in baskets. (Gold Medal.)

Messrs. W. CUTBUSH & SON, Highgate, showed a large group of border flowers, with a pool in the centre planted with Nymphæas. (Silver-gilt Medal.)

Messrs. JOHN FORBES, LTD., Hawick, staged a comprehensive collection of hardy flowers, including Dahlias, Phloxes, Pentstemons, Violas, and Hollyhocks. (Silver-gilt Medal.)

Messrs. ED. WEBB & SONS, Stourbridge, arranged a large stand of garden produce, the principal features being Melons, Tomatos, and Onions. Sweet Peas were shown in a splendid condition, and there were also fine bunches of Comet Aster. (Silver-gilt Medal.)

Messrs. CUNNINGHAM, FRASER & Co., Edinburgh, showed a collection of border flowers, a large batch of Helenium Riverton Gem being a prominent feature. They also showed well-flowered plants of hardy Ericas in pots and early-flowering Chrysanthemums. (Silver Medal.)

Messrs. G. GIBSON & Co., Bedale, showed cut flowers, their Phloxes, Gaillardias, and single Pyrethrums being very fine. (Silver Medal.)

Messrs. G. FAIRLAWN & SONS, Carlisle, showed a collection of Dahlias, the variety Dreadnaught being prominent among the Cactus varieties. (Silver Medal.)

Messrs. CLIBRANS, LTD., Altrincham, filled a large table with well-grown varieties of their strains of vegetables, the produce being excellently arranged. (Silver-gilt Medal.)

Messrs. STORRIE & STORRIE, Glencarse, exhibited a large collection of well-grown fruit trees in pots. There were fruits of more than 150 varieties of Apples, 30 varieties of Pears, and 30 distinct Plums gathered from pyramid trees grown in the open at Glencarse. They also displayed plants of Coleus, Celosia, and Schizanthus in groups. (Gold Medal.)

Messrs. GEO. BUNYARD & Co., LTD., Maidstone, showed a splendid collection of gathered fruits, including choice examples of Apples Charles Ross, Waghorn's Scarlet, Mère de Ménage, and Lady Sudeley. The Pears included fine dishes of Marguerite Marillat, Triomphe de Vienne, and Dr. Jules Guyot. (Silver Medal.)

Messrs. LAING & MATHER, Kelso, exhibited pot plants of Ivies, Ampelopsis, and Carnations, also border flowers, including Cactus and Pompon Dahlias. (Silver Medal.)

Mr. ROBERT BOLTON, Carnforth, showed Sweet Peas in all the leading varieties, John Ingman, Charles Foster, Marchioness of Tweeddale, Earl Spencer, and Edron Beauty being specially fine. (Silver Medal.)

Messrs. D. & W. CROLL, Dundee, showed plants and a collection of fruit. (Silver Medal.)

Messrs. GUNN & SONS, Olton, exhibited a large collection of Phloxes, also Viola cornuta purpurea. (Silver Medal.)

Messrs. THYNE & SON, Dundee, displayed miscellaneous flowers, including Antirrhinums and other border flowers, Sweet Peas and early-flowering Chrysanthemums. (Silver Medal.)

The Rev. H. MAYALL, Comrie, put up a pretty and artistic exhibit of Sweet Peas in large vases, with sprays of Smilax. (Silver Medal.)

Messrs. T. S. WARE, LTD., Feltham, showed splendid plants of tuberous-rooted Begonias, including the fine variety Lady Cromer. (Silver Medal.)

Mr. M. CUTHBERTSON, Rothesay, showed a collection of Pansies and Violas. (Silver Medal.)

Messrs. M. LISTER & SON, Rothesay, exhibited a small collection of Pansies, Violas and Dahlias. (Bronze Medal.)

Mr. D. MACLEOD, Manchester, staged a small collection of Orchids.

The DISTRESS COMMITTEE for the City of Edinburgh showed vegetables grown on land reclaimed by the unemployed at Muireston. The Potatos were remarkably fine, and there were good Runner Beans, Tomatos, Leeks, Celery and Cauliflowers. (Silver-gilt Medal.)

Mr. D. MCCORNISH, Crieff, staged a collection of Phloxes, Antirrhinums, and other border flowers. (Silver-gilt Medal.)

The Rev. J. HART, Aberlady, showed varieties of Apples. (Silver Medal.)

Messrs. J. FAIRLEY & Co., Cairneyhill, exhibited Roses. (Silver Medal.)

Messrs. THOMAS METHVEN & SONS, Edinburgh, arranged a circular group consisting chiefly of Clematis. The centre of the exhibit was composed of Liliums, the whole being edged with dwarf Abutilons. (Silver Medal.)

Messrs. YOUNG & Co., Cheltenham, showed perpetual-flowering Carnations, the varieties Britannia and Enchantress being especially well shown. (Silver-gilt Medal.)

Messrs. MASON & Co., Jamestown, exhibited a small collection of early-flowering Chrysanthemums, Pansies and Violas.

Countess COWPER, Panshanger, Hertford (gr. Mr. R. Staward), exhibited 50 baskets of Onions. (Silver Medal.)

Messrs. J. COCKER & SONS, Aberdeen, staged a collection of border flowers. (Silver Medal.)

Messrs. M. CAMPBELL & SON, Blantyre, showed a small exhibit of Chrysanthemums and Dahlias. (Silver Medal.)

WATFORD HORTICULTURAL.

At the meeting of this association held on the 8th inst., Mr. W. Waterton read a paper on "Gathering, Packing, and Transmitting Flowers, Fruit and Vegetables for Exhibition."

* * * The Editors will be glad to receive, for consideration, large photographs of horticultural subjects, suitable for reproduction in this Journal.

AMPELOPSIS AND PULMONARY DISEASES: *Correspondent.* We have never heard of any species of Ampelopsis causing pulmonary trouble. Such trouble usually arises from inhaling irritating dust, or impure air, such as is found in ill-ventilated rooms in cities and large towns.

ASTERS DYING: *T. T.* Send a specimen of one of the affected plants for examination.

ASTERS WITH PARASITE: *Aster.* The curious plant growing on your Asters is a species of *Cuscuta* (Dodder).

BEGONIA LEAVES: *R. E. F.* There is no disease present in the Begonia leaves. The trouble is due to an excess of moisture. Stand the plants well apart so that the air may circulate freely amongst them; open the ventilators on all favourable occasions, and do not wet the foliage too frequently.

BEGONIA RUST: *W. F. S. P., Hexham.* The rusty appearance of your Begonia leaves is caused by thrips. Dip the plants in tobacco water to which a little soft soap has been added.

CELERY SPOTTED: *E. K. and Enquirer.* It is too late to check the disease, but remove all the affected leaves, and burn or bury them. The same ground should not be used for growing Celery for the next two or three years.

CHRYSLIS: *K. McL., Melton Mowbray.* The curious case found on the top of a stake amongst your Michaelmas Daisies is a Cocoon of the Puss Moth (*Cerura vinula*). The caterpillars feed mostly upon Willows, Osiers, and Poplars.

"FRENCH" GARDENING: *C. R. N.* It is unusual for gardeners who practise intensive culture in France to take pupils, although there may be some who make exception. Such schools as Versailles, Vaujours, and Fleury, all within 16 miles from Paris, include intensive culture in the curriculum. The scholars must fulfil certain conditions, as to age, and this branch is only a part of the tuition. There are numerous French gardens in England which are managed by Frenchmen, where the system of culture is identical with that practised in France, differing only according to local circumstances.

GRUBS: *Young Gardener, Westmoreland.* The specimens you sent were dried up, and it was impossible to say what they were. The dried skin of one looked like that of a young Leather Jacket. If you send fresh specimens packed in damp earth and moss, we will endeavour to give you a satisfactory reply.

IVY STEMS: *A. P., Cork.* There is no disease present in your Ivy. The blotches on the leaves have been caused by drip.

MELONS AND CUCUMBERS: *Enquirer.* The plants have both been badly injured by eelworm. There is no cure at this stage. The soil in which the plants have grown may be treated with gas-lime. Next season, either sterilise the soil by baking, or procure fresh loam from a distance. See that the house is thoroughly cleansed before it is used again for these plants.

NAMES OF FRUITS: *A. M. S.* 1, Kerry Pippin; 2, Graham; 3, Worcester Pearmain; 4, King's Acre Pippin; 6, send again later.—*Grinstead.* 1, Gascoyne's Scarlet Seedling; 2, Stirling Castle; 3, Bismarck; 4, Lady Henniker; 5, Cellini; 6, Brownlee's Russet.—*W. B.* Emperor Alexander.—*Shillito.* Goodyear Pippin.—*F. J. S.* Devonshire Quarrenden.—*F. Edgington.* 1, Farmer's Seedling; 2, Winter Hawthornden; 3, Warner's King; 4, Waltham Abbey Seedling; 5, Beauty of Stoke; 6, not recognised.—*Pickwell.* 1, Emperor Alexander; 2, Cox's Pomona; 3, Potts's Seedling; 4, Worcester Pearmain; 5, Hornead's Pearmain;

6, Peasgood's Nonesuch.—*O. Nicholas.* 1, Melon Apple; 2, Egremont Russet; 3, Stone's or Loddington's Seedling; 4, Gascoyne's Scarlet Seedling; 5, Ashmead's Kernel Improved; 6, Domino.—*O. M. M.* The numbers should run consecutively. 209, Wellington or Dumelow's Seedling; 74, decayed; 126, Lord Suffield; 192, Alfriston; 124, Hawthornden; 134, French Crab; 193, Wyken Pippin; 144, Ross Nonpareil; 206, King of the Pippins; 178, Northern Greening; 194 and 195, these specimens are immature. We only undertake to name six fruits at one time.

NAMES OF PLANTS: *H. R., Holland.* The plant is *Micromeria Douglasii* (not a *Sibthorpia*), a native of North-western America. It is a sweet-scented plant, with small flowers, and belongs to the N.O. Labiatae.—*A. R.* *Mirabilis jalapa*.—*J. B.* *Eucomis punctata*.—*R. E. T.* 1, Send when in flower; 2, *Phyllanthus nivosus*; 3, *Rhipsalis cassytha*; 4, *Ophiopogon*; 5, *Asparagus myriocladus*.—*G. F., Wigan.* *Hedychium Gardnerianum*.—*R. T.* 1, *Oncidium cheiroporum*; 2, *Brassia maculata*; 3, *Odontoglossum Lindleyanum*; 4, *Cochlidia rosea*.—*E. C.* 5, *Tecoma (Bignonia) jasminoides*; 6, *Blechnum polypodioides*; 7, *Adiantum capillus Veneris*; 8, *Davallia canariensis*; 9, *Polypodium pustulatum*; 10, *Nephrolepis davallioides*; 11, *N. exaltata*; 12, *Polystichum angulare proliferum*.

ORCHID LEAVES WITH MARKINGS: *F. V. T.* The fungus disease on the Orchid leaves is not necessarily caused by bad cultivation but by contamination. The remedial measures were described in our last issue.

PEACH TREES DISEASED: *F. Z., Rotherfield.* The Peach trees are attacked by Peach mildew. The trees should be sprayed next spring when the leaves are commencing to expand, at intervals of eight days, with a solution of liver of sulphur, using 1 ounce in 3 gallons of water.

POTATOS DISEASED: *"Ceux."* The scabbed surface of your Potatos is not due to disease: it has been caused by the hard, dry soil injuring the delicate skin of the young tubers.

PURPLE-PODDED PEA: *T. W., Kirkintilloch.* The purple-podded Pea is well known in cultivation, but it has very little value for the table. The seeds are large and grey-green in colour, which, in cooked samples, turns to brown. The pods lose their purple colour when boiled, and become almost green. They are tough and leathery, even before they are fully grown.

ROSES: *Miss B.* No. 1 is certainly not Billard et Barré, which is a deep-yellow variety. It resembles Camœns. No. 2 is Killarney; Augustine Guinnoisseau is a pale blush-white Rose, and in every way distinct from what you send. No. 3 is probably Countess of Gosford, but the flower was much shattered. No. 4 is not Kaiserin Augusta Victoria, which is a pale lemon-white variety. No. 5 seems true to name, but Mme. Lambard is usually richer in colour than your specimen.

WALNUT AND MULBERRY: *Irish Enquirer.* The age at which the Walnut may be expected to fruit will, of course, depend largely on the nature of the soil and whether the trees have been grafted or not. The best sorts are the thin-shelled, French varieties, which are usually grafted or budded on the common Walnut. When these are planted in not too rich a soil, they usually commence bearing nuts in from 12 to 15 years. Seedlings of *Juglans regia* (the common Walnut) would not bear fruit in this time. A dwarf variety known as Dwarf Prolific comes into bearing when quite young, but the fruits are not equal to the French kinds. The Mulberry known as "Large Black" is the best variety. It is not wise to prune Mulberries severely, but, as in the case of the Walnut, the pruning should be directed towards making a shapely tree.

ROSES AT THE SHOW.

AFTER the trying heat and drought of the summer it was natural that some curiosity should be felt as to what kind of display there would be at the N.R.S. Autumn Rose Show of 1911, and it is probable that few were more surprised than the exhibitors themselves to find the classes well filled and the hall crowded. No doubt some credit for this happy result was due to the President the Rev. J. H. Pemberton, whose forethought and ingenuity had, almost at the last moment, provided the exhibitors with some additional classes specially appropriate to a year of drought. But even apart from these special classes the decorative sections and classes for Tea Roses were unexpectedly well filled, though very naturally those classes intended for exhibition boxes of H.T.s and H.P.s were somewhat weak. Mr. Mawley was certainly right in calling it "the triumph of the Rose," for since the advent of autumn Roses there has not been a summer that has imposed so heavy a strain on the Rose, or one during which it has been more difficult to find a flower capable of standing even a few hours

when cut. Looking back on last year's show it is difficult to imagine a greater contrast between the Roses exhibited then, and those shown last week. Last year, whereas the old H.P.s were displayed in their full glory, the Teas were lacking in quality, and many of the flowers in the decorative classes were badly stained. This year there were but few H.P.s, and these not equal to the best, while the Teas and Roses in the decorative classes, if sometimes rather small flowers, were wonderfully bright, clean, and well-formed. If it was, in fact, a triumph for the Rose, it was largely to the Tea Roses that the triumph was due. Many were surprised at the number of flowers of Maréchal Niel shown. Something like a dozen new Roses were staged in the class for new seedling Roses. The most noticeable was Sunburst, raised by Pernet Ducher, the French hybridist, who has given us so many useful Roses. It is understood that the flowers shown were from plants grown under glass, and that on a technical ground the Committee were unable to give this Rose an award. Mr. Pemberton showed a very beautiful little Rose, Margaret Harding, which he states to be a yellow sport from Mme. Jean Dupuy. It was one of the best Roses in the class, and should prove a valuable addition to our garden Roses, particularly if it proves to have the constitution of its parent. It is well shaped and of a good colour. Some thought it resembled Lady Mary Corry, but the yellow seemed of a deeper tint. A nicely-shaped pink Rose Freda, shown by Messrs. Paul & Son, may perhaps be heard of again, especially if it proves, as stated by the raisers, to be very free flowering. Two good red Roses were shown not very unlike in colour. One by Mr. Hugh Dickson, and the other called Mrs. Muir Mackean, by Messrs. S. McGredy & Son, received the award of a Silver-gilt Medal.

Coming to the general exhibition, perhaps the most noticeable exhibit was the large group staged by Messrs. W. & J. Brown, which faced one on entering the hall. It received the award of a Gold Medal, and contained a great central pillar of The Lyons Rose flanked by pillars of White Maman Cochet, Joseph Hill, and other varieties, the back being filled up with Roses innumerable, and the whole surmounted by great sprays covered with Rose hips, which gave distinction to the group. A group of Roses arranged on the floor in one corner of the hall by Messrs. Paul & Son was an excellent example of tasteful arrangement. Seashell, one of the perpetual-flowering Wichurianas introduced by this firm, looked well in this group, as did flowers of Mme. Mélanie Soupert, Mme. Jules Graveaux, and Sénateur Mascaraud, while groups of Dean Hole of a remarkably fine colour appeared at the back of the collection. Noticeable, too, was a similar group staged in another corner of the hall by Messrs. Hobbies, Ltd. In the decorative exhibits staged by Messrs. Alexander Dickson & Sons, the most striking flowers were Duchess of Wellington and Alexander Hill Gray, both particularly well

shown. Mr. Prince had, as usual, a very clean-looking exhibit, in which Mme. Mélanie Soupert, W. R. Smith, and Mme. Constant Soupert were specially worthy of mention. He had also good bunches of Gottfried Keller and The Lyons Rose. The show this year seems to have caught Mme. Constant Soupert just right, for there were many beautiful flowers of this Rose in the boxes of both amateurs and nurserymen. Among the amateurs it secured for Mr. M. Whittle, of Leicester, the Medal offered for the best bloom; and the success of this veteran rosarian gave considerable pleasure to many visitors at the show. As a whole, the Roses in exhibition boxes were of poorer quality than usual, and the colour of the red Roses in particular was somewhat inferior. The most noticeable specimens in Mr. Hugh Dickson's box were, C. J. Grahame, Jonkheer J. L. Mock, Leslie Holland, and Monsieur Joseph Combet; in that of Messrs. Adam and Craigmile, Horace Vernet, Earl of Warwick, Ben Cant, and Rayon d'Or. This is, I think, the first occasion on which I have seen Rayon d'Or staged in an exhibition box. In that of Messrs. Cocker & Sons, I may mention Earl of Warwick, which secured a Medal, and Gloire de Chedane Guinoisseau; in that of Messrs. A. Dickson & Sons, Alexander Hill Gray, Mrs. Wakefield, Christie Miller, Mabel Drew, and two old friends not often seen nowadays, Danmark and Annie Wood.

In the amateurs' section, the decorative Roses were more satisfactory than the exhibition classes. The competition for 12 distinct varieties was strong, and the winning stand contained perhaps the best bunches of Roses that have been staged in this class.

The Ladies' Artistic section again attracted much notice. The class for bowls was well filled and Mrs. Courtney Page's bowl of Kaiserin Augusta Victoria was beautiful both for the cleanness and quality of the flowers and the taste displayed in their arrangement. Mrs. Tisdall's bowl of decorative Roses with Wichuriana foliage was also very tasteful, but perhaps the effort might have been even more pleasing if the foliage had been somewhat suppressed. There were five entries in the class for table decoration, a class which always gives rise to much comment and difference of opinion among visitors to the show. None I fancy was surprised to find that a table with Irish Elegance arranged by Mrs. Hammond had again secured the first prize, but one of the visitors at all events seemed to think other Roses ought to have a chance and suggested that the N.R.S. should make two classes for table decorations, one for single and the other for double Roses. "Then," it was added, "We might see some really beautiful Roses." A novel combination of colours was afforded by a table arranged with the Lyon's Roses, together with a brilliant yellow Rose, named after the exhibitor, while Mrs. J. Langton arranged a pretty table with Edu Meyer and Irish Elegance in combination with Gruss an Teplitz foliage.

There was also an elaborately arranged table cleverly decorated with soft pink Roses and Fern and other foliage, producing a rich effect, which would probably have secured a higher place had it not been very much overcrowded.

Take it all round the N.R.S. may congratulate itself on the result of the Autumn Show and the development of autumn Roses, for we now know by experience that alike in a year of drenching rain or in one of torrid drought we have Roses which may be relied on for an autumnal display and moreover that we have exhibitors who can bid defiance to either extreme of weather. *White Rose*.

NOTES ON IRISES.

IRIS FILIFOLIA.

FOR some years past an Iris has been offered by dealers under the name of *Iris filifolia*. It is a valuable garden plant, for it is about the first member of the Spanish Iris group to flower, and its blooms are large, with blue-purple standards and pale-blue falls, set off with a golden central stripe. It grows about 12 or 18 inches high, and increases rapidly in rich, light soil. Like all Spanish Irises, it is the better for an annual shift of quarters. This operation may be performed as soon as the foliage turns yellow—about the beginning of August. If it is not carried out, a struggle for existence ensues between the central flowering bulb and the four or six bulblets which cluster round its base, with the result that either the flowering bulb is deprived of some of the nutriment that it would otherwise obtain, or else the bulblets are unable to develop for the following years. In the wild state the latter is the usual result, and the empty husks of bulblets that have been unable to develop are commonly to be found among the withered coats of old flowering bulbs, in which collected specimens are almost always enclosed.

Anyone who has the patience to wait four or five years for the flowers should cross this Iris with pollen of *I. lusitanica* and the ordinary garden forms of *I. xiphium*. The result will be a series of varieties of the so-called Dutch Irises, that have lately been introduced into commerce. The widely-circulated statement that in obtaining these "Dutch" Irises all the known species of Spanish Irises were combined, seems to be erroneous, for none of them shows any trace of perianth tube, which would almost certainly have appeared sooner or later if either *tingitana*, *Boissieri* or *junceae* had been among the parents. Moreover, the early-flowering habit of the seed parent explains the precocity of the hybrids, which come into flower in the last week in May—usually a full fortnight before the first of the ordinary Spanish varieties.

How the name of *Iris filifolia* came to be applied to the Iris in question is not apparent, for a reference to Boissier's description in *Voyage Bot. Esp.*, p. 602, t. 170 (1839-45), shows clearly that the identification is wrong. Boissier's plant is distinguished at once from *xiphium* by the presence of a tube equal in length to half the length of the bud, while the *filifolia* of the trade has no tube, apart from the short funnel that separates the ovary from the base of the segments of the flower.

It is just possible that the confusion may have originated from the fact that both the true and the false *filifolia* are found in the neighbourhood of Gibraltar. The one may have been collected and re-introduced for the other. Thanks to the kindness of a correspondent I have, this year, had the true *filifolia* in flower here, and the

half-dozen blooms that I had were enough to show how desirable an Iris this is. The stem is about 15 inches high, and bears one or two flowers of the richest red-purple, the falls being decorated with a broad, central golden oblong patch, surrounded by a blue halo. Thanks to the warm, dry weather, seed set in abundance, and the bulbs also have increased in number. It is to be hoped, therefore, that the true *Iris filifolia* may soon be less rare in our gardens than it appears to be at present.

Curiously enough, I also received early this summer some Iris flowers from the neighbourhood of Gibraltar, which, as far as could be seen from their somewhat withered state, were identical with the false *filifolia*. They are known to local botanists as *I. Fontanesii* Godr., a name which by the way, appears to be based upon a confusion and to have no validity. The name of *I. xiphium* var. *præcox* would seem to be the most appropriate. *W. R. Dykes, Charterhouse, Godalming.*

LYCOPodium SQUARROSUM.

THIS is one of the choicest species of *Lycopodium* and is rare, even in botanic gardens. It is sometimes known as *L. Hippuris*. The genus is

FIG. 102.—LYCOPodium SQUARROSUM.

(From a specimen in the Botanic Garden, Cambridge.)

not often regarded as ornamental, but the specimen portrayed in the accompanying illustration, growing about 2 feet high, is distinctly ornamental and is decidedly interesting as representing a type of vegetation common and gigantic in the carboniferous period, but now almost extinct. In a state of nature the stems of this plant are pendulous, but in cultivation it is convenient to have them supported as shown, indeed they grow upright until their weight causes them to hang down. The leaves are awl-shaped, dark green and spreading, the narrower terminal shoots bearing sporangia and forming the spikes. These are as much as 7 inches long. It may be interesting here to remark that in *Lycopodium* the spores are of one kind, while in *Selaginella*, sometimes erroneously called *Lycopodium*, the spores are of two kinds, the female spores large and the male spores small. *L. squarrosus* is a native of the Himalayas, Ceylon, the Philippines and the Seychelles. *R. Irwin Lynch, Botanic Garden, Cambridge.*

NOTICES OF BOOKS.

HOW TO COOK VEGETABLES.*

ENGLISH-GROWN vegetables are proverbially the best in the world, but the English cooking of them is often as bad as it can be. Mr. C. Herman Senn, in his little volume entitled "*How to Cook Vegetables*," ought to do much to remedy this evil, aided, as he doubtless is, by the increasing number of people who prefer an entirely vegetarian diet. Perhaps it is to vegetarianism that we owe some slight improvement in cookery that has taken place of late; but its advocates are as yet somewhat too ingenious in converting good vegetables into bad imitations of meat dishes. In most households "vegetables boiled to a pap in water," as they have been described by a foreigner, are still tolerated.

To take one section of Mr. Senn's practical volume, we may mention Vegetable Marrows, concerning which he has much to tell us. He gives clear instructions for boiling them, for making them into fritters, for baking them, for stuffing them with forcemeat, for cooking them in a savoury way with spices, and in stock, and for serving them in three different ways with cheese in the fashion of Cauliflower *au gratin*. Mr. Senn tells of at least 70 methods of making Potatoes palatable.

Several of the less commonplace vegetables are described, among these being Colcannon, Cardoons, Finocchio, Kohl-rabi, Sorrel, Sauerkraut, Crosnes, Green-corn, Beetroot-tops, Okra, and even Yams. No mention is made of Mercury (Lincolnshire Asparagus), which is easily cultivated and by no means to be despised. These vegetables rarely find a place in the menu of the average household. Sauces are not neglected, and the volume includes directions also for the cooking of Truffles, Mushrooms, Morels, and Cèpes.

Truffles with champagne, Bananas with bacon, Brussels Sprouts with Chestnuts, and Tomatoes with Walnuts, are but a few of the more ambitious concoctions in which Mr. Senn tries to interest us. We could wish that he had given a list of the ingredients required at the head of every recipe, instead of only here and there. The fashionable "paper-bag" cookery is briefly discussed, but most cooks, amateur or professional, know that this is not well suited for vegetables.

In all, 500 ways of cooking vegetables are mentioned, and every housewife who acquires this useful little book and puts the instructions into practice will do much to redeem the reputation of the English cook from the accusation of monotony in her methods. The price of the volume brings it within the reach of most middle-class households.

PLANT NOTE.

ANTHOLYZA PANICULATA MAJOR.

THE flowers of *Antholyza paniculata*, when raised high above the broadly ribbed leaves, are very effective in autumn, and the variety major is even more beautiful than the type. Unfortunately, the variety is later in coming into bloom, and in the colder districts of the United Kingdom, and even in some of the milder parts, the flowers are frequently spoiled by early frosts. This season was apparently an exception, and it shows the necessity of planting the variety in a warm, dry position, so that the blossoming may be advanced. The plant is worth growing where it will flower in good time, as the scarlet and yellow flowers appear very beautiful in combination with the handsome leafage. I find that deep planting is beneficial, placing the corms beyond the reach of frost, and 6 inches deep at least. I may add that I have had *A. paniculata* major for eight or nine years. *S. Arnott.*

* *How to Cook Vegetables*, by C. Herman Senn. (The Food and Cookery Publishing Agency, Westminster.) Price 2s.

CALLIANTHEMUM RUTÆFOLIUM.

CALLIANTHEMUM RUTÆFOLIUM is one of the earliest of our spring-flowering plants coming into bloom about March or April and lasting for a considerable time. It is suitable either for the rock-garden or hardy-flower border, being of easy cultivation and growing readily in any good garden soil.

It forms a dense dwarf cushion of foliage at the period of flowering, above which, on short peduncles, stand the white or very slightly pink-tinted blooms, which are an inch or more in diameter.

The foliage afterwards elongates until it becomes from 4 to 6 inches long. It may be readily propagated in spring, just as growth commences, by division of the crowns. Each of these, if placed in small pots and grown in a close frame, will soon become established plants.

It is a native of Europe and Siberia, and is said to be identical with the Himalayan *C. cachmerianum*. Other varieties are *C. rutæfolium anemonoides*, *Botanical Magazine* t. 7603, and *C. r. Kernerianum*. *R. L. H., Edinburgh.*

PRIDEAUX PLACE.

THE Cornish seat of the Prideaux (pronounced to rhyme with dukes) Brune family spreads its arms around the small fishing town of Padstow, on the north coast of the duchy, in true patriarchal fashion. The town clusters around the quay on level ground, and immediately behind it rise the grounds of "Place" in horseshoe shape. Padstow is a small, irregularly-built town of less than 2,000 inhabitants. Its harbour is unequalled for security anywhere along the wild north coast of the county. No matter how wild a storm may be raging just outside, once a vessel has found anchorage in the harbour it is in safety; but, to make the harbour, perfect local knowledge is necessary, for on the other side of the narrow gulf lies the dreaded Hell Bay, with death in waiting. The terrible disaster of 1900, when the two lifeboats stationed at Padstow—a steamer and a rowing boat—were wrecked, will for ever live in the minds of the people of Padstow.

In such an old-world town as Padstow one rightly expects many old customs to survive the bustle and heedlessness of modern life. On May Day the may-pole is dressed, and girls in white, wearing garlands of flowers dance around it. Elders of the other sex bring out the hobby-horse, which, with its eight attendant hobby-horse pairs (a corruption of peers), canters and gambols through the town to the front of "Place," where the lord of the manor receives them, and empties a purse of money into the hands of the "pairs" "for the horse to drink." Amongst the towans, as the sand-dunes are called, across the estuary, stands the buried church of St. Enodoc, which at times has been so overwhelmed by sand storms that the clergyman is said to have effected an entrance through the roof.

As befits lords of the manor, the heads of the Prideaux-Brune family have always closely associated themselves with the welfare of the town of Padstow. An ample supply of pure water, a modern sewage system, and a splendid institute all owe their existence to the public spirit of the father of the present owner, Col. C. R. Prideaux-Brune, who, with the Rifle Brigade, saw service in the Ashanti War.

Legend has it that Prideaux Place stands on the site of the chapel which St. Patrick built after he swam over from Ireland on an altar of stone. This is as may be, but it is fairly evident that when the present mansion was erected, towards the end of the 16th century, the ruins of the chapel of St. Samson, Bishop of Dol, which dates from A.D. 546, were demolished. The house, rich in antiquarian and artistic treasures, is a large castellated building, with its front in the form of an E. In the front hall there are

specimens of Chippendale furniture, and the extensive library was recently re-arranged by Mr. John Lane. Against the front of the building there are some exceedingly fine plants of *Magnolia grandiflora*, which produce enormous numbers of large flowers, scenting the air for a great distance. At the other end, *Ficus repens* climbs to the eaves, being so perfectly at home that it bears the distinct-looking, arboreal form of foliage. *Solanum jasminoides* makes long trails of growth, which become wreathed with flowers. In front of the mansion, on a narrow grass terrace bordering the road, there is a row of *Cordyline australis*; all fine plants raised from seed ripened in the gardens. These tall, straight-stemmed plants look very imposing, and are admirably suited to the architecture of the walls. The gardens and pleasure grounds are just over 20 acres in extent, and are chiefly enclosed by a belt of trees and shrubberies, which possess many delightfully shady walks. In the spring, thousands of bulbous flowers enhance the prospect. Snowdrops, closely followed by Crocuses, which later on give place to the golden Daffodils, clothe the ground. *Anemone apennina* grows well where wire netting has been laid flat over the patches, otherwise pheasants greedily eat the tubers. On the windy sides—and winds rage fiercely at Pri-

the grounds there is a charming informal bog-garden with a huge clump of *Gunnera manicata*, a tall-flowered *Eryngium pandifolium*, *Polygonum cuspidatum* and other moisture-loving plants, whilst on slightly drier ground various Bamboos and *Phormiums* are equally at home.

A modern conservatory faces a small, but exceedingly gay flower-garden, the chief features being fine Cannas, *Lobelia cardinalis*, various Begonias, and tall pillars of ivy-leaved *Pelargoniums*, which are sunk in the grass at regular intervals by the sides of the walks. Against the back wall of the mansion there is an exceedingly fine *Cornus capitata*, more generally known as *Benthamia fragifera*. When in flower, this half-hardy tree is a beautiful sight, bearing hundreds of its single, rose-like flowers, to be followed by large fruits, seedlings from which spring up promiscuously between the flat stones of the courtyard.

Mr. Brown, who has had charge of these gardens for many years, succeeded the late Mr. Tallack when that very capable gardener went from Cornwall to Shiplake Hall. Like his predecessor, Mr. Brown does everything well, and is especially successful with indoor plants.

A stove-house contains clean, well-coloured Crotons, *Dracenas*, and other plants useful for

FIG. 103.—*CALLIANTHEMUM RUTÆFOLIUM*: FLOWERS WHITE OR LIGHTLY TINGED WITH PINK.

deaux Place—stone walls break the force of the gales, and ivy has been planted in large quantities under the trees. *Euonymus* of all kinds and *Aucubas* have been found to withstand successfully the salt-laden gales, and these shrubs grow well in partial shade. Of the many noteworthy shrubs growing in the more sheltered parts of the grounds, mention must be made of *Ilex latifolia*, 25 feet high; *Griselinia littoralis*, which, as its specific name implies, is quite at home near the sea; *Fatsia japonica* grows to be a huge bush, and near by is an unusually fine *Pittosporum Colensoi*, while *Berberis japonica* sends out its huge leaves. *Photinia serrulata* fills a large corner by the conservatory, and is very attractive in the early spring, when its purple young shoots appear. In a sheltered dell towards the coast a number of *Cordyline australis* have found a congenial home, and here many hundreds of Primroses and Polyanthus of Miss Willmott's strain and Wilson's Blue Primrose bloom well, and uncommonly early. Miss Willmott's Polyanthus are also grown in quantity for furnishing an unheated glass-house in the spring. On one of my visits this house contained a large batch of exceedingly fine plants with flowers 1½ inch across, emitting a most pleasant perfume. Away at the opposite end of

house decoration. An unusual feature consists of a number of *Datura suaveolens* growing in 5-inch or 6-inch pots. By potting firmly, and standing the pots in saucers of water when the plants are well rooted, each plant will bear half-a-dozen or so of its large, white, trumpet flowers. These plants, when in bloom, are in great demand for drawing-room decoration. Until a few years ago Mr. Brown was amongst the most successful exhibitors of Grapes and Chrysanthemums in the West of England, and although he does not now exhibit, there is not the slightest falling off in the quality of his produce. The Grapes from his well-managed vineries are of very high quality, and the late sorts keep till long after Christmas. In the frame-ground a number of pits are devoted to the early forcing of vegetables. The frame Potatoes grown at Prideaux Place are May Queen and Ringleader; the tubers are planted at a greater distance apart than is usual, but the results fully justify the method. The other customary forcing crops are also successfully grown; and during the summer these pits are occupied by various plants useful for house decoration, Carnations being particularly in request.

The principal kitchen garden slopes to the south-east and produces very early crops of high-

class vegetables. Fruit trees are grown against the walls, and here in this favoured climate Peaches fruit well out-of-doors. Bush Apple and Pear trees have been planted around the kitchen garden plots, and when the seasons are at all favourable good crops are assured. Besides such standard varieties of Apple as Cox's Orange Pippin, Blenheim Pippin, Sturmer Pippin, and Annie Elizabeth the lesser-known Stone's Apple, a Kentish fruit otherwise known as Loddington Seedling, is esteemed. This variety bears an enormous crop of large culinary Apples coming into bearing at an early stage. This regularity of bearing is due largely to its habit of making short-jointed growth. As may be expected in a seaside garden, Asparagus yields enormous cuttings of large shoots. Practically the whole of the north coast of Cornwall is famed for its crops of Potatoes and Onions, including Eschalots, and Prideaux Place is no exception to the rule. The light, sandy soil, with plenty of sunshine, favours the production of firm, high-class bulbs and where, as in this garden, good cultivation is the rule, large size is added. At the village flower-shows in North Cornwall the Onion and Eschalot classes are closely contested, the entries are usually very numerous, and often

trail of leaves of fruit trees, Scarlet Runner Beans, and what not, as brittle and brown as though scorched by fire. In such a sparsely-populated country, the furred and feathered foes of the gardener abound, and, besides the ordinary protection of buds and fruits, means have to be taken to protect crops from the onslaught of pheasants and hares. In a garden like that at Prideaux Place, which is attached to a sporting estate, it is no uncommon experience to find the pheasants perched on the fruit walls eating Peaches before they are fully ripe, or making a meal of the best Brussels Sprouts. On one visit Mr. Brown showed me a fine bed of Parsnips on which the game birds had begun to take toll. The wise gardener takes these happenings philosophically, does his best to guard against the depredations, and endeavours to grow extra quantities, so that his supplies shall not run short. A. C. Bartlett.

CAMPANULA ACUTANGULA.

THE genus *Campanula* contains many dwarf-growing species, providing charming little plants of great value for the rock-garden, or for cul-

plants have only recently come into cultivation; the specimen illustrated at fig. 104 was obtained from Mons. H. Correvon two years ago. The flowers, which exceed 1 inch in diameter, are produced freely for a long time, and the one-flowered peduncles are either axillary or terminal. The plant is a valuable addition to the moraine garden. W. I.

THE PRIMULAS OF THE EUROPEAN ALPS.

(Concluded from p. 202.)

HYBRIDS.—IV.

P. minima × *P. villosa* (*P. Laxii*, *P. flatnitensis*, *P. variiformis*) has, unlike *P. villosa*, a scape shorter than the leaves, and is easily distinguishable by its glands, which are nearly colourless; from *P. minima* it differs in its several-flowered scape, and glandular, nearly opaque leaves. It has been split into two named varieties, neither of which is common in culture. *P. × Sturii* (Widmer); leaves broadly cuneate, with 8-10 tiny teeth, sparsely scattered with colourless or pinkish glands. Scape shorter than the leaves, one to five flowered. Corolla-tube redly glandular outside, the throat filled with long hairs. (Styria.) *P. × truncata* (Widmer = *P. Jiraseckiana* of Tratt); leaves wedge-shaped, roundly truncate at their end, with five to seven teeth, set round the edge with very short, colourless glands. Scape two-flowered; the flower-tube sprinkled externally and in the throat with tiny colourless glands. (Styria.)

P. minima × *P. ænensis* = *P. coronata* (Porta) has, unlike *P. minima*, which it closely resembles, glandular leaves, and a two to four-flowered scape. It is smaller than *P. ænensis*, has a longer calyx, and non-glutinous leaves. Unfortunately, like all the hybrids in which *P. minima* has had a hand, this cross varies indefinitely, and has accordingly, like the rest, been divided unnecessarily into named forms, which overlap. Of these, *P. × pumila* (Widmer) is very small, and close to *minima*, with two-flowered scape, and six to nine regular, horny-pointed denticulations to the leaf. *P. × Widmeræ* (Pax) is bigger, carries four flowers, and has obovate leaves, with eight to ten tiny teeth, not horny-pointed. Both these and their intermediates—all ought to come under *P. coronata*—are found in the Alps of Southern Judicaria.

P. hirsuta × *P. minima* (*P. Brennia*, *P. diversa*, *P. venalensis*).—This, again, is a most gorgeous but very variable cross, inclining now towards *P. hirsuta* and now towards *P. minima*. Its subdivisions are annoying and uncalled for.

P. × Steini (Widmer) is the primary intermediate (as I should like to call it, *P. Forsteri* 2), with oblong-spatulate leaves, glandular but lucent, with seven to ten horny, pointed teeth from the middle to the tip. Flower-scape carrying from two to five large flowers. (Brenner Alps.) Then there diverge from this (among many other forms, of course): towards *P. hirsuta*, *P. × Kellereri*, a wonderful beauty at its best, differing from *P. hirsuta* in having horny-pointed teeth to the little leaves, which also have shorter glands. They are viscid-opaque, very glandular, ovate-cuneate, rounded at the tip, thickly toothed from their middle: the scape carries from two to six flowers, which are very large, and of a flaring crimson. Then, towards *P. minima*, *P. Steini* is called *P. × Forsteri* (Stein), which has all the small habit of *P. minima*, and a much shorter, fewer-flowered scape than *P. Kellereri*. The leaves, however, unlike *P. minima*'s, are rounded at the tip and glandular, though lucent and wedge-shaped. The flowers are of enormous size and the most gorgeous colouring. All these forms are found, in greater or less abundance, with their many variations, among their parents, on the Brenner Alps. It is curious to note the size and brilliance of the blossoms often produced through

Photograph by W. Irving.

FIG. 104.—CAMPANULA ACUTANGULA FLOWERS PURPLISH-BLUE.

it is a coastguardsman who wins the leading prize.

The general conception of gardening in Cornwall implies that it is a very easy matter. The seeds are sown—cultivation of the ground seems to be quite unnecessary—and a genial climate, with a more than average rainfall, does the rest; the gardener rejoicing in a dolce far niente until the time of the harvest. Such appears to be the ideal of some of the daily newspaper writers, but, as Mr. Brown, and many other painstaking gardeners in Cornwall, could tell us, there is another side to the story. Except in a very small portion of the duchy—along part of the south coast where the early Broccoli are grown—the soil is shallow and “hungry.” Ten dry days are sufficient to cause plants to hang out signs of distress. The water supply is usually very limited; so to combat the lack of moisture thorough preparation of the soil is obligatory, and one soon gets “down on the country,” as the natives say when the rock is reached. As always, dry weather brings insect pests in its train; these have to be anticipated and fought. In the spring, and again as autumn approaches, fierce salt-laden gales sweep over the gardens, leaving behind them a

ture in pans. *C. acutangula* has trailing stems bearing large, star-like flowers of a purplish-blue shade of colour. It is closely allied to the difficult *C. Morettiana*, and is considered by some to be a form of that species, but the flowers are not so distinctly funnel-shaped, being flatter and more star-like in appearance; neither is the plant so hairy in any part of the stem or leaves. *C. Morettiana* is found growing in the Southern Tyrol in the cracks of calcareous rocks; *C. acutangula* is a native of the high Alpine regions of Northern Spain, where it grows in open, stony places. The plant has small, round, toothed leaves and short, one-flowered stems. The latter are produced freely from a central rosette of stalked, Ivy-shaped leaves, and flower in June and July. Like *C. Morettiana*, it is a difficult plant to cultivate; it needs treating in the same way as *C. Allionii* and *C. cenisia*, which are found growing in the moraines of glaciers and masses of stony debris on the Alps. When grown in pans, the receptacles should be half-filled with drainage; the soil should consist largely of coarse sand and shingle, only about one-third of loam being necessary. *C. acutangula*, Ler. and Lev., was described as a new species in the *Journal of Botany* in 1879, but

the not pre-eminently large or brilliant *P. hirsuta*. See also, for instance, *P. Heeri*.

P. minima × *P. tyrolensis* = *P. Juribella* (Sündermann).—This queer, lovely, and very rare little hybrid has only, I believe, been quoted from above the Giur-bella Alp, where, however, it is sufficiently abundant, growing among *P. minima* in the fine mountain grass. Even in this one station, the hybrid varies, but can always be recognised by its leaves, much fuller and rounder than *P. minima*'s, and of a duller grey-green, thanks to their glands. The scape (pace Pax) occasionally carries two flowers, and forms can be found which tend more towards *P. tyrolensis* than towards *P. minima*, the mother, to whom *P. Juribella* usually approaches.

P. minima × *P. glutinosa*.—This very abundant and vast series of hybridisations (the only series in which *P. glutinosa* shares) is usually treated under four named heads, irrespective of which way the cross may have been made. However, for the moment it may be simpler to take first the two main forms, suggesting *P. minima* × *P. glutinosa*, and then the other two, more suggestive of *P. glutinosa* × *P. minima*. The whole question, of course, is painfully academic and illiberal: these two species yield an endlessly polymorphic progeny, in which it is quite useless to attempt any such rigid delimitation.

P. × Huteri (Pax) is close to *P. glutinosa*, with violet flowers, and glutinous, dentate leaves, which, however, are oblong-spatulate. This form passes on into

P. × salisburgensis (Pax: *P. floerkeana*, Reichb.), whose scape is not glutinous, and whose leaves are wedge-shaped, armed towards their end with seven to nine well-marked teeth. Flowers red-violet, and reminiscent in size of *P. glutinosa*. This form then merges, or is connected with, the reverse cross,

P. minima × *P. glutinosa*, of which the first and most important development, well known in gardens, is the very brilliant *P. × Floerkeana* (Pax: *puberula*, Schott, and *permixta* Gusmus). This plant is, if typical, very intermediate. Its spatulate leaves, bright green, have nine to twelve very vivid, triangular, horny-pointed teeth. Its flower-scape is glutinous, almost as tall as *P. glutinosa*'s, with one to four very large flowers of a bright red-mauve. This, the commonest hybrid, is variable, and passes on, through many intermediate forms, to one which is stereotyped as

P. × biflora, a rare occurrence, approaching exceedingly close to *P. minima*, but with two big pink flowers on the very short scape. Here the influence of *P. glutinosa* seems to have almost passed away: even the calyx bracts have not the full bagginess so characteristic of *P. glutinosa*, though the leaves are obovate spatulate, with sharp teeth down to their tip.

All these forms, and countless others, linking up these four, and offering a chance of 40 more, occur in greater or less abundance wherever *P. minima* joins company with *P. glutinosa* on the very high granitic moors, where alone the latter is able to dwell. Brenner Alps, Southern Dolomites (not on Dolomite, naturally), &c. Monzoni-Thal.

And now, finally, for two last words of comfort to those whom this perusal of unnecessary intricacies may have appalled. In the first place, rule of thumb is the best way in the end of determining a hybrid's name and origin. Not one of them but keeps, to the seeing eye, a preponderant look of the mother to whom it belongs. These crosses always offer an obvious suggestion, anyhow, of their parentage. And also, if you come upon them in the open wilds, the presence there of both their progenitors as well will almost always make their pedigree plain. In the second place, the half, at least, of all the foregoing minutely-differentiated names are, or ought to be, mere bruta fulmina, with which the gardener need have no concern. Between two species there will be two perfectly plain crossings, this way and that (or only one way, perhaps). One name should suffice for each crossing: although within this limit there may be an almost endless amount of variation. To name and precisify such differences once and for all is nothing better than a vanity as idle as attempting to weave solid ropes out of the shifting sand. *Reginald Farrer.*

THE WEEPING VARIETIES: ULMUS MONTANA.

THERE are two well-marked weeping varieties of the Scotch or Wych Elm, viz., *Ulmus montana pendula* of Loudon; and the Camperdown Weeping Elm. In the *Kew Handlist of Trees and Shrubs* (second edition, 1902), Loudon's plant is the only one mentioned amongst the numerous varieties of *Ulmus montana* as a weeping form, and, excepting in British and American nursery catalogues, the Camperdown variety very rarely receives notice in any of the literature pertaining to trees.

Mr. Mitchell, nursery foreman to Messrs. R. B. Laird & Sons, Ltd., Edinburgh, informs me that some 30 years ago he saw the original plant of the variety growing at Camperdown House, the Earl of Camperdown's seat near Dundee. The tree, Mr. Mitchell states, was of considerable age then, and quite prostrate in habit, creeping along the ground amongst other Elms.

Although both varieties are frequently met with, it was but quite recently that I had the oppor-

manner, and stretching them out sometimes horizontally, but at other times almost perpendicularly downwards, so that the head of the tree exhibits great variety of shape. By some, this variety is supposed to belong to an American species of Elm; but from its large, rough leaves, its vigorous young wood and large buds, and, above all, from its flowering at the same time as *U. montana*, and, like it, ripening in abundance of seeds, which no American Elm whatever does in Europe, we have not a doubt that it is a variety of *U. montana*. Grigor (*Arboretum*, first edition, 1868, p. 338) refers to Loudon's plant thus:—"The most ornamental and picturesque tree of the genus is *U. pendula* (Loudon), Weeping Elm, of which there are also several varieties. Plants raised from seeds are apt to lose the peculiarities of the species. It is therefore propagated by being grafted on the tops of the stems of any of the common Elms. In this way it grows freely, and soon forms a head of considerable magnitude, and of the most wild, diversified, and rugged form. In the vigour of youth, it shoots forth in a frond-like manner, often directing its branches horizontally, some down-

FIG. 105.—ULMUS MONTANA PENDULA.

Loudon's variety on right; Camperdown on left.

tunity of seeing a number of fine specimens of them growing side by side. This was in the Grange Cemetery, Edinburgh (see fig. 105), where the tree has been extensively planted, and by the kindness of Mr. Riddell, the superintendent, I was able to obtain photographs. The tree of the Loudon variety measures 43 inches in circumference at a height of 5 feet from the ground. It is 15 feet high, and has a spread of branches measuring 40 feet. Another tree of the same variety has a girth measurement of 43 inches at 5 feet, with a spread of branches of 30 feet, and there are others of similar dimensions. One of the latter, it was observed, had been grafted on the Exeter Elm, *U. montana fastigiata*. The larger of the two trees of the Camperdown variety has a girth of 37 inches at 5 feet from the ground, and is fully 15 feet to the summit of the crown, with a spread of branches of 20 feet.

In *Arboretum et Fruticetum Britannicum* Loudon gives an illustration (vol. vii., fig. 241) of a weeping Scotch Elm, 16 feet high and 4 inches in diameter. Loudon's description of the tree (*Arb. et Frut. Brit.*, vol. iii., p. 1,399) is as follows:—"This is a beautiful, highly characteristic tree, generally growing to one side, spreading its branches in a fan-like

wards, some upwards, and some obliquely, displaying a majesty and grandeur in its ramifications which are never seen in any other young tree. As an object for the lawn, the park, or the pleasure ground, it has no equal among fast-growing plants. Its picturesque effect resembles that of the Cedar." Both Loudon and Grigor refer to fine trees of this variety at the Fulham and Hammersmith nurseries, near London, and the latter mentions that "the best specimen of the tree in Scotland stands in Blackfriar's Haugh, Morayshire, about 30 feet in height, with a trunk 4 feet 6 inches in girth at 1 foot above the surface, and the spread of its branches measures 108 feet in diameter."

Both varieties are undoubtedly handsome, ornamental trees when they are well grown, and more especially when they come to a considerable size, but the Camperdown variety is undoubtedly the choicer of the two. It forms a fine, umbrella-shaped head, which is in marked contrast with the flat, somewhat stiff-looking crown of the other variety, while its leaves, which are relatively broader and rounder, clothe the branches better, owing to the lateral twigs not bending downwards and leaving the main branches bare as they do in Loudon's variety. *A. D. Richardson, Edinburgh.*

The Week's Work.

FRUITS UNDER GLASS.

By E. BECKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Hertfordshire.

FRUIT TREES IN POTS.—The work of repotting the principal batch of pot trees must now be undertaken. The culture of fruit trees in pots, which is increasing, offers many advantages, the fruits being superior in flavour and colour to those grown out-of-doors, and the crop never endangered through the blossoms being destroyed by frost. Very little artificial warmth is necessary, the chief requirements of the plants being room and light. Later trees may be grown in cold houses, where they will fruit in advance of specimens out-of-doors. Most kinds of fruits may be grown in pots successfully, and though only a few trees are cultivated they will furnish a useful supply of early fruits. Where it is intended to introduce fresh trees that have been potted for the purpose, these should now be brought indoors as they will require repotting. With the exception of old, established trees in large pots, potting should be done annually. Clean, sound pots are essential, for if the pots are not satisfactory they will cause trouble at a later date. Perfect drainage is most important, and nothing is better for placing over the crocks than good fibrous loam, arranged grass side downwards, always using this in preference to the roughest of the compost or such materials as leaf-mould or spent manure from an old Mushroom bed. The compost should consist mainly of fibrous loam, and, for preference should be pulled to pieces, adding a good sprinkling of mortar rubble, some soot, bonemeal and chemical manure. The soil should be neither too wet nor too dry. In potting, the soil should be well worked down around the old ball, and a sprinkling of fine, crushed bones over the rough material will be beneficial later. Carefully remove the old crocks at the base of the roots and reduce the amount of old soil with a pointed stick. After potting, give a thorough watering, and stand the pots on a hard bottom formed of cinder ashes in the open. If maiden trees are to be purchased for growing on, these should be procured as soon as possible, and potted into fairly small receptacles, shortening the strong roots with a sharp knife.

MELONS.—Assist Melon plants on which fruits are swelling by occasional sprinklings of a rich fertiliser. Less water will be required as the days shorten, and more fire heat will be necessary, especially at night time. Whenever the weather permits, ventilation should be afforded, closing the structure again early in the afternoon. As the fruits commence to ripen, withhold stimulants altogether, lessen the amount of water at the roots, afford more air, and provide artificial heat to assist in developing the full flavour of the fruits. Young plants, forming the latest batch, should be syringed with tepid water to encourage a clean growth.

PLANTS UNDER GLASS.

By JAMES HUDSON, Gardener to LEOPOLD DE ROTHSCHILD, Esq., Gunnersbury House, Acton, Middlesex.

THE CONSERVATORY.—Dwarf, early-flowering Chrysanthemums are very suitable for the decoration of the conservatory at this season, and they will last for a month to come. The large number of flowers produced by well-grown specimens is surprising, and healthy plants having plenty of good foliage last in a fresh condition for a long time. They may be grown out-of-doors until they are wanted, which is a great advantage, as the glasshouses can be utilised for other plants. These dwarf Chrysanthemums require very little training, and the flowers need not be disbudded. They do not provide such a wide range of colour as the large-flowering kinds, but the variation is ample for all purposes. By the time these remarks are printed it may be advisable to bring the more forward specimens indoors, as the fine weather appears to be breaking up, and we may expect a considerable quantity of rain. The more forward specimens of the larger flowering kinds that have

been disbudded will also need to be placed under cover very shortly; some of our plants have already been brought under glass. When they are housed, a close watch must be kept for mildew and if any is detected the foliage must at once be dusted with sulphur—preferably very fine black sulphur, which is almost invisible on the plants. Continue to give liberal supplies of food to Chrysanthemums developing their flower-buds. Make preparation for the housing of the general stock of Chrysanthemums by the end of this month, endeavouring to have them all arranged indoors by the end of the first week in October at the latest.

LILIUM SPECIOSUM.—Plants of *Lilium speciosum* that have been checked by placing them under a north wall will prove useful at this season. They are best grown in rather small pots during their first year; afterwards, if they have done well, they may be shifted into a pot one size larger. These remarks apply to bulbs that have grown singly in pots.

CANNA.—Plants of *Canna* that have been cultivated as advised in a previous calendar will still prove serviceable in the conservatory. The foliage is extremely ornamental, and, if the old flowers and seed-pods are picked off, the plants will lend a semi-tropical appearance to their surroundings. During the next few weeks it may be necessary to circulate a little heat in the water pipes to prevent damping. The ventilators must be opened, otherwise the atmosphere will remain stagnant.

SALVIA SPLENDENS.—Plants of *Salvia splendens* in pots out-of-doors are making a good display. If any of them can be spared from the flower-garden, they should be brought under glass, where, if the old spikes are removed and a liberal treatment afforded the roots, they will furnish another crop of flowers. *Grandiflora* is the best variety for October and later flowering, being more reliable at that season than *Glory of Zurich* or any of the other dwarf varieties. *S. splendens* is extremely useful when grown as standards, and *grandiflora* is one of the best sorts for this kind of training.

SOLANUM CAPSICASTRUM.—Plants of *Solanum capsicastrum* that are planted out should have the shoots stopped to throw all the energies of the plant into the berries. In the course of a few weeks they may be potted, keeping them in a close frame or greenhouse until the roots have recovered from their disturbance. Do not pot too large a mass of the old earth; if the growth is firm and hard the "ball" may be reduced with advantage.

RICHARDIA AFRICANA.—Arum Lilies that have been planted out should be lifted and potted as soon as possible, treating them as advised for *Solanum*.

THE ORCHID HOUSES.

By H. G. ALEXANDER, Orchid Grower to Lt.-Col. Sir G. L. HOLFORD, K.C.V.O., C.I.E., Westonbirt, Gloucestershire.

AUTUMN NOTES.—The hot, dry summer has suited Orchids requiring high and intermediate temperatures. The brilliant sunshine, together with the high temperature, have resulted in a strong, solid growth that may reasonably be expected to produce extra fine flowers next season. Moreover, the beneficial effects of this summer upon many Orchids will be seen next year in new growths of greater vigour than usual. In many instances Orchids, and especially those with pseudo-bulbs, are too densely shaded in bright weather. I am well aware that in mixed collections it is a difficult matter to regulate the shading to suit all the plants, but this is not the case where a house is wholly devoted to one kind. Without proper light and air Orchids cannot be expected to remain in a healthy and free-flowering condition; they may, for a time, make free growth in a densely shaded house, but they will gradually become enfeebled under such conditions. The weather is now much cooler, and the longer nights remind us that the summer is past. Henceforward growers should make the most of all the sun's heat and light. It is impossible to give precise directions as to diminishing the shading at this season. Much will depend on the aspect of the house and the arrangements of the plants; in any case, the diminutions should be gradual. The foliage of all Orchids should now be getting harder, and very little protection will be needed after about the end of this month, provided the

amount of shading has been systematically reduced.

WATERING.—The watering of the plants will, from now onwards, require much more judgment than when the plants were in active growth. Orchids cannot be treated collectively in this respect. The wants of the various species and the condition of the growth of the plants have to be considered separately, and the treatment varied accordingly. Many with pseudo-bulbs will have finished, or be fast completing their bulbous stems. With these, more than with most Orchids, it is necessary to watch individual plants, affording those with unfinished growths sufficient sustenance to avoid weakening the older bulbs, even when the new ones are formed. It is a mistake to cut down the water supply too suddenly, as the roots of many are most active just as the new pseudo-bulbs are swelling. Many plants of distichous-leaved species are still growing freely. These should be kept moist at the roots until the latter show, by the white films closing over the points, that their season of rest is at hand. Here again individual plants may require special care, and none of them must be over watered, as spotted leaves and other troubles result from affording too much water at this season. All terrestrial kinds with strong and persistent roots that are growing freely will require ample waterings to encourage healthy growths, and the production of strong flower-spikes.

VENTILATION.—The successful culture of most Orchids depends, to a large extent, upon a proper amount of atmospheric moisture. While this should be plentiful during the growing season, much less is required now. The cooler divisions of the range will require the least damping, because evaporation will be less in them. In the warm house sufficient atmospheric moisture must be afforded to counteract the effects of fire heat necessary to keep up the desired temperatures. Ventilation, artificial heat, and moisture must be regulated one with another. Houses kept close and moist are quite as unsuitable for the cultivation of Orchids as those that are cold and draughty. In those houses where a small amount of fire heat is necessary, keep the ventilators open a little both night and day, damping the paths and bare spaces freely in order to promote suitable conditions of moisture and temperature. On bright, warm days, the sun's heat should be taken full advantage of by these means and not by closing up the house early as some advise. A few degrees of warmth are saved by the latter method; but, by leaving the ventilators open a trifle, the shading may be removed earlier, giving the plants the full benefit of the sun's rays, which is a very important consideration.

THE FLOWER GARDEN.

By R. P. BROTHERSTON, Gardener to the Earl of HADDINGTON, K.T., Tynningham, East Lothian.

SEEDLING BEDDING PLANTS.—The present is a suitable time to afford larger pots to seedlings of *Hollyhock*, *Humea elegans*, *Francoa ramosa*, and similar subjects intended for bedding next year. The plants need to be kept under cool conditions, and, though they may make very little growth in the winter, they will be gaining vigour all the time, and will grow strongly on the return of genial weather in the spring.

CARNATIONS.—The potting of border Carnations should be finished as soon as convenient. I use principally 4 inch and 5 inch pots, placing a single plant in each pot. The plants should be placed in frames at once, but the lights, for the present, need only be put on during heavy rains. Because of damage done to these plants by rats, moles, and mice I am obliged later in the season to place them in a cool house from which these pests can be excluded. Winter-flowering varieties still in flower in beds or borders may be lifted carefully, placed in flower-pots, and utilised for decorative purposes in the greenhouse.

MICHAELMAS DAISIES.—Fortunately border Asters have been not so much affected by the abnormal heat as most plants, and they are flowering only slightly in advance of their usual time. Most of the kinds, if the ties are loosened, may be made to spread over a considerable space. By this means places occupied all through the summer by other flowering plants may be largely

filled, and, if there are plants of Asters in reserve, these may be utilised for furnishing other vacant places. No plants may be transplanted more satisfactorily than these, and though they introduce a tone of grey in the flower border, their presence is not at all displeasing.

HELLEBORUS ALTIFOLIUS.—This plant is beginning to show its buds, which will shortly expand into massive blooms. Where the soil is still dry, it may be advisable to soak the roots with water. Leaves that are damaged by fungous disease should be removed, the ground made tidy again after the watering, and the beds made generally neat for the season. Several other Hellebores will shortly be in flower at Tynningham. These are planted at the foot of a wall with a south-east aspect, and yield large quantities of flowers from late autumn till spring. These also need examining for decaying foliage, which should be all removed and the plants made tidy for the winter.

THE WILD GARDEN.—Grass which has been permitted to grow uncut since the summer in semi-wild places should now be mown as close to the ground as possible. There is just time for a little new growth to be made before the winter arrives, and the closer the grass is trimmed the easier it will be to sweep up tree leaves when they commence to fall. Primroses do well in these places, and increase from self-sown seeds; seedling Primroses raised from a spring sowing may be transplanted subsequent to the mowings being cleared away. Trees of Lime and Chestnut have been shedding the leaves for several weeks past, causing much work in sweeping them up. If there is no time to remove the leaves and other litter after it has been swept up heaps should be formed at short intervals to be removed later as opportunity presents itself.

SWEET PEAS.—A sowing of Sweet Peas may be made now, either in the open or in pots. The variety Nellie Jenkins has flowers of a lovely shade of lavender; it is one of the best of its shade. Melba has flowers of a strikingly beautiful shade of soft salmon. Thomas Stevenson and May Campbell are other good varieties. Isabel Malcolm is a shade betwixt Paradise Ivory and Clara Curtis; this also is worth growing. If these I have named are grown in addition to the old favourites they will provide a choice selection of flowers for the garden and house.

THE HARDY FRUIT GARDEN.

By W. HEDLEY WARREN, Aston Clinton Gardens, Buckinghamshire.

CHOICE OF TREES FOR PLANTING.—Whether the trees have been grafted or budded, be careful to select only those that have been worked on young stocks, as old, stunted stocks which are sometimes grafted or budded, seldom give satisfactory results. Healthy stocks have a smooth, clean, shining bark, and those that have a rough, wrinkled surface should be rejected. In stone fruits, reject any tree that shows a trace of gumming. It is essential that the tree is well furnished with young wood in every part, and this applies particularly to fan-trained specimens, for if by injudicious pruning the main branches are bare of young wood for several inches from their origin, it is only with great difficulty that new shoots can be induced to grow at those parts. This trouble is more easily overcome in trees of other shapes; simply shortening the branches will usually result in the production of plenty of young growths. It is of the greatest importance in the case of stone fruits to prune and dress carefully roots that have been damaged in transplanting. The roots of Peach and Apricot trees should be dressed with styptic after they are trimmed, for if this is neglected gumming is almost sure to follow. If a strong, leading root has been damaged, it should be pruned to a lateral root, as by diverting the sap into an existing channel, the formation of root-fibres will be hastened. All roots that are inclined to grow in a downward direction should be cut away, unless they can be made to grow horizontally. Planting should not be done when the soil is in a wet or heavy condition; it is far better to defer the operation until a more favourable time; but it must be remembered that trees planted early in autumn usually become well established before the winter. Do not plant the roots too deeply; the top roots should not be

more than 6 inches below the surface of the ground. Roots will readily grow downwards into unsuitable soil, but it is a difficult matter to entice them to grow near to the surface, unless the border slopes at a very sharp angle, which is not desirable. Where crops of vegetables are grown between fruit trees, the necessary digging must be done carefully, for if the roots are injured, canker may put in an appearance, and suckers will form. If the planting is followed by a spell of dry weather, the soil around the newly-planted tree should be kept in a moist but not sodden condition. Watering must be regulated according to the state of the soil and conditions of the weather: too much moisture will cause many of the root-fibres to die. It is very rare that trees planted in the autumn require more than one copious application of water at the roots, but frequent syringings overhead are beneficial.

DISTANCE OF PLANTING THE TREES.—Trained trees for growing on walls 10 to 12 feet high may be planted at the following distances apart:—Apples, 18 to 20 feet; Apricots, 20 to 24 feet; Cherries, 12 to 15 feet; Figs, 16 to 18 feet; Pears, 25 to 30 feet; Peaches and Nectarines, 12 to 15 feet; and Plums, 18 to 20 feet. In the case of standard or half-standard trees in the open, Apples, Pears, and Plums should all be placed 20 to 30 feet apart; but pyramid and bush trees need only 10 to 12 feet between them. Gooseberries and Currants should be planted not closer together than 5 or 6 feet.

THE KITCHEN GARDEN.

By JOHN DUNN, Kitchen Garden Foreman, Royal Gardens, Windsor.

TURNIPS.—Late-sown Turnips should be thinned to 6 inches apart in the rows. The crop, if allowed to remain in the ground over the winter, will prove valuable in the spring, for apart from the roots, the green tops will furnish useful greens, which promise to be a short supply this season. Afford frequent waterings whilst dry weather continues, and dust the plants freely with fine wood ashes in the early morning to keep the Turnip fly in check and stimulate the growth of the plants. The frequent use of the Dutch hoe between the rows will assist the plants to make a free growth.

BEET.—Plants of the earliest sowing should be lifted without delay or the roots may become coarse and tough. Late-sown Beet should be watered freely. This late crop will prove valuable during the spring if the roots grow to a sufficient size before frost sets in. Hoe the soil between the rows as frequently as possible and never allow it to remain caked after watering the plants.

CARROTS.—The main crop of Carrots should be lifted and stored as soon as possible, or many of the best roots will split after the first heavy rain. Late-sown Carrots should be watered freely if dry weather continues; thin the plants to prevent overcrowding. Hoe the ground between the rows and do all that is possible to hasten the development of the crop before the season is far advanced.

LEEKs.—The Leek is a gross-feeding plant, and should have frequent applications of weak, liquid manure. There are few plants which repay the cultivator better for generous treatment than the Leek. After each watering, let the soil be stirred with a hoe to encourage a free growth. Further plantations of this vegetable may be made from plants of late sowings to provide supplies in April and May.

GLOBE ARTICHOKEs.—Plants of Globe Artichoke should not be allowed to become too dry at the roots. If the bed has been mulched during the summer the plants will be much finer next season, as mulches not only provide food, but also keep the soil moist.

CUCUMBERS.—A batch of plants should be planted now to afford supplies of Cucumbers during January. A gentle bottom heat should be provided to promote a free growth, as it will be an advantage to have the plants well furnished with growths before the dull weather sets in. Train the shoots carefully, allowing plenty of room between them. Pinch the side shoots frequently to promote a sturdy growth, and remove the fruits until they are required, and then only allow a sufficient number to develop necessary

for the requirements of the establishment. A humid atmosphere with a night temperature of 70° should be maintained.

THE APIARY.

By CHLORIS.

TO REMOVE BEES FROM AWKWARD PLACES.—During the summer many swarms take up their abode in very awkward places, causing inconvenience and worry to the nervous. The stray swarms often take up their abode between floor and ceiling, having gained access through a ventilating brick, or in roofs, through defective slates or eaves, or in hollow trees. Sometimes people attempt to take the bees and honey by removing boards or slating, and they find, to their utter amazement, that they have made a great mistake, for it is not like overhauling a bar frame hive, as they imagined. Some of the most expert beekeepers have met with unexpected failure in their attempts to take the bees. The following method, though slow, is sure, easily accomplished, and safe. First, close all the means of entry and exit except one. In roofs, this may be done by the aid of putty, or even paper, if closely packed into all the crevices. The position should be closely watched during the day to make certain that every opening save one has been closed. If a weak colony inhabits a straw skep, this will suit admirably for the next part of the business. A floorboard should be securely roped on the hive. Failing this, a small box big enough to take three or four frames should be made roughly, nailing on a floorboard, and roping on a roof. In the late evening, when the bees are not on the wing, take a "Porter Bee Escape" fixed on a piece of wood, with a hole in the centre, which should coincide with the hole used as an entrance for the bees to the roof or other place. Fasten it down, packing it all round with putty to make the bees pass through the escape. Near or above the escape, fix the colony in the skep, or nucleus in box, with a queen, frame of brood, workers, and frames containing stored honey. The bees, finding themselves shut out of their old home, will join with those used as a decoy, generally uniting with them without trouble or fighting. To completely secure all the bees it will need about three weeks, and the only attention required will be to see that the bees have found no other opening by means of which they can leave or enter their old nest. At the end of the time, the trapped bees may be removed to the apiary, and, if necessary, the slates or boards, etc., may be removed and the stored honey easily taken by the aid of the smoker.

PURCHASING BEES.—At this season of the year many beekeepers are ready to sell all or part of their stocks and appliances. In some instances, the price is very low, and, therefore, tempting to those who know little about beekeeping, but are most anxious to make a start. Such offers need careful consideration, because the colonies may be diseased, and, consequently dear at any price. If a beekeeper can be induced to examine the colonies, it would be wise to obtain his expert advice, even if the novice has to pay for it. Failing this, no bees nor appliances should be purchased without a written guarantee from the vendor that the apiary is free from disease.

MOVING THE BEES.—Having decided to purchase the bees, the best method of removing them has to be determined. Unless the new home is 1½ to 2 miles away, it cannot be done until the weather is too cold for the bees to fly. In the evening, after sunset, give the bees a puff of smoke through the entrance to drive in those on guard. Afterwards, close the entrance, then open the hive, and as the quilts are removed, smoke between the frames to drive down the bees. Next screw down the lugs of the frames by the aid of two strips of wood, then place a piece of perforated zinc over the frames, put on the roof, and make all safe by roping all together securely. To prevent the combs being broken by jolting, put a good layer of straw in the bottom of the cart. In order to prevent loss of bees, place a branch in front of the entrance, after removing the rope, perforated zinc, and screwed-down laths. Re-opening the entrance and replacing the quilts. This will obstruct the bees when taking their first flight, and cause them to take note of the new position.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, as well as specimens of plants for naming, should be addressed to the EDITORS, 41, Wellington Street, Covent Garden, London. Communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Local News.—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Illustrations.—The Editors will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c., but they cannot be responsible for loss or injury.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.

APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY, SEPTEMBER 26—

Roy. Hort. Soc. Coms. meet. Vegetable Competition (Lecture at 8 p.m. by Mr. H. Senn, on "Salads.")

WEDNESDAY, SEPTEMBER 27—

Watford Fl. Sh. Irish Gard. Assoc. and Benev. Soc. meet.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last Fifty Years at Greenwich—54°9'.

ACTUAL TEMPERATURES:—

LONDON.—Wednesday, September 20 (6 p.m.): Max. 65°; Min. 58°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—Thursday, September 21 (10 a.m.): Bar. 29°5'; Temp. 59°; Weather—Sunshine.

PROVINCES.—Wednesday, September 20: Max. 60° Southampton; Min. 49° Scotland N.

SALES FOR THE ENSUING WEEK.

MONDAY, TUESDAY, WEDNESDAY, THURSDAY

AND FRIDAY—

Dutch Bulbs, at 67 & 68, Cheapside, by Protheroe & Morris, at 10.30.

MONDAY, WEDNESDAY, AND THURSDAY—

Dutch Bulbs in variety, Roman Hyacinths, Freesias, Lilliums, &c., at Stevens's Auction Rooms, 38, King Street, Covent Garden, at 12.30.

TUESDAY—

Sale of Nursery Stock in Variety at the Cottage Nursery, 110, Brockley Road, S.E., by Protheroe & Morris, at 12.

WEDNESDAY—

Trade Sale of Lilliums and Miscellaneous Bulbs and Plants, at 2; Palms and Plants, at 5; at 67 & 68, Cheapside, by Protheroe & Morris.

It is a commonplace and universally recognised fact that plants respond to changes of external conditions in various ways, among others, by changes of form. The Gorse, *Ulex europæus*, when cultivated in a moist atmosphere, ceases to produce spines, and may continue to form leafy shoots like those of the seedling. Rosette plants, under similar conditions, undergo a marked alteration of habit. The stem, which, in ordinary circumstances, is short, elongates, and hence the leaves, instead of forming a rosette, are borne in a loose spiral on a miniature tree-like stem. Instances of this plasticity might be multiplied indefinitely, and are recorded in all the botanical text-books. Nevertheless, the exact extent to which the normal form of a plant is the outcome of environmental influences remains unknown, and can only be determined by laborious experiment. Yet the solution of this problem is essential to an understanding of many of the most important phenomena exhibited by plants; for example, those concerning the

variation which plants exhibit, which variation, by common consent is the starting point in the origin of new forms of plants.

In order to make a beginning of the experimental investigation of the influence of external conditions in moulding the form of plants, it is not necessary to seek for examples of remarkable deviation from characteristic structure. Every plant in the course of its life-history presents the most remarkable instances of changes of form which may serve as the bases for investigation. Thus, a plant passes the first part of its life in a vegetative stage, later it produces new organs and assumes a reproductive condition. Hence the general problem of the influence of external conditions in determining plant form may be investigated by the attack of the special problem. This special problem may be stated thus: are the changes of state which a plant undergoes in the course of its life-history determined by external conditions, and, if so, what are these conditions? The brilliant researches of Professor Klebs, of Heidelberg, have for their point of departure this special problem, and the results which he has obtained are of such general importance as to deserve the attention not only of botanists but of all horticulturists.

For purposes of convenience, it will be well to divide our account of these researches into two parts. For the present we will deal with the evidence provided by the lower plants, and on another occasion with that provided by flowering plants. It will be evident at once to everyone with a knowledge of the structure of plants that the lower plants serve for the kind of experiment with which we are now concerned far more readily than the higher plants. The simple fungi and algæ consist of single cells or of threads made up of similar cells. These cells are each exposed to the air or water or earth in which they live. They are therefore more directly at the mercy of their environment than are the many-celled complex higher plants.

If, therefore, change of one or other condition of the world in which the simple plant lives, produces a definite effect on the form of that plant, it should be readily recognisable. When we consider the life-history of one of the simple fungi or green algæ, we find that it exhibits a certain train of events, which appear to succeed one another with certainty, and, indeed, inevitably. Take, for example, a fungus studied by Klebs, *Saprolegnia mixta*, a saprophytic organism which is met with commonly in the bodies of dead insects in stagnant water. A spore falls on a dead insect; the spore germinates, and grows, to form a group of threads (the mycelium), which penetrate the dead body in all directions. This is the vegetative stage. After some days, the threads grow out from the body into the water, and produce at their tips vast numbers of zoo-spores, which are liberated, swim away through the water, and, perchance, find a new insect on which to settle. This is the stage of non-sexual reproduction. Yet, later, when the actively-growing mycelium has nearly exhausted the nutriment contained in the tissues of the dead insect, the fungus passes into its

third stage, that in which sexual organs are formed. The egg-cells which it produces may be fertilised by male cells, and resting spores are produced, which spores are capable of lying dormant for months before they germinate.

By means of a laborious and ingenious series of experiments, Klebs has shown that the apparent inevitability of this succession of events—vegetative phase, phase of asexual propagation, phase of sexual reproduction—is nothing but an illusion. Grow the mycelium of this fungus in a rich, nitrogenous medium, and it continues its vegetative stage indefinitely. All that is necessary to maintain the fungus in the vegetative stage is to transfer it occasionally from one rich nutrient solution to another similar solution. By this means, Klebs has cultivated the fungus in its mycelical state for no less a time than six years.

Again, by transferring the mycelium from a rich nutrient solution to one poor in food, the second phase—that of formation of asexual spores—is produced with certainty and despatch. And, again, by cultivating it on certain kinds of food, limited in amount, Klebs has shown that the fungus passes into stage three, that in which it produces its sexual cells, and, having done so, dies. When certain inorganic salts are withheld, egg-cells only are produced, and these egg-cells develop parthenogenetically into new plants. If, on the contrary, inorganic salts, and particularly phosphates, are provided, male cells as well as egg cells are formed, and sexual reproduction takes place.

Two impressive facts emerge from these experiments. One, that the several stages in the life-history of this organism are determined absolutely and completely by definite external conditions. The other, that, as shown by the behaviour of the mycelium supplied with rich food, under definite, constant conditions, the fungus undergoes no change of state, but remains for years in its vegetative, mycelical form.

It will be observed at once that the regular succession of stages as observed in the fungus when it invades the body of a dead insect, is also due to regular changes of conditions of food supply. Phase 1: vegetative or mycelical; continues so long as the dead body provides plenty of nitrogenous food. Phase 2: asexual propagation; begins at the tips of the threads as soon as they have grown some distance out into the water, which is, of course, relatively poor in nitrogenous food material. As bees swarm and leave a crowded hive, so do the spores of *Saprolegnia mixta* produced in swarms swim away from the no longer congenial spot. Phase 3: sexual reproduction; occurs as soon as the supply of food material in the body of the insect falls below a certain minimum. At any moment, by providing appropriate conditions, any phase may be induced.

These facts will appeal to the gardener with singular interest, for he will recognise that the facts learned from this simple fungus are those that he has learned already, if in less precise fashion, from his observations on flowering plants. He

GAYA LYALLII (SYN. PLAGIANTHUS LYALLII); FLOWERS WHITE.

Photograph by E. J. Wallis.

knows the value of rich nitrogenous manures in inducing luxuriant vegetative growth. He has seen, for instance, manures applied to market gardens at the rate of 50 or more tons to the acre. The gardener knows that such supplies as this would be inimical to flower production, and that it is useless to expect good fruit crops if the roots of trees are too heavily manured. Again, every grower knows how sterile of flowers are Potatoes grown in this country. That this sterility is due to the continuous cultivation of the plant in rich soil would seem to follow both from Klebs's investigations and also from the fact that in countries such as Brittany, where manure is applied but sparingly to the soil, the Potato fields in summer are a mass of bloom. The grower who is endeavouring to raise fresh varieties of Potato from seed might well take this fact into consideration, and instead of carrying out his trials on rich soils, try them on poorer ground. For, as he knows too well, not a few of our good varieties fail altogether to produce pollen, and hence cannot be used freely in breeding experiments.

From our knowledge of horticultural facts, and from Klebs's studies of the behaviour of the lower organisms, we are encouraged to conclude that the laws of Nature are no local by-laws, but that they run throughout her realm. How these laws are rendered obscure by the complex conditions obtaining in the flowering plants, we shall endeavour to show in a subsequent article.

ROYAL HORTICULTURAL SOCIETY.—The next meeting of the Committees will take place in the Society's Hall, Vincent Square, Westminster, on the 26th inst., when special prizes are offered for vegetables. At the 3 o'clock meeting a lecture on "Salads" will be given by Mr. C. HERMAN SENN.

FLOWERS IN SEASON.—Blossoms of the pretty Calceolaria Golden Glory are sent us by the raisers, Messrs. ROBERT VEITCH & SON, Exeter, these having been culled from plants which had already bloomed earlier this season. In a note accompanying the flowers, Messrs. ROBERT VEITCH & SON state that plants growing in the open have yielded a bountiful supply of seed, and, after these were harvested, the plants developed this second crop of flowers.

APPOINTMENT FROM KEW.—We learn from the *Kew Bulletin* that Mr. J. J. NOCK, a member of the gardening staff of the Royal Botanic Gardens, has been appointed Curator of the Hakgala Gardens, Ceylon, by the Secretary of State for the Colonies, on the recommendation of the Director.

A TRAINING COLLEGE GARDEN.—On the 16th inst. Lord PENTLAND, the Secretary for Scotland, opened the College Garden which has been formed at Mains, near Dundee, by the St. Andrew's Provincial Committee for the Training of Teachers. The garden forms part of 3½ acres of ground leased for the purpose. Nearly £2,000 have been spent on the building of greenhouses, a potting shed, a lecture hall, and a rock-garden and pond. Although the formal opening only took place on the 16th inst., about 40 students from the Training College and several country schoolmasters have already commenced a course in horticulture.

CHRYSANTHEMUM CONFERENCE.—As will be seen on reference to p. 229, the National Chrysanthemum Society will hold a conference on December 4. Papers will be read by Mr. F. W. LADDS, on "The Culture of Disbudded and Spray Blooms," and Mr. PERCY CRAGG, on "Soil Preparation and the Use of some Chemical Foods." An exhibition will be held in conjunction with the conference.

ROSES AND OYSTERS.—Colchester is famous for its Roses and oysters, and it is appropriate that the annual oyster feast of the town, to be held on October 12, will have as its president Mr. FRANK CANT, of the firm of FRANK CANT & Co., Rose nurseries, Colchester, in his official capacity as Mayor of the borough.

FUNGUS FORAY.—The annual fungus foray of the British Mycological Society was held during the past week in Somersetshire, this being the fifteenth annual outing. The president this year is Mr. E. S. SALMON, of the South-Eastern Agricultural College, Wye. At Taunton, on the 19th inst., Mr. E. W. SWANTON, of the Educational Museum at Haslemere, gave an illustrated lecture on fungi. He said that orchard trees in Somersetshire were largely infected with fungous diseases, and advised the growers to practise spraying.

"THE BOTANICAL MAGAZINE."—The *Botanical Magazine* for September contains illustrations and descriptions of the following plants:—

ACINETA MOOREI, tab. 8392.—A plant of this new species was purchased from Messrs. SANDER & SONS, Bruges, in 1903, for the Royal Botanic Garden, Glasnevin. It flowered for the first time in 1905, and not again until 1909. It is smaller than most of the known species, less vigorous, but a good grower. The flowers are showy, sub-globose, straw-coloured closely punctulate with brown spots. Sir FREDERICK MOORE states that the plant thrives well in a mixture of Osmunda fibre, good peat, and charcoal in a basket suspended from the roof of an intermediate Orchid house with a minimum night temperature of 55° Fahr.

VIBURNUM HENRYI, tab. 8393.—Illustrations of this new Chinese species were published in *Gardeners' Chronicle*, October 8, 1910, the plant in flower forming a supplementary illustration, and the same plant in fruit was figured on p. 109. The *Botanical Magazine* plate shows the fruits to be coloured coral-red, but they deepen as they ripen until nearly black.

SENECIO SAXIFRAGOIDES, tab. 8394.—This New Zealand species is described as most closely allied to *S. lagopus*, Raoul, but it is of stouter habit, with larger and thicker leaves, more densely villous on the upper surface. The *Botanical Magazine* plate has been prepared from a plant in the collection of New Zealand plants brought together by Mr. H. H. TRAVERS, and disposed of by auction by Messrs. PROTHEROE & MORRIS in 1908. It was planted with various species of *Olearia* in an unheated frame, where it grew well and flowered freely in the summer of 1910. The flower-heads and bright yellow flowers are very effective, and it is thought that the species may prove hardy in England, in which case this should be a useful plant for the rock garden; it is a perennial and grows 1 foot high, whilst its evergreen foliage is very handsome.

CLEMATIS CHRYSOCOMA, tab. 8395.—This Chinese plant is said to approach very closely to the Eastern Himalayan form treated by Mr. BRÜHL as var. *chumbica*, of *C. montana*. It differs chiefly from the Chumbi Valley plant in its coarser indumentum, and it is possible that the two may not be specifically distinct. But until a revision of the numerous varieties of *C.*

montana recognised by BRÜHL has been effected, Mr. SPRAGUE states that it is desirable to maintain *C. chrysocoma* as a separate species. The plant was presented to Kew by Mr. M. L. DE VILMORIN in the spring of 1910. It grew freely during the summer, and flowered abundantly from the old wood, but at the first frost died down to the woody base, so that it was necessary to take up the plant and house it during the winter. It is a shrub of low stature, with erect or decumbent pale-brown, sparingly hairy branches. The flowers are produced on short, leafy twigs; the sepals are white with a rosy margin.

IMPATIENS HERZOGII, tab. 8396.—The *Botanical Magazine* illustration of this species from New Guinea recalls the appearance of *I. Hawkeri*, and Sir JOSEPH HOOKER states that *I. Hawkeri* Bull is its nearest ally. A plant of *I. Herzogii* was raised at Kew from a cutting sent from the Royal Botanic Garden, Glasnevin, where plants were raised from seeds sent by Dr. R. SCHLECHTER from German New Guinea. It grows freely, flowers abundantly, and is amenable to very varied cultural conditions. It has survived the winter, and flowered well in the cool moisture of an Odontoglossum house in a night temperature of 50° Fahr.; in the dry atmosphere of a Cactus house, and in a bright stove pit with a night temperature of 65° Fahr., but the stove provides the most suitable conditions for the plants, which require a rich soil, and may be readily propagated by cuttings. It should be said that whilst *I. Hawkeri* is partially hairy and has dark red flowers, *I. Herzogii* is perfectly glabrous, and has vermilion-coloured flowers. Whilst therefore it is easy to separate them from an horticultural point of view, Sir JOSEPH HOOKER points out that there is little room for doubt that they are forms of the same species.

BLACK GRAPE DIRECTEUR TISSERAND.—A bunch of this Grape was shown before the Fruit Committee of the R.H.S. on the 12th inst., and a bunch of Alnwick Seedling, with which it was thought to be synonymous. Directeur Tisserand was raised by MM. ETIENNE SALOMON ET FILS, at their vineyards at Thomery (Seine-et-Marne, France), a village about 5 miles from Fontainebleau, and celebrated for its vineyards of Royal Muscadine (syn. Chasselas de Fontainebleau, White Sweetwater, &c.), the common Grape of the French restaurants. In the descriptive catalogue of vines issued by the raisers (1903 edition), which includes 2,265 names of varieties, many of them mere synonyms, Directeur Tisserand is described as an early variety, or only 12 to 15 days later than Royal Muscadine; the bunches above medium size, bluntly conical; the berry large, ovoid, hammered (martelé), handsome, black, with fine bloom; a good keeper; growths short. As compared with Alnwick Seedling, therefore, the bunches should be smaller, and the berry not so round, whilst it should ripen three weeks earlier, when grown in the same conditions.

A GARDEN OF WEEDS.—In a report on school gardening presented by the committee at the annual convention of the Society of American Florists it is stated that, at Amherst, Massachusetts, a novel illustration of object teaching was instituted by Dr. BEALES, of the Michigan Agricultural College, who started as a part of the school garden a weed garden patch, so that the children could learn to distinguish destructive and undesirable vegetation.

PUBLICATIONS RECEIVED.—*Peru To-Day*: a monthly account of Peru's development. (Peru: The West Coast Publishing Co.) Price 5d.—*Orchids for Amateurs*, by Alwyn Harrison; edited by T. W. Sanders. (London: W. H. & L. Collingridge.) Price 2s. 6d.

GAYA LYALLII.

(See Supplementary Illustration.)

THE recommendation of *T. H. C.* in *Gardeners' Chronicle*, July 29, p. 73, to plant this tree on an eminence so that the flowers may be better seen is good advice so far as most localities are concerned, but it does not apply in favoured situations such as Cornwall, where *Gaya* (*Plagianthus*) *Lyallii* flowers so profusely that the leaves are almost hidden. It is to be regretted that this fine plant is not more frequently cultivated, especially in those localities where it is known to succeed.

As pointed out by *T. H. C.*, the figure of *Gaya Lyallii*, which appeared in the issue for July 22, scarcely conveys a correct idea of the appearance of the flowers as they appear on the growing plant. The present Supplementary Illustration illustrates the correct pose of the flowers and the details of their structure.

Several changes have taken place in the nomenclature of this plant, and it has been placed successively in the genera *Sida*, *Hoheria* and *Plagianthus*. In the *Journal of Botany*, vol. 30, 1892, Baker describes it under the name of *Gaya Lyallii*, and this name is retained by Cheeseman in his *Manual of the Flora of New Zealand* (1906). In this latter work the tree is stated to be one of the most beautiful in the New Zealand flora. It occurs in the South Island from Nelson to Otago, sometimes at an elevation of 3,500 feet, often forming a fringe to the sub-alpine Beech forests. At high elevations the tree is deciduous, but in the river valleys of Westland, where it is abundant, it is evergreen. In New Zealand the tree is stated to attain to a height of from 15 to 30 feet. The pure white flowers are produced in axillary fascicles of from 3 to 5, being rarely solitary; they are apparently of two forms, one having long styles almost equalling the stamens, and another with styles less than half as long. A variety is included in the appendix to Cheeseman's *Flora* under the name of *ribifolia*. This is stated to be a distinct-looking plant with leaves deeply lobed or incised, usually smaller and less acuminate than those of the type, and with the stellate pubescence more conspicuous, especially on the under surface. This form is abundant in many parts of Marlborough and Canterbury, occurring usually on the lower ranges flanking the eastern side of the Southern Alps, whereas the type is more common in the humid climate of Westland. *H. Spooner*.

BRITISH ASSOCIATION.

ADDRESS TO AGRICULTURAL SUB-SECTION.

THE address by the chairman of the sub-section, Mr. W. Bateson, F.R.S., to the agricultural sub-section must have been listened to with interest by all serious students of agriculture and allied arts.

Mr. Bateson began his address by pointing out that, with the institution of the Development Grant, a national subsidy was provided on a considerable scale in England for the first time, and that the conditions under which it might most successfully be applied were matters for careful consideration. Other nations had made enormous efforts in this direction, and we had their experience to guide us. While fully appreciating the valuable results that had already been obtained wherever agricultural science had been properly organised, he could not help asking whether the whole outcome might not have been greater still. The supposed necessity for satisfying a public opinion, which demanded rapid returns for outlay and preferred immediate apparent results, however trivial, to the long delay which is the almost inevitable accompaniment of any serious production, was responsible for much. It could not be too widely

known that, in all sciences, research is nearly always a very slow process. If this is true for new industries, chemical and electrical, for instance, still more is it the case in an ancient art like agriculture.

An applicable science must be created before it could be applied. It was with the discovery and development of such science that agricultural research would for a long time best occupy its energies. To tell a man that he must not pursue an enquiry further because he could not foresee an immediate application of the knowledge he would acquire was almost always a course detrimental to the real interests of the applied science.

In this country, where the Development Commission would be for many years presumably the main controller of agricultural research, the constitution of the Advisory Board formed a guarantee that broader counsels would prevail; and it was to be hoped that the future administration of this work would be guided in the same spirit.

We should beware of giving false hopes. Why not take the farmer and gardener into our confidence and tell them that in these things science was only approaching the experimental stage? To affect otherwise would be unworthy of the dignity of science. So only would the confidence of the laity be assured towards research. In spite of the imposing results already obtained by breeders, he found almost all had some ideal not yet attained: that they were looking to scientific research to help them obtain results with greater ease and certainty. In certain selected cases science was able to help these enquirers, and if the practical man and the science student could combine their respective experiences, he believed that these cases would be found to be very numerous.

The modes by which combinations could be made and new forms fixed were, through the recent developments of genetic science, now reasonably clear; and with that knowledge much of the breeders' work was simplified.

One of the interesting examples Mr. Bateson mentioned was Mr. H. M. Leake's work on the "Cotton of India." The cottons of fine quality grown in India are late in flowering. In the United Provinces a comparatively early-flowering form is required. Hitherto, no early form of high quality has existed, but Mr. Leake has now made the combination needed. It is safe to say that this practical achievement could not have been made with such rapidity and certainty until the development of genetic physiology by Mendelian analysis.

One of the greatest advances claimed for this work was that it should induce raisers of seed crops to take more hopeful views regarding their absolute purification than has hitherto prevailed. It is at present accepted as part of the natural perversity of things that most high-class seed must throw "rogues." This view may be correct, but more probably we should regard these rogues either as the product of a few definite individuals, or as chance impurities. In either case they can presumably be got rid of.

The "bolting" of crops grown as biennials, especially root crops, was referred to as another important class of cases to which similar considerations apply.

Whether the loss due to these causes would prove preventable or not, one thing was certain: we had now the power to formulate rightly the question which the breeder was to put to nature, and the method by which he could obtain an answer to his question, in whatever sense that answer might be given.

Yet had Mendel's eight years' work been done at an agricultural school, supported by public money, one could imagine much shaking of heads on the county council governing that institution at investigations of the seemingly barren problem, "What is a species?"

Another line of research Mr. Bateson thought likely to lead to economic results was an investi-

gation of the nature of variation in size of an organism or its parts.

What, again, he enquired, was the cause of self-sterility? American experimenters were, no doubt, right in attributing the failure of large plantations of a single variety of Apple or Pear in a high degree to this cause.

And what was the meaning of the wonderful increase in size or in "yield," which so often followed a first cross? This fact had been made use of in breeding stock and raising table poultry. It has been suggested by Mr. G. N. Collins, of the U.S. Department of Agriculture, that it might be applied in the case of Maize. The cross is easy to make on a commercial scale, and the increase ranges as high as 95 per cent. Mr. Bateson believed that, to understand the meaning of these phenomena would be an addition to human knowledge of very great significance.

In the application of science to agriculture, chemistry very properly and inevitably had come first, while breeding had remained under the control of commonsense alone. Much, however, as the student of the conditions of life had done and could do for agriculture, the breeder could do more. If one had a Wheat of poor yield, no amount of attention to cultivation or manuring would give a good crop. An animal that was a bad doer would remain so in the finest pasture.

In conclusion, the lecturer said he wished to sound the same note with which he began: if we were to progress fast, there must be no separation between pure and applied science. The practical man and the science student had everything to gain from free interchange of experience and ideas.

BACTERIOTOXINS IN THE SOIL.

In a paper read before the Botanical Section of the British Association, Prof. W. B. Bottomley gave an account of his recent experiments on the occurrence of toxins, injurious to germination and growth, in soil and manure.

He finds that an aqueous extract of well-rotted manure or fertile soil, after filtering through a Pukall filter, has an injurious effect on the germination of seeds, and on their further growth in sand-cultures, even when supplied with normal food solution.

This effect of the extract can be destroyed by boiling, and the boiled extract, although slightly retarding germination, has a beneficial effect on the further growth of the seedlings.

The extract was also found to have a marked influence on the growth of certain soil organisms. It stimulates the growth of denitrifying bacteria and inhibits that of the nitrogen-fixing bacteria, both these effects being absent when boiled extract is used.

It is suggested that the harmful effect is due to the presence of bodies, probably of the nature of toxalbumoses, formed in soil and in manure by the activities of the putrefying and denitrifying bacteria. By heating, the toxic effect is destroyed, and the substance rendered available as a nutriment.

These observations are of interest for comparison with those of American observers, who conclude that toxic substances are excreted by the root-hairs of certain plants, and also with the recent experiments on soil sterilisation carried out at Rothamsted.

FIXATION OF NITROGEN BY MYRICA GALE.

PROF. BOTTOMLEY has recently investigated the nodules which occur on the roots of the Sweet Gale (*Myrica Gale*), with the view of determining whether they are concerned with the assimilation of atmospheric nitrogen, as he believes to be the case for the similar structures on the roots of *Podocarpus*, the *Cycas*, *Alder*, and members of the *Eleagnaceæ*.

He finds that the root-nodules of *Myrica* arise as modifications of normal lateral roots, which by branching repeatedly and by the growth of a

thin rootlet from the apex of each nodule, give rise to the characteristic "clusters" on the main roots.

Branching is due to the outgrowths of lateral roots which become hypertrophied. In section, the cortical tissue of the young nodule shows numerous "bacterial cells," in which the bacteria can be identified by suitable staining.

Towards the apex of the nodules, injection threads, quite similar to those seen in the nodules of leguminous plants, can be seen passing from cell to cell, and the whole structure is protected by a corky external covering.

Pure cultures of the bacteria from the bacterial cells show small rod-like organisms, identical in appearance and structure with *Pseudomonas radicola*, the bacillus concerned in the formation of leguminous nodules, and the cultures give a definite fixation of nitrogen when cultivated in Erlenmeyer flasks. In one such experiment, the flask inoculated with the bacteria contained 2.58 milligrams of nitrogen per 100 c.c. at the end of the experiment, as compared with 0.53 milligrams in the control flask not inoculated. Sterile plants of *Myrica* injected from cultures soon developed the characteristic nodules.

Prof. Bottomley concludes that the root nodules of *Myrica* are of the same nature as those of Alder, Cycas, and the Eleagnaceæ, and play the same part in the economy of the plant.

THE BRITISH FLORA AND ITS RELATION TO THE GLACIAL PERIOD.

A DISCUSSION on this subject took place at a joint meeting of the Botanical, Geographical, and Geological Sections of the British Association, the presence of many distinguished foreign plant-geographers making the occasion one of special interest.

The plant population of the British Isles at the present day consists chiefly of a selection of species common to northern and middle Europe, peculiar elements being the so-called Lusitanian flora of Cornwall and S.W. Ireland, certain North American species found sparingly in Western Ireland, and the Alpine flora of the uplands.

Evidence of complete glaciation occurs everywhere north of the Thames and Severn, and although there is no direct evidence of the presence of an ice-sheet south of the Thames, remains of Arctic animals and plants have been found in Wiltshire and Devonshire, and erratic boulders, probably ice-transported, have been found in Tor Bay and at Selsey, pointing to the existence of icebergs and a cold sea bounding the southern coasts. From this evidence it is difficult to believe that a pre-glacial temperate flora could have survived such severe conditions, and this is the view held by Mr. Clement Reid, who opened the discussion. With the exception of the Alpine flora referred to above, he believes the plant-population of Britain to be entirely composed of Colonists, which have come in since the last glacial period. Such facts as the occurrence of Spruce as a native in pre-glacial times, but not at present, confirm this view.

Prof. Drude, of Dresden, disagreed, and holds, from a comparison with the present flora of Greenland, that many temperate species may have survived the glacial period in the more sheltered situations. With regard to the Lusitanian and Alpine ingredients of the flora, Mr. Lewis drew attention to the possibilities opened up by a consideration of changes of level of land and sea in past glacial times, which, if of any magnitude, would to some extent affect climates, and provide land communication between Great Britain and Ireland and the Continent. Evidence pointing to such changes having occurred exists in the terrestrial peats on the Dogger Bank and elsewhere, at or below the present sea level. He criticised comparison with the Krakatoa flora, in view of the great difference in the factors concerned in plant-distribution under tropical conditions.

Prof. Ostenfeld, of Copenhagen, supported Mr. Reid, and considers the introduction of the Lusitanian species as probably due to winds and birds, although the possibility of land-connections is not to be overlooked.

With regard to the origin of the Alpine flora some diversity of opinion still exists. The old view of Forbes that the Alpine species are survivors from the Arctic flora of the glacial period, driven to higher altitudes as more temperate conditions of climate began to prevail, still finds a supporter in Mr. Reid.

The more popular view at present is to regard them as the oldest Colonists of the existing flora, which came in from Central and Northern Asia at the close of the glacial period.

Further contributions to the discussion were made by Prof. Schröter, of Zurich, Dr. Stapf, Dr. Moss, and Mr. Arber.

(To be continued.)

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

AMERICAN MELONS.—During the past two seasons I have been attempting to grow American Melons, and at present I am not at all satisfied with the results. I have tried them on hotbeds, and have kept them in a moist atmosphere (except during flowering time), thereby getting plenty of vigorous growth and a good show of flowers, both male and female. I have tried the plants in cold frames with just a prepared mound of earth for each plant. Plenty of air was admitted to the frame, and it was kept as cool as possible, with the result that the plants developed wiry stems carrying small thick leaves and plenty of flowers; but still I could not get a set of fruits. After many hours spent in pollinating, airing, pruning, &c., the lights were thrown open day and night, and the plants left to chance, the result being several Melons set, but only two or three came to maturity, owing, I think, to the exhaustion of the plants during the early part of the season. These American Melons, although of rough appearance and of medium size, possess the most exquisite flavour. I think the seeds came from South America, where the plants grow in the open and get very heavy dews at night. *Sydney Lawrance.*

LARGE PEACHES.—I was interested in reading the account of the weight of some Peaches (see p. 209), and I am sorry that I am not now able to send you a fruit of Sea Eagle, I gathered a few days ago, which turned the scale at 1½ lb.; also one of Princess of Wales, which weighed 18 ounces. They were both very fine fruits. *J. L. Waterman, Syndale Gardens, Faversham.*

CALCIUM CARBIDE RESIDUE.—Having read some notes in a recent issue of the R.H.S. *Journal* on the above subject and in various publications from time to time, I would like to add my experience, as there seems to be some uncertainty as to its safety and utility. Having had charge of a plant for the making of acetylene gas for several years, I have tried various experiments with the residue. As to its safety for horticultural use, I have found that when properly exhausted in the plant, it is thoroughly saturated with water, and this removes the greater portion of any poisonous matter. Such material may be applied to the soil at once, dug in, and the land cropped without any harmful effects. The method, however, of applying the substance is most important, as if applied in a wet state the particles cannot be so finely divided, and it remains in the ground in lumps, which set hard and help to disfigure the surfaces of roots and tubers. If laid aside for some months to get perfectly dry, it may be broken fine with the back of a spade, and thus be more evenly distributed. A heavy soil is benefited most of all by its use, and if used when trenching in every spit, will quickly break up and help to drain it. There seems to be no hard-and-fast rule as to the quantity to apply, but from one to four bushels per rod, according to the nature of the soil and the rate at which one requires to open it up, is a reasonable amount. I have used double this

quantity without any harm to crops of any kind. The residue is a compound of lime and charcoal, therefore it supplies both grit and lime, and is required less on light soils than soils of a heavier nature. Where used fresh, it seems to rid the soil of troublesome insects, and I would advise that it be allowed to lay aside for a few days until it can be passed through a sieve to separate the particles. *A. Wheeler, gardener to Rev. Barclay Buxton, Ware.*

ROSA HEMISPHERICA (see p. 198).—The following copy of a letter in my possession will be interesting to all Rose growers, as the writer is no longer with us:—"The Deanery, Rochester, May 20, 1893. Dear Mr. Gilbert,—I gratefully appreciate your kindness in sending to a brother gardener the very beautiful Roses which I have just received. This 'Yellow Provence,' as rare as it is exquisite, is a sight to make an old man young, and when the Pope sends a golden Rose to some favoured disciple he can hardly give more pleasure than you have given to Yours sincerely, S. Reynolds Hole." The above letter refers to flowers which the late Mr. R. Gilbert, of Burghley, sent to Dean Hole. They were grown in a cool lean-to greenhouse facing south; the plants were raised from layers and planted in the border inside. The house did not contain any pipes or artificial means of heating. This method of cultivation is more certain to give good results than out-door culture, as the flowers are protected from damp, and my opinion is they did not produce the hard green eyes which I referred to previously as the great difficulty here in average seasons. Some interesting remarks may be found in Dean Hole's *Book of Roses*, pp. 169, 170, which also quotes a statement from a book by the Rev. Mr. Hanbury to the effect that this Rose flowered well "in the parching and dry summer of 1762." *W. H. Divers, Belvoir Castle Gardens, Grantham.*

GRAFT HYBRIDS (see pp. 161, 195).—I enclose a small portion of *Cytisus purpureus* raised from seed some 15 years ago. The seed was taken from a tree of *Cytisus Adami*, containing the *Cytisus purpureus* form. I also send specimens in flower of *Kitaibelia Lindemathii*, which is said to have been raised by grafting *Kitaibelia vitifolia* on *Abutilon Thompsonii*. *R. Lindsay, Kaimes Lodge, Murrayfield, Midlothian.*

BIGNONIA GRANDIFLORA.—I can fully endorse what Mr. W. A. Cook says at p. 192 regarding the beauty and effectiveness of this hardy climber, as a few days ago I saw a plant of it in grand flower on a south wall at Orsett Hall, Major Whitmore's beautiful place near Grays. The long sprays of large, well-developed purple and red flowers were very attractive, depending gracefully from the wall. The plant is growing in an ordinary border alongside a well-flowered and highly flourishing plant of *Magnolia Soulangiana*. The young shoots of the *Bignonia*, like those of the *Passiflora* and *Tacsonia*, should not be stopped but simply thinned out, otherwise long flowering shoots will not be obtained. I have known several people to fail in flowering the above-mentioned climbers through having pinched the points out of the young growth or shortened them with the knife, which process resulted in a thicket of young shoots but no flowers! *H. W. W.*

THE EFFECT OF THE DROUGHT.—The drought experienced during the present season will have a permanent effect on trees and plants growing in the open in this district. The roots will penetrate into the lower strata of soil in search of moisture, and this in the case of fruit trees is not to be desired. Here, then, comes in the great value of mulching, for if the mulch is applied in good time and kept moist, it will be found that the soil just under the mulch, and in some cases the mulch itself, is full of fibrous roots. To get the full benefit of the mulch it must be kept moist. Another circumstance I have noticed this season is, that seedlings of various plants growing in the open garden have exceptionally long primary roots, and in cases where they have been lightly watered daily, quite a mass of rootlets is formed in that layer of soil which has been kept moist, but below that layer there are barely any lateral roots, but just the long primary root growing straight down. *Sydney Lawrance, Manor Farm, Barkham, Wokingham.*

FRUITING OF THE POMEGRANATE (see p. 209).—There is a fine plant of Pomegranate growing against a south-east wall in these gardens, which has fruited for several years past. This year I counted a dozen fruits which are very pretty objects, appearing like red balls. The border in which the tree is planted was widened last autumn, and this, in conjunction with the hot, dry summer, has favoured the production of so many fruits. The tree is about 17 years old and about 9 feet in height. *J. A. Hall, Shiplake Court Gardens, Henley-on-Thames.*

A "GILBERT WHITE" MANUSCRIPT.—Mention has been made in the daily papers of the recent sale of an hitherto unpublished manuscript by Gilbert White. It consists of a Nature calendar which the author of *The Natural History of Selborne* carefully drew up before he wrote the first of the letters which form the basis of the book. To the latter, he tells us, he meant to add an *Annus Historico Naturalis*, and it seems that the manuscript was intended to be used in this connection. The Selborne Society will shortly produce the calendar (which is particularly interesting) in facsimile, and print a limited edition on Italian hand-made paper. *Wilfred Mark Webb, Hon. Sec. of the Selborne Society, 42, Bloomsbury Square, London.*

WASPS (see p. 209).—I recently dug out a wasps' nest after placing cyanide of potassium in the entrance the previous evening. I succeeded in getting the nest out whole. It was cut through with a large knife, and was found to contain eight tiers of comb, the two lowest consisting entirely of queen cells, which I estimated to contain some 700 cells. We counted 250 young queens fully developed, and I noticed that the cells from which these had hatched were again restocked with eggs. I concluded that this nest must have contained in perfect young females, grubs in queen cells, and eggs, not fewer than 1,000 potential queens, each capable of founding a colony next season. This nest was the twenty-sixth I have destroyed this year. *Arthur J. Coll, Fruit Grower, Holder's Hill, Hendon.*

—Mr. Bartlett asks on p. 209 if any reader of the *Gardeners' Chronicle* has taken more than 42 queen wasps from one nest, and if it is the habit of wasps to breed so many queens in one colony. After many years' experience, I find that it is, and more especially at the end of the breeding season. In September, 1910, I destroyed a nest which contained 90 young queens. On previous occasions I have found as many as 120 queens in one nest. I have destroyed this season 300 nests on an estate of 300 acres, but have not found so many young queens this season; not more than 30 have been found in one nest. I fully endorse all Mr. Oldham has said on p. 192 about the wasp plague. I have used cyanide of potassium for destroying the wasps in the nests, and Scott's Wasp Destroyer on some of the wall fruit trees. This preparation is very effective, and keeps them in check for a time, but, as Mr. Oldham says, they seem as plentiful as ever. The Board of Agriculture and county councils would confer a great benefit to all fruit-growers if they encouraged the destruction of queen wasps in the spring and early summer. Prizes are offered at our local flower show for queen wasps, and this season no fewer than 1919 were captured. *F. Edwards, Warnham Lodge Gardens, Sussex.*

A CLOUD OF SPORES.—A day or two after the fall of rain which terminated the long drought, I found the mowing machine, which was being used to remove dead bents on the lawn, enveloped in a cloud of greenish dust, which could be seen from a distance. On investigation, the machine was found to be covered with a greenish deposit; on the board next to the knives it was quite one-eighth of an inch deep, and on all parts it was thick enough to be rubbed off with the finger. Examined under the microscope, I found that the dust consisted of spores, and Mr. F. T. Brooks, of the Botanical Laboratory, identified them as those of ground moulds, including *Macrosporium*, *Cladosporium*, and *Alternaria*. Some of the spores readily germinated when placed in a drop of water on a glass slide. The grass during the very hot weather had almost been burnt up, and, from observations near by, the temperature of the ground a foot down must have reached over 71°

F.; at a depth of 4 feet, the highest temperature has been about 65°. At one time the lawn was absolutely brown. It then began to get green by the ascendancy of *Lotus corniculatus*, *Crepis virens*, and other Composites, such as *Yarrow*, and various weeds. *Lotus corniculatus* has the appearance now of being able to make a fairly good dry-season lawn by itself. A dry season, such as we are experiencing, must tend to make a great change in the composition of turf and grass lands. In a few years I have noticed a considerable difference in the turf vegetation of this botanic garden, especially where it has been newly laid down from seed in years past, and it has become, on the whole, inferior, owing, most probably, to increasing dryness of the ground, due to surrounding drainage. One of the best lawn grasses we have here is *Poa trivialis*; but even this grass is now completely burnt up, except where the turf is shaded. *R. Irwin Lynch, Botanic Garden, Cambridge.*

SOCIETIES.

ROYAL HORTICULTURAL.

Scientific Committee.

SEPTEMBER 13.—*Present:* Mr. A. W. Hill, M.A. (in the Chair); Messrs. J. O'Brien, J. Fraser, and F. J. Chittenden (hon. sec.).

Bulbophyllum orthoglossum.—Mr. O'BRIEN drew attention to this uncommon species (figured in the *Gardeners' Chronicle*, June 20, 1908, p. 406) shown by Sir JEREMIAH COLMAN, Bart., and which had been imported from the Philippine Islands.

Gall on Tanacetum, &c.—Mr. J. FRASER showed specimens of a gall on *Tanacetum vulgare* formed by the fly *Hormomyia tanaceticola*, both on the stem and in the leaf axils. It had been collected on the Thames bank near Richmond. He also showed the fasciated stem of a vegetable Marrow which showed about 40 ridges. Mr. FRASER remarked concerning the perpetuation of abnormalities that many appeared to depend upon merely local conditions, and could not be perpetuated, e.g., although he made cuttings from the abnormal stem of the Mint he showed last year with leaves displaced and showing other abnormalities, they had reproduced the normal type entirely this season.

Quince with felted growth.—Mr. FRASER also showed a Quince covered with hairy growth, somewhat similar to that seen on the young fruits, but here persisting to a late period.

Oats and Barley shooting after harvest.—Mrs. E. ROBERTSON sent specimens of Oats and Barley making a second growth after the harvest had been cut. The growth sprang from below the main stem, and bore flowers at the height of about a foot. They were collected at Limavady, Co. Derry.

SCOTTISH HORTICULTURAL.

SEPTEMBER 5.—The monthly meeting of the above association was held in the Goid Hall, 5, St. Andrew Square, Edinburgh, on this date. Mr. Massie, the president, occupied the chair, and there were 80 members present.

Mr. Alex. Porter, market gardener, Davidson's Mains, read a paper on Montbretias. The most important use of the Montbretia, said Mr. Porter, was as a decorative subject for the flower garden, but it was also useful as a pot plant, and for cut flowers. The origin of the numerous varieties was Montbretia *crocosmaeflora*, a cross between *Crocsmia* (*Tritonia*) *aurea* and Montbretia (*Tritonia*) *Poppin*, raised by M. Lemoine, of Nancy, and sent out by him in 1882. The result of crossing the varieties of *crocosmaeflora* raised by Lemoine with *C. aurea imperialis*, a variety obtained by selection by Max Leichtlin, of Baden-Baden, and *C. aurea maculata*, a South African variety, was the present race, to which Mr. Davison, of Westwick House Gardens, Norfolk, had contributed some notable varieties, including "Prometheus," probably the largest flowered variety in cultivation.

Mr. Porter recommended annual lifting and re-planting of the corms. He said his practice was to lift the plants in November, and, after the stems had died down, to store the corms in shallow boxes in light sandy soil, and kept rather

dry in a cool place where frost could not penetrate. They should be started in slight heat in March, hardened off in cold frames, and planted out in ground prepared in the ordinary way by digging and manuring in April. For pot cultivation, fibrous loam with some well-decayed manure and sand and a little bonemeal should be used, and the plants should be potted in winter or early spring, and treated as for outdoor culture. When the pots were well filled with roots, a little artificial manure might be given at intervals of 8 to 10 days.

The exhibits at the meeting were:—Montbretias and a variety of Aster shown by Mr. PORTER; *Liliums sulphureum* and *nepalense* and a dwarf *Kniphofia*, "Marie Dirken," from Messrs. DICKSONS & Co., Edinburgh; perpetual-flowering Carnations, grown in a small greenhouse in a back garden, from Mr. JOHN FRASER, East Norton Place, Edinburgh; seedling American Tomato, from Mr. W. WILLIAMSON, Logie Green Nursery, Edinburgh; and *Polyporus versicolor* (?) from Messrs. JAMES GRIEVE & SONS, Edinburgh.

At the meeting on October 3, a conference and discussion on Early-flowering Chrysanthemums will be held.

WEST LINTON AND DISTRICT HORTICULTURAL.

SEPTEMBER 9.—Situated as this district is, 800 feet to 1,000 feet above sea level, it is one of the latest in Scotland; nevertheless fine vegetables and flowers are grown in the clear hill air. The annual flower show was held on the above date, and was a great success. Two groups of plants occupied the centre of the principal hall. One contributed by Mrs. WOODROP, Garvald House (gr. Mr. Haig), had a fine centre of *Lilium tigrinum Fortunei splendens*; the other came from Sir JAMES R. FERGUSON, Bart., Spittalhaugh (gr. Mr. Kennedy).

There were six classes for collections of vegetables, and between 20 and 30 collections, large and small, were put up.

In the open class for 10 kinds, Mr. D. KENNEDY, Spittalhaugh, was 1st; Mr. J. JOHNSTONE, Lamancha, 2nd. In the cottagers' class for 10 kinds there was a keen competition, and Mr. PHILIP SOMERVILLE, surfaceman, Machiehill, was 1st; Mr. A. DALGLEISH, 2nd; and Mr. THOMAS MORTON, 3rd.

Potatoes were excellent in every class. Mr. SOMERVILLE and Mr. ROBERT DICKSON, Ironston, being the chief winners. Mr. SOMERVILLE showed Perfection and Dobbie's Russet in splendid condition. Mr. DICKSON's best dish consisted of very fine tubers of British Queen.

The classes for Onions, Leeks, Parsley, Carrots, Shallots, and Cabbages were all well filled. Winningstadt Cabbages were fine specimens, 10 lb. to 12 lb. in weight.

Mr. THOMAS YOUNGER was 1st for Violas; Mr. DAVID WAUGH, 2nd. The flowers were large and fresh. In future it would be well that only one variety be allowed in each bunch.

French Marigolds, beautifully striped, likewise Antirrhinums, annuals, Asters, 6 inches in diameter, and Sweet Peas were outstanding classes among the flowers.

Mr. D. MILLER, gardener to Dr. Ritchie-Jeffrey, was 1st in both Sweet Pea classes, showing fine bunches of Maud Holmes, Tennant, Spencer, Etta Dyke, Mrs. C. W. Breadmore, Othello Spencer, and Constance Oliver. Mr. J. MOFFAT, Medwyn, was a good 2nd in the principal class.

Dr. RITCHIE JEFFREY put up a large collection of excellent Sweet Peas not for competition. It consisted of about 60 of the leading varieties, and formed quite a feature of the show.

SANDY HORTICULTURAL.

AUGUST 31.—The forty-third annual exhibition of the Sandy and District Floral and Horticultural Society was held in the park of Sandy Place on this date. Fine weather prevailed, and there was a large number of visitors.

In the floral and vegetable classes, the Misses FITZPATRICK, Bedford (gr. Mr. Birkenshaw), won no fewer than 15 1st, 14 2nd, and 2 3rd prizes. In the class for 48 Rose blooms, Mr. F. M. BRADLEY, Peterborough, and Mr. G. N. W. BIRCH, Peterborough, won the 1st and 2nd prizes respectively.

NEWTOWNARDS HORTICULTURAL.

SEPTEMBER 7.—The annual flower show of this Irish society took place on the above date. Despite the unfavourable season, the show was quite equal to those of former years. In the class for a group of plants in pots shown by amateurs who employ a gardener there were several meritorious exhibits. Lord DUNLEATH, Ballywalter Park, was awarded the 1st prize, and Mr. CHARLES DUFFIN the 2nd prize. The premier collection was remarkable for some excellent Codiaums, which were relieved with Bamboos, Palms and Ferns. Mr. CHARLES DUFFIN, Belfast, excelled in the class for 10 stove and greenhouse plants, which included some beautiful specimens of Codiaum. Mr. DUFFIN also won the 1st prize in the class for table plants, but he was placed second to Lord DUNLEATH in the class for six Codiaums. Mr. JOHN STEVENSON, Newtownards, and Mr. W. J. FERGUSON, Newtownards, won most of the prizes in the classes for amateurs who do not employ a gardener.

In the nurserymen's classes Messrs. ALEX. DICKSON & SONS, Newtownards, put up a most imposing exhibit, in which hardy flowers were specially good. There was a close competition for 24 bunches of hardy border flowers. Mrs. EDWIN HUGHES, Craigavad, was awarded the 1st prize in this class; 2nd, Mr. P. KERR-SMILEY. Colonel WALLACE showed the best 24 bunches of Sweet Peas, whilst Mr. H. E. RICHARDSON was successful in the class for 12 bunches of Sweet Peas. Major DUNBAR BULLER was awarded the 1st prize for Show Dahlias. There was a keen competition in the class for a decorated table of fruit, and in a keen contest Sir THOMAS DIXON, Hillsborough Castle, obtained the premier award, being followed by Lord O'NEILL, Shane's Castle.

NATIONAL CHRYSANTHEMUM.

SEPTEMBER 11.—The Executive Committee met at Carr's Restaurant, Strand, on the above date, Mr. Thomas Bevan presiding. An interim financial statement was read by the secretary, with the result that it was resolved that prize money awarded at the forthcoming October and November shows should be paid immediately thereafter.

The conference to be held on December 4 is now arranged. There will be two sittings, one at 7 p.m. and the other at 8 p.m. At the first Mr. F. W. Ladds will read a paper entitled "Culture of Disbudded and Spray Blooms," while at the latter Mr. Percy Cragg will give a discourse on "Soil Preparation and the Use of some Chemical Foods." In conjunction with the conference there will also be a small exhibit of Chrysanthemums. The annual dinner will take place on November 23 at the Holborn Restaurant.

MOFFAT AND UPPER ANNANDALE HORTICULTURAL.

SEPTEMBER 15.—The annual exhibition of this society was held at Moffat on the above date. There were many excellent exhibits in the open classes for pot-plants, Begonias, Pelargoniums, Ferns, and Greenhouse plants being very good. JOHN WALLACE, Esq., Craigieburn (gr. Mr. J. M'Kay), was awarded the 1st prize for Begonias, whilst Mr. W. MURRAY, Ardenholm, excelled in the class for Zonal-leaved Pelargoniums. For greenhouse plants in flower, J. WALLACE, Esq., was first, and he also led in the classes for Chrysanthemums. J. SMITH, Esq., Craigielands (gr. Mr. Luke Fraser), showed the best foliage plants, whilst Mr. J. HAMILTON, Haywood, was placed first for Fuchsias; J. WYLLIE, Esq., Elmbank, Dumfries (gr. Mr. J. Henderson), for Early Chrysanthemums; and J. RANKIN, Esq., Dalswinton (gr. Mr. A. Grigor) for Exotic Ferns. Colonel YOUNGER, Langshawbush (gr. Mr. Jas. Raphael), and Mr. R. PORTEOUS, Heatherlyhaugh, were among the other successful exhibitors.

Collections of cut flowers were generally good, amateurs winning the 1st prizes in several classes. Colonel YOUNGER was placed first for hardy flowers. H. KESWICK, Esq., Cowhill Tower (gr. Mr. C. G. M. Murray) led in the class for Sweet Peas with a fine exhibit. Roses were well shown by Mr. J. ADAMSON, Lockerbie, who won several 1st prizes for these and other flowers. Winners in the other classes included Mr. J. SMITH, Colonel YOUNGER, Mr. J.

WALLACE, Mr. D. WHITELAW, and Mr. R. PORTEOUS.

In the fruit division Mr. J. RANKIN showed the best Grapes, and the other principal prize winners were Miss CLARK, Jardington, and Messrs. H. KESWICK, W. LOCKHART, Wyseby Lodge; J. BROWN, Wanlockhead; J. WALLACE, J. SMITH, J. WYLLIE; and R. PORTEOUS.

In the vegetable classes the leading prize-winner was Mr. J. RANKIN, but Mr. H. KESWICK gained the 1st prizes in the class for a collection and in some other classes. Other successful exhibitors of vegetables were Messrs. J. SMITH, R. PORTEOUS, J. A. RENTON, J. HARKNESS, Newfield Burn, J. EASTON, and Colonel YOUNGER.

NATIONAL ROSE.

SEPTEMBER 14.—The autumn show of the National Rose Society took place on this date at the Royal Horticultural Society's Hall, Vincent Square, Westminster. In a season of extreme drought, it was not surprising to find the quality of blooms inferior to those of average years, but

provided additional classes at the president's suggestion.

NURSERYMEN'S CLASSES.

In the premier class for 36 blooms, distinct, there were five exhibits, and all were so meritorious that the judges awarded an extra prize. The 1st prize was awarded to Mr. HUGH DICKSON, Belfast, for blooms of remarkably even quality; an exhibit which would have been a credit to the growers at the very height of the Rose season. The varieties included W. K. Smith, Mrs. Maynard Linton, Gladys Harkness, Ulrich Brunner, John Ruskin, Leslie Holland, Claudius, William Shean, Hugh Dickson, Caroline Testout, Frau Karl Druschki, J. B. Clark, Senateur Mascurand, Mrs. David M'Kee, Lyon Rose, Mary Müller, Mrs. Richard Draper, Mrs. Chas. E. Allan, Dr. O'Donel Browne, Killarney, Bertha, Mme. Wagram, Comtesse de Turenne, Mrs. Stewart Clark, Mdle. Clarice Jouranville, Countess of Gosford, Paul Neyron, Lady Alice Stanley, Mme. Joseph Combet, Chas. J. Grahame, Mme. Second-Weber, H. E. Richardson, Countess of

FIG. 106.—SOPHRO-LÆLIO-CATTLEYA "JEANETTE"; COLOUR VERMILION-RED, WITH PALE YELLOW IN THE BASE OF THE LIP.

(Shown at R.H.S. meeting on September 12 by Messrs. Charlesworth & Co., and awarded a First-class Certificate.)

(See p. 211.)

they were considerably better than might have been expected. Their numbers compensated for any falling off in quality, and the exhibition was a splendid success. The Lyon Rose, which was shown so well at the summer exhibition, again attracted considerable attention, but the most prominent variety was the rich yellow Rayon d'Or. Although several seedlings were presented for award, not one was considered worthy of a Gold Medal, but a Silver-gilt Medal was awarded to Messrs. McGREDY & SON for the Hybrid Tea variety Mrs. Muir MacKean, which received a card of commendation at the summer exhibition. The colour is a rich red with a bluish shade at the base of the petals; although a fine large bloom, it lacks perfume. Another variety shown by this firm named British Queen is a good white H.T. variety with a pale primrose base. The H.T. variety Mrs. Wallace H. Rowe is a pretty pink Rose, but it does not appear to show any improvement on existing varieties of its type. In view of the exceptional season, the committee

Shaftesbury, Jonkheer J. L. Mock, Mrs. John Laing, and Ard's Pillar. 2nd, Messrs. JAMES COCKER & SONS, Aberdeen, who staged fresh blooms, including two "premier" flowers. Their best varieties were Mme. Hoste, Capt. Hayward, Mrs. S. Clark, Chas. J. Grahame, Mme. J. Combet, C. de Tudor and Alfred Colomb. 3rd, Messrs. ALEX. DICKSON, Newtownards, Co. Down, Ireland. 4th, Messrs. ADAM & CRAIGMILE, Aberdeen.

Most of the blooms exhibited in the class for 18 exhibition Tea and Noisette Roses had fresh and delicate-looking petals, and emitted a most pleasant perfume. The 1st prize collection, shown by Mr. GEORGE PRINCE, Oxford, was particularly good, the best blooms being Mme. Constance Souper, Mrs. Edward Mawley, Maréchal Niel, W. R. Smith, and Maman Cochet; the 2nd prize was won by Messrs. JEFFERIES & SON, Cirencester, who showed some exceedingly fine blooms, but they were not so even as those in the 1st prize exhibit; the varieties Mme. Jules Gravereaux and Mme. Jean Dupuy were

unusually fine; 3rd, Mr. HARRY DREW, Longworth. The choicest Tea Rose was Molly Sharman Crawford, which was exhibited in the collection of Messrs. ADAM & CRAIGMILE, Aberdeen.

Although the class for 12 varieties, shown in vases, seven blooms of each variety, was only contested by two growers, both exhibits were worthy of prizes. The premier collection was shown by Mr. HUGH DICKSON, Belfast, the six best blooms being Caroline Testout, The Lyons Rose, J. B. Clark, Ulrich Brunner, Hugh Dickson, and Miss Cynthia Forde; 2nd, Messrs. COCKER, Aberdeen, whose best blooms were Hugh Dickson, Capt. Hayward, and Miss Laing.

Mr. HUGH DICKSON was easily 1st in the class for 12 blooms of any variety shown in a vase, with fine, richly-coloured blooms of Hugh Dickson; 2nd, Messrs. W. CRISP & SONS, Colchester, with white Maman Cochet.

DECORATIVE ROSES.

In the class for 24 distinct varieties, no fewer than three nor more than seven trusses of each variety, the 1st prize was won by Mr. J. MATTOCK, Headington, Oxford. He showed clean flowers associated with healthy foliage of Mme. Jules Grolez, Duchess of Wellington, Lady Waterlow, Trier, Countess of Derby and others; 2nd, Mr. JOHN PIGG, Royston, Herts., whose vases appeared to be on the point of toppling over Léonie Lamesch and Ecarlate are both dark Roses which were shown in this collection.

Messrs. SPOONER & SONS, Woking, were decidedly first in the similar class for 12 varieties. General McArthur, Mrs. Aaron Ward and Prince de Bulgarie were especially good; 2nd, Mr. E. WOLLARD, Brighton, with good sprays of Crimson China, Orleans and Mrs. W. H. Cutbush; 3rd, Mr. CHAS. TURNER, Slough.

A class was provided for 12 varieties lightly arranged in bamboo stands. This was a disappointing class, but probably the fault lies more with the stiff and rather ungainly stands than with the exhibitors. The 1st prize was awarded to Mr. J. MATTOCK, Oxford.

The best exhibit of 12 varieties of dwarf Polyantha Roses was shown by Messrs. W. SPOONER & SONS, Arthur's Bridge, Woking. Perle d'Or, Léonie Lamesch, Eugénie Lamesch, Jessie, Mrs. W. H. Cutbush and Cécile Brunner were all very attractive. Mr. GEORGE PRINCE, Longworth, who was awarded the 2nd prize, had a splendid vase of Orleans Rose.

GROUPS OF ROSES.

Messrs. PAUL & SON, Cheshunt, obtained the Gold Medal offered for a representative group of Roses with a low and light arrangement which enabled the flowers to be easily seen. The semi-circular group was backed with healthy young Bamboos and bordered with *Adiantum cuneatum*. The best of their very fine Roses were Rayon d'Or, Sénateur Mascaraud, Jessie, Marquise de Sinety, Mme. Delany, and a quantity of Maman Levavasseur (the best of the late-flowering Polyantha Roses), and Agate (the very dwarf Pompon Rose).

Messrs. HOBBISS, LTD., Dereham, who received the Silver-gilt Medal, filled the corner by the annexe with a group in which the yellow and pink shades of colour predominated. Heads of cluster Roses on very tall stems were raised high above the chief portion of the arrangement. Small pot plants of the bright-red G. C. Waud, Sunset (a compact flower of good yellow colour), Mrs. E. J. Holland (pink), Souvenir de Marie de Zayas (a deep pink, with curled petals), and Sunrise occupied prominent positions at the front of the group.

A Gold Medal was also offered for a group of cut Roses displayed on staging. It was awarded to Messrs. W. & J. BROWN, Peterborough. This very large exhibit was arranged in a bold and striking manner. Lyon Rose, which the firm exhibits in such good form, was placed in the centre, and on each side were arranged tall stands of Joseph Hill, General McArthur, Florence Pemberton and Mme. Constant Soupert. Of the many good varieties set out on the floor of the staging we especially noted Cardinal, Earl of Warwick, Harry Kirk, and the deep, rich yellow Rayon d'Or. The 2nd prize was a Silver-gilt Medal, and this was won by Messrs. GUNN & SONS, Olton, Warwickshire. The Lyons Rose was particularly bright in this collection, and Pink Maman Cochet, Souvenir de Pierre

Notting, and Lady Ashtown were also very good specimens. A Silver Medal was awarded to Messrs. JNO. JEFFERIES & SONS, Cirencester, for a smaller but very fresh collection.

Messrs. GEORGE JACKMAN & SON, Woking, Surrey, this year broke Messrs. E. M. BRADLEY's long sequence of wins in the class for a group of cut Roses. For the first time in six years, Messrs. BRADLEY, Peterborough, have to be content with the 2nd prize. There was a great similarity in the arrangement of these two groups, which were placed side by side. The winning collection contained some fine masses of the Lyon Rose, Prince de Bulgarie, Maman Cochet, Caroline Testout, Souvenir de Pierre Notting, and Mme. Ravary. The smaller vases of Roses included good examples of Zéphirine Drouhin, Lady Hillingdon, Duchess of Wellington, Mrs. Aaron Ward, and Hugo Roller. Outstanding varieties in the 2nd prize collection were Pauline Bersez, Harry Kirk, Mrs. Aaron Ward, W. P. Smith and the Lyon Rose. 3rd, Messrs. BEN. CANT & SONS, Colchester; 4th, Messrs. R. HARKNESS, Hitchin.

The excellence of the four exhibits in the class for 36 varieties in not fewer than three trusses of each would convey the impression that the season has been favourable to the production of quantities of fine, richly-coloured Roses. The leading exhibits were arranged on steep shelves, and the vases contained at least 20, frequently more, blooms of each variety. The 1st prize was awarded to Mr. J. MATTOCK, New Headington, Oxford, for an exceedingly meritorious display, which included a fine selection of exhibition and decorative Roses. The single variety Irish Elegance was shown in almost as good style as at the summer show. E. V. Hermanos, Rhea Reid, La Tosca, Anna Olivier, Comtesse de Cayla, Mme. Jean Dupuy, Betty, and The Bride are a selection, comprising the best of this fine exhibit; Mr. GEORGE PRINCE, Oxford, was awarded the 2nd prize; 3rd, Mr. R. ADAMS, White Wells Nurseries, Bath.

In the supplementary classes open to nurserymen Mr. HUGH DICKSON, Belfast, showed nine exceedingly fine baskets of cut Roses, and was awarded the 1st prize.

ROSE HIPS.—The class for Rose Hips in nine varieties only brought forward two competitors. Messrs. PAUL & SON, Cheshunt, were awarded the 1st prize for a varied collection, comprising large, brightly-coloured hips of *Rosa rugosa*, the long-spined *R. macrophylla*, *R. pimpinellifolia*, which has small, Fern-like leaves and very dark, nearly round fruits. Rose altaica also bears very dark purple hips, somewhat the shape of a Spanish Onion. *R. rubrifolia* had scarlet hips, *R. microphylla* bore large, green, spiny hips, whilst the cross between that species and *R. rugosa* is much the same size, but in the case of the hybrid the hips have lost some spines and have taken colour from *R. rugosa*. *R. pomifera* bears large, brightly-coloured hips.

AMATEURS' CLASSES.

There were five good exhibits in the premier amateurs' class for exhibition Roses; the winning stand, shown by Mr. E. M. EVERSFIELD, was extra good. This exhibitor is especially successful with White Maman Cochet. His other varieties included Queen of Spain, W. R. Smith, Mme. Jules Gravereaux, and Bessie Brown. 2nd, Mr. CONWAY JONES, Gloucester, whose best blooms were C. J. Grahame, Lady Ashtown, and Mons. Paul Lede. 3rd, Rev. J. H. PEMBERTON, Havering-atte-Bower, Essex.

In competition with five other exhibitors, Mr. G. SPEIGHT, Market Harborough, showed the best 12 exhibition Roses, the best variety being Horace Vernet. This received the Silver Medal offered for the best Rose, other than Hybrid Tea, Tea or Noisette variety, in the show. 2nd, Mr. W. O. TIMES, Hitchin.

Mr. M. WHITTLE, Leicester, showed splendid blooms in the class for nine blooms. M. Constance Soupert (a very richly-coloured bloom) received the Silver Medal as being the best Tea or Noisette variety (in the amateurs' classes). The Lyon, Bessie Brown, and Souvenir de Pierre Notting were exceedingly fine. 2nd, Mr. W. UPTON, Leicester, who had a Dean Hole and Mme. Jules Gravereaux very good. Mr. CONWAY JONES exhibited the best 12 blooms in Class 21, and Mr. E. M. EVERSFIELD received the 2nd prize.

In the class for six blooms Mr. W. UPTON,

Leicester, obtained the 1st prize with a stand which contained an almost perfect specimen of White Maman Cochet. Mr. E. M. EVERSFIELD was awarded the 1st prize for exhibition Roses shown in vases.

In the supplementary classes for amateurs, Rev. J. PEMBERTON was awarded the 1st prize for three baskets of distinct varieties of cut Roses, and he was also 1st in the class for seven varieties shown in vases, in which class Mr. H. R. DARLINGTON was placed 2nd. Mr. ROBINS, Ingatstone, was awarded the 1st prize for five varieties, and Mr. J. W. BURGESS, Tunbridge, for three varieties shown in vases.

PREMIER BLOOMS.

NURSERYMEN'S CLASSES.

H. P.: Gloire de C.-Guinoisseau, shown by COCKER & SONS, Aberdeen. H. T.: Earl of Warwick, shown by Messrs. COCKER & SONS, Aberdeen. T.: Molly Sharman, Crawford, shown by Messrs. ADAM & CRAIGMILE, Aberdeen.

AMATEURS' CLASSES.

H. P.: Horace Vernet, shown by Mr. J. SPEIGHT, Market Harborough. H. T.: Earl of Warwick, shown by Mr. E. M. EVERSFIELD, Horsham. T.: Mme. C. Soupert, shown by Mr. H. WHITTLE, Leicester.

GENERAL BULB GROWERS OF HAARLEM.

The following awards were made at the August meetings of the Floral Committee of this Society:—

FIRST-CLASS CERTIFICATE.

Gladiolus gandavensis "Europa."—A white variety, spotted with red at the base of the petals.

AWARDS OF MERIT.

Gladiolus gandavensis "Niagara."—The flowers are yellow, striped with violet.

G. g. "Lieberfeuer."—A finely-shaped flower of scarlet-red colour, striped with violet.

Canna "Tiercelet."—A pure yellow variety, with flowers of good form and size.

C. "Hungaria."—This variety of *Canna* has bright-rose flowers, the petals being of a large size.

Dahlias "Conquest" (Cactus), dark brown; "Crystal" (Cactus), rose and white; and "The Imp" (Cactus), brownish black.

LAW NOTE.

GROUND LANDLORD'S RIGHTS.

To many of those who are either owners or tenants of other than freehold houses and have planted creepers and climbers to clothe their dwellings and boundary walls with beautiful—and, what is more, protective—foliage it may be news that the ground landlord, with a view to the maintenance of the buildings on his land, has, or claims to have, the right to demand at short notice that not only the house itself, but the garden walls shall be "pointed," pains and penalties being incurred if such be not done "without delay" and to his satisfaction. The case—an actual one—concerns a number of semi-detached houses in one of our prettiest western suburbs, which are let on a 99 years' lease, having still about 70 years to run. These houses are substantially built, the rental value being about £50, and are mostly tenanted by men who have purchased them for their own occupation. Both the front and back gardens—these latter about 80 feet by 30 feet—are well kept, and in one case filled with very choice collections of valuable plants. Most of the houses are beautifully clad from bottom to top with Ampelopsis, Ivy, and other plants. The road itself is an avenue of well-grown trees, and this avenue, with the verdure-clad buildings on either side, has a very pretty appearance. The buildings, under such circumstances, are naturally well cared for by the occupants, and are in such good repair that a very keen eye indeed is required to detect the need for "pointing" the brickwork which is now insisted upon by the ground landlord, in order to protect his eventual interest as owner 70 years hence, when the lease expires, and the buildings, for which he has not paid a penny piece at any time, and which have formed a substantial guarantee for his ground rents, will fall into his hands free, gratis and for nothing. It is in view of this

distant eventuality that the present so-called owners are called upon to destroy the amenities of their holding, for it is obvious that a body of bricklayers imported into a garden for the purpose of pointing its boundary walls, to do which they must perforce pull down all the creepers covering such walls and those of the house itself would inevitably inflict such damage as would take years to remedy. This point is quite apart from the expense which the work would involve: which work is uncalled for. The demand, too, is made regardless of season; it must be attended to "without delay," and the presumption is that, should such demand be ignored, the ground landlord would take upon himself to get the work done to his satisfaction, claiming the cost from the leaseholder.

The question here arises whether, in the case of rare and valuable plants, the owner could not hold the ground landlord responsible for any damages to such plants done by his workpeople, after duly warning him of the risk he ran. He could place the house and garden walls at his disposal for the purpose indicated, while pointing out to him that he should hold him responsible for such damages, and requiring him to leave everything intact as he found it, or make any damage good.

In any case, even if the ground landlord possesses such powers as appear so greatly to the leaseholder's detriment, it is bad policy to enforce them under the circumstances described. Usually, a man buys a house so as to be free from the risk of being turned out of it, and thus being deprived of garden and other amenities which he may have created by years of labour, but which would appear to be open at any time to destruction or damage on an extensive scale at the bidding of another, from which he naturally expected he would be exempt so long as the ground rent was punctually paid. It seems desirable, before purchasing a house on other than a freehold basis, to narrowly scrutinise the ground-rent contract, and insist upon the insertion of some protective clause before closing the bargain. D.

A LEGAL OPINION.

AN interesting question is raised by Mr. "D's" article under the above heading, and, as usual, there is a good deal to be said on either side of the case. The two main points involved are:—

1. Is the landlord acting reasonably in calling for the houses to be repointed; and
2. Can the landlord be restrained from having the work done if it involves damage to the Ivy, &c., growing on the house, or, at all events, can he be required to make good any damage so caused.

Dealing with the first question, it is obviously necessary to consider what was the original bargain between the two parties who entered into it, i.e., the landlord who let his land for building purposes and the tenant who agreed to erect the house in return for the use of the land for 99 years at a fixed rent. In most cases of this kind the tenant would be a builder, who would enter into the arrangement for the purposes of profit. The whole matter is, in fact, a question of business arrangement and calculation on either side.

The builder usually prefers not to buy the land outright, as the purchase money would absorb capital which could be more usefully employed in his business. He therefore arranges to hire the land for 99 years at a fixed rent of a few pounds per annum (in practice the amount usually runs from £3 to £10 a year, according to the area, value of the neighbourhood for residential purposes, and the size of the house to be erected). During the next 99 years, therefore, the landlord and his successors must be content with the fixed rent, irrespective of whether his land doubles or trebles in value meanwhile. On the other hand, at the end of the 99 years the ownership of the house passes from the tenant to the landlord.

At first sight this might appear to be rather hard on the tenant, but in practice the matter can be adjusted by quite a simple arrangement. Money invested at compound interest doubles itself every few years, so that (on the well-known principle of "the nails in the horseshoe") a very small sum thus invested to-day would pro-

duce a very large amount in 99 years' time. Accordingly, the tenant can take out a form of insurance policy (known as a redemption or sinking-fund policy), under which, at the end of 99 years, any insurance company will pay to him a sum in cash equivalent to the value of the house which is passing from him to the landlord. To obtain this amount the tenant can either pay a small sum down now, or, if he prefers it, he can pay a very small premium each year. This premium the tenant can regard as extra rent for the purposes of his business calculations when considering whether the venture will bring him a satisfactory profit. In many instances the annual value of the property will have risen in a few years by more than the amount of the insurance premium, and this increased value will be enjoyed by the tenant, as the landlord is still tied down to the fixed rent originally agreed upon.

As the landlord thus looks to the value of the house to recoup him for his loss of extra rent during the 99 years, he naturally stipulates that the structure of the house should be kept in reasonably good repair during this period, as obviously it would be contrary to the bargain between the parties if the tenant should quit the property leaving the house in such a condition as to be suitable only for use as a dilapidated cowshed instead of as a residence to be let for occupation. Accordingly, in the building lease which the tenant takes up, he agrees to keep the house in good repair, and empowers the landlord to call for such necessary repairs to be done from time to time. If, therefore, the builder enters into a bargain to this effect it seems scarcely reasonable for him to grumble afterwards when he is required to abide by his share of the arrangement. If, however, the landlord makes demands beyond the terms of the lease, then the tenant can safely refuse to comply with his demands. In practice, the matter is usually settled amicably between two surveyors, one representing the landlord and the other acting for the tenant.

In some building leases it is arranged that the landlord shall not have the right to call for the premises to be repaired, except during the last seven years of the term, but in that case the landlord's consent usually has to be obtained before the lease can be sold or transferred. Otherwise, the landlord's successors would generally find at the end of the 99 years that the lease had been transferred to a "man of straw," who, having nothing to lose, would calmly ignore the promises of his predecessors to keep the house from falling into ruin.

So far the position is simple enough, but the second point raised by Mr. "D" involves a more difficult question of fair play. It is impossible not to sympathise with the lover of horticulture called upon to see his cherished decorations of Ivy, &c., completely ruined by the ruthless hand of the bricklayer and renovator. On closer examination, however, the matter appears to resolve itself into a simple question of fact. The house is either in such a bad state of repair as to require the re-pointing of the bricks or it is not. In the former case it would presumably be impossible to carry out the necessary repairs without damaging the Ivy growing on it. There would still, however, be no necessity for the garden to suffer damage in any other respect if due care is used, and the tenant has two courses open to him. He can either make a special contract with a builder to carry out the work without damaging the garden or he can leave the landlord to do the work at his (the tenant's) expense, and can counterclaim for the value of any damage unnecessarily caused to the garden, giving the landlord due notice beforehand of the intention to hold him responsible.

If, on the other hand, the re-pointing of the bricks is, as Mr. "D" suggests, quite unnecessary, then, unless the lease is drawn in an unusual and peculiar form, the tenant can refuse to comply with the notice and may calmly await events.

Whether Ivy is a protection or a detriment to the structure of a house is a question on which experts appear to differ. Some surveyors hold the opinion that Ivy causes the structure to rot, as, although offering some protection against storms, yet, on the other hand, they contend that it is apt to retain moisture which would otherwise run off quickly. This aspect of the matter, however, does not arise when considering the legal rights of the parties, and the experts may be left to argue it out between themselves.

Obituary.

GEORGE FLETCHER.—We regret to record the death of Mr. George Fletcher, senior partner of the firm of Messrs. Fletcher Bros., Ottershaw Nurseries, Chertsey, Surrey, on the 14th inst. in his 74th year. The funeral took place on the 19th inst. at Ottershaw Church.

* * * The Editors will be glad to receive, for consideration, large photographs of horticultural subjects, suitable for reproduction in this Journal.

APPLE SUCKERS: W. F. We are not surprised that fresh suckers are more numerous on the stem each year after cutting off those of the previous season. This practice favours the production of adventitious buds at the base of the cut shoots, which give rise to fresh suckers the following season. The development of suckers in such numbers shows that the trees need root-pruning. Take out a trench some little distance from the trunk of each tree, and sever a number of the stouter roots that are growing in a downward direction. This will check the energies of the trees, and prevent the formation of suckers on the stems.

APPLES: Rev. F. T. S. The Apples have fallen owing to the extreme heat of summer; the decaying is subsequent, but no fungous disease is present.

BEGONIA RUST: F. W. C. and Lorraine. The rust is caused by the Begonia mite. It is advisable to dip the plants at intervals of three days in a solution of tobacco water. If the plants are too large to dip, they should be sprayed with the same solution.

BURNING BUSH: J. W. Your friend is referring to *Dictamnus Fraxinella*. The ripe fruits of this plant emit a volatile oil, which vaporises on hot, dry days, and if a match is lighted over the bush, the vapour ignites momentarily. We observed this interesting phenomenon in Mr. Ladham's nursery at Rownhams, near Southampton, on a hot day in August, 1908. See *Gardeners' Chronicle*, October 10, 1908, p. 259.

CARNATION RUST: J. C., Chingford. This is a fungous disease. The first symptom is the appearance on the leaves of pale spots, which, developing later on into blister-like protuberances, finally burst at the apex, and allow the chocolate-coloured spores to disperse. The best way to combat an attack is rigorously to pinch off and destroy every leaf on which the first sign of disease is perceptible. This may have the result at first of making the plant appear disfigured; but, if persisted in, and the leaves thus removed are destroyed by burning—as well as all those plants which are so debilitated by the process as to be incapable of making good specimens—the disease will eventually be overcome. You will still, however, have to be careful that the pest is not re-introduced by fresh stock plants procured from various sources; and you will find it necessary to keep your plants in such a condition that they will be best able to resist an attack. They can best be preserved in a healthy condition by being grown as sturdily as possible, and having the leaves firm in texture, with tough, fungus-resisting skins. It will be found very much easier to keep the plants clean if they are kept always indoors. During the winter months the roots should be kept rather dry, and the foliage perfectly dry. Spraying with potassium sulphide is recommended as a preventive of this disease, but it must not be relied upon, and the removal of affected leaves neglected.

CATERPILLARS ON CABBAGES: W. R. B. The most satisfactory method of destroying caterpillars on Cabbages is by handpicking. It is not practical to employ any of the very poisonous insecticides, but you might try the effects of quassia extract, rinsing the Cabbages well before they are eaten. We do not

undertake to reply by post to correspondents' queries.

CELERY DISEASED: *W. P. and G. L. S.* The Celery plants are affected with a fungus disease, *Cercospora Apii*. Burn the diseased leaves, and do not plant Celery on the same ground for some years.

CULTURE OF CRASSULA: *E. W. S.* You should insert cuttings as early in the year as possible, and pot them up singly or in threes into 2½-inch pots as soon as they have made roots. When they begin to grow pinch out the leads and place the plants in an unheated frame or well-ventilated greenhouse, where they will be exposed to full sunshine. Pot them on as required and continue to pinch the points out during the whole of the first season of growth, the aim being to get a good foundation of growth in the first season for flowering in the following year. The majority of the plants should be in 5-inch and, if strong, in 6-inch pots by the end of September, these sizes being sufficiently large for flowering plants of from 18 to 20 months old. During the winter months keep them in a house or frame well up to the glass, and merely keep the atmosphere above the freezing point. On no account should they be coddled with heat at this stage, otherwise they will fail to flower, and they may even make sappy new growths. Keep them partially on the dry side during the whole of the winter months, but not dry enough to cause the leaves to fall or even shrivel. The endeavour should be to induce the plants to rest completely, as this will insure a good crop of flowers in the following spring and early summer. About the end of March, growth recommences, and as soon as the flower-heads show, the plants should be fed liberally with manure water until the flowers begin to open, but not longer. The three best *Crassulas* for your purpose are the South African *C. jasmnoides*, with white flowers; *C. coccinea*, with bright scarlet flowers, and the hybrid between these two species, known as *C. Mrs. Pfitzer*, with pink flowers. All three plants have fragrant flowers.

DESTROYING LARGE ROOTS OF PINUS: *J. F. X.* The simplest plan is to destroy the roots with dynamite. If the wood is exceptionally dry, you might try burning them when saturated with saltpetre. To do this successfully you will need to bore holes in the softest parts of the wood, and fill them with a concentrated solution of saltpetre, replenishing the liquid as fast as it soaks into the tissue. When the wood is thoroughly saturated set it on fire.

HYMENOCALLIS: *H. D. L.* Most of the species of *Hymenocallis* (known in gardens as *Pancratium*) require a warm house during their period of growth and until the flowering season is past; but after that stage they should be kept in a cooler but not cold temperature, and, whilst the supply of water at the roots should be decreased, they must not be what is called "dried off." Fibrous, yellow loam, with a sprinkling of peat and a little dried cow manure added, is the best compost for these and for similar strong-growing, bulbous plants. When once they are in pots of convenient size, they are best left undisturbed for several years, but during the growing season, and whilst the flower-spikes are in course of development, waterings twice a week with weak liquid manure is beneficial, as the manure water supplies sufficient nourishment to compensate for the small amount of soil in which they are growing. *Hymenocallis* are liable to the attack of thrips, and the leaves should be sponged occasionally with a weak insecticide. During the flowering period, the plants may be removed to a drier house, in order to prolong the bloom, or they may be used for decorative purposes in the dwelling house. The plants are propagated from seeds and off-sets. Seeds should be sown on the surface of the soil in a seed-pot and barely covered with fine soil. Seedlings should be grown on without observing a resting season until they flower. Off-sets from the bulbs should be potted on for the purpose of increasing the stock. Their removal is necessary to the vigour of the old flowering bulbs in order that these latter may acquire all the strength possible.

LOGANBERRY DISEASED: *G. H. O., Cumberland.* Botrytis is the cause of the injury to your Loganberries; this has probably passed on to the fruits from decaying vegetable matter lying about.

NAMES OF FRUITS: *C. W. T.* 1, Ribston Pippin; 2, Warner's King; 3, not recognised; 4, Duke of Devonshire; 5, Bachelor's Glory; 6, decayed, resembles Peasgood's Nonesuch.—*C. H.* Mère de Ménage.—*F. L.* Small's Admirable.—*Rev. F. T. S.* Bramley's Seedling.—*W. D. S.* Trumpington.—*North.* 1, Newton Wonder; 2, Gascoyne's Scarlet Seedling; 3, Bramley's Seedling; 9, Baumann's Red Reinette; 13, Prince Albert.

NAMES OF PLANTS: *E. C.* *Codiaeums*: 1, Lady Zetland; 2, probably *Irregularare*; 3, probably *triumphans*; 4, *Noblesse*. Nos. 2 and 3 are doubtful, as the specimens were in very poor character.—*J. M. M.* *Sedum maximum*.—*William Earley.* *Ricinus communis* "Castor Oil" plant.—*J. A. Seales* *Emilia flammea*.—*C. T. & Co.* Probably *Plantago lanceolata*; probably *Senecio Jacobæus*; specimen very scrappy.—*E. C.* *Hibiscus Trionum*. *E. T. 1.* *Helenium autumnale cupressus*; 2, *Anthemis tinctoria*; 3, *Phygelius capensis*; 4, *Lychnis coronaria*; 5, *Pulicaria dysenterica*.—*J. Edwards.* *Acer dasycarpum*, the Silver Maple of Eastern North America.—*Enquirer.* *Chlorophytum elatum variegatum*, *Nandina domestica*.—*J. C. G.* *Lycium barbarum (chinense)*; it is known as the Tea plant from having been recommended as a substitute for Tea.—*T. E., Harpenden.* *Phytolacca decandra*.—*J. F. X.* 1, *Olearea Haastii*; 2, *Pernettya mucronata*; 3, *Thymus montanus*; 4, *Lobelia siphilitica*; 5, next week; 6, *Skimmia japonica*; 7, *Cornus alba* var. *Spathii*; 8, *C. alba* variety; 9, *Artemisia Abrotanum*; 10, *A. vulgaris*; 11, not found; 12, *Antholyza paniculata*.—*H. H.* 1, *Adiantum tenerum*; 2, *A. formosum*; 3, *Lastrea varia*; 4, *Gymnogramme calomelanos*; 5, *Onychium japonicum*.—*R. T. T.* 1, *Cœlia triptera*; 2, *Bulbophyllum auricomum*; 3, *Odontoglossum gloriosum*; 4, *Brassia maculata*.

ONIONS AT EXHIBITIONS: *Fair Play.* Onions staged in competition at exhibitions should not have the skins removed, as the bulbs are required to be shown whole.

ORANGE TREES: *J. T.* Oranges will succeed in a cool, airy greenhouse in winter, but they are scarcely likely to do well in an ordinary dwelling room. In any case, your seedlings will not fruit successfully unless they are grafted. The best method of grafting is by side grafting. Cut down the trees to the desired height, and select a scion about half the size of the stock. The scion should be securely tied to the stock with worsted, or, if the tree forming the stock is extra large, some untwisted soft string may be used. On no account should bast or raffia be employed. Grafting wax sufficient to cover the top of the stock and scion should be applied to the graft in order to keep out water. Keep the grafted trees in a close place, preferably a pit, and shade them whenever there is sunshine. The temperature of the pit may range from 40° to 50°, but must not be allowed to exceed 50°. After a good callus has formed the trees may be gradually brought to the light and the shading discontinued. The grafts need not be untied until the autumn, unless the tying material is found to be cutting into the bark of the stock.

POTATO TUBERS: *Cestrian.* There is no disease present in your Potato plant. The young out-growths have been injured by the abnormally hot weather.

R.H.S. EXAMINATION: *Ernest.* The examination of the Royal Horticultural Society is held each year on some date in April. The syllabus is divided into two parts—practical and theoretical. A gardener should be able to give satisfactory answers to any of the questions dealing with practical gardening, as they are set on every-day gardening work and are usually of an elementary nature. The other part of the syllabus requires an insight into the sciences allied to horticulture, including botany, chemistry, and physics. Your best plan would be to join evening classes where

these subjects are taught, or, failing that, you should obtain suitable text books and study them at every opportunity. Advertisements sometimes appear in our advertising columns from persons who conduct classes by post for intending candidates.

ROSE: *R. E. G.* Your specimen appears to be *Rosa lucida*, but it was dry and withered when received.

SALE OF SURPLUS GARDEN PRODUCE: *V.* Judging from your letter, there should be some surplus produce of fruit and vegetables available for marketing after supplying your own requirements. The produce should be presented at the respective shops in a clean, fresh, and sound condition. The fruits should be graded, placing the large, even-sized fruits free from blemish in baskets by themselves, and so on with the second and third-rate quality fruits. The amount realised by the sale of the surplus produce should contribute largely to the upkeep of the gardens. Vegetables which are most in demand in shops should be considered when sowing and planting the crops, and a plentiful and regular succession of these should be aimed at in and out of season. Always endeavour to have a good supply of such vegetables as Peas, French Beans, Scarlet Runners, Cauliflowers, Lettuces and Spinach ready for marketing when there ceases to be a glut of these vegetables in the market during the months of July, August and September. Curled Parsley is always profitable to grow, as also is Mint during the early spring months. The growing and marketing of surplus produce will necessarily increase the work of the gardener and necessitate the exercise of extra forethought on his part beyond that ordinarily incurred in the performance of his regular duties, and this should be considered. It is impossible for us to estimate what sum you should realise by the sale of the surplus produce, as much will depend upon local and other circumstances, of which we have no knowledge.

SHOT HOLE FUNGUS: *J. L.* The most certain remedy known for this fungus is "self boiled lime-sulphur mixture"; it will be well to collect all the fallen leaves and burn them.

SOIL FOR EXAMINATION: *H. T. S.* The soil is apparently a poor sample of very light texture. Organic manures, and especially cow and pig dung, would be valuable, also any vegetable refuse and leaf mould to supply humus. If you do as you suggest, and apply a heavy dressing of manure, *Chrysanthemums* should grow fairly well in it.

TENANT'S FIXTURE: *Subscriber.* Your best plan will be to try and come to terms with the tenant. It might be advantageous to buy the factory and allow him to continue to rent it for as long as the arrangement proves satisfactory. If you could dispose of your surplus fruit to him for jam making, it would be an advantage, and then, when he retired, you might be in a position to carry on the factory. If you contemplate a local trade, it might prove a disadvantage to dispossess the tenant of his business, as it might prejudice you with those whom you wish to serve.

VINE LEAVES DISEASED: *Prof. Treuberg, Russia.* The leaves are affected with the "Grape Mildew." A certain remedy is to spray the vine with Bordeaux mixture made at half the normal strength, commencing the spraying early in the season before the mildew appears on the leaves.

WEED ON A LAWN: *C. J.* From your description, we suspect the plant is *Prunella vulgaris* (Self Heal). Prepare some fine soil, mix with it some nitrogenous manure, such as nitrate of soda or sulphate of ammonia, and apply it as a top-dressing. This will cause the grass to grow freely, and in time crowd out the weeds. Repeat the top-dressing in the spring.

MARKET-GARDENING IN SOUTH-EAST SCOTLAND.

THE district extending eastwards from Edinburgh for about 30 miles on the fringe of the south shore of the Firth of Forth includes some of the richest and most highly-rented agricultural land in the world. But beside farm produce, vegetables are cultivated extensively for market, and some of the closest-cropped gardens in Great Britain are to be found there. The high quality of the vegetables grown on this land is well known; a striking feature, too, is the clean cultivation of the ground, for in many places, one may search in vain for a weed of any description. Many of these market gardens have belonged to the same family for generations, the present occupiers being nearly all bred from a race of gardeners reared on the soil and trained to the business in a hard school. They are energetic workers, and by dint of industry and skill win the last pennyworth that the soil can yield. The extent of the market gardens varies from 15 to 25 acres. The produce is sold mainly in the Edinburgh and Glasgow markets. Many of the older-established gardeners grow their own excellent strains of vegetables, the result of careful selection over many years. The strains of early Cabbage, Leeks, Beetroot, Drumhead Savoys, Brussels Sprouts, and, in some cases, early Milan Turnips, are second to none in commerce. Till recently the seeds of these various stocks were harvested in the gardens, but it has become a common practice to send selected plants

to remote districts, in order to preserve the true strains. Several of the more progressive growers send their plants to England, where the seed is ripened, and the results justify the extra expense.

The procedure adopted in one garden of 22 acres, which is a model in every respect, may be taken as a general example of the manner in which these places are worked. The rent in the district varies from £6 to £10 per acre; in this particular instance it is £9. Two horses are kept, with a man to attend to each, while there are four other men and two women employed regularly. During summer an additional 15 or 16 women are engaged, the work including weeding, raising early Potatoes and bunching vegetables. Suitable labour is readily obtainable in the district, and is drawn largely from the fishing and mining classes in the immediate locality. Women are paid at the rate of from 1s. 6d. to 2s. per day, while the men receive as a rule 21s. per week with house; the hours worked are from 6 a.m. to 6 p.m., with the usual breaks for meal-time. Twice weekly, at least, and during summer, oftener, the employer and his van-men leave home about 2.30 a.m. for Edinburgh with produce, which is sold in the Waverley Market. Great attention is paid to manuring the ground, which is dressed heavily with dung. Artificial manures, with the exception of a little nitrate of soda occasionally for forcing purposes, are employed but rarely. Assuming that Potatoes are planted, generally about the third week in March, the land receives for this crop farmyard manure at the rate of 45 tons per acre. Only early sorts are grown, as maincrop varieties do not pay. The Potatoes are raised in the first week of August, and the ground receives another dressing of 55 to 60 tons per acre of the same manure. Early in September it is planted with Spring Cabbages, this crop being cut and marketed by the middle of the following June, when the ground is again available. The only manure then applied is a dressing of soot at the rate of 30 cwt. per acre. Leeks are planted at the end of June or early in July. There is no fixed rotation of cropping, which varies with the district and the methods employed by the cultivators. After Leeks, Celery is sometimes planted, the ground receiving a heavy dressing of manure for this vegetable; in some cases as much as 160 tons per acre. It is the general practice to plant early Potatoes or Lettuces on the ridges thrown up from the Celery trenches, these being harvested before the Celery requires earthing up. After Celery, Beet is found to be the best crop, and for it no manure is applied. Culinary Peas are grown largely, planted in ground which was manured for a previous crop. In one garden, early Turnips have been cultivated on the same piece of ground for 16 years in succession, and are usually the first in the local market. This is done on a southern slope, the previous crop always being Leeks, the land receiving 50 tons of manure per acre for the Turnips. Every year this crop is marketed in the first week of June, Peas

coming in usually about the third week of May. White Lisbon Onions are largely cultivated, this crop being interplanted in spring with either Brussels Sprouts or Cabbages. As the land is usually too rich for raising plants from seed, a portion of ground is specially reserved for the purpose, frames being utilised for Lettuce and Celery. Most of the gardens include long stretches of frames, and often a greenhouse, which, when not occupied with young plants, is used for growing a crop of Tomatoes or for forcing Mint. The Leeks are generally a selection from the old Musselburgh, and there are many fine stocks in the district. The seeds are ripened along the foot of walls or hedges, but some growers, as already stated, send plants to the south for seed purposes. Brussels Sprouts are developed from the Dalkeith stock, and many growers have some very good selections that are not to be excelled anywhere, and this also applies to Cabbages. These stocks are zealously guarded by the owners and carefully retained by them, having been in the families for many years. Home-saved Beetroot is preferred, Northumberland Red, Edinburgh Market, and Cheltenham Greenleaf being the favourite varieties. In Potatoes, Mid-Lothian Early is now the general variety cultivated, these keen growers having long ago recognised that it is the best for their purpose, giving a good crop always and tubers of fine quality. Epicure is still grown, but not so largely as it was a few years ago. Dalmeny Early proved almost useless. The old British Queen is still grown for a second early crop. The Drumhead Savoys are all home-saved, and are carefully grown and selected year after year. Many are grown to an enormous size, weight being a consideration in the market. Rhubarb is largely forced in houses, and these, when not occupied by Rhubarb, are used for a crop of Mushrooms. The Rhubarb is carefully planted out after being forced, the varieties being usually Early Albert, Victoria, and Tobolsk. Daws's Champion is becoming more common, several growers already having a good stock of this variety. Heavy crops are the rule in these gardens. One grower secured over 50 tons of Leeks per acre, and 16 to 18 tons of early Potatoes is a common crop. Manure is a heavy item in the expenditure. It varies from 2s. 6d. to 4s. 6d. per ton, according to the district. The market growers stack it and keep it in the best possible condition, so that it loses little or none of its fertilising properties.

Expenditure may be reckoned at from £15 to £30 per acre for labour and manure, the returns varying from £60 to £180 per acre. The land is given occasionally a dressing of lime, so that it is always in the best possible condition for plants. Competition from Continental-grown vegetables is now severe, but the home-grown produce is of much superior quality. The marketing arrangements are by no means satisfactory, and it is noteworthy that steps are being taken to introduce co-operative selling. George M. Taylor, Mid-Lothian.

NEW OR NOTEWORTHY PLANTS.

FICUS PANDURATA = LYRATA.

At the Ghent Quinquennial Exhibition held in April, 1903, Messrs. F. Sander & Sons, St. Albans, showed a group of new plants, which included a *Ficus* with large, handsome foliage and named *F. pandurata* (see figs. 107 and

108), and persistent. The base is distinctly cordate, with rounded auricles, and the petiole is about an inch long. Another character which distinguishes this species is the large, dark brown, persistent, bract-like, boat-shaped stipules, which are about 2 inches long, and set so as to hide the stem. The plant is easily propagated by means of stem cuttings, and it enjoys plenty of heat and moisture at all times. Among large-leaved *Ficuses*, this is certainly one of the best yet introduced.

ful comparison proved its identity with Messrs. Sander's plant. This species was named and described by Dr. Warburg, of Berlin, in Engler's *Botanisches Jahrbuch*, vol. 20 (1894), where we are told that the species grows to a height of 40 feet, and it was found by Preuss near Elephant Lake, Cameroons. It is probable, therefore, that the plant was introduced into cultivation by the Germans, but on this point perhaps Messrs. Sander can enlighten us. The change of name in this case is not fortunate, as the leaves of this *Ficus* are certainly not lyre-shaped, but fiddle-shaped. Still, this makes no difference, and we must conform with the rule which gives preference to the oldest name, unless that name happens to be wrong. A good popular name for the plant would be that of the "fiddle Fig." W. W.

FIG. 107.—FICUS LYRATA (PANDURATA).

108). This plant has since become popular, particularly in the United States, on account of its decorative qualities and its good nature under cultivation. It usually forms a simple, sturdy, upright stem, which is clothed from the base to the apex with foliage, even when the stem is 12 feet high. The name *pandurata*—fiddle-like—gives a very good idea of the shape of the leaves (see fig. 108), which are broadest in the upper half, their length varying from 8 to 18 inches, and their width about one-third less. They are leathery in texture, dark green, quite gla-

A few days ago, when looking through the fine series of figures of *Ficuses* in Vol. 1 of the *Annals of the Botanic Gardens, Calcutta*, I came across a figure of one called *F. pandurata*, which is quite different from the plant thus named by Messrs. Sander. It was described by Dr. Hance as a low, diffuse bush, with membranous panduriform leaves, and is a native of South China. The habitat of Messrs. Sander's plant was not known. Search through the specimens in the Kew Herbarium, however, resulted in the discovery of a type specimen of *F. lyrata*, and care-

THE ROSARY.

CULTURAL HINTS FOR OCTOBER.

OCTOBER is a very busy month in the Rose garden. Wherever the ground is in a suitable condition, and the growth of the plants fairly ripe, planting may be commenced by the end of the month. Care should be taken to ascertain the habit of growth of varieties before planting them, as it is not pleasing to find a vigorous grower outcrowding its neighbour or a dwarf grower placed at the back of a border where it is hidden by other plants. A good effect may be gained by planting beds or groups of two varieties only, arranging the dwarf-growing sort around the outside. Colours should also be considered in planting. Do not fail to plant firmly, treading the soil about the roots as it is added. The roots should be spread out and, should the soil be very dry, a copious watering afforded after the first layer of soil is added. Dwarf Roses need planting about 3 inches above the junction of the scion and stock: stock standards should never be planted deeply. They will need staking at once to secure them from damage by autumn winds. If the plants have young shoots at the points of their growths, it is well to prune them away, otherwise they will tax the energies of the roots, which will have a difficulty in obtaining sufficient moisture after they are transplanted. Should the plants arrive from the nursery in a dry and partially shrivelled condition, immerse them in water for a day previous to planting; if the weather is frosty, bury them in soil without unpacking them, until the weather is favourable. October is the best month for procuring Briars for use as stocks for standards. It is essential that the roots are not harmed by frost, and if the planting is done whilst the ground is warm, new roots will have a much better chance of forming.

October is by far the best month in which to propagate from cuttings stocks of the Manetti, De la Grifferae, and those known as the cutting Briar stocks, for grafting dwarf plants. Seedling Briars may be purchased cheaply, and it does not pay the amateur to raise them. The cuttings should be made in much the same way as ordinary Rose cuttings, but they should be longer, and it is imperative to remove carefully all but the two or three top buds, for if their removal is neglected there will be serious trouble with suckers later on. I much prefer cuttings obtained from seedling Briars to those taken from shoulders of standard stocks. Those from the seedling stocks are smaller, and the removal of the surplus buds takes longer, but they root better, and furnish stocks with less pith than those from the standards. While upon the subject of stocks, I may mention that only the hedge Briars intended for standards need planting now. Standard stocks may be planted deeper the first year than is advisable when they are transplanted. Let the soil about the roots be made quite firm, and plant at 9 inches apart in the row, allowing 3½ feet apart between the rows. There will be a difficulty in working them during the summer if they are crowded. Not

enough attention is paid to the trimming of standard Briars. Cut off all clumsy and nobby roots, as these will only decay, or, if they live, produce a large number of suckers. The roots of the Briar may be trimmed much shorter than is done by many, and Briars may be transplanted better if the roots have been well pruned.

ROSES UNDER GLASS.

Pot Roses should be housed, or protected by other means, from rains and frost. They may be

very ripe, do not commence forcing the plants until next month. If the plants are fairly well ripened, continue to lift and pot Roses, keeping them as cool as possible, and do not allow the wood to shrivel in the least. A batch of these plants should be very useful for late forcing, and will blossom just in advance of those outside.

Stocks intended for grafting next month should be potted up at once, plunging them deep enough to cover that portion of the stem on which the graft will be inserted. I will deal with the

THE KAISERIN AUGUSTA VICTORIA GROUP.

KAISERIN AUGUSTA VICTORIA, brought out by Lambert in 1891, is well known as a beautiful lemon-white Rose, and holds a good place in the list of exhibition Roses. Where it does well it is a useful Rose, generally well shaped, and of fair substance, so that it may be relied on to stand well in the exhibition box or specimen vase. It does not, however, succeed in all gardens, nor is it very free in flowering. Possibly it is better in the south than in the colder north, for I think it is not always a success on the cold clays of the Midlands, and in my own garden, some 15 miles north of London, I have seldom kept it long. It has, it is true, produced a climbing sport, which is vigorous enough, but with me it has proved a rather unsatisfactory Rose on account of its persistent refusal to flower anywhere except at the very top.

We have now several Roses of a rather similar type, which are worth consideration. In 1901, Messrs. A. Dickson & Sons sent out the Duchess of Portland, a pale, lemon-coloured Rose, with a somewhat deeper colour in the centre, sometimes with a tinge of pink. This is often a beautiful Rose, and the colouring very delicate, but the plant is only of moderate growth, which means that it is not a very good doer, and the texture of the petals is not very firm, while the Rose does not stand so well when cut as does Kaiserin Augusta Victoria. The Duchess of Portland obtained a Gold Medal in its day, but is already excluded from the N.R.S. catalogue.

The next year, 1902, Schneider obtained Perle von Godesberg as a sport from Kaiserin Augusta Victoria. This Rose is of a slightly deeper colour than its parent, and has proved with me to be a more satisfactory Rose in the garden. It is described as moderately vigorous, but does not seem to be a very long-lived plant, and requires renewal from time to time. Its flowers, however, are produced more freely than those of its parent, and they are firm and of good substance, lasting fairly well when cut in the house or staged in the exhibition box.

In 1904, Messrs. A. Dickson & Sons produced Mrs. David McKee. This is proving a better garden plant than any of the Roses named. The foliage is good, and the plant fairly hardy and floriferous. The flowers are a creamy-white, often slightly deeper coloured in the centre, and the petals are large, shapely, and fairly full. It seemed likely to make a good exhibition Rose, but in this respect I have found it somewhat disappointing, as it is apt to collapse unexpectedly. Perhaps it is one of those Roses which do not like the atmosphere of a hot tent. I am inclined to think that it is on its merits as a garden Rose that Mrs. David McKee will have to rely to secure popular favour.

This year (1911), Messrs. A. Dickson & Sons have given us another Rose of a similar type in Mabel Drew. It is too early to speak of its value in the garden, but it may be described as a fuller Mrs. David McKee, and, so far as one may judge of it from the appearance of maiden plants, Mabel Drew seems to be a satisfactory Rose. The test is not a strong one, and we shall have to wait for a few years until we have grown and tested it in our own gardens before its merits or demerits will appear; but the new-comer seems promising, and belongs to a beautiful group, of which many rosarians would like to find a member alike useful in the garden and for cutting. As such, it is well worth a trial; but we shall have many questions to ask of it before we admit it to the position of a popular favourite. Will it open well in a dull season? Will it ball in a wet one? And will it, in all seasons, flower freely and retain its form whether grown as an exhibition Rose or for garden decoration? Two or three more summers should answer these questions, and we will hope that the verdict may be favourable, for the Rose comes of a good type. *White Rose.*

FIG. 108.—LEAF OF FICUS LYRATA.

allowed full exposure when the weather is favourable, but unless they can be protected quickly when necessary, the wood is often spoilt for forcing purposes. Pits, frames, and cool-houses may be used for the dwarfier plants, but weeping standards in pots will require more head-room. The wood needs to be thoroughly ripened, but it must not be frosted. Unless the wood is

methods of grafting in my next notes, meanwhile the new roots will be forming, and it is desirable to have the stock a little more forward than the scion. Stocks that were potted a few weeks earlier are quite equal to those established during the summer, as the roots start to grow quickly when placed in fresh soil and plunged in a pit or cool frame. *Practice.*

NOTICES OF BOOKS.

THE CAMELLIA.*

SOME years have elapsed since M. Le Texnier began to write his excellent series of little books on the history of some of the most popular florists' flowers, including the Chrysanthemum, Dahlia, Carnation, Hyacinth, Tulip, Begonia, Canna, Fuchsia, and Cyclamen. All the books are more or less uniformly interesting and instructive, and, what is perhaps more important than all, the result of the author's personal research.

Among English horticultural writers we have no one exactly like Le Texnier, for besides giving us this useful series of floral histories, in which there is much matter new to English readers, he has also written in identical style biographies of some of the great gardeners and amateurs.

The historical and literary aspects often hold a far less important place in gardening books than they deserve. When a competent grower of a particular flower compiles a treatise on its care and culture he begins his work by adding a few pages on the subject of history, which part of the book is frequently the least satisfactory, and might, in many cases, be omitted altogether.

M. Le Texnier has not only the patience necessary for such work, but all the material at hand for gleanings from authoritative sources. He possesses also the ability of sifting and arranging his matter, beside the literary skill to place the result in an acceptable form before his readers. No student of floricultural history and literature should be without the complete series known as *Essais sur l'Histoire de Quelques Fleurs d'Ornement*.

"Le Camellia" occupies 40 closely-printed pages. The story of the flower is told from the earliest times, beginning with Kaempfer's reference in his *Amaenitates exoticæ* in 1712. The progress of its culture in England, Belgium, France, Holland, and elsewhere in Europe is given in detail, and forms the groundwork upon which a much more elaborate historical account could easily be prepared. The plan of "Le Camellia" is uniform with the other of the series, and those English authors on floricultural matters whose knowledge is often limited to what has happened within their own country would do well to widen it by a perusal of some of these concise little works, which should find a permanent place on the shelves of their reference library. C.

ORCHIDS FOR AMATEURS.†

THE object of this new work on Orchids is to show the amateur gardener that these plants do not all require a special house for their culture, but that many may be grown successfully in houses where ordinary greenhouse plants are cultivated. The author's experiences are those of an amateur who grows Orchids on a small scale, and he has taken considerable pains to convey his ideas in simple language. The book is divided into three parts. The first section deals with Orchids suitable for cultivating in cool houses, some 60 species being enumerated with remarks as to their treatment, housing and other requirements.

The second part treats of Orchids suitable for growing in a warm house. About 50 species are dealt with, and short chapters on potting, watering and other cultural details are given.

The remaining part gives the author's idea of the treatment of imported Orchids, propagation, insect pests, fungous diseases and other matters relating to Orchids. The remarks certainly justify the title, for it may be taken as one of the merits of the book that the amateur is in evidence from the first page to the last. There are some recommendations in the book which

might give new ideas even to expert Orchid growers. For example, under the heading "Feeding" we find, "To prevent *Oncidium*s from deteriorating, feeding, supplemented by annual repanning, is of absolute necessity. Guano should be given three times a week during the growing season, and when in flower. Add a teaspoonful of the dry guano also to the compost of *Oncidium macranthum* and *Marshallianum*. If few, and repanned annually, this deterioration will be effectually checked." This, and some other remarks are difficult to understand, but the author has evidently derived a considerable amount of pleasure from his own small collection of Orchids, and has carefully noted the methods which have produced the best results. There are 20 illustrations of popular Orchids, and the book is well printed and furnished with a good index.

It is a pity that the title is the same as that of the little work issued some time ago by Messrs. Mansell & Hatcher, the well-known Orchid firm of Rawdon, Leeds.

BRITISH ASSOCIATION.

(Concluded from p. 227.)

PART PLAYED BY ENZYMES IN THE ECONOMY OF PLANTS AND ANIMALS.

MUCH labour has been expended during the last few years in the endeavour to become better acquainted with the nature of the bodies known as enzymes, and to realise more completely the exact part they play in the economy of plants and animals. The importance of a greater knowledge of these bodies, if we are to understand more fully the nature of life and life-processes, has been recognised for some time.

Dr. E. F. Armstrong's paper, which was read at a joint meeting of the Chemical and Agricultural sections of the British Association, was to a large extent a résumé of the interesting investigations carried out by his father and himself.

There seems no doubt that the products formed during the action of an enzyme accumulate and combine with that agent, bringing about a stoppage of the re-action and preventing the changes from going too far.

An enzyme does not usually occur in an active state, but requires the presence of another substance to set it free. Thus Starling found that there was a substance "secretin" which was not destroyed on boiling (and was, therefore, not itself an enzyme), the presence of which was necessary for the liberation of enzymes in the bodies of animals. Also, the material to be acted on is not always readily accessible to the enzyme, e.g., in plants the glucosides and the enzymes which decompose them are stored usually in different cells. To secretin, and some other substances like it, Starling gave the name "hormone," and Dr. Armstrong has thought fit to extend the use of this term to include other exciting substances, in many ways allied to secretin, such as chloroform, toluene, &c.

Thus a leaf of *Aucuba* placed in toluene water very soon blackens, the toluene serving as a hormone and liberating the enzyme, which acts on the glucoside in the leaf to produce as a result a black substance. A Laurel leaf treated in the same way does not blacken, but hydrocyanic acid is evolved, the particular change in any case depending, of course, on the nature of the glucoside present in the leaf.

In plants, a large number of glucosides occur, but in such small quantities that their isolation is very difficult except in seeds, &c. Miss Wheldale has obtained evidence that the production of some plant-pigments is due to the interaction of these glucosides and enzymes. Possibly the production of perfumes is due to a similar cause, the special period at which the perfume is liberated may possibly be determined by that at which a hormone is produced. Most of the substances tacked on to the sugar in the

glucosides can act as hormones: so that on the hydrolysis of these glucosides these hormones are liberated and further degenerative changes occur. Ammonia and carbon-dioxide also act as hormones. In this connection, Dr. Russell's experiments on the stimulation of root growth in partly sterilised soils may be mentioned. Briefly, the partial sterilisation results in a differential destruction of the soil organisms, the net result of which is that ammonia is liberated in the soil.

The high stimulative effect of ammonium sulphate when used as a manure may receive some explanation on these lines. It is quite possible that each glucoside has its own particular enzyme, but until the isolation of glucoside and enzyme can be effected with more precision than at present this cannot be decided. It is at least certain that a plant has in, say, its leaves, enzymes capable of acting for the most part only on the glucosides in those leaves. The enzymes occurring in the seeds, however, are much more catholic in action.

It is possible that the total number of enzymes present in the seed may in some way become segregated in the various members of the mature plant. Whether this is the case, or whether the enzymes in seed and leaf are totally different in character, remains for future work to show.

A point of considerable interest is the variation of glucoside with conditions. Thus, last year *Lotus corniculatus* was found to contain no hydrocyanic acid except in some few plants all growing under rather arid conditions. This summer, on the contrary, practically all plants examined from different parts of England contained hydrocyanic acid; some plants from Scotland, however, contained none. This shows that we are not dealing here with two varieties of *Lotus*, but that the chemical nature of the plant is altered by different external conditions.

The case of some of the *Vicias* again is worth noting. Through the whole of their growing period they show no trace of hydrocyanic acid except just before the pods begin to ripen and turn black.

DUNE VEGETATION.

At a meeting of the Botanical Section, Prof. Cowles, of Chicago, gave an account of the vegetation of the moving dunes which border the eastern shores of Lake Michigan.

In some places these dunes present a front of moving sand 40 metres to 60 metres high, advancing steadily and submerging the forests and cultivated lands in their line of advance.

The rate of movement has been measured over a number of years by Prof. Cowles and his students, by "blazing" the trees which stand in the path of advance, and the interesting photographs were shown recording striking changes in the topography of the country which had occurred during the last 15 years.

The ecology of the dune vegetation is peculiar. Certain species, e.g., *Tilia americana* show amazing vitality, and respond to the gradual submergence in sand by sending out adventitious roots from the upper branches. One such specimen, 40 metres high, submerged to a height of 38 metres in sand, was in full flower and leaf when photographed. Other curious results occur, for example, the American vine, *Vitis vulpina*, growing as a climber, is often left marooned at the apex of the hillock of sand under which the trees originally supporting it are buried.

Another interesting feature is the distinct succession of floras which establish themselves as the dunes become more stable. The first species to become established are various sand-breeding grasses, such as *Psamma arenaria*, also trees like *Populus deltoides*, the latter showing remarkable vitality, and being the first arboreal species to become established as well as the last to disappear when overwhelmed by sand. Next occurs a zone of shrubs, characterised by *Prunus pumila*, various species of Willow, accompanied later by *Vitis vulpina*.

* *Essais sur l'Histoire de Quelques Fleurs d'Ornement*. Le Camellia. (Paris: Librairie Horticole.)

† *Orchids for Amateurs*, by C. Alwyn Harrison, edited by T. Sanders, F.L.S. (London: W. H. and L. Collingridge, Aldersgate Street.) Price 2s. 6d.

As the dunes become more stable, various species of *Pinus* become established with *Quercus velutina* and a characteristic undergrowth quite distinct from that of the open dunes. Finally, behind the dunes proper, a dense forest of various mesophytic trees occurs as the last stage in the series, including *Pinus Strobus*, Hemlock Spruce, Beech, *Liriodendron tulipifera*, and *Nyssa sylvatica*.

A point of some interest is the fact that certain mesophytic and marsh plants show the greatest amount of resistance to the onslaught of the extremely xerophytic conditions induced by the sand, and not, as might be expected, the more

structure, but on account of the nature of their protoplasm. Well-known cases are the Lichens, and annual plants on the formation of seeds.

Less known are some of the desert plants of Algeria, for example, a species of *Peganum*. This plant is structurally a hygrophite, with large leaves, thin cuticle, stomata on both sides of the leaves, &c.: nor has it the long tap root of plants like the *Colocynthis*, enabling it to make use of subterranean water supplies. It has, however, one peculiarity in which (as Fitting showed) it differs from most plants, namely, the very high osmotic pressure of its cell sap. In consequence of this, the root hairs of this plant are able to obtain

As a result of many experiments, it was found that the size of the openings of the stomata was proportional to the rate at which water was given off, and it was therefore concluded that the stomata form, if not the sole, at least the chief regulating mechanism of transpiration.

In conclusion, attention was drawn to the difficulty of saying whether, under given conditions, it was best for the plant to have its stomata open or closed. Thus in a hot, dry climate, when one would expect the stomata to close, so as to economise water, they sometimes remain open. In this case, the explanation appears to be that closure of the stomata (and the consequent preventing of evaporation) would result in a fatal overheating of the leaf.

ELECTRICITY AND PLANT LIFE.

THE effect of electricity on certain functions of plant life, a subject which has always appealed to popular fancy, was dealt with in two papers read before the Agricultural section.

The first of these papers was by Mr. J. H. Priestly and Miss E. M. Lee. The experiments consisted in ascertaining the effect of a direct current on the activity of bacteria in decomposing milk. In the case of weak currents the decomposition usually proceeded rather more rapidly where the current was used than in the control where no current was used, though the results obtained do not seem entirely conclusive. Currents higher than about 40 microampères appeared to retard growth, 150 microampères causing complete inhibition.

The second paper dealt with investigations of Messrs. J. H. Priestly and R. C. Knight on the effects of electric discharge on the respiration of Pea seedlings.

The authors claim to have shown that the rate of respiration is (1) decreased when a direct current is used, even when this is very weak, (2) slightly increased when an alternating current is used, (3) very considerably increased when an overhead discharge of high voltage is employed. The authors' numbers, however, do not in every case support this interpretation very convincingly. In experiments of this kind it is well to remember that, besides acting directly on the plants used, the current may act indirectly by altering the conditions in which the plant is growing.

Field experiments were also carried out, and an increase in crop, though not always very marked, was generally obtained. When the poles, bearing the electrified wires, were moved to some other part of the field, it was this new area which usually showed the increase in the year following. The evidence of there being an increased yield, and the amount of the increase, do not seem to justify the application of the scheme on a commercial basis at present.

LIGUSTRUM OVALIFOLIUM MULTIFLORUM.

THIS beautiful free-flowering form of the broad-leaved Privet was a happy discovery made by Mr. George Paul in a Continental nursery, where it was planted among *L. ovalifolium* in a hedge. His quick eye noticed its unusual floriferousness, and he carried it off to become the parent of many a handsome free-growing bush, instead of leading a life of constant shearing in a trim hedge. In early July every axillary shoot ends in a spike of pure white flowers, and these are so freely produced that, as the accompanying illustration (see fig. 109) shows, they almost hide the leaves.

In early July it is one of the most beautiful sights in the garden, but, unfortunately, it is endowed with the strong Elder-like scent of the other members of the Privet family, which is not agreeable to most people. I have found it as hardy as the ordinary Privet. A severe winter browns and removes many of its leaves, but has not so far killed back any shoots. *E. A. Bowles, Waltham Cross.*

xerophytic forms, which are, curiously enough, the first to give way as the sand advances.

TRANSPIRATION OF PLANTS.

A SEMI-POPULAR lecture was delivered by Dr. Francis Darwin, F.R.S., entitled "The Balance sheet of a Plant."

The lecturer confined his attention, for the most part, to adaptations in plants against injury from loss of water of a more or less temporary character.

It was pointed out that, besides the temporary xerophyly conferred on some plants (e.g., deciduous trees) by their structure, there are other plants which are able to withstand temporary desiccation, not by reason of any peculiarity of

water from soil particles much more efficiently than is the case where the osmotic pressure is of the normal magnitude.

It was suggested that *Peganum* might be only an extreme case of a general phenomenon, and that there is some evidence that when a plant in a country like our own begins to suffer from loss of water, the osmotic pressure begins to go up, automatically enabling the root hairs of the plant to obtain water from the soil more effectually.

The lecturer also dealt in detail with the experimental work that had recently been occupying himself and Miss Pertz—namely, the disproving of Lloyd's contention that the stomata have no regulatory function on transpiration.

The Week's Work.

PLANTS UNDER GLASS.

By JAMES HUDSON, Gardener to LEOPOLD DE ROTHSCHILD, Esq., Gunnersbury House, Acton, Middlesex.

SEEDS FOR PRESENT SOWING.—A sowing of Sweet Peas made now will furnish plants that will be useful in early spring, either for decoration or for furnishing cut blooms. Those intended for specimens should be grown in 9-inch pots, but those for supplying cut flowers may be grown in boxes. The boxes may be accommodated at the ends of houses next to the roof-glass, where they will receive plenty of light. They will occupy little room, and give a good return without much trouble. In either case, the seeds should be sown in small pots, three seeds being a sufficient number in each pot. They should be germinated in a cold pit or frame until the season of frost approaches, when they should be removed to a warm house. The shoots may be pinched when about 3 inches high, and, if the plants are growing freely, they may be afforded a larger receptacle. Mignonette may also be sown now. Some of the best plants of Mignonette that I ever grew were raised from seed sown at this time of the year. Sow in 4½-inch pots, placing a little fowl dung over the drainage materials and mix mortar rubble with the loam instead of silver sand. Make the soil very firm, and use it preferably when on the dry side, but water it before the seeds are sown. Place the pots in a cold frame until the seeds have germinated, and remove all but four or five of the seedlings from each pot. When the plants have commenced to make a good growth, remove them to a shelf in the greenhouse as near to the roof-glass as possible, as sunlight is essential to success. The beautiful *Nemophila insignis* is of great service in the early spring as an edging plant in the conservatory. It may be placed around groups of other plants, producing a pretty effect with its drooping shoots covered with blue flowers. A batch of White Primulas, edged with this delightful annual, is very effective. The seed should be sown now, and the plants treated as advised for Mignonette.

ASCLEPIAS CURASSAVICA may also be raised from seeds sown at the present time. They should be germinated in a moderate heat and afforded a good treatment to provide strong specimens for flowering next season. For the present, they may be allowed a moderately cool treatment, and when the winter arrives they should be grown on steadily.

HIPPEASTRUM.—Seeds of *Hippeastrum*, which is better known to many gardeners as *Amaryllis*, should be sown at once if this has not already been done. This plant is much better raised at this time of the year than in the spring. The seeds need to be sown with extra care, as each one must be inserted on its edge. A budding knife may be used to make holes in which the seeds are inserted. Sow in square seed-pans filled with loam and leaf-mould mixed with silver sand. Raise the plants in a stove temperature, and see that they do not receive a check at any time. Place the pans in a position close to the roof-glass, so that the leaves do not become unduly elongated.

CYCLAMEN LATIFOLIUM (PERSICUM).—Late September or early October is soon enough for sowing seed of the florists' *Cyclamen*, for if the sowing is made much earlier the greater portion of the early growth is formed during dark days, and the result is that the plants are handicapped. The colours should be kept distinct, which is an easy matter if seeds are procured from a reliable firm. Use a soil similar to that advised for *Hippeastrum*. Scatter the seed thinly over the surface and press it firmly into the soil, then apply a thin layer of a sandy mixture. Place the seedlings upon a shelf in a temperature suitable for promoting healthy growth.

CORDYLINE INDIVISA AND C. AUSTRALIS.—Both these plants will probably have ripened a considerable quantity of seed this summer, which should be sown as soon as it is ripe, so as to lose no time in raising the plants. Treat the seedlings as advised for *Cyclamen*.

THE HARDY FRUIT GARDEN.

By W. HEDLEY WARREN, Aston Clinton Gardens, Buckinghamshire.

PRUNING.—The pruning of fruit trees may be undertaken at any time from autumn to spring, provided the work is done during mild weather. As soon as the leaves commence to fall, and sometimes earlier, if the wood is well ripened, a start may be made with the pruning of Apple and Pear trees. The pruning of the trees early assists the fruit-buds to become plump, well ripened, and in every way stronger than if the pruning is deferred until the spring. Although it is advantageous to prune trees early, yet, if the wood is still green, and the buds in an immature condition, the operation is better deferred until the spring, but not until the sap has commenced to rise. When the wood is unripened, the sap is in a more or less active condition, and will continue so until the winter sets in. By pruning unripened shoots in the autumn, the remaining buds would, in all probability, be more or less injured and the tree weakened. Unripened shoots and immature buds are always liable to injury from frost, and if the pruning is postponed until spring, damaged shoots may be cut back to sound wood. For the same reason, many growers defer the pruning of Fig and Mulberry trees until the spring, as these trees are especially liable to injury from excessive cold. Others neglect the pruning of Peaches and Nectarines until the trees are bursting into bloom, a practice I do not advocate, as it causes the blossoms nearest the ends of the recently-pruned shoots to drop. Where there is an extensive range of wall trees, early varieties of Apples and Pears should be pruned first, and, later, during mild weather, Peaches, Nectarines, and Apricots on south walls. These may be followed by trees growing on west and east walls, and the last to be pruned are those planted in a north aspect or in the open. In the pruning of fan-trained wall trees, special care should be taken to retain healthy, young wood in the centre of the trees, otherwise, when the trees should be at their best condition, they will be partly destitute of fruit-bearing wood. In the training and pruning of young trees, careful attention is required to form a good foundation to supply suitable wood for future years, for when this is neglected, and the centres of the trees become destitute of wood, it is only with great difficulty that suitable shoots can be made to grow—especially in the case of Peach and Nectarine trees—without pruning back to the main branches of the tree, which means the loss of one or two seasons' fruit. It sometimes happens that gross-growing shoots are formed by the tree; these, if not required for furnishing the wall, should be removed as soon as possible. Occasionally it may be found expedient to remove a large branch altogether, in which case a luxuriant growth will, if shortened to the required distance, supply a number of lateral growths for filling the vacant space. Stone fruits are much more susceptible to injury by the removal of a large limb than are Apples and Pears, and in no case should a bare stump be left in the expectation of lateral growths forming, as these stumps almost always canker and ultimately die.

THE ORCHID HOUSES.

By H. G. ALEXANDER, Orchid Grower to Lt.-Col. Sir G. L. HOLFORD, K.C.V.O., C.I.E., Westonbirt, Gloucestershire.

ONCIDIUM.—The plants belonging to the *O. crispum* section of this genus, namely, *O. Forbesii*, *O. curtum*, *O. Gardneri*, *O. crispum*, *O. Martianum*, and *O. Marshallianum*, are characterised by their rough, wrinkled, pseudo-bulbs, of a bronzy tint, and their leathery leaves. *O. Marshallianum* blooms in late spring and early summer, whilst the others display their gay sprays in late summer and autumn. Amongst the many beautiful and free-blooming species in this favourite genus, few can surpass *O. varicosum*, and certainly none can excel it for autumn flowering. The blooms of all the plants I have mentioned are showy and lasting, and produced freely upon erect, branching spikes; consequently they are first-class exhibition plants. In the case of newly-imported specimens, these should not be allowed to exhaust themselves in supporting flower-spikes the first year they are in cultivation, for the enormous number of blooms sometimes borne upon a single panicle

taxes the plants very severely, and so weakens them that they take a very long time to recover. If the inflorescences are cut away, saving first a flower or two just to prove the variety, the plants should flower beautifully in the next season. Even with established plants, care should be taken that the flower-spikes are not left too long upon them, and, if there are any specimens in a debilitated condition through carrying a large inflorescence last year, the spikes of these should be removed soon after they appear. A mistake often made in the cultivation of these *Oncidiums* is growing them on a low stage, a long way from the light, in deep pots and a large quantity of compost. They are more satisfactory when grown in shallow pans or baskets, suspended close to the roof-glass, and near the ventilators, in a position where the plants are exposed to the light, but not to bright sunshine. In such conditions, the growth will be hard and solid. They need considerable ventilation, especially at this season, when the pseudo-bulbs are filling out, for there are few Orchids which suffer more if kept in a confined atmosphere. A close observation of the roots is the best guide as to the quantity of water these plants need at any season. Plants growing and rooting freely must be watered freely, and it will be found that the roots are generally very active at the time the flower-spikes are forming. All these *Oncidiums* are best wintered in a well-ventilated, cool structure, where they will remain at rest, and the plants should be given just enough water to enable the pseudo-bulbs and leaves to retain a plump and healthy condition.

CATTLEYA CITRINA.—This species is a native of Mexico, where it is found growing at a very high altitude, consequently the plants do not require much heat in cultivation. They must, however, be exposed to the light, and treated to plenty of ventilation. The best method of cultivation is to fasten the plants securely on blocks of wood or Teak-wood rafts, the latter being preferable, as a little peat and moss can be packed in between the bars for the roots to ramify. The plants are now in full growth and rooting freely, therefore they require a liberal but not excessive supply of water. When the pseudo-bulbs are fully made up, and the plants are resting during the winter, they will bear drought without injury, but as soon as the flower-buds appear in the spring a good supply of moisture is again needed.

FRUITS UNDER GLASS.

By E. BECKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Hertfordshire.

PINEAPPLES.—With the approach of autumn, less moisture must be employed in houses where Pines are cultivated, and damping and syringing must be reduced accordingly. The night temperature should be reduced gradually until a minimum of 55° to 60° is reached; a few degrees more or less may be permitted in accordance with the weather conditions. The roots also will need less moisture at this season. Fruiting plants may still be given applications of weak guano water, but not in quantity sufficient to keep the soil in a sodden condition. When the use of much fire-heat becomes imperative, the atmosphere must be moistened, as dry air is harmful. The shading may be removed from the roof-glass, and on bright days a slight damping overhead will prove beneficial, closing the pit early in the afternoon. Admit a little fresh air whenever the weather allows.

EARLY VINERY.—Where it is customary to start vines during the month of November, to provide Grapes early in May, attention must soon be directed towards getting the house, rods and borders in order. Cleanliness is of the greatest importance, therefore the glass and woodwork should be washed thoroughly, and the latter painted. If the houses are not repainted annually, then extra care must be exercised in washing, and any cracks or joints offering a hiding place to mealy bug, painted with paraffin. The pruning of the vines need not be deferred when it is ascertained that the growth is well matured. Prune the laterals to two good buds, and use a pruning knife in preference to secateurs, avoiding long, slanting cuts. Remove any loose bark from the main rods, but avoid paring them severely. By means of a stiff brush, wash the stems well with a warm solution of

insecticide, exercising the greatest care not to damage the buds. If mealy bug is present after washing the rods twice, paint them with the mixture I advised in the Calendar for January 7, p. 7. When the vines have been attended to, tie the rods up out of the way and commence top-dressing the border. Carefully remove any loose soil and litter on the surface, and apply, as a top-dressing, a compost specially mixed or a layer of whole turves, after first sprinkling bone-meal or a patent vine manure over the border. If the soil shows signs of excessive dryness, give a good watering before these materials are applied. Cleanse the exterior of the hot-water pipes, and afterwards paint them with a mixture of lamp-black and oil.

FIGS.—The earliest forced Fig trees that are permanently planted out should be encouraged to ripen up their growth. As the shoots mature, water should be withheld from the borders until the soil becomes dry on the surface. A free circulation of warm air will accelerate the ripening of the growth. The foliage should be syringed so long as it remains, to keep red spider in check. Endeavour to keep the house tidy and remove the fallen leaves to the fire or rubbish heap.

THE FLOWER GARDEN.

By R. P. BROTHERSTON, Gardener to the Earl of Haddington, K.T., Tynninghame, East Lothian.

PROPAGATING.—Cuttings may be taken at any time now of the hardier bedding plants, including *Violas*, *Pansies*, *Veronica Andersonii*, *variegata*, *Anthemis tinctoria*, *Gazania splendens*, *Antirrhinums*, *Calceolarias*, *Chrysanthemums* and *Nepeta Mussinii*. All these plants are most easily dealt with if the cuttings are inserted from 2½ to 3 inches apart in a shallow bed of compost, prepared for them in cold frames. It is advisable to see that the cuttings are kept from flagging, both before and after insertion. Together with the above, cuttings of *Lavender*, *Rosemary*, *Parkinson's Sage*, shrubby *Veronicas*, and many other suffruticose plants may be inserted for increase of stock; they should all be well rooted by next March. Many *Dianthus*es having a cushion-like habit, notably several varieties of Sweet William, *Dianthus plumarius* and *Pink Mrs. Sinkins*, will, if pulled to pieces, be found to root freely. The seeds of annuals intended for early flowering should be sown without delay. The seeds of *Gladioli*, *Sweet Peas*, *Kniphofias*, *Montbretias*, and *Carnations* are ready for gathering, and should be carefully watched, to prevent their falling off the plants and being lost.

SWEET PEAS.—These have been such a failure this season in many gardens that even the great heat and abnormal drought do not seem sufficient to account for their lack of success. I had no water to spare for our plants, but, strangely enough, they reached an average height of 9 feet high, and flowered up to the end of the present month. I feel sure that in many cases the cause of failure is too close planting. It has been my practice for years to allow 2 feet between each plant, and I obtain as many flowers as most people do from four times the number. Very firm soil seems to be essential to success. It is not enough in the case of a light soil to trench in the autumn, and then leave the ground to become firm merely by allowing it to lie exposed to the weather. The soil should be firmly compressed by treading down the separate layers during the operation of trenching. I have found this necessary also in the case of other plants, including *Carnations*. In order to carry out this process successfully, the ground must be in a good condition and sufficiently dry, and those who can proceed now with the preparation of the soil for next year's crop will be wise to do so, and not to defer it until too late. Surface hoeings and mulchings are good in their way, but do not take the place of a proper initial preparation. The question of an efficient water supply for the garden has been brought well to the front this year. I have been informed by gardeners that they have been obliged to resort to all sorts of devices in order to obtain enough water to keep the most important plants alive. One had to employ a locomotive to draw the water from a distance. In some cases it is the flowers that have suffered; in some it is other crops. Nothing can save such flowers as *Phloxes*, *Rudbeckias*, *Chrysanthemums*, *Dahlias*, *Violas*, *Antirrhinums*, *Godetias*, and *Begonias* if the water supply is

insufficient. Mulching is a great help, but alone it is not enough. Another fact which is well known in this connection is that watering to be effective must not be too long delayed. Once the soil is allowed to become dry, it is an extremely difficult matter to re-moisten it; and, for this reason, in a hot, dry year like this it is found very much better to apply a small quantity of water at short intervals—say, two or three times a week—than to give a copious, but infrequent, supply. Another important matter in a dry season is to strengthen the liquid used for watering with manure, either superphosphate of lime, sulphate of ammonia, dried blood, or fish guano. During very dry weather plants are capable of appropriating an almost unlimited quantity of manure, and pure water seems to do but little good—it keeps them alive, but produces very small effects in the way of growth and flowering.

THE KITCHEN GARDEN.

By JOHN DUNN, Kitchen Garden Foreman, Royal Gardens, Windsor.

PARSLEY.—Parsley should not be allowed to become over-grown, or the leaves will lose their colour. If the foliage is cut down now and a good watering afforded the roots, the new growth will be of a much better quality, and the plants will withstand the winter better than if left uncut. If cold frames are available they may be utilised for growing Parsley to afford supplies during the winter; the plants should be pricked off at a distance of 6 inches apart. The lights should not be placed on the frames until the weather becomes unfavourable or the plants will become weakly and drawn. The soil in which they are planted should not be too light in texture, and should be trodden moderately firm before the young plants are put out. Give frequent waterings during the autumn so that the plants may become established before winter arrives.

WINTER SALADS.—Every available cold pit should be filled with Lettuce or other salad plants, so that they may become established before the winter arrives. It is a much better practice to plant winter salads where they will grow without disturbance, than to lift them from the open ground after they have grown to their full size, sometimes after they have been injured by frost. If seeds were sown at the end of August, there should be plenty of strong Lettuce plants suitable for planting in pits. The soil should be raised to within 15 inches of the roof-glass and trodden tightly whilst moderately dry. Allow 9 inches between the plants, as plenty of space is required to stir the soil between the rows with the Dutch hoe. The lights should not be placed on the frames until the very latest, except during heavy rains. A small sowing of Lettuce seed may be made now to furnish plants for early spring supplies. The seedlings should be protected from inclement weather and planted in cold pits as early in the new year as possible.

FRENCH BEANS.—French Beans growing in cold pits should be protected by the lights at night, which should be removed again in the morning. Give a light dusting of artificial manure previous to affording water, and stir the soil between the rows to promote a clean, healthy growth. Plants growing in open borders should have some protection afforded them on cold nights, so that pods may be gathered from them as far into the autumn as possible. Gather the pods whilst they are quite young, whether required for use or not, so that the plants may continue in bearing.

HERBS FOR WINTER USE.—No time should be lost in making provision for the supply of green herbs required throughout the winter. Prepare a gentle hotbed in a slightly heated pit, and cover the bed with a few inches of fine soil. Roots of Mint should be lifted carefully, placed closely together on the bed, and covered with fine, sifted leaf-soil, which should be washed in amongst the roots with clean water, warmed to 70°. In about 10 days the young shoots will appear above the surface of the soil, at which stage plenty of fresh air should be afforded to prevent the growths from becoming drawn. Tarragon may be treated in the same manner, lifting the roots with as much soil adhering to them as possible. Chives may be placed in the same pit, but the plants should

be cut over at least a month before they are required for forcing. Sorrel does not require bottom heat, but a good, heavy soil, and plenty of water to keep the plants growing freely. Marjoram may occupy part of the same pit, but should be allowed plenty of air, or damping may set in. The plants should be grown in pots, and be placed in a night temperature of 45°.

CHEVIL.—The last sowing of Chevill should be made at once, preferably in a cold pit, where air may be given freely to keep the crop from becoming drawn, and to promote a dark green colour in the leaves.

THE FRENCH GARDEN.

By PAUL AQUATIUS.

WINTER CROPS.—French Beans raised from seeds sown in July are now in full bearing. The lights are placed in position, but ventilation is afforded both day and night whilst the weather permits. The main batch of Celery has benefited by the moist condition of the weather, and the plants are growing splendidly. It will be preferable to defer bleaching the leaves for two or three weeks, unless a constant supply is needed. The Celery which has been grown in the old manure beds must be marketed as soon as possible, as the beds should be broken up before wet weather sets in. Carrots raised from seeds sown in July are ready for bunching. This crop has been excellent this year, and a very profitable one where plenty of water has been afforded.

SPRING CROPS.—Spring Cabbages should be planted without delay in well manured ground. The Cabbages raised late in August have proved very useful, as those of the earlier sowings were too strong for planting out. A few Cabbage seeds have been inserted in a frame for procuring plants for cutting in June when there is generally a great scarcity of green vegetables. They will be transplanted in February. Cauliflower seeds that were sown about the middle of September have germinated well, and the seedlings are now through the ground. From this stage, ventilation should be given freely both day and night in order to obtain well-hardened plants. Set frames on the ground and place six or eight barrow loads of well-decayed manure in each frame, so that the plants may be close to the glass. The plants will be pricked out about the middle of October, 750 to 800 per frame, and an ample allowance will be made for losses over and above the number required for the following spring. Another batch of Cauliflower seeds should now be inserted under cloches for procuring plants for placing out-of-doors late in March, as those sown in September are often too strong for the purpose, being only suitable for planting under glass earlier in the month. The sowing of Lettuces for a spring crop will be commenced about October. The Cabbage Lettuce "Little Black Gott" and Cos Lettuce "Paris Grey" are sown first at an interval of two or three days, whilst the varieties *White Passion* and *Paris White* will not be sown before October 15, for they can only be planted out in March. The winter quarters for all the Lettuces must be ready within a few days. The ground should be well dug, raked, and afforded a top dressing of decayed manure that has been passed through the ½ inch screen. The manure should be spread evenly over each bed in depth according to the quantity at command. The cloches are set three rows per bed with 1 inch space between each. Where possible a path, 1 foot in width, should be allowed between each bed.

STRAWBERRIES.—Strawberry plants intended for forcing should be trimmed and placed in frames in a well-sheltered, dry situation. The lights should be placed in position on the frames to protect the plants from rains, but ample ventilation must be afforded both day and night.

MUSHROOMS.—The beds made early in September have been spawned, three rows of spawn having been placed on each ridge. After a few days the mycelium will have spread into the manure when the old spawn should be taken out. A top-dressing formed of two-thirds old mortar and one part good loam passed through a screen should be put on the ridge to the depth of 1 inch and well pressed down. The lights should be kept closed and covered with mats. During damp weather the mats should be removed during the daytime to avoid an excess of moisture in the frames.

APPOINTMENTS FOR OCTOBER.

- TUESDAY, OCTOBER 3—
Scottish Hort. Assoc. meet.
- WEDNESDAY, OCTOBER 4—
National Chrysanthemum Soc. Sh. (2 days).
- SATURDAY, OCTOBER 7—
Soc. Française d'Hort. de Londres meet.
- MONDAY, OCTOBER 9—
United Hort. Benefit & Prov. Soc. Com. meet.
- TUESDAY, OCTOBER 10—
Roy. Hort. Soc. Autumn Fruit Exh. (2 days).
- WEDNESDAY, OCTOBER 11—
Affiliated Mut. Imp. Soc. Ann. Meet. at R.H.S. Hall, at 3 p.m.
- THURSDAY, OCTOBER 12—
Soc. Nationale d'Hort. de France (Paris) Exh.
- WEDNESDAY, OCTOBER 18—
R.H.S. Ireland Winter Sh. (2 days).
- MONDAY, OCTOBER 23—
Nat. Chrys. Soc. Executive Com. meet.
- TUESDAY, OCTOBER 24—
Roy. Hort. Soc. Coms. meet. (Lecture at 3 p.m. by Rev. Prof. Geo. Henslow, on Prof. Hugo de Vries' "Theory of the Origin of Species and Varieties by Mutation.")
- WEDNESDAY, OCTOBER 25—
Croydon Chrys. Sh. (2 days). Irish Gard. Assoc. and Benev. Soc. meet. Hereford Fruit and Chrys. Sh. (2 days).
- FRIDAY, OCTOBER 27—
Maidenhead Chrys. Sh. (2 days).
- TUESDAY, OCTOBER 31—
Brighton Chrys. Sh. (2 days). Haywards Heath Chrys. Sh. (2 days).

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last Fifty Years at Greenwich—53°1'.

ACTUAL TEMPERATURES:—

LONDON.—Wednesday, September 27 (6 p.m.): Max. 69°; Min. 51°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—Thursday, September 28 (10 a.m.): Bar. 29°9'; Temp. 59°; Weather—Overcast.

PROVINCES.—Wednesday, September 27: Max 63° Cambridge; Min. 52° Newcastle.

SALES FOR THE ENSUING WEEK.

- MONDAY, TUESDAY, WEDNESDAY, THURSDAY AND FRIDAY—
Dutch Bulbs, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 10.30.
- MONDAY, WEDNESDAY, AND THURSDAY—
Dutch Bulbs, at Stevens's Auction Rooms, 38, King Street, Covent Garden, at 12.30.
- TUESDAY AND WEDNESDAY—
Thirty-seventh Annual Sale of Nursery Stock at Sunningdale Nurseries, Windlesham, Surrey, by Protheroe & Morris, at 12.30.
- WEDNESDAY—
Ornamental Palms and Plants, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 5.
A small collection of Japanese Dwarf Trees; also a consignment from Belgium of Palms, Bay Trees, Azaleas, &c., at Stevens's Auction Rooms, 38, King Street, Covent Garden, at 2.
- FRIDAY—
Orchids, at Protheroe & Morris's Rooms, at 12.45.

The facts already recorded in our article on this subject in last week's issue demonstrate that the normal and natural phases of development through which such a simple fungus as *Saprolegnia mixta* passes are controlled by definite external conditions. There is no innate necessity for such a plant to pass from a vegetative to a reproductive stage. Provide it with certain external conditions, for example, with a rich and continuous supply of nitrogenous food, and the fungus remains indefinitely in the vegetative phase. Alter these conditions and it passes into the reproductive phase. We have now to consider the results of similar experiments, which, like those already recorded, are due to Professor Klebs, on the influence of definite changes of conditions on the higher plants.

It will be recognised, as already indicated, that the problem is much more difficult of re-solution in the higher than in

the lower plants. Unlike a simple fungus, the body of which consists of a limited number of similar cells, the flowering plant is made up of an enormous number of cells. Moreover, the cells which constitute the body of the flowering plant are by no means all alike, but show, as the result of their specialisation to different kinds of work, extraordinary diversity of shape and size. Thus a root hair cell has the form of a hollow tube, a cell of the surface of a leaf that of a flat plate, and so on. Because of this diversity of function, and also because of differences of position—some being on the surface, others beneath the surface—the several cells of a flowering plant are affected differently by a definite change in external conditions. For yet another reason, which horticulturists in particular will appreciate, the problem of determining the precise effect of a change in external condition on a flowering plant is rendered peculiarly difficult. The tissues and groups of tissues into which the cells of a plant are regimented have definite and limited functions. Some serve the purpose of collecting food material, some that of manufacturing food, others perform the function of reproduction. Just as in a great industrial undertaking—in a shipyard, for example—all sorts of preliminaries have to be attended to before the undertaking can be launched successfully, so is it with the complex organism which we call the flowering plant. Our analogy of a shipyard will help us to a clearer view of this fact. Before a single plate is laid, much preliminary work in the way of assemblage of material has to be carried out. So in the plant, before a flower-bud is formed, the plant has had to carry out the complex work of assembling material of the kind proper for the building up of the flowers. Hence, it follows that the external conditions which determine luxuriant production of flowers are not necessarily those which obtain at the moment when the flowers are about to open; but, on the other hand, are those which operated, it may be months or even the year, before. The gardener reveals a perfectly sound knowledge of this principle when he insists that the amount of fruit borne in any given year is determined by the "ripening of the wood" in the previous year. Neither the gardener nor the botanist knows what precisely is meant by the expression "ripening of the wood," but the gardener, at all events, understands that unless the preliminaries to flower-formation are properly attended to by the plant, the harvest is bound to be poor. He recognises also that external conditions, weather, and particularly sunlight, play a decisive part in these preliminary operations.

Despite the several difficulties in the way of scientific experimental investigation of the problem of the influence of external conditions on the form of flowering plants, Professor Klebs has been able to show that the same general laws hold for both higher and lower plants. His experiments have been conducted on various plants, but chiefly on species of *Sempervivum*. The habit of an ordinary member of this genus is to form a rosette

of leaves. From this rosette, short runners are developed in the spring, and, after a time, a fresh rosette is produced at the apex of each runner. The young rosette takes root, separates from the parent plant, and repeats the formation of offsets next year. A rosette, normally, blooms in its third or fourth year, according to the conditions to which it is subjected. When ripe to flower, the stem of the rosette, which till then has remained short, elongates and bears flowers. The fruits ripen and the plant dies.

So much for the normal course of events—the ordinary life's history of a *Sempervivum*: now for the effects produced by change of external conditions.

Klebs has shown that it is possible to compel a plant of this genus to flower in its third year. To secure this, all that is necessary is to cultivate it during its first year in very rich soil, and to grow it during its second year in small pots in poor soil and to keep it relatively dry.

Not only is it possible to make a *Sempervivum* flower at a given time, but it is also possible to prevent one which is ready to blossom from producing flowers and to compel it, as it were, to turn back again to a vegetative state.

The success with which this can be done is determined by the extent to which the preparations for flowering are already advanced. Thus, a plant ripe to flower, that is, one which under ordinary conditions would blossom in the course of a few weeks, may be prevented from doing so if it is grown in a well-manured bed, for example, in a frame the soil of which is heated by hot-water pipes, the soil well watered, and the frame kept close. In these circumstances, in spite of the advanced state of its preparations for flowering, the plant remains throughout the year in a vegetative state. Similarly, if a plant ripe to flower is cultivated in a hothouse from January to March at a temperature of about 88°, though it grows well enough, it remains sterile of flowers.

If, however, similar methods are adopted a little later—in April—they are without effect. The plant has gone too far to turn back, and it blooms in spite of the untoward conditions. By experiments of this kind it is possible to get deeper insight into the nature of the flower-preparation processes. Thus, if, of a series of *Sempervivums*, plants ripe to flower are put, one each day, in darkness at high temperature, and the plants keep under these conditions till the middle of April, even though they are subsequently exposed to normal conditions in the light, they are found to have lost for the year the power of flowering. Such plants may show that they are, as it were, vexed by contradictory order, and though they do not carry out the order commanding them to flower, they go the first step in this direction. The stem elongates as it does when flowering is about to take place, but instead of flowers the elongated stem bears a terminal rosette of leaves. Similarly, if rosettes ripe to flower are brought into a house glazed with blue glass, the plants, unable to assimilate adequately, become vegetative, though they show their readiness

Photograph by G. Forrest.

PRIMULA BEESIANA.
GROWING WILD ON THE MOUNTAINS OF YUNNAN, CHINA.

to flower by elongating their stems, which may become 10 to 12 inches long.

If red glass is used instead of blue, the balance in favour of flowering is more marked, for in red light assimilation is more active than in blue, though less than in ordinary light. The plants in red light not only elongate their stems, but also branch and bear a few flowers.

Red light produces also a remarkable effect on the buds which normally give rise to rosette-bearing runners. If a bud is exposed to red light, it continues indefinitely to form a runner and fails to develop a rosette. Then, if placed in ordinary light, its rosette-forming propensities, hitherto suppressed, find full play, and rosettes are produced not only at the apex, but on other parts of the runner, a phenomenon which does not occur in nature.

Just as flowering may be suppressed, although lengthening of the stem may go on, so the lengthening of the stem may be prevented without a checking of flowering. This Klebs effects by planting rosettes ripe to flower at the end of April in rich soil and placing them in a strong light. In these conditions flowers are borne on the tip of the rosette.

The extent to which the form of this plant may be moulded by changing the conditions is almost endless. By growing it at low temperatures, branching of the inflorescence is checked, and a single terminal flower is produced. By taking a plant ripe to flower, growing it in blue light, and then replacing it in ordinary light, every leaf axil may be caused to produce a rosette. By similar interference with the normal course of events, Klebs has been able to induce monstrous forms of flowers like those often observed in plants of other genera, but never before seen in *Sempervivum*. Thus when the flower-stalk of a well-fed *Sempervivum Funkii* was cut off, new flower-branches were produced from the base of the stalk attached to the plant, and these branches bore flowers in which the sepals were transformed into petals, and the petals into stamens, and so on. Thus, in some instances, double flowers were produced, the stamens becoming petaloid. Doubles obtained in this way in the case of *S. acuminatum* have produced interesting progeny. Of 21 plants raised from seed obtained from artificially induced double flowers, four showed abnormalities similar to those of the parent. Thus we have some evidence that abnormalities induced by change of external conditions may be inherited.

It would, however, be premature to discuss this aspect of Professor Klebs' remarkable experiments. The facts which stand out clearly and indisputably from those researches are that each phase in the life history of a plant is determined by definite external conditions, that the conditions which are of most importance are those such as temperature, light, food supply, and moisture, which are concerned in plant-nutrition, and that by taking advantage of the known effects of these conditions it is possible to modify profoundly and at will the form of a plant.

NATIONAL SWEET PEA SOCIETY.—The annual exhibition of this Society for 1912 will be held on July 9 and 10, in the Royal Horticultural Hall, Westminster.

NATIONAL CHRYSANTHEMUM SOCIETY.—The early show of the National Chrysanthemum Society will be held on Wednesday and Thursday next, October 4 and 5, at the Crystal Palace, Sydenham. Particulars may be obtained from the Secretary, Mr. RICHARD A. WITTY, 72, Savernake Road, Gospel Oak, London.

MIDLAND DAFFODIL SOCIETY.—The report of this highly-successful society is a record of good work done during the past year. The annual show proved a great success, and the functions held in connection with it, including the opening ceremony and the banquet at which the exhibition judges and visitors were present, were remarkable for the enthusiasm displayed. The new classification by the Royal Horticultural Society has been adopted, and an enlarged schedule has been drawn up in accordance with that system. Among the new classes there is one for a collection of original species and natural hybrids of Daffodils. The statement of accounts shows that the society is in a flourishing condition financially. A few changes have been made on the Executive and Floral Committees, and Mr. HERBERT SMITH has been appointed sole secretary, Mr. JACOB, who has shared the office since the formation of the society, having been appointed chairman of the committee.

FAILURES AMONG GARDENERS, FLORISTS, AND NURSERYMEN IN 1910.—The 28th annual report of the Inspector-general in Bankruptcy for the year ended December 31, 1910, shows that the number of receiving orders and administration orders was 3,880, a decrease of 190 as compared with 1909. The liabilities, as estimated by debtors, amounted to £8,211,678, an increase of £2,407,536 on the year. There were assets as estimated by debtors of £2,867,068 against £2,154,034 in the preceding year; and the estimated loss to creditors is set down at £7,255,989, an increase of £2,169,858 as compared with 1909. In a comparative table attached to the report, the Inspector-general shows the aggregate figures relating to various trades, from which it appears that the number of failures among gardeners, florists and nurserymen in 1906 was 32, in 1907 45, in 1908 and 1909 48, and in 1910 55 failures. The amount of indebtedness in 1910 amounted to £68,144. It will thus be seen that there was an increase of seven in the number of failures in 1910, as compared with 1909; there was also an increase of £35,380 in the total liabilities.

THE GRAIN CROPS.—The Board of Agriculture and Fisheries has received the following telegram from the International Agricultural Institute:—"The preliminary statement of the production of Wheat in each of the following countries is:—France, 171,455,000 cwts.; United Kingdom, 34,231,000 cwts.; Hungary (including Croatia and Slavonia), 103,198,000 cwts.; Italy, 102,919,000 cwts.; Russian (73 governments), 339,259,000 cwts.; Canada, 109,594,000 cwts.; United States of America, 352,703,000 cwts.; and Egypt, 20,377,000 cwts. The production of Barley is:—United Kingdom, 27,617,000 cwts.; Hungary, 32,519,000 cwts.; Roumania, 10,823,000 cwts.; Russia, 186,946,000 cwts.; Canada, 22,089,000 cwts.; United States, 61,212,000 cwts.; and Japan, 40,497,000 cwts. The production of Oats is:—United Kingdom, 53,543,000 cwts.; Hungary, 27,501,000 cwts.; Russia, 262,906,000 cwts.; Canada, 111,729,000 cwts.; and United States, 240,637,000 cwts. The production of Rye is:—France, 24,051,000 cwts.; Hungary, 27,156,000 cwts.; Russia, 401,443,000 cwts.; and United States, 15,298,000 cwts. The estimated

production of Maize in Italy is 46,835,000 cwts., Russia 31,879,000 cwts., and United States 1,367,694,000 cwts. The figures now given for those countries for which information has reached the Institute, estimate the production this year as compared with last year as follows:—Wheat 0.5 per cent. above, Barley 0.5 per cent. below, Oats 11.1 per cent. below, Rye 3.6 per cent. below, and Maize 13.4 per cent. below. The estimated production of Rice is:—In Spain 4,081,000 cwts., Italy 9,308,000 cwts., and United States 9,097,000 cwts. The area under Wheat in Chile is placed at 1,482,000 acres; under Oats, 741,000 acres; and the condition of both crops is 20 per cent. above average."

ROSE-LEAF BLOTCH.—This disease, which has been prevalent in the South of England this summer, is characterised by the presence of large purple patches on the upper surface of Rose leaves. It is caused by a parasitic fungus known as *Actinonema rosæ*. Part of the mycelium is situated on the surface of the leaf, but some of the hyphae penetrate the tissues in order to obtain nourishment from the host. The fruit-bodies of the fungus appear as small dark specks on the discoloured areas of affected leaves. The spores are colourless and once septate. When the disease is present in quantity premature defoliation may occur. Blotched leaves should be collected and burnt.

THE TREATMENT OF SEEDS WITH HYDROGEN PEROXIDE.—Experiments by Mr. E. MIÉGE (*Ann. Ecol. Nat. Agric. Rennes*, II., 1908) on the effect of hydrogen peroxide on the germination of seeds, indicate that, though this substance is poisonous when used in strong solutions, dilute solutions facilitate germination and stimulate the seedlings to more active development than that exhibited by untreated plants. Mr. MIÉGE concludes also from his experiments that hydrogen peroxide (1 per cent.) is a useful fungicide in which to steep seed affected by rust or smut. Immersion of infected seed for a quarter of an hour in a 1 per cent. solution of hydrogen-peroxide is stated not only to destroy the fungus spores, but also to protect the seedling from attack. It would be worth while to try the effect of this specific on Holyhock rust.

THE GENUS HAUYA.—Few horticulturists, probably, have heard of this genus, which is closely allied to *Fuchsia*, and, so far as is known, restricted to Mexico and Guatemala, at elevations of about 3,000 to 6,000 feet. Botanically, it differs from *Fuchsia*, among other things, in having a woody capsule and winged seeds, instead of a fleshy berry and small wingless seeds. In habit the species of *Hauya* come nearest, in stature, to *Fuchsia arborescens*, figured in the *Botanical Magazine*, tab. 2620, and in the *Revue Horticole*, 1873, p. 311, with a coloured figure, under the name of *F. syringi-flora*. The latter name is not inappropriate, inasmuch as the dense panicles of small flowers resemble those of a Lilac. The flowers of *Hauya* more nearly resemble, except in colour, those of an *Oenothera* of medium size. When Mr. W. BOTTING HEMSLEY was compiling the *Botany of the Biologia Centrali-Americana*, in 1880, only one species had been described, but he added a second and a third. Later DONNELL SMITH described two more, and recently, in the *Botanical Gazette*, July, 1911, there are descriptions of five other new ones. Apparently no species of *Hauya* has been in cultivation; yet, judging from dried specimens, they must be very attractive plants when in flower. The blossoms are as large as the largest of the *Fuchsias*, with broad petals, and white or pink in the two cases in which the collectors have noted the colour. They are shrubs or trees, the largest attaining a height of at least 40 feet.

PINUS SYLVESTRIS ON CHALKY SOILS.—In the course of his investigations on the distribution of *Pinus sylvestris* in the various countries of Europe. Mr. GOLESCO observes that this species, which is generally "chalk-shy" in Western Europe, becomes almost exclusively calci-phil in Roumania. Professor BONNIER has already made the interesting observation that various species of plants which are chalk-shy in Western Europe become either indifferent to chalk or calci-phil in the east of the continent. He ascribes this change of habit to change of climate. In Eastern Europe the climate becomes more and more continental in type, and hence plants which, in less severe climates, display chalk-shunning proclivities, are driven, in the regions of greater cold, to seek the warm, chalky soils.

PUBLICATIONS RECEIVED.—*Publications of the Arnold Arboretum*. No. 4. *Plantæ Wilsonianæ*, an enumeration of the woody plants collected in Western China for the Arnold Arboretum of Harvard University during the years 1907, 1908, and 1910, by E. H. Wilson; edited by Charles Sprague Sargent. Part I. (Cambridge, U.S.A.: Harvard University Press.)—*Oxtordshire Education Committee*: Report on the School Gardens Competitions, 1911.—*Wheat Growing in Canada, The United States, and the Argentine*, by William P. HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

GRAPE DIANA HAMBURG.—I am very anxious to obtain a plant or cutting of a Grape called "Diana Hamburg." It was raised some years ago by Jacob Moore, of New York, but I am unable to find it anywhere in the United States, so that the last hope of rescuing it from oblivion is the chance of a plant being in existence in this country. It is required for a scientific investigation concerning sterility in Grapes. Any one possessing the variety would greatly oblige by communicating with me direct. W. Wilks, Sec., Royal Horticultural Society, Vincent Square, S.W.

THE EDINBURGH AUTUMN SHOW.—For many years past excursion fares have been granted by the Caledonian Railway Company to visitors of this show, the fare from Dumfries being 4s. with a proportionate reduction from stations nearer Edinburgh. Similar fares were in operation from Carlisle along the main line. The excursion fares were available for the first day of the show, with the option of returning on the second day on payment of about a fourth of the ordinary fare. This year, however, the excursion fares only operated on the second day of the show, and exhibitors were consequently debarred from receiving any advantage; while others who had intended to go on the Wednesday only found,

on reaching the stations, that they would have to pay the ordinary fare. I am informed that the North British Railway Company adopted the same practice, with regard to some of the towns they serve. Were these arrangements in accordance with the understanding between the Railway Companies and the Royal Caledonian Horticultural Society? A Galloway Gardener.

LARGE ENGLISH ELMS.—The remarks on European Elms (see p. 202) remind me of some very large trees of the English Elm, growing in the churchyard at Ross, Herefordshire. I measured more than one that had a circumference of 17 feet at 3 feet from the ground. The story is told that a former rector cut down some of the Elms growing in the churchyard and two Elms sprang up in the chancel of the church, where they reached a height of 7 or 8 feet and then died. Nothing would induce the people of Ross to have the stems removed, and Virginian Creepers are planted to cover them in summer. It is only by a close inspection that it can be seen that the leaves are not the leaves of the trees themselves. There are other large Elms in the neighbourhood, perhaps the largest in England. W. P. R., Holywell.

THE WEATHER IN NORTH WALES.—We have had a glorious summer as far as sunshine is concerned, and the crops generally are very good. Apples are a heavy crop and the quality excellent, which should insure their good keeping if well harvested. But the object of my note is to show how short a summer we have had free from frosts. On June 16 all our Marrows, Runner Beans, Begonias, and Dahlias were cut down by 5° of frost, and now again, on the morning of September 21, the same thing has occurred, leaving us only 14 weeks without frost. From a gardener's point of view, this is a serious matter, for what he has gained by the sunshine he has lost by the frosts. J. S. Higgins, Rüg Gardens, Corwen, N. Wales.

A DUTCH GARDEN.—A few days ago I had the pleasure of going over a very fine garden in Holland, namely, that belonging to Baron van Heekeren van Wassenaer. I was very much surprised to see such a garden in Holland. The turf slopes and lawns were perfect in every respect; finer grass could not be seen, and the colour was excellent. The garden contains a very fine lot of standard Oranges in tubs, the finest I have ever seen. They measure about 12 feet through and 12 feet high, and are in excellent condition—good colour, well fruited, and clean. There is also an unusually good collection of clipped Yew and Box trees, the finest specimens, so far as culture is concerned, known to me. They are well looked after, and are a credit to the gardener, Mr. Rabjohn, who was appointed last April as gardener, after having served a considerable time at Welbeck Abbey. H. J. C., Middlesex.

ANTHOLYZA PANICULATA.—This plant, which is not extensively grown in English gardens for the reason stated by Mr. S. Arnott on p. 218, is, when forced, a useful and beautiful subject for the decoration of the greenhouse or mansion. I have obtained blooms in April, after they had flowered in the south of Europe, and potted them in May, allowing them to grow very slowly. Under this treatment they flowered about the end of November or early in December. The broad, handsome foliage and Montbretia-like flowers are much admired. F.

THE WASP PLAGUE.—Many years ago I used to pay threepence each for queen wasps in the spring, and a shilling each for wasp nests which were destroyed in the summer and autumn. About 20 years ago I made a study of wasps, and watched them for hours in the summer, particularly for the food they brought home to their nests, and I found that through the spring and summer they lived and reared their young on grubs, caterpillars and flies. While there was plenty of this kind of food, they never attempted to touch any kind of fruit, or even honey, although these had been placed near to the entrances of the nests. They go more to the forest trees for their food than to fruit trees and flowers, although I have watched them at work on Apple, Pear, and Plum trees. It is

very difficult to find a wasp's nest in summer, because they are in such a hurry to hunt for food, and I have often been surprised that such strong nests have been so close to where men have been working, and they have not seen them until they have trodden on the hole leading to the nest. Bees are very much like wasps. When honey is plentiful they do not attack fruit. If the bees have stored honey plentifully, they are not so prone to attack fruit; but if the honey has been taken away from them, they must have something in its place. After I became convinced of the great amount of good wasps do, I ceased to kill queen wasps, as I look upon them as friends; but I destroy nests as soon as I find that the wasps are attacking the fruit, although I have never been quite sure that I am justified in doing so. *Vespa*.

CRASSULA COCCINEA.—Although a lovely greenhouse plant, *Crassula coccinea* is, perhaps, seen at its best when 40 to 60 good plants are massed in the flower-garden. I have adopted the same method of winter treatment as you advised *E. W. S.* on page 232. As soon as the flower-heads are formed, the plants should be placed out-of-doors and protected only when heavy rains or frosts prevail. About the middle of May they may be transferred to their flowering quarters. Tall, straggling specimens should be planted sufficiently deep to allow dwarfier ones being plunged close to them, or even on the top of the pots. This keeps the middle of the bed well furnished. Plants in 5-inch pots should be plunged well below the rim, and these, when taken up in autumn, should be repotted into 7 and 8-inch pots, and wintered as advised. Cuttings, too, may be inserted late in the autumn, as plenty are then obtainable from the tall plants which have become unsightly. I have planted the same specimens out for three consecutive summers. Cuttings of this plant should be inserted whenever they are obtainable. G. Ferrington, Cloverley Gardens, Shropshire.

LAGERSTROEMIA INDICA (see p. 209).—I may inform Mr. Norman that we have at Leonardslee an exceedingly handsome plant of *Lagerstroemia indica* some 12 feet high, and in most perfect bloom. It has been in flower since the beginning of August, and it is a perfect mass of bloom at the present time. Many tender plants succeed in Sussex and Kent gardens. W. A. Cook, Leonardslee Gardens, Sussex.

PRIMULA BEESIANA, FORREST.

(See fig. 110 and Supplementary Illustration.)

THIS is a new and handsome species from the Lichiang Range, N.W. Yunnan, named in honour of the firm of Messrs. Bees Ltd., Cheshire, for whom it was collected. Though not attaining any great altitude, the highest point it reaches being only 11,000 feet, still the plant has proved perfectly hardy in Britain, flowering and fruiting freely.

It loves moisture, and, like most of the Alpine and sub-Alpine Primulas, it forms huge colonies in its native habitat, often covering many acres, but so far it has only been seen in one district. The situations favoured are moist, gravelly meadows along the margins of small mountain streams, where pure, spring water percolates through the light soil.

Excepting in colour, *P. Beesiana* is almost identical at first sight with *P. Bulleyana*, another recently-introduced species from the same region. It is much the same in height and almost as robust in habit, whilst its habitat is similar in character, although the two species are never found growing together. The flowers are as numerous, both as to number of whorls—5 to 8, and individual blooms, 12 to 16 to the whorl—and the plant possesses the same luxuriant foliage, differing from the above-mentioned species only in having the midrib of the leaf a dull fleshy-red. However, the flowers at once separate them, *P. Bulleyana* having buff-orange-coloured blooms, whilst those of *P. Beesiana* are of a deep

rose-carmine, with the eye bright orange, almost the same colouring as in *P. Poissonii*, *P. angustidens* and *P. Wilsonii*.

Amongst the many beautiful species of *Primula* recently introduced to cultivation from Central and Western China, *P. Beesiana* is sure to take a prominent position, not alone because of its beauty of colouring and robust habit, but owing to its hardiness and the ease with which it is propagated.

The average plant attains a height of 2-3 feet, and gives promise of exceeding this in cultivation. The leaves are thin in texture, ovate-lanceolate, apex-rounded or acute, attenuated towards the base into a narrow wing, 12 to 22 centimetres long by 3 to 6 inches in breadth, margin irregularly dentate; under surface slightly hispid, upper surface glabrous. Scapes numerous, two to seven, stout, tall, 2 to 3 feet, towards

SOCIETIES.

ROYAL HORTICULTURAL.

SEPTEMBER 26.—The fortnightly meeting held on Tuesday last was of more than usual interest. In all sections the exhibits were worthy of remark, but owing to a special vegetable competition, the exhibits in the fruit and vegetable section were the outstanding feature. The FRUIT AND VEGETABLE COMMITTEE recommended three Gold Medals, and they also granted 12 Awards of Merit, six to Raspberries, five to Potatoes and one to a Carrot. Plants and cut flowers again made an exceedingly fine display, Michaelmas Daisies predominating. The FLORAL COMMITTEE recommended a Gold Medal for a group of choice stove and greenhouse plants, and 10 Awards of Merit were awarded to novelties. Orchids were extensively and well shown. Several novelties were forthcoming, and one of

collection of stove and greenhouse ornamental foliage and flowering plants. A row of well-grown *Cocos flexuosus* stretched along the back, and in the middle of this fine group there was a row of very healthy *Nepenthes* bearing fine pitchers; those on *N. mixta* and *N. elegans* were unusually large, whilst those of *N. Mastersiana* were the most highly coloured. The cool-house plants included a fine *Dicksonia antarctica*, *Araucaria elegans*, a single-stemmed *Roupala corcovadensis*, many choice Ferns and several fine pots of *Nerine sarniensis*, and four batches of *Cannas* with large heads of richly-coloured flowers. Standard plants of *Callicarpa purpurea* bearing purple fruits at every node had an uncommon appearance. Of the many choice tropical plants, we especially noted *Bertolonias* in variety, *Eriocnema maculata* (with beautifully-marked leaves), tall, useful plants of *Aralia elegantissima*, *Sphaerogyne latifolia* (a large, handsome foliaged plant), besides many *Codiaeums* and *Begonias* of

FIG. 110.—PRIMULA BEESIANA IN ITS NATURAL HABITAT.
(See also Supplementary Illustration.)

[Photograph by George Forrest.]

the apex densely coated with a white farina, each scape bearing five to eight superposed whorls, with 12 to 16 blooms to each whorl: flowers faintly fragrant. Bracts linear, $1\frac{1}{2}$ to 3 centimetres long; pedicels stout, at the time of flowering about equal to the bracts, later much exceeding them. Calyx campanulate, 5 to 10 millimetres long, divided to the middle, segments lanceolate, striate towards the base, with heavy lines of farina. As the capsule attains maturity, the calyx becomes much broadened and thickened, with the segments almost ovate. Corolla: tube cylindrical or funnel-shaped, 1 to 2 centimetres long; limb 2 centimetres broad, deep rose-carmine, eye orange-yellow. Capsule, large, ovoid, very slightly exceeding the calyx. George Forrest.

these is illustrated in fig. 111. The ORCHID COMMITTEE granted one First-class Certificate and two Awards of Merit. At the 3 o'clock meeting, in the lecture room, an address on "Salads" was delivered by Mr. H. Senn.

Floral Committee.

Present: Messrs. Hy. Marshall and Henry B. May (Chairmen); and Messrs. Charles T. Druery, J. Dickson, W. Bain, Chas. Dixon, Wm. J. James, W. P. Thomson, George Paul, Chas. E. Pearson, J. T. Bennett-Poë, H. J. Jones, J. Jennings, J. F. McLeod, Wm. Howe, G. Reuthe, Jas. Hudson, W. B. Cranfield, John Green, E. A. Bowles, Herbert J. Cutbush, Edward Mawley, Walter T. Ware, Arthur Turner, E. H. Jenkins, C. R. Fielder, and J. W. Barr.

MESSRS. JAMES VEITCH & SONS, LTD., Chelsea, filled the end of the hall with an exceedingly fine

the Rex type, with highly-coloured leaves. (Gold Medal.)

Messrs. H. B. MAY & SONS, Upper Edmonton, again showed a collection of beautiful Ferns. Small plants of *Adiantum ciliatum* and *A. caudatum*, with delicate arched fronds, attracted much attention. Plants of *Selaginella caesia* var. *arborea*, which in spring bears bluish-green foliage, supplied a touch of colour in its autumn bronze. *Selaginella amœna*, deep-green fronds with pale-yellow tips, was represented by a fine plant. Other uncommon *Selaginellas* were *S. gracilis*, *S. formosa* (a sport from *S. stolonifera*), a dainty small-foliaged variety, and *S. atroviridis*. Amongst the rarer Ferns we noted *Acrostichum aureum*, with stout fronds, which lose their yellow tint as they mature; *Osmunda palustris* Mayi, more quaint than beautiful; *Brainea insignis*; *Pteris ludens*, which throws up large single

fronds, and *Adiantum macrophyllum*, with bright salmon-pink fronds. (Silver Flora Medal.)

Messrs. BARR & SONS, Covent Garden, London, set up a collection of hardy herbaceous and rock-garden flowers. The greater portion of this attractive collection consisted of cut sprays of Michaelmas Daisies, Golden Rod (*Solidago Golden Wings*), and herbaceous Phloxes. Amongst the first-named there were several brightly-coloured varieties, such as *St. Egwin*, *Miss Southall*, and *Lustre*, which appeared to advantage amongst the more common blue and lighter shades of colour. The boxes contained some very large-flowered forms of *Colchicum speciosum* with both white and purple flowers. *Primula Forbesii*, *P. villosa*, *Cyclamen neapolitanum album*, and *Leucojum autumnale* are all dainty little flowers. (Bronze Banksian Medal.)

Messrs. H. J. JONES, LTD., Ryecroft Nurseries, Lewisham, staged a very fresh and clean-looking selection of Michaelmas Daisies. The covering of white paper added a distinct appearance to this exhibit. Besides several very good unnamed seedling varieties, we noted *Lil. Fardell*, *Ryecroft Pink*, and Mrs. F. J. Raynor as being the best of the pink shades, and Mrs. Matthews and *Decima* as good whites. Of the many blues shown, *Splendens* and *Precocité* were the best. (Silver Banksian Medal.)

Mr. G. REUTHE, Keston, Kent, staged a collection of Alpine and rock plants backed by a double row of cut sprays of Michaelmas Daisies. Amongst the rare Alpines we noted *Calophaca wolgarica*, a dwarf, yellow-flowered leguminous plant, the very rare *Rhododendron intricatum*, *Oxalis lobata*, a creeping species with large golden flowers, and *Wahlenbergia serpyllifolia*. A small group of *Colchicums* included *C. Bornmülleri*, *C. Bivonæ*, and the very free-flowering *C. Decaisnæ*.

Mr. JAMES BOX, Lindfield, Sussex, arranged a good collection of Sunflowers and Michaelmas Daisies. Along the front of this group there were several vases of *Aster Amellus* Surprise, the stems being 2 feet high and bearing large, bright flowers. *A. A. Charlie* and *A. Keston* were the largest-flowered blue sorts. Mrs. R. Pulling was the best white variety. *Aster Golden Spray* would be very attractive if associated with the brightly-coloured varieties, but when placed near the pale blues and the white sorts it has a somewhat dingy appearance. (Silver Banksian Medal.)

On the right of the entrance Messrs. W. CUTBUSH & SON, Highgate, London, arranged a miscellaneous collection of hardy herbaceous plants in an attractive manner. Michaelmas Daisies were present in large masses of distinct colours, and at the back there were *Heleniums* and *Solidagos*. The most desirable of the *Asters* were *Star Shower*, *Ultramarine* (a very good blue), *Lustre*, *Perfection* (an abundant, small, white-flowered variety), *Purity* (which has large, white flowers), and the compact *St. Egwin*. A few *Water Lilies* showed that the hardy *Nymphaeas* still produce good flowers, whilst large batches of *Colchicum* betokened the presence of autumn. Besides the large-flowered *Colchicum giganteum* and *C. Bornmülleri*, there were smaller batches of *Crocus zonatus* with pale-blue flowers and the deeper-coloured *C. speciosus*. (Silver-gilt Banksian Medal.)

Mr. L. R. RUSSELL, Richmond, again showed a very fine collection of profusely-flowered Clematises, growing in relatively small pots. On this occasion the plants were arranged on one of the side tables, which brought their flowers better under observation, and enhanced their beauty. In addition to the varieties of *Fuchsia* which we previously noticed as being especially valuable, there were *americana*, *elegans*, *mystifolia minor*, and *microphylla*, a dainty-flowered, hardy variety. Amongst other shrubby plants, *Caryopteris mastacanthus*, a very desirable, blue-flowered wall plant, and *Polygonum Baldschuanicum*, so useful for covering pergolas, were also well shown. (Bronze Flora Medal.)

Messrs. G. & A. CLARK, LTD., The Nurseries, Dover, showed *Caryopteris* in well-flowered sprays. Other useful hardy plants in the group were *Desmodium pendulifolium*, *Salvia azurea*, *Leonotis Leonurus* (unfortunately not quite hardy), *Tricyrtis hirta nigra* (small purple and white Lily-like flowers), and the bright red *Zauschneria californica*.

Messrs. ALLWOOD BROS., Haywards Heath, Sussex, staged a small, but exceedingly choice,

selection of Carnations. Excepting two of the new *Perpetual Malmaisons* Mrs. C. F. Raphael (large, bright flowers) and *Marmion* (white, overlaid with cherry colour), the varieties shown were of the perpetual-flowering type. Besides the splendid "White Wonder," which received an Award of Merit at the previous meeting, there were *Lady Alington* (a fine deep pink flower with a delightful perfume), *May Day* (rose-pink), *Scarlet Glow*, and two new French seedlings with yellow ground.

Carnations with agreeable perfume were exhibited by Messrs. W. WELLS & CO., Merstham, Surrey. The pink *Dorothy Gordon* and the deeper-coloured Mrs. C. W. Ward were attractive, whilst *Princess Charming*, *Bonfire*, *Florida*, and *Brooklyn* (a new rose-pink Carnation with fimbriated petals) were also noteworthy. Various Phloxes, Michaelmas Daisies, and early-flowering Chrysanthemums formed a part of this attractive display. (Bronze Banksian Medal.)

A very bright collection of Verbenas was exhibited from the gardens of the Hon. VICARY GIBBS, Elstree, Herts. (gr. Mr. E. Beckett). Of the many varieties shown in such excellent condition, the brilliant *King of Scarlets*, *Pioneer* (a floriferous plant with flowers of a delicate shade of pale rose), *A. Blondin* (deep rose), *Diana* (purple), *Seville* (blue), *Scarlet White Eye*, and the well-known *Miss Willmott* are a selection. (Silver Flora Medal.)

Messrs. JAMES BACKHOUSE & SONS, LTD., York, brought an exceedingly fine collection of autumn Crocuses. The flowers were very large, and clear and distinct in colour. *Colchicum speciosum* and its variety *album* were shown in quantity. (Silver Flora Medal.)

Mr. CHAS. TURNER, Slough, sent five fine clumps of *Gynerium* (Pampas Grass) in two varieties. The dwarf variety (*pumilum*) bore a large number of good plumes, but those of the taller *G. Bertinii* were perhaps the more graceful. (Bronze Flora Medal.)

The Misses HOPKINS, Mere Gardens, Shepperton-on-Thames, arranged a small collection of herbaceous and Alpine plants.

THE GUILDFORD HARDY PLANT NURSERY COMPANY exhibited a neat collection of cut blooms, including *Delphinium sinense* (with rich blue flowers), *Salvia angustifolia*, *Gaura Lindheimeri*, the pure yellow *Coreopsis verticillata*, and some good spikes of *Funkia grandiflora*.

Messrs. R. VEITCH & SON, Exeter, brought a very interesting selection of *Nerines* bearing flower-spikes of various shades of pink. The individual flowers were larger than those of the *sarniense* hybrids, and had quite a charming colouring. The plants shown included *Nerine Bowdenii* with long, narrow petals of pink flowers; *N. Exonia* (*Bowdenii* × *Fothergillii*), of which two forms were shown, both having bright-pink flowers, but in one case the flowers are slightly deeper in colour and more erect. Under the name of *Cyrtanthus hybrida*, the cross raised by Sir Trevor Lawrence between *Cyrtanthus sanguinea* and *Valotta purpurea* about 20 years ago, was shown bearing orange-scarlet flowers.

An imposing array of Dahlias came from Messrs. CARTER, PAGE & CO., London Wall, London, which consisted chiefly of *Pæony*-flowered varieties, making a fine blaze of colour. The group contained many good varieties, such as *Lady Saville*, *Wordsworth*, *Turner* and *Vandyck*. (Silver Flora Medal.)

Messrs. H. CANNELL & SONS, Swanley, Kent, staged a fine collection of Dahlias. Among the most recent varieties we noted such excellent sorts as *South Pole* (the best white), Mrs. J. Coisard (a very large rose-coloured variety), *Ethel May* (yellow and buff), and an immense bloom of the Hon. R. Borden (a pale-buff and yellow variety). A good selection of *Cactus* varieties was shown, as well as many fine single and collarette Dahlias. At one end of this exhibit there was a small collection of Cannas. (Silver Banksian Medal.)

Mr. H. SEALE, Sevenoaks, arranged a group of Dahlias in a very attractive manner. Along the front of the stand collections of miniature *Cactus* varieties set up in shallow, rustic stands with *Aster* foliage, short sprays of *Populus*, &c., made a good show. (Silver Banksian Medal.)

A representative display of Dahlias was shown by Mr. J. T. WEST, Brentwood, Essex. At one

end a couple of plants of the fine yellow decorative variety *Brentwood Yellow* showed a healthy dwarf habit, in which the blooms could be readily seen. (Silver Banksian Medal.)

Dahlias in good varieties of all sections were shown in splendid character by Messrs. J. CHEAL & SONS, Crawley. There were many very good single-flowered varieties, and of the many *Cactus* Dahlias the most distinctive were *J. B. Riding* (deep chestnut and yellow), *Lustre* (crimson), *Iolanthe* (chestnut-red), Mrs. F. H. Cook (brick-red), and the pure white *Snowdon*. (Silver-gilt Banksian Medal.)

Large flowers of *Pæony* Dahlias, arranged with various sprays of hardy shrubs, were shown by Messrs. BAKERS, Wolverhampton. (Bronze Flora Medal.)

Dahlias, in which the collarette kinds predominated, were arranged by Mr. JAS. RIDING, Chingford, Essex. The most attractive of this, the newest, phase of the autumn flower, were *Diamant*, *Orphée*, *Crown Princess Charlotte*, *Mme. L. Viger*, and *Union Jack*. (Bronze Banksian Medal.)

Messrs. T. S. WARE, LTD., Feltham, also staged an interesting and attractive assortment of Dahlias in many distinct and richly-coloured varieties. (Bronze Banksian Medal.)

Besides the varieties of *Nymphaea* which received awards, the Earl of WARWICK contributed blooms of *Nymphaea pennsylvanica*, a pale-blue variety; and *N. Maynardii*, a magnificent and fragrant flower, fully 9 inches across and of a lovely pale shade of heliotrope.

AWARDS OF MERIT.

Nymphaea Listeri.—A tropical *Water Lily* nearer to *N. zanzibarensis* than *N. stellata*. The flowers are of a deep bright blue with darker blue stamens. *N. Listeri* resembles *N. pulcherrima*, but is darker than that variety.

N. Lord Brooke.—This variety also is of the same character as the preceding, differing only in the colour, which is a very pale pink with a slight suffusion of purple; the flower was about 8 inches in diameter. These were shown by the Earl of WARWICK, Easton Lodge, Dunmow, Essex (gr. Mr. H. Lister).

N. stellata rosea.—The name, in this case, indicates the section to which it belongs. The variety has all the characteristics of the type, the flowers standing erect with stems close upon 2 feet in length. The colour is a clear pink, both in the petals and stamens, with the golden centre that is typical of *N. stellata*. This, like the two preceding, is sweetly scented. Shown by LEOPOLD DE ROTHSCHILD, Esq., C.V.O., Gunnersbury House, Acton (gr. Mr. Jas. Hudson).

Nerine Veitchii.—A new species from South Africa with flowers 2½ inches across, having recurved segments. It has the appearance of a pale form of *N. Bowdenii*. Shown by Messrs. R. VEITCH & SON, Exeter.

Rose "Rayon d'Or".—A beautiful deep-yellow bloom with claret colour on the exterior of the petals. Shown by Messrs. PAUL & SON, Cheshunt.

Dahlia Uranus (Cactus).—A large incurved bloom with reddish spots and splashes on a white ground.

D. Golden Wave (Cactus) (see p. 247).

D. Stability (Cactus).—A smaller bloom of a mauve shade of colour, and a very attractive variety. All three were shown by Messrs. JAMES STREDWICK & SONS, St. Leonard's-on-Sea.

D. "Queen of the Mauves" (Single).—A bloom of very good form, the name indicating the colour. Shown by Mrs. M. V. SEALE, Sevenoaks.

D. "Madhi" (see p. 247). Shown by Messrs. J. CHEAL & SONS, Crawley.

D. "Prince de Venosa" (Collarette).—The rich red florets of this flower are set off by a white collarette. Shown by Messrs. DOBBIE & CO., Edinburgh.

Orchid Committee.

Present: Harry J. Veitch, Esq. (in the Chair); and Messrs. Jas. O'Brien (hon. sec.), C. H. Curtis, R. G. Thwaites, T. Armstrong, A. A. McBean, W. Cobb, J. Charlesworth, J. Cypher, J. E. Shill, W. P. Bound, W. H. Hatcher, A.

Dye, Garney Wilson, W. Bolton, John S. Moss, and W. H. White.

LEOPOLD DE ROTHSCHILD, Esq., Gunnersbury House, Acton (gr. Mr. Hudson), showed some finely-grown specimens of the cinnabar-scarlet *Habenaria militaris* with dense heads of brilliant

Caladium argyrites. A grand plant of *Cattleya* Iris with nine flowers.

Sir TREVOR LAWRENCE, Bart., K.C.V.O., Burford (gr. Mr. W. H. White), showed a finely-flowered specimen of *Zygopetalum Maxillare* with a dozen spikes (Cultural Commendation), a

Baron BRUNO SCHRÖDER, The Dell, Englefield Green (gr. Mr. J. E. Shill), showed *Odontoglossum Memoria Baron H. Schröder*, a beautiful hybrid of the *O. cœruleum* class, the flowers having a white ground colour, and the greater part of the surface covered with bright violet blotches, the reverse side being almost as showy as the face. The plant had a very strong spike, on which only a few of the basal flowers were expanded, and the Committee desired to see it again when fully expanded.

FRANCIS WELLESLEY, Esq., Westfield, Woking (gr. Mr. Hopkins), showed the beautiful new *Cattleya* Mrs. Frederick Sassoon (see Awards); *C. Gaskelliana* "Delight," a fine white form with a pale purple mark on the lip; and *Cypripedium Dowleri* Westfield variety, white with some minute blackish dots on the petals and dorsal sepal.

R. G. THWAITES, Esq., Chessington, Streatham (gr. J. M. Black), showed *Cattleya Adula* Thwaites' variety, a grand flower with a glowing, purplish-crimson lip; and *Lælia pumila alba Purity*, a charming white flower with a chrome yellow tinge in the tube of the lip.

SAMUEL LARKIN, Esq., The Ridgways, Haslemere (gr. Mr. Hales), was awarded a Silver Banksian Medal for an effective group in which the prominent plants were two very fine specimens of *Vanda violacea*, the pretty *Cattleya Lythamensis* (bicolor *Grossii* × *Gaskelliana*), like a large rosy-mauve *C. Iris*; two *C. Maronii*, and several *C. Iris* and other hybrid *Cattleyas*.

W. WATERS BUTLER, Esq., Edgbaston, Birmingham (gr. Mr. R. H. Jones), showed an interesting seedling between *Cattleya Dowiana aurea* and *C. Hardyana*, the two crossings with *C. aurea* resulting in a form closely approaching *C. Hardyana* *Massaiana*, the lip being very fine, velvety crimson with gold veining at the base, the sepals and petals white veined and marbled with rose colour.

H. S. GOODSON, Esq., Fairlawn, Putney (gr. Mr. G. E. Day), staged a small group in which the central figure was his *Cattleya St. Gothard*, one of the finest hybrid *Cattleyas*, the flowers being very large and in colour equal to the best *C. Warneri*. The group also included some pretty *Lælio-Cattleyas*, *Sophro-Cattleyas*, and other crosses of *Sophrontitis grandiflora*.

MESSRS. CHARLESWORTH & Co., Haywards Heath, were awarded a Silver Banksian Medal for a group of rare Orchids, the most important being their new *Odontoglossum Harwoodii*, The Shrubbery variety, which secured a First-class Certificate (see fig. 111). *Vanda Marguerite Maron* had a spike of ten flowers.

MESSRS. SANDER & SONS, St. Albans, were awarded a Silver Banksian Medal for a group of hybrid *Cattleyas*, *Lælio-Cattleyas*, &c., including good forms of *C. Iris*, *C. Lord Rothschild*, *C. Ella*, *C. Pittiana*, *Lælio-Cattleya Walter Gott*, L.-C. Hon. Mrs. Ashton, and others. Of species there were *Phalænopsis Sanderiana* and a white form said to be a variety of the same; the singular little *Sievekingia peruviana*, *Catasetum maculatum*, *Vanda Sanderiana*, *Uropedium Lindenii*, and *Miltonia spectabilis Moreliana*.

MESSRS. STUART LOW & Co., Bush Hill Park, were awarded a Silver Banksian Medal for an effective group, at the back of which were well-flowered *Oncidium varicosum* and *O. oblongatum*. Among the hybrid *Cattleyas* *C. Iris Caesar*, with bronzy sepals and petals and rich crimson lip, represented one of the best forms of this favourite hybrid the influence of the best form of *C. bicolor Grossii*, used as one of the parents, being distinctly marked. Forms of *C. Hardyana*, *C. Gaskelliana* The Princess, white with a small purple mark on the lip and some *Odontiodas* were also noted.

MESSRS. JAS. VEITCH & SONS, Chelsea, in their magnificent display of foliage plants, had an effective central group of *Lælio-Cattleya Violetta*, L.-C. *Haroldiana*, and other *Lælio-Cattleyas*; *Cattleya Iris*, *C. Carmen*, *C. Mrs. J. W. Whiteley*, *Brasso-Lælias*, *Cypripediums*, *Phalænopsis Esmerelda* and hybrid *Cypripediums*.

MESSRS. HASSALL & Co., Southgate, were awarded a Silver Banksian Medal for a group in which the forms of *Lælio-Cattleya Walter Gott* were very effective, the Southgate variety having a flower equal to a good *C. Iris* and of a bright rosy-lilac colour.

Mr. E. V. Low, Vale Bridge, Haywards Heath, staged a small group of very interesting

[Photograph by John Gregory.]

FIG. 111.—*ODONTOGLOSSUM HARWOODII* "THE SHRUBBERY VARIETY."

Awarded R.H.S. First-class Certificate on Tuesday last. (See p. 246.)

flowers well displayed above the bright green, silver-mottled leaves. The plants represented this species better than it has been shown before, and Mr. Hudson was awarded a well-merited Cultural Commendation. The specimens were skilfully arranged with Maidenhair Fern and

specimen of *Epidendrum floribundum* with a spike having ten branches, the remarkable *Epidendrum Laucheanum* (see Awards), and the new hybrid *Lælio-Cattleya Phœbeus* (L.-C. *Phœbe* × *C. Warscewiczii*) with buff-coloured sepals and petals and rose-veined lip.

plants, including *Bulbophyllum coccinum* with four sprays, *Cirrhopetalum ornatissimum*, *Oncidium incurvum album*, the pretty greenish-yellow *Cypripedium Rossettii* Westonbirt variety, *C. Germaine Opoix*, *C. Bingleyense*, *C. Wiertzianum* and *Brasso-Lælia Jessopii*.

AWARDS.

FIRST-CLASS CERTIFICATE.

Odontoglossum Harwoodii "The Shrubbery variety" (*maculatum auriferum* × *Wiganianum*) (see fig. 111), from Messrs. CHARLESWORTH & Co.—This is a second and much finer form of the remarkable cross shown by Messrs. CHARLESWORTH & Co., on January 31, 1911, which also gained a First-class Certificate. The flowers of the new form are flatly arranged, the broad labellum being a very fine feature. Colour buttercup yellow with blackish purple spotting, the lip having two large blotches, one on each side of the crest and another of the same colour in front.

AWARDS OF MERIT.

Cattleya Mrs. Frederick Sassoon (*Mantini nigricans* × *Dowiana aurea*), from FRANCIS WELLESLEY, Esq., Westfield, Woking (gr. Mr. Hopkins).—In this beautiful hybrid the fine form and rich colour of the best *C. Mantinii* are retained, but the flowers are much larger, and the labellum more openly displayed. The sepals and petals are rosy-mauve, and the lip ruby-crimson with fine gold veining from the base.

Epidendrum Laucheanum, from Sir TREVOR LAWRENCE, Bart. (gr. Mr. W. H. White).—A remarkable, slender species producing pendulous racemes over 2 feet in length, the drooping half being closely set with smallish flowers, the sepals and petals of which are purplish and the lip yellow.

CULTURAL COMMENDATIONS.

To Mr. James Hudson (gr. to LEOPOLD DE ROTHSCHILD, Esq.) for finely-grown *Habenaria militaris*.

To Mr. W. H. White (Orchid grower to Sir TREVOR LAWRENCE, Bart., K.C.V.O.) for a large specimen of *Zygopetalum maxillare*.

Fruit and Vegetable Committee.

Present: G. Bunyard, Esq. (in the Chair); and Messrs. A. H. Pearson, J. Cheal, W. Bates, G. Woodward, A. Dean, F. Perkins, W. Fyfe, W. Pope, J. Gibson, H. Markham, J. Willard, P. C. M. Veitch, P. D. Tuckett, J. Jaques, G. Wythes, W. Poupert, H. S. Rivers, E. Beckett, O. Thomas, W. H. Divers, G. Reynolds, W. Humphreys, and J. Davis.

The question as to whether the Grapes *Directeur Tisserand* and *Alnwick Seedling* were synonymous was again discussed, but no definite conclusion was arrived at. It was recommended that the two Grapes should not be shown together in a collection of distinct varieties. The Committee, however, considered *Directeur Tisserand* the better variety to cultivate, as it was a freer setter than *Alnwick Seedling*.

Messrs. LAXTON BROS., Bedford, showed fruits of a new Plum, of rich purple colour named *Plentiful*, a *Clingstone* variety.

ROGER LEIGH, Esq., Barham Court, Kent (gr. Mr. G. Woodward), showed very choice fruits gathered from wall trees in the open of Peaches *Sea Eagle* and *Nectarine*. A Cultural Commendation was awarded.

A collection of 20 handsome Melons named *Barnett Hall Favourite* was exhibited by F. H. COOK, Esq., Guildford (gr. Mr. J. A. Michelson). (Silver Banksian Medal.)

LEOPOLD DE ROTHSCHILD, Esq., Gunnersbury Park, Acton (gr. Mr. G. Reynolds), staged fruits of *Queen Pineapples*, white-fleshed Melons, Peaches *Gladstone*, *Lady Palmerston*, *Thomas Rivers*, *Nectarine*, *Princess of Wales*, *Albatross*, and *Sea Eagle*, also *Nectarines Pine Apple* and *Albert Victor*. All the fruits were shown in excellent condition. (Silver-gilt Banksian Medal.)

J. A. NIX, Esq., Tilgate House, Crawley (gr. Mr. E. Neal), set up a capital collection of fruit, embracing some 80 dishes, including, on boards, excellent bunches of *Gros Maroc*, *Mrs. Pince's Black Muscat*, *Madresfield Court*, and *Black Alicante* Grapes, all having well-finished berries. There were also Sutton's *A1*, *Perfection*, *Hero* of Lockinge, and other Melons, boxes of *Transparent*

Gage and *Coe's Golden Drop* Plums, Peaches *Princess of Wales*, *Walburton Admirable*, and *Nectarine*, Pears *Durondeau*, *Beurré Superfin*, *Williams's Bon Chrétien*, and *Uvedale's St. Germain*. Also of Apples *Bramley's Seedling*, *Royal Jubilee*, *Warner's King*, *The Queen*, *New Hawthornden*, *Loddington Seedling*, *Lord Derby*, *Blenheim Pippin*, *Gascoyne's Scarlet Seedling*, *Domino*, *Adams's Pearmain*, *Cox's Orange Pippin*, *Benoni*, *Coronation* and *James Grieve*. (Silver-gilt Knightian Medal.)

A large and superb collection of fruit was shown by Colonel BORTON, Chevening, Maidstone (gr. Mr. J. Whittle). The collection included 60 dishes and baskets of superb Apples. *Bismarck*, *Mère de Ménage*, *Warner's King*, *Newton Wonder*, *Tyler's Kernel*, *Peasgood's Nonesuch*, *Belle Dubois*, *Lord Derby*, *Emperor Alexander*, *Lane's Prince Albert*, *Lady Henniker*, *Alfriston*, and *Blenheim Pippin* represented cooking varieties; whilst of dessert sorts there were beautiful examples of *Allington Pippin*, *Cox's Orange Pippin*, *Rival*, *King of the Pippins*, *Golden Reinette*, *Melon Apple*, *Mabbott's Pearmain*, *Wealthy*, *Barnack Beauty*, *Charles Ross*, and *James Grieve*. Excellent Pears of the varieties *Doyenné du Comice*, *St. Luke*, *Beurré Fouqueray*, and *Durondeau*; and Peaches and other fruits were included in the collection. (Gold Medal.)

MESSRS. G. BUNYARD & Co., LTD., Maidstone, staged a collection of fruit from pot trees of wonderfully fine quality. Specimens of *Uvedale's St. Germain* Pears, each weighing 2 lbs., and large fruits of *Catillac* were remarkable. Also of dessert varieties, such as *Duchesse d'Angoulême*, *President d'Osmonville*, *Conference*, *St. Luke*, *Pitmaston Duchess*, and *Marguerite Marillat*, were shown excellently. Of Apples were noticed *Coronation*, *Golden Noble*, *Allington Pippin*, *Rival*, *Peasgood's Nonesuch*, *Cox's Pomona*, *Wealthy*, *Charles Ross*, *James Grieve*, *Mother Apple*, *Houblon*, and *Ribston Pippin*. (Silver-gilt Knightian Medal.)

A. W. SUTTON, Esq., Bucklebury Place, Berks., showed 10 dishes of orchard-grown Apples, including good fruits of *Peasgood's Nonesuch*, *Warner's King*, *Gascoyne's Scarlet Seedling*, *Cox's Pomona*, and *Lord Derby*.

A remarkable collection of ornamental gourds, forming a most attractive exhibit, was shown by E. MOCATTA, Esq., Woburn Place, Addlestone (gr. Mr. Stevenson). In this collection were *Giant Red Etampes*, *Giant Paris*, *Boulogne Gray*, *Spanish Giant*, and other huge, round gourds, the very curious and elegant bottle gourd, specimens of *Long Green Naples*, some 4 feet in length, *Green Hercules Club*, *Turk's Cap*, *Green Hibbard*, *Yellow and Green Naples*, *Warty* and *Smooth Orange*, *Striped* and *White Pear-shaped*, and many others. (Gold Medal.)

Messrs. SUTTON & SONS, Reading, set up one of the most representative collections of vegetables ever exhibited in the Society's hall. The group included very fine Cauliflowers, Celeries, Onions, Cabbages, Leeks, Carrots, Parsnips, Tomatoes, Beets, Lettuces, Potatoes, *Kohl Rabi*, Marrows, *Corn Cobs*, fine *Gladstone Peas*, *Best of All Runner Beans*, *Capsicums* and *Salads*. (Gold Medal.)

Messrs. JAMES VEITCH & SONS, LTD., Chelsea, staged an admirable collection of 60 dishes of vegetables, including *Giant Onions*, fine Cauliflowers, superb *Hackwood Park Runner Beans*, *Tomatoes*, *Potatoes*, *Kohl Rabi*, various *Gourds*, and numerous other varieties. (Silver-gilt Banksian Medal.)

Messrs. BARR & SONS, Covent Garden, also exhibited a collection of vegetables, including *Cabbages*, *Kales*, *Beets*, *Carrots*, *Parsnips*, *Onions*, *Potatoes*, *Lettuces*, *Tomatoes*, *Endives*, *Marrows*, and *Corn Cobs*. (Silver Knightian Medal.)

AWARDS OF MERIT.

The following varieties of autumn-fruiting Raspberries, Potatoes, and Carrots were grown under trial at Wisley Gardens, and were recommended for award after inspection by a sub-committee:—

RASPBERRIES.—*Surpasse d'Automne* (bright yellow), *Surpasse Merveille Rouge* (fine red), *Everlasting Feldbrummer*, *Perpetual de Serrière*, these four were sent by Mr. J. BURN CROMER; *Rouge Merveille* (red), sent by Messrs. BUNYARD & Co.; and *Surpasse Fastolf* (red), sent by Mr. W. PFITZER, Stuttgart, Germany.

POTATOS.—*Balgownie Seedling*, sent by Mr. J. LYULE, Aberdeen; *Scottish Prolific*, from Messrs. DOBBIE & Co., Edinburgh; *Erin's Queen*, from Mr. W. E. SANDS, Hillsborough, Ireland; *Great Scott*, sent by Messrs. R. VEITCH & SONS, Exeter; and *Tremendous*, shown by Messrs. TOO-GOOD & SONS, Southampton.

Carrot Early Gem, a stump-rooted, clean-skinned variety, from Messrs. SUTTON & SONS, Reading

COMPETITIVE VEGETABLE CLASSES.

The Champion Challenge Cup, offered for the greatest number of points obtained in these classes was won by the Hon. VICARY GIBBS, Aldenham House, Elstree (gr. Mr. E. Beckett).

The Sutton Challenge Cup, offered for the best exhibit of 12 distinct kinds of vegetables was won by the Duke of PORTLAND, Welbeck Abbey, Nottinghamshire (gr. Mr. J. Gibson), who staged a collection of extraordinarily high quality. New Red Intermediate Carrots were 2 feet long, of perfect shape, and without a blemish, whilst the Student Parsnips, which averaged nearly 3 feet in length, were of equal merit. Brussels Sprouts were large and very firm, whilst Autumn Mammoth Cauliflower were excellent. Each vegetable in this premier exhibit was practically perfect of its kind. The strongest dishes in the 2nd prize collection, shown by H. V. TATHAM, Esq., Kendall Hall, Elstree (gr. Mr. W. Craiger), were Leeks, Celery, Onions and Tomatoes.

The Hon. VICARY GIBBS was the only competitor in the class for nine distinct kinds, and he deservedly received the 1st prize.

W. H. MYERS, Esq., Swanmore Park, Bishop's Waltham (gr. Mr. G. Elwood), arranged the best collection in the class for six kinds of vegetables. In this exhibit Ailsa Craig Onions, Autumn Mammoth Cauliflower, and Leeks were exceptionally fine. 2nd, J. KERR, Esq., Loudwater, Rickmansworth (gr. Mr. J. Avery), who showed very fine Onions and Tomatoes. 3rd, H. KEEP, Esq., Aldermaston.

The best collection of 12 varieties of Potatoes was shown by Mrs. H. DENISON, Little Gaddesden, Berkhamsted (gr. Mr. A. Gentle), the best varieties being *Purple Eyes*, *Duchess of Cornwall*, and *Snowball*. 2nd, A. BASILE, Esq., Woburn Park, Weybridge.

The 1st prize for the smaller collection of Potatoes was won by the Hon. VICARY GIBBS, who showed excellent tubers of Sutton's *Ideal* and *Edgecote Purple*. 2nd, W. H. MYERS, Esq.; 3rd, H. T. TATHAM, Esq.

The Onions shown were immense and solid bulbs of such even quality that we did not envy the judges their task of discriminating between the two leading exhibits. 1st, Hon. VICARY GIBBS; 2nd, the Duke of PORTLAND; 3rd, A. B. H. GOLDSMITH, Esq., Caversham Park, Suffolk (gr. Mr. G. Hatch).

The nine kinds of salads which won the 1st prize in a class for these vegetables for the Hon. VICARY GIBBS were attractively set out, and they presented an appetising appearance. Mounds of Mustard and Cress rose up from a bed of cool green Parsley, on which lay a brace of fine Cucumbers and Beet, perfect in shape and colour. 2nd, H. T. TATHAM, Esq.

The 1st prize for six kinds of salads was won by W. H. MYERS, Esq. 2nd, B. HENDERSON, Esq., Epping House, Little Berkhamsted (gr. Mr. H. Smith).

A class was provided for nine distinct kinds of vegetables other than those already mentioned. The 1st prize was won by the Hon. VICARY GIBBS, who showed an interesting collection of such kinds as *Capsicum Golden Dawn*, *Long Purple Egg plant*, and very fine *Kohl Rabi*. 2nd, W. H. MYERS, Esq.

SINGLE DISHES.

The remaining 32 classes were for single dishes of the various kinds of vegetables. As was only to have been expected, the entries for Peas were not very numerous. Only two varieties (Mr. Gladstone and Sutton's *Latest of All*) were shown. All the Beans were exceedingly good, and the Cauliflowers were fine and of pure colour. The Celery and Leeks were immense, as also were the Onions. The Beets shown were good, clean roots of rich colour; but in the class which had largest entries, that for Vegetable Marrows, the same high quality was not present—many of the Marrows were too old.

ORSETT AND DISTRICT AGRICULTURAL AND HORTICULTURAL.

SEPTEMBER 7.—This society held its 17th annual exhibition on the above date in the grounds of Orsett Hall, the residence of the President, Major Whitmore, in ideal weather. Nineteen classes were provided for hardy fruit.

Mr. T. RIDGWELL, Orsett, showed the best dozen dessert Apples of any one variety in a grand dish of Worcester Pearmain. Mr. E. NEIGHBOUR followed closely with handsome, highly-coloured fruits of Quarrenden. Major WHITMORE had the best dish of Pears in the variety Pitmaston Duchess, Mr. T. RIDGWELL being a close 2nd with Clapp's Favourite.

Mr. E. NEIGHBOUR was awarded the 1st prize in the class for a collection of eight dishes of hardy fruit (two dishes of one kind being permitted), Mr. T. RIDGWELL was a good 2nd. Good examples of Apples, Pears, and Plums (including Pond's Seedling, Monarch White, Magnum Bonum and Jefferson), Morello Cherries, Figs, and Peaches were shown in both collections. There were nine exhibits in this class. The class for a collection of four kinds also created a keen competition. Mr. M. DORSETT, North Ockendon, was placed 1st and Mr. McIVER, Orsett, 2nd. Mr. T. RIDGWELL had the best four dishes of Pears. Mr. W. SUTTON excelled in the class for four dishes of Plums, staging Pond's Seedling, Jefferson, Belgian Purple, and Sultan. Mr. E. NEIGHBOUR was 1st in the Grape classes, showing medium-sized bunches of Black Hamburgh.

In the special classes for Apples grand specimens were staged. The class for the best half-sieve of any one variety of Apple packed ready for market excited a keen competition. Mr. T. RIDGWELL, Orsett, was awarded the 1st prize, showing Worcester Pearmain; 2nd, Mr. W. SUTTON, Orsett, with the same variety.

Messrs. M. DORSETT, J. IBBS, and E. NEIGHBOUR were the most successful exhibitors in the classes for plants in pots, and Messrs. D. McIVER, J. JESSOP, J. BROUGHTON, and E. NEIGHBOUR were winners of 1st prizes in the cut flower classes. Mr. NEIGHBOUR and Mr. W. CHILD were 1st for collections of nine kinds and six kinds of vegetables respectively in the order in which their names are given.

MANCHESTER AND NORTH OF ENGLAND ORCHID.

SEPTEMBER 14.—Committee present: Z. A. Ward, Esq. (in the Chair); and Messrs. R. Ashworth, W. R. Lee, C. Parker, H. Thorp, J. C. Cowan, J. Cypher, W. Holmes, A. J. Keeling, F. K. Sander, and H. Arthur (secretary).

Z. A. WARD, Esq., Northenden (gr. Mr. Weatherby), was awarded a Silver-gilt Medal for a magnificent group of Cattleyas of the Iris section, prominent amongst which was a fine form named Ward's variety, to which a First-class Certificate was awarded. A Cultural Certificate and Bronze Medal were granted to the gardener for the excellent condition of the Cattleyas.

Col. J. RUTHERFORD, M.P., Blackburn (gr. Mr. Lupton), staged a group of Cattleyas and Cypripediums, for which a Silver Medal was awarded. Cattleya Gaskelliana alba, C. Dominianum langleyense, C. Iris sanguineum, Cypripedium Rossettii, C. chortlonii, and Lycaste Skinneri alba were all very good.

W. R. LEE, Esq., Heywood (gr. Mr. Woodhouse), was awarded a Silver Medal for a group of choice plants, including Cattleya Thurgoodiana var. Nobilior, for which a First-class Certificate was awarded; C. Gaskelliana alba, C. Mrs. John Leeman (aurea × Digbyana), and C. Maqueda.

Dr. HODGKINSON, Wilmslow (gr. Mr. Moore), staged an interesting plant of Lælia tenejalis (grandis tenebrosa × majalis).

R. ASHWORTH, Esq., Newchurch (gr. Mr. Gilden), staged an unnamed variety of Cataseum macrocarpum; the plant received an Award of Merit.

J. MCCARTNEY, Esq., Bolton (gr. Mr. Holmes), staged L.-C. Rubens var. magnifica (Award of Merit), a good variety.

Messrs. J. CYPHER & SONS, Cheltenham, were awarded a Silver Medal for a group containing Cypripedium triumphans, C. Niobe superbum, C. Milo, C. Leonæ, C. Fairrieana, Miltonia spectabilis

Moreliana, a dark-flowered variety; Vanda cœrulea, and Odontoglossum grande.

Messrs. KEELING & SONS, Bradford, staged a group to which a Bronze Medal was awarded. Cypripediums predominated, the best being C. Kimballianum, C. Lord Derby, C. Rolfeæ superbum, and C. Charlesworthii.

Messrs. HASSALL & Co. staged a few plants of merit, including Cattleya iridescens (bicolor × Eldorado) var. Cuprea, an unnamed hybrid, (Harrisonæ × Iris), Lælio-Cattleya Walter Gott, and Cypripedium Harefield Hall × Hitchinsiae.

Mr. ED. V. LOW, Haywards Heath, staged Cattleya Gaskelliana var. Phyllis, Cattleya Adula, Cypripedium mirabilis, and C. Amboyne.

Mr. W. SHACKLETON, Great Horton, Bradford, staged a plant of Cypripedium Lord Ossulston Chillingham variety.

AWARDS.

FIRST-CLASS CERTIFICATES.

Cattleya Thurgoodiana var. *nobilior*.—A splendid flower of good form and substance.

Dendrobium Phalaenopsis Colmanii.—A large, full flower. Both shown by W. R. LEE, Esq., Heywood (gr. Mr. Woodhouse).

Cattleya Iris Ward's var., from Z. A. WARD, Esq., Northenden (gr. Mr. Weatherby).—One of the finest forms of the type, the sepals and petals being very brilliantly coloured and with an intense colour in the lip.

AWARDS OF MERIT.

Lælio-Cattleya Maqueda (Geo. Woodhams × Lord Rothschild), from W. R. LEE, Esq. *Cattleya Adula* var. *Maronii*, C. Iris "St. Giles," and C. "No. 3," all from Z. A. WARD, Esq. (gr. Mr. Weatherby). *Lælia tenejalis* (L. grandis tenebrosa × L. majalis), from Dr. HODGKINSON, Wilmslow (gr. Mr. Moore). *Cataseum macrocarpum*, from R. ASHWORTH, Esq. (gr. Mr. Gilden). *Lælio-Cattleya Rubens* var. *magnifica*, from J. MCCARTNEY, Esq., Bolton (gr. Mr. Holmes). *Cattleya iridescens* var. *Cuprea* (C. bicolor × C. Eldorado), from Messrs. HASSALL & Co., Southgate, and *Miltonia Crashlayana* var. *alba*, from Messrs. A. J. KEELING & SONS, Bradford.

NORTH OF ENGLAND HORTICULTURAL.

SEPTEMBER 20.—The monthly meeting of the above society was held at the Emmanuel Hall, Leeds, on this date. Numerous exhibits were staged in the plant and floral section, and the Committee awarded the following Medals:—

PLANTS AND FLOWERS.

The PLANT and FLORAL COMMITTEE made the following Awards of Medals:—

Large Silver-gilt Medal to Messrs. GIBSON & Co., Leeming Bar, Bedale, for hardy flowers.

Large Silver Medal to Messrs. HARKNESS & SON, Bedale, for hardy flowers.

Silver Medals to Messrs. E. J. BATCHELOR & SON, Harrogate, for herbaceous flowers, annuals, and Roses; Messrs. SEAGRAVES & Co., Sheffield, for border Chrysanthemums; and Messrs. YOUNG & Co., Cheltenham, for Carnations.

Large Bronze Medal to Messrs. J. BACKHOUSE & Co., York, for hardy flowers, with a central group of *Colchicum speciosum*.

Bronze Medals to Messrs. W. J. JARMAN, Ripon, for Peony-flowered Dahlias; Messrs. CLIBRAN & SON, Altrincham, for hardy Chrysanthemums; and Messrs. S. BROADHEAD & SON, Huddersfield, for hardy flowers, including Alpines.

ORCHIDS.

The ORCHID COMMITTEE awarded the following Medals to groups of Orchids:—

Silver Medals to Mr. E. V. LOW, Haywards Heath, Sussex; and Messrs. MANSELL & HATCHER, Rawdon.

Large Bronze Medal to G. W. JESSOP, Esq., Rawdon (gr. J. Wilkinson).

FRUIT AND VEGETABLES.

The FRUIT and VEGETABLE COMMITTEE made the following Awards:—

Large Gold Medal to Messrs. SUTTON & SONS, Reading, for vegetables.

Large Silver-gilt Medal to Mr. W. LAWREN-SON, Yarm-on-Tees, for Apples and Pears.

Large Bronze Medal to the Hon. Mrs. G. W. WINN, Walton Hall, Wakefield, for a collection of Apples.

Silver Medals to Miss MAXWELL STUART, Tadcaster (gr. Mr. J. Haynes), for Apples.

AWARDS.

FIRST-CLASS DIPLOMA.

Colchicum speciosum album, shown by Messrs. J. BACKHOUSE & SON, York.

SECOND-CLASS DIPLOMA.

Cattleya Adula, shown by Mr. E. V. LOW, Haywards Heath.

NATIONAL DAHLIA.

SEPTEMBER 20, 21.—The Metropolitan show of the National Dahlia Society, being the second this season, was held in the Royal Botanic Society's Gardens on these dates. The blooms exhibited were of excellent quality, and the show was one of the finest exhibitions of Dahlias, embracing all sections, that has been seen during the present year.

In the class for three vases of Cactus Dahlias, distinct, put into commerce for the first time in 1909-10, Mrs. M. V. SEALE, Sevenoaks, was awarded the 1st prize, for Mary Purrier, Prima Donna, and Johannesburg. The same firm won the 1st prize for Pompon Cactus varieties.

Mr. S. MORTIMER, Rowledge, Farnham, secured the leading place for 24 show and fancy Dahlias, whilst Messrs. J. CHEAL & SONS, Crawley, excelled in the class for 12 blooms.

In the principal class for Cactus-flowered varieties, Messrs. J. STREDWICK & SON, St. Leonards, again won the 1st prize, with beautiful blooms of Indomitable, Olympic, Orion, Elite, Golden Wave, Uranus, and similar varieties. 2nd, Messrs. J. CHEAL & SONS.

Mrs. M. V. SEALE was awarded the 1st prize for 24 Cactus blooms, distinct, arranged on boards, and Mr. CHARLES TURNER, Slough, was awarded the 1st prize for 12 varieties, distinct. Mrs. M. V. SEALE won the 1st prize in the class for 12 varieties of Pompons, in bunches of 10 blooms each, and Messrs. J. CHEAL & SONS gained a similar success for 12 single varieties.

Mr. CHARLES TURNER was awarded the 1st prize for six vases of Peony-flowered Dahlias, and also for six varieties of giant decorative varieties, six blooms of each variety, arranged in vases.

AMATEURS' CLASSES.

For nine Cactus varieties, in bunches of three blooms each, Mr. F. W. FELLOWES, The Lane House, King's Walden, obtained the 1st prize, the Rev. ARTHUR BRIDGE, Worth Rectory, and Mr. F. GRINSTED being placed 2nd and 3rd respectively.

In the class for 12 blooms of Cactus-flowered varieties, distinct, shown on boards, there was a keen competition. Mr. H. PEERMAN, Nantwich, was placed 1st; the Rev. G. TWENTYMAN, New Barnet (gr. Mr. W. Lockyer), 2nd; and Rev. ARTHUR BRIDGE, 3rd.

Mr. CHARLES LUCKIN, Thakeham, excelled in the class for 12 blooms in four varieties.

Mr. A. P. IRONSIDES, Chippenham, showed the best Pompon varieties; and the Rev. ARTHUR BRIDGE was placed 1st for single-flowered varieties.

AWARDS.

FIRST-CLASS CERTIFICATES were awarded to the following varieties:—

Golden Wave (Cactus).—A pure yellow variety.

Frederick Wenham (Cactus).—The colour of this variety is apricot, with a yellow centre.

Sunlight (garden Cactus).—A yellow variety, tinted with apricot. These three were shown by Messrs. J. STREDWICK & SON.

Florrie Wells (Cactus).—The colour is rich red, shaded with violet. Shown by Mr. H. SHOESMITH.

Mahdi (single).—A deep maroon variety. Shown by Messrs. J. CHEAL & SONS.

Diadem (collarette).—A deep rose-pink flower, with a white collar.

Leitstern (collarett).—The florets are deep red, set off by a white collar. These last two were shown by Messrs. DOBBIE & Co.

NON-COMPETITIVE EXHIBITS.

A fine stand of Dahlias, embracing all sections of the flowers, and Roses in variety, were shown by Messrs. HOBBIES, LTD., Dereham. (Large Gold Medal.)

Gold Medals were also awarded to Mr. J. T. WEST, Brentwood, Messrs. J. BURRELL & Co., Cambridge, and Messrs. T. S. WARE, LTD., Feltham, for exhibits of Dahlias.

Silver-gilt Medals were awarded to Messrs. DOBBIE & Co., Edinburgh, for a collection of collarett Dahlias, many of which were quite new; and to Messrs. JAMES CARTER & Co., Forest Hill, for Pæony-flowered and other Dahlias. Mr. CHARLES TURNER, Slough, and Mr. J. B. RIDING, Chingford, were both awarded Silver Medals.

Messrs. S. SPOONER & SONS, Hounslow, staged a collection of Apples, for which a Gold Medal was awarded.

Obituary.

ALEXANDER M'LAREN.—We regret to record the recent death of Mr. Alexander M'Laren, gardener to the Duke of Fife, at Mar Lodge, Braemar, Aberdeenshire. Mr. M'Laren, who was a native of Ardbeg, was 73 years of age. He had been gardener at Mar Lodge for about 50 years. He is survived by a widow and six children.

EDWIN MIZEN.—This well-known market gardener died suddenly on the 9th inst. at Eastfields Farm, Mitcham. Mr. Mizen was born at Ashdown, Essex, and commenced business as a market gardener in Battersea about 50 years ago. He was eminently qualified for the work he had taken up, and success followed his efforts, with the result that 44 years ago he removed to Mitcham, where he conducted a large market garden. His principal indoor crops were Tomatos and Mushrooms, but out-of-doors the crops were of a general character. Mr. Mizen was actively engaged in his business up to the time of his death, but his energies had been somewhat impaired by an accident which occurred last spring. His sudden death was due to heart failure.

TREES AND SHRUBS.

QUERCUS VELUTINA.

So far as foliage is concerned, this is one of the most ornamental of the American Oaks, the dark green leaves being large and handsome, ranging sometimes up to 10 inches in length and 6 inches in width, with a few well defined lobes. The bark of the younger branches is yellow or orange coloured, from which peculiarity the common name of Yellow Bark Oak is derived. The species is described in Sargent's *Silva of North America*, being found growing wild in rocky or sandy soil from Maine to Ontario, and as far south as Florida and Texas. Under normal conditions the tree attains to a height of from 60 feet to 70 feet, with a trunk $3\frac{1}{2}$ feet in diameter, and there would appear to be no reason why its maximum dimensions should not be attained in gardens in this country. Planted as a specimen tree on a lawn or in a park, it cannot fail to attract attention, for its distinct foliage is at once noticeable amongst other trees. The variety *rubrifolia*, which is known as the "Champion Oak," has even larger foliage than the type, and the growth is of a very vigorous character. Acorns provide the most suitable means of raising a stock of plants of *Q. velutina*, and there should be no difficulty in obtaining a supply from the American nurserymen. W. Dallimore.

GARDENING APPOINTMENTS.

[Correspondents are requested to write the names of persons and places as legibly as possible. No charge is made for these announcements, but if a small contribution is sent, to be placed in our collecting box for the Gardeners' Orphan Fund, it will be thankfully received, and an acknowledgment made in these columns.]

Mr. THOMAS YOUNG, for the past 8 years Superintendent of the gardens of the Crichton Royal Institution, and previously Gardener at Kinloch Castle, Rum, and Hart-rigge, Jedburgh Warren Tower, Newmarket, as Gardener to Mrs. WILSON, Belvoir Park, Belfast.

Mr. ALEXANDER MACDONALD, for the past 2½ years Foreman in the gardens of Lord ELPHINSTONE, Carberry Tower, Musselburgh, as Gardener to Lord CLINTON, Stevenstone Gardens, Torrington, Devonshire.

Mr. J. S. HIGGINS, for the past 8½ years Gardener at Rüg Gardens, Corwen, N. Wales, as Gardener to the Hon. F. G. WYNN, Glynllivon Park, Carnarvon, N. Wales.

Mr. E. M. MUTLOW, for the past 8 years Gardener to A. G. HAYMAN, Esq., Hapsford House, Frome, Somersetshire, as Gardener to F. H. FAWKES, Esq., Farnley Hall, Otley, Yorks. (Thanks for 1s. 6d. received for the R.G.O.F. box.—Eds.)

Mr. T. WHITING, for the past 2 years Gardener to the late Mrs. MILLER, Shotover Park, Wheatley, Oxfordshire, as Gardener to Colonel A. D. MILLER, D.S.O., at the same place.

Mr. JOHN M. ANNAND, Foreman at Brucklay Castle Gardens, Aberdeenshire, as Gardener to BRODIE OF BRODIE, Esq., Brodie Castle, Forres.

Mr. T. HILL, for the past 9½ years Gardener at Woolton House, Newbury, as Gardener to the Rev. CHARLES F. TOWNLEY, Fulbourne Manor, Cambridge.

Mr. W. EDGERTON, for the past 16 months Foreman in the gardens at Whitley Abbey, Coventry, as Gardener to A. H. HEATH, Esq., Street Ashton Lodge, Streton-under-Fosse, Lutterworth.

Mr. A. C. PARSONS, recently Gardener to the late Mrs. HOLZ, Waratah, Chislehurst, Kent, as Gardener to HUGH ACLAND TROYTE, Esq., Huntsham Court, Bampton, North Devon.

Mr. W. NICHOLLS, for the past 11 years Gardener to C. SHEPHERD-CROSS, Esq., The Oaklands, Preston Brook, Cheshire, as Gardener and Bailiff at The Training College, Warrington.

Mr. E. SANDERS, for the past 4 years Gardener to Major A. F. WATT, Hemingford Grey, St. Ives, Huntingdonshire, as Gardener to F. MEYRICK JONES, Esq., Home Place, Holt, Norfolk.

Mr. A. BURFOOT, for the past 3½ years Foreman at HONEYS, Twyford, Berkshire, as Gardener to R. MILLS, Esq., Stevenston Manor, Whitchurch, Hampshire.

Mr. W. H. HAWTHORN, for the past 11 years General Foreman in the gardens at Frensham Hill, Farnham, Surrey, as Gardener to C. E. N. CHARRINGTON, Esq., Broadoaks, West Byfleet, Surrey.

Mr. J. B. LOWE, for the past 3 years Gardener to GEOFFREY LUBBOCK, Esq., Broadoaks, West Byfleet, Surrey, as Gardener to the same gentleman at Greenhill, Sutton Veny, Warrminster, Wilts. (Thanks for 5s. sent for R.G.O.F. box.—Eds.)

Mr. R. J. LOVE, for the past 12 months Gardener and Orchid Grower to A. G. GROVES, Esq., Horfield Lodge, Horfield, Bristol, as Gardener to Dr. HENSON, Elmsett Hall, Wedmore, Somersetshire.

Mr. HARRY SKINNER, for the past 2½ years Foreman in the Pleasure Grounds at Shendish, King's Langley, Hertfordshire, as Gardener to KENNETH WALKER, Esq., Tegfynydd, Llanfalletg, Carmarthenshire, South Wales.

Mr. F. LAILEY, for the past 5 years at Elvetham Hall, as Gardener to Miss R. A. BURRELL, Fairthorn Manor, Botley, Hants.

Mr. C. HOBBS, for the past 7 years Gardener to G. F. S. WARNE, Esq., Frolbury Manor, Abinger, as Gardener to G. P. DOOLETTE, Esq., Merlebank, Caterham Valley.

DEBATING SOCIETIES.

GUILDFORD AND DISTRICT GARDENERS'.

A meeting of the above association was held at the Workman's Hall on the 19th inst.; Mr. G. Johnson presided. Mr. G. Carpenter, of West Hall Gardens, Byfleet, read a paper on "Outdoor Peach Culture." Mr. Nichols exhibited a collection of Apples, and Mr. Edwards two dishes of Pears.

CROYDON & DISTRICT HORTICULTURAL.

A well-attended meeting of this society was held at the Sunflower Temperance Hotel, Croydon, on the 19th inst., when a lecture was given by Mr. D. B. Crane on the "Viola." Mr. Crane said that seeds may be sown during July in a cold frame, and the seedlings should be allowed to grow sturdily until their flowering stage is reached. To get a stock which shall be true to colour and type cuttings are best, and these root easily enough. They should always be taken from the base of the plants, as stem cuttings rarely succeed. Spring is the best time for taking the cuttings, and they should be inserted in frames facing south so as to get as much sunshine as possible. July is also a good month to take cuttings, using a cold frame sheltered from the sun; by the first or second week in October they may be planted out.

READING GARDENERS'.—The opening meeting of the autumn session of this association took place in the Abbey Hall on the 18th inst.; the president, Mr. F. B. Parfitt, occupied the chair, and there was a very large attendance. The successful candidates at the examination held at the conclusion of the evening classes conducted under the auspices of the Reading University College last winter and spring were presented with certificates. Mr.

Alexander Dean gave a lecture on "Floral Ideals," in which he explained the meaning of the term "florist flowers," as generally understood, and proceeded to give a masterly and exhaustive address exemplifying the long and patient efforts of the horticulturists 50 or 60 years ago in the production of what they considered to be perfection of form and colour in various flowers. Their ideals demanded perfect symmetry in appearance with precision and regularity in marking. Modern ideas of artistic beauty tend in the opposite direction; indeed, the lecturer remarked, the shaggy and uneven Cactus and other Dahlias which were now popular would have appealed but little to Glenny and his contemporaries, and he (Mr. Dean) confessed that his sympathies were all with the old notions, and contended that many beautiful ideals of the florist of 50 or 60 years ago had been modified in the wrong direction. The present generation aimed at size, and to secure this florists were prepared to sacrifice not only form but perfume. As types of successful culture and selection he instanced the Auricula, gold-laced Polyanthus, Carnation, Hollyhock, Dahlia, Pansy, Viola, Pentstemon, Primula, Sweet Pea and Rose, fully explaining the points aimed at by the florists in the production of perfect blooms of each kind.

THE WEATHER.

THE FOLLOWING SUMMARY RECORD of the weather throughout the British Islands, for the week ending September 23, is furnished from the Meteorological Office:—

GENERAL OBSERVATIONS.

The weather continued fine and dry in nearly all districts until about the middle of the week, when a decided change occurred. Rain fell very generally on Tuesday and Wednesday and again on Saturday, but in the interval the conditions over England were mostly fair. Thunderstorms occurred in many parts of the country on Wednesday and Thursday.

The temperature was below the average in all districts, a condition of things that had not prevailed since the closing week of June. Over North Britain the deficit was slight, but in the Midland Counties and England S.W. it amounted to more than 2.5°, and in England S.E. to 3.5°. The highest readings occurred mostly either on the 19th or 20th, but as a rule the thermometer failed to reach 70°, and in Scotland W. and England N.W. it did not touch 65°. The lowest readings were observed in the latter half of the week when the thermometer in the screen sank below the freezing point in many parts of Great Britain, and touched 24° in Scotland E. (at West Linton). On the surface of the grass the lowest temperatures reported were 18° at Llangammarch Wells and 22° at Balmoral, Hereford and Marlborough.

The mean temperature of the sea was again higher than during the corresponding week of last year, the difference being rather large around the east and south-east coasts of England. The means for the week ranged from nearly 63° at Eastbourne and the Shipwash and 61° at Newquay to between 51° and 53 off the North of Scotland.

The rainfall was in excess of the average in all districts excepting Scotland E. and W.—largely so in England S.W. and the English Channel. The heaviest daily amounts occurred on the 19th and 20th; on the former date 1.1 inch was recorded at Glencarron and 1.2 inch at Aspatria.

The bright sunshine exceeded the normal in the eastern and central parts of Great Britain, as well as in the north of Ireland, but was deficient in the western districts generally. The percentage of the possible amount ranged from 58 in England S.W. and 56 in England E. to 22 in England N.W. and to 19 in Scotland N.

THE WEATHER IN WEST HERTS.

Week ending September 27.

The thirteenth dry week in succession.—During the daytime the temperature has been as a rule rather above the average, while on the other hand the nights were mostly cold, and some very cold for the time of year. The exposed thermometer on two nights registered respectively 2° and 3° of frost. The ground is, at the present time, 2° warmer at 2 feet deep, and 3° warmer at 1 foot deep, than is seasonable. Rain fell on three days, but to the total depth of only about a quarter of an inch. There was no percolation through the turfed or bare-soil gauge; indeed, it is now 12 weeks since any rainwater at all has come through either of these gauges. The sun shone on an average for 6½ hours a day, or for 2½ hours a day longer than is usual at the same period in September. Calms and light airs have, as a rule, prevailed during the week. The mean amount of moisture in the air at 3 p.m. fell short of a seasonable quantity for that hour by as much as 15 per cent. E. M., Berkhamsted, September 27, 1911.

CATALOGUES RECEIVED.

BROWN & SONS, 31, Bridge Street, Bristol—Bulbs.
THOMAS RIVERS & SON, Sawbridgeworth—Fruit Trees, Roses, and Shrubs.
H. CANNELL & SONS, Swanley, Kent—General List of Nursery Stock.
WM. CUTBUSH & SON, Highgate Nurseries, London—Strawberries.
KARL THERKILDSEN, Avenue Road, Old Southgate, London—Roses.

FOREIGN.

GEMEN & BOURG, Luxembourg—Roses.
ERNST BENARY, Erfurt, Germany—Seeds.

REMARKS.—All varieties of English Apples are still very plentiful, especially Cox's Orange Pippin, which is particularly fine this season. There is a better trade for English Pears. The first consignment of Pears from Washington State, U.S.A., arrived this week; the fruit is exceptionally fine and packed in boxes containing four to six dozen fruits; the Californian Pears are also good. The Plum season is nearly over, there being only a few fruits of Pond's Seedling, Monarch, and Bush Plums. Californian Plums are arriving in an over-ripe condition. Grapes from all sources are a very plentiful supply, especially Channel Island varieties. Sales can only be effected at low rates. English Peaches are nearly over, also those from France and Belgium, but there are good Peaches from Washington State, U.S.A. A shipment of Peaches is expected to arrive from Ontario during the present week. Cobnuts are very plentiful and good, and are selling freely. Walnuts, both English and French, are a good supply, but the Nuts are small. Supplies of Tomatoes continue plentiful, the second crop being a very good one; there is a slight increase in their value. French Tomatoes are also good; these are packed in crates weighing about 18 lbs., selling at from 1s. 6d. to 1s. 9d. per crate. Field

Mushrooms are plentiful and cheap, but cultivated Mushrooms are rather scarce. There is a slight increase in the supply of vegetables, with a slight decrease in prices generally. E. H. R., Covent Garden, September 27, 1911.

REMARKS.—Prices are firmer and there is every probability of a further rise. Edward J. Newborn, Covent Garden and St. Pancras, September 27, 1911.

APPLES SPOTTED: J. P. C. There is no disease present in the fruit. The injury was caused by the hot weather.

BEGONIA UNHEALTHY: T. J. Finch. No disease is present in the plant. The damping of the foliage of Begonias of the Gloire de Lorraine type is a common occurrence. It is due to an excessively moist, close atmosphere. Keep the plants and their surroundings drier and ventilate the house freely, standing the pots well apart.

BULBS ROTTING: Daffodil. The bulbs are badly infested with the bulb mite. Those which are still sound should be dusted thoroughly with flowers of sulphur.

CATERPILLAR FOR NAMING: J. E. R., Ripple Hall. The caterpillar sent us is that of the pale Tussock moth (Dasychira pudibunda), and is known as the "Hop-Dog." The caterpillar feeds on Hops, Roses and other plants.

CELERY AND TOMATOS DISEASED: Perplexed. The Celery leaves are injured by the Celery leaf blight. (Cercospora Apii). It is too late to save the crop. Next season the Celery plants should be sprayed with an ammoniacal carbonate of copper solution when they are young, repeating the sprayings occasionally during the period of growth. The Tomatos are attacked by the Tomato Black Rot (Macrosporium Tomato). This is the most common fungus attacking Tomatos. Guard against extremes in affording water, in the use of green manure or anything which is likely to cause the fruits to crack. All fruits that show signs of disease should be taken off and burnt. It will be desirable to spray the plants occasionally with potassium sulphide, particularly when they are setting their fruits. Renew the air in the house when the weather is favourable, and avoid having too much moisture in the atmosphere.

CEROPEGIA SANDERSONII: L. G. P. This Ceropegia is a native of Natal, and requires a warm greenhouse or cool stove to grow it successfully. Soil in which ordinary greenhouse plants are potted, composed of peat and fibrous loam with a liberal admixture of sand, will suit it. The plant should be afforded moist conditions during its season of active growth, but needs to be kept moderately dry during its period of rest. It is the seed parent of the first recorded hybrid of the genus C. hybrida N.E.Br. (see Gardeners' Chronicle, December 8, 1906, p. 383). The genus is only found growing in the Old World, but is widely distributed in the tropical and sub-tropical latitudes from the Canary Islands to the Philippines. Nearly 200 species are known, but not more than about 30 are in cultivation. They are not showy plants, but the flowers are very interesting.

CORRECTION.—In the report of the Sandy flower show (see p. 228), Mr. Birkenshaw was described as gardener to Miss Fitzpatrick. It should have read Mr. H. Tysoe.

CUCUMBERS DISEASED: J. D. The Cucumbers sent are badly injured by Colletotrichum oligochaetum. The diseased leaves should be removed and burned and the plants afterwards sprayed with liver of sulphur.

GARDEN SLOPING NORTH: Lady Penzance. You ask for instructions how to lay out a garden of seven-eighths of an acre, situated 550 feet

above sea level, facing north and with a chalk soil. Also what is the best manure and the most suitable flowers, vegetables, and fruits to cultivate. It will be wise to add as much dark soil as possible to the land, and the leaf-mould, which, you say, is at hand, will be valuable for this purpose. The pig manure, which will help to conserve moisture, will be the better of the two organic manures you mention. Many Roses, especially the Wichuriana hybrids, should do well, but you must not expect to grow fine Hybrid Perpetuals. A trial of the Tea, Polyantha, and Rugosa Roses may be made with every expectation of moderate success. The conditions would not be favourable to Sweet Peas, but Carnations may be grown. Other suitable flowering plants are Doronicum, Stocks, German Irises, Wallflowers, Sweet Williams, Pinks, Scabiosa, Campanulas, Lupines, Helenium (especially Riverton Gem), Coreopsis, Michaelmas Daisies, and many annuals. Peas and Beans are not suitable, nor would you be able to grow good Parsnips, but if the stump-rooted Carrots and the turnip-shaped Beet are chosen, these and nearly all other vegetables may be grown. The best standard Apples are Alfriston, Allington Pippin, Cockle's Pippin, Duchess of Oldenburg, Hambling's Seedling, Lane's Prince Albert, Lord Derby, Newton Wonder, Stone's Apple, Dumelow's Seedling, Worcester Pearmain, and Yellow Ingestre. Pears should be grafted on the Pear or "free" stock, and be selected from the following sorts:—Beacon, Beurré Bosc, Conseiller de la Cour, Emile d'Heyst, Marie Louise, and Souvenir du Congrès. Of Cherries you should select Early Rivers, Frogmore Early Bigarreau, Late Duke, May Duke, and Tartarian. (See reply to A. C. B. on a similar question in the issue for August 12, p. 120.)

GOOSEBERRIES FOR A ROXBURGHSHIRE GARDEN: J. S. E. The following varieties are suitable for your purpose:—Whinham's Industry, Early Sulphur, Preston Seedling, Bright Venus, Keepsake, Langley Beauty, Crown Bob, Roaring Lion, Leveller, and either Ironmonger or Red Champagne, Whitesmith and Red Warrington.

GRAPES DISEASED: J. C., Hadnall. The rust found on the Grapes is caused by the presence of moisture on the fruit. The house should be ventilated early in the morning, so that the fruit will become dry before the temperature rises. No fungous disease is present.

INSECTS FOR NAMING: G. Spragg. The two insects sent are (1) the adult of a cuckoo-spit insect (*Philænus* sp.), and (2) a bug belonging to the genus *Anthocoris*. Both were so damaged that the species cannot be determined. The former is injurious to many plants, including Chrysanthemums. The latter is beneficial and feeds on aphides, leaf hoppers, &c. The ill-effects shown in the brown patches on the leaves is not due to the insects; the damage is pathological and is frequently due to some climatic check or wrong treatment in cultivation. The discoloration usually disappears later in the season.

MOLES: Perplexed. A good plan to get rid of moles in small gardens is to mix half a peck of slacked lime in 20 gallons or so of water, and pour the mixture into one of the holes; chloride of lime may also be recommended.

NAMES OF FRUITS: A. W. B. 1 and 3, decayed 2, Small's Admirable; 4, Dumelow's Seedling (Wellington); 5, Whiting Pippin; 6, Royal d'Angleterre.—A. G. RHODODENDRON BLOOMING: T. F. It is not uncommon for Rhododendrons to develop a few blossoms at this season.

ROSES: A. G., Cardiff. The variety Conrad F. Meyer succeeds very well on a wall. The Rev. F. Page Roberts grows it in this position, and thinks that, owing to the splendid ripening it gets when cultivated on a wall, it is more free-flowering than in any other position. This is worth noting, because the fault of Conrad F. Meyer is that, although a beautiful Rose and exceptionally hardy, it is not very free in the production of blossoms. It is, of course, capable of growing into an enormous bush if given free scope. We call to mind a plant growing in a garden in the Midlands which is already from 10 to 12 feet high and 8 feet through. The question for you to determine is whether you like Conrad F. Meyer sufficiently to devote the valuable space given by a wall to this Rose. Something depends on the aspect of the wall, which is not stated, and whether you might not be better remunerated by using some free-flowering Rose, such as Climbing Caroline Testout, or, if the wall faces south, Climbing Pape Gontier or Climbing Mrs. W. J. Grant. In respect to your second question, we may say that there are many Hybrid Perpetuals which often take some years to get established after being moved, and we are not surprised at Charles Lefebvre acting in this way. Victor Hugo is another Rose that dislikes moving. General Jacqueminot, however, is one of the freest of the H.P.s, and we should not have expected it to act in this way if proper cultivation has been followed. In the London district one might expect to find a border against a wall somewhat dry for H.P.s, but this is unlikely at Cardiff, where the average rainfall is half as much again as in London. Was the border well made before the Roses were planted? This is often a cause of trouble. However, as the Roses are now making good growth, and we have had a grand year for the ripening of the wood, they may be expected to flower well next year, if the shoot-boring sawfly, which often attacks the most vigorous shoots, is kept at bay. Mme. Léon Pain is a far better Rose than Viscountess Folkestone as a bedder. Not only is the colour and shape much more pleasing—which may be a matter of taste—but Mme. Léon Pain has

better foliage, gives a much larger proportion of good flowers, and flowers more continuously, while the buds are specially beautiful and the blossoms are held erect and look well both near and at a distance. Mme. Léon Pain is one of the very best bedding Roses of the taller-growing varieties. The weakness of Viscountess Folkestone is that, whilst it often gives a good Rose, it does not always do so, and the flowers are not well carried on account of its thin stems and rather floppy habit. We prefer to cultivate it as a standard rather than in a bed.

RUSH MATTING: Miss J. M. M. Under the general term of Rushes the stems of several species of marsh-growing or water plants are known commercially. All the species—perhaps in decreasing quantities—are used for making seats of chairs, hassocks, mats and baskets. *Juncus effusus* furnished the wicks for the old rush lights. Norfolk seems to have been the chief county where the raw material was dealt with, and an annual fair was held at Norwich, where large quantities were sold. The larger stems of the well-known Bulrush or Reed Mace (*Typha latifolia*) are also used for the coarser kinds of mats, while *Scirpus lacustris*, belonging to the Sedge order, and also known in some localities as Bulrush, is, or was, used in Norfolk for making baskets, hassocks, and similar articles. The specimen you send is insufficient for its accurate botanical determination, but it would seem to belong to a *Scirpus* rather than to the other plants mentioned. The following firms are dealers in rushes:—Messrs. S. A. Gosser & Co., 23, Moor Lane, Fore Street, London; Howard Walter & Co., 24, George Street, Tower Hill, London; and J. F. Ravinet & Co., 98, Southwark Street, London.

RUST ON PEAR: G. B., Westbury. The Pears are attacked by Pear-scab. All dead twigs should be cut from the tree. Next spring, when the leaves are beginning to unfold, spray the trees with Bordeaux mixture at half the usual strength.

VINE BORDER: H. Jones and Young Gardener. The best compost for a vine border is good, rich, fibrous loam procured from an old pasture, mixed with 5 cwts. each of old mortar rubble and $\frac{1}{2}$ inch bones to every five loads of the loam. A quantity of wood ashes or charcoal may also be added. First place the drainage in a proper order, and then arrange over the drainage materials some good turves with the greensward downwards. The most satisfactory method, if the existing vines are in a poor state, would be to burn them, and commence afresh with young ones, placing fruiting canes between the permanent vines with a view to removing the former when the latter require more room. The border in this case would be much better made up at intervals extending over three or four years. If the old vines are to be retained, the whole of the old soil should be removed, and if the roots are carefully preserved and the work carried out during October no harm will happen to them. Instead of planting young vines between them, train up a young growth from the bottom each year, subsequently removing the old rods. Young Gardener may plant the varieties he names, though it is not a good practice to plant too many varieties in the same vinery. If Muscat of Alexandria is included, plant this variety at the warmer end of the house. Muscat Hamburg would not be suitable.

VINE ROOTS: A. T. H. The vines are badly infested with eelworm. The only certain remedy is the injection of carbon bisulphide into the soil. A specialist in this matter would do the work most satisfactorily.

THE MARKET FRUIT GARDEN.

AUTUMNAL weather did not set in until the latter part of the last week of September, by which time we had enjoyed nearly four months of splendid summer, after two months of exceptionally warm and sunny spring. On the whole, the season since the end of March has narrowly missed being one of the most perfect seasons ever experienced in this country. A few more showers in May and a dripping June would have prevented the serious damage to orchards and gardens inflicted by the persistence of drought, even if the rainfall of July and August had been as deficient as it proved to be. The wonderful amount of sunshine and high temperature in themselves were entirely beneficial, and only a moderate degree of moisture in the soil was needed to render the conditions perfect. Lacking this moisture, the season proved one of the most unfortunate ever experienced for the vegetable crops of market gardens, and in some respects a bad one for fruit plantations. My own district is one of the many parts of the country that suffered severely from the drought, which was least interrupted in the eastern and south-eastern counties. My register of rainfall shows 0.67 inch for May, 1.94 inch for June, 0.28 inch for July, 0.83 inch for August, and 1.13 in. for September, making a total of only 4.85 inches for five

months, rain having been measurable on no more than 28 out of 153 days. If statistics for any great number of past years were available for the district, I imagine that this would prove a "record," and possibly the hours of sunshine which are not registered here would be beyond precedent. Now let me sum up the advantages and disadvantages of the extraordinary meteorological conditions just described, so far as fruit orchards are concerned.

ADVANTAGES.

The season has been one of the best ever known for clearing the land of weeds, a gain of no slight importance after two or three summers in which it was almost impossible to keep fruit plantations even approximately clean. The setting of fruit was helped by the abundance of sunshine and the absence of cold winds, which allowed insects to work freely in fertilising the blossoms. The efficiency of spraying was greater than usual, because there were no heavy falls of rain to wash off the ingredients of spray-stuffs. The markings of certain spraying mixtures, and particularly lime-sulphur-iron, used here experimentally in summer strength in two orchards, remained on the foliage for nearly three months.

One of the greatest benefits of the hot and sunny drought was the check which it gave to fungous diseases. There was not only the indirect advantage just mentioned, which affected fungus as well as insect attacks, but the direct influence as shown in the cases of unsprayed rows of trees left as checks. Consequently, Apples and Pears were more free from scab than I have ever before seen them, and the foliage of Black Currants has remained free from the leaf-rust which had attacked it in many previous seasons. Again, in this connection there was the greatest degree of immunity from powdery mildew and brown rot on Apple trees that has ever been noticed. It remains to be seen whether the extraordinary attack of brown rot on Plums, which occurred here in the spring, has been checked sufficiently to effect a permanent benefit.

The perfect ripening of fruit may also be mentioned to the credit of the sunny season, although the colouring of Apples might have been improved by more rain. So far as tested at present the keeping condition of Apples and Pears has proved exceptionally high, as might have been expected from the soundness and cleanliness of the fruit. The astonishing swelling of Apples to their full sizes characteristic of the several varieties, on well cultivated arable land, if not to greater sizes than usual, may be attributed to the high temperature of the soil, and regarded as having taken place in spite of the drought. This result did not extend to grass orchards, so far as my observations enable me to judge; nor did it extend to Plums, which, for reasons to be mentioned hereafter, were generally undersized.

No mean advantage was the exemption from gales and even from strong winds, which the settled weather insured up to the last day of September, when the first gale of the season occurred. Previous to

that date there were hardly any windfalls, properly so called, although there was much dropping of fruit.

Last, but not by any means least in importance among the advantages of the season that occur to me, is the thorough ripening of the young wood and fruit-buds of all kinds of fruit, which is a good augury for next year.

DISADVANTAGES.

The worst of the disadvantages incidental to the prolonged drought were the tremendous and persistent attacks of the aphid and the red spider on Plum and Apple trees. In spite of spraying, the foliage of Plums was damaged beyond complete recovery by these infestations, and the fruit accordingly was generally undersized, as well as thinner than usual in most orchards. The injury, it is to be feared, will not be limited to the current season, but will show in the impairment of the vigour of the trees for at least another year. Aphid infestation on Plums has been as bad occasionally before, but no approach to the virulence and persistence of the attack of red spider has ever before been noticed. It extended to Apples, which I have never in any previous season noticed as being materially affected by the pest. A few red spiders can still be seen on the undersides of some leaves with the aid of a magnifying glass. The heat and drought must be held accountable for this unprecedented infliction, and there is grave reason to fear an injurious sequel to it next season, unless spraying operations or climatic conditions should check the development of the pest. The aphid infestation was particularly remarkable in respect of its frequent renewal up to the end of September, when the insect was to be found on many young shoots of Apple trees, and particularly on trees planted within the last three years. It was only by means of repeated sprayings that young trees were kept from serious and permanent injury in the forms of stunting and distortion as results of the repeated attacks of the pest. In this case, again, a bad sequel is to be feared, though this is not a certainty, as comparative immunity from aphid attack in 1910 followed one of the worst infestations in 1909. Possibly in consequence of the particular efficacy of spraying operations alluded to above, attacks of the Apple sucker and the various caterpillars were less serious than they have been often in previous years, at least so far as my plantations were concerned. A somewhat important exception in relation to caterpillar attacks, however, has to be mentioned, reference to it being reserved for a separate paragraph below.

Another injurious result of the drought was the profuse dropping of Apples without any strong wind to blow them down. Every variety grown by me, excepting Gascoyne's Scarlet, was more or less affected in this way as it approached the ripe stage. A similar dropping of Plums took place soon after the fruit had set, leaving their crops more or less deficient in most parts of the country.

More serious, because a permanent source of loss, is the dwarfing of a great number of Plum trees and Black Currant bushes planted in the autumn or winter of 1910-11, together with the dying of not a few. Similarly, Black Currants raised from cuttings planted at the time named perished to a great extent, or lost their leaves early, and failed to make any considerable growth. Plums and Currants planted a year earlier, as well as Apples, made excellent growth in spite of the drought.

Last among the disadvantages incidental to the hot drought to be named was the wasp plague.

A SECOND BROOD OF THE CODLIN MOTH.

Early in September it was noticed that a great number of Bramley's Seedling Apples had tiny holes in them, with very small circles red in colour around the perforations. In very few cases was there more than one hole in an Apple, and almost invariably it was in about the middle of one side of the fruit, or a little lower down. Several fruits were cut, and nothing appeared to the naked eye to account for the damage. The supposition was, therefore, that the holes were only surface wounds caused by some unknown insect. Specimens were sent to Mr. Theobald, who reported that the mischief was the result of a second and late attack of the Codlin Moth. Such an attack is quite uncommon in this country, and may probably be attributed to the exceptional heat of the season. The maggot of this pest, in the ordinary attack just after the blossom has fallen, enters at the calyx of the fruitlet, and comes out at various points when fully grown and about to assume the pupal stage. Never having seen a second attack before, I failed to imagine the true cause of what was noticed. But, after receiving Mr. Theobald's report, I found tiny maggots inside several Apples—so small that my naked eye, which is the worse for wear, had failed to detect them in the first instance. A second brood of Codlin Moths is common enough in the United States, but extremely uncommon in England. Many bushels of Bramley's Seedling, chiefly made up of some of the finest of the Apples, were rendered unmarketable except as damaged fruit, while some other late varieties, including Lane's Prince Albert, were attacked to a slight extent. This second brood of the Codlin Moth in one of my plantations is all the more remarkable on account of the fact that the ordinary brood troubles me very little, possibly partly because the trees are sprayed with a wash containing arsenate of lead just after the fall of the blossom, and partly because my plantations are isolated.

GATHERING APPLES BY INSTALMENTS.

The loss caused by the gale shows the importance of gathering dessert Apples by instalments as they ripen, instead of waiting till all of a given variety are well coloured. As all kinds were gathered before the usual time, on account of the dropping, the only varieties remaining on the trees when the gale occurred, except in a particularly well-sheltered orchard, were Cox's Orange Pippin and Allington Pippin, other late sorts having been picked a day or two before. The ground was soon strewn with fruit, but much less thickly in the case of Cox's Orange Pippin than in that of Allington Pippin, because the ripest of the former had been gathered. Allington Pippin had only just begun to drop to any considerable extent, and as many of the Apples were still green, the intention was to delay picking them for another week. What ought to have been done was to gather the ripest as soon as dropping began. As this was not done, about one-fourth of the crop became windfalls.

RESULTS OF EARLY GATHERING.

There appears to be no doubt that Apples were fit for gathering before the usual time; for mid-season and late varieties have never kept better up to the present period.

PREPARATIONS FOR PLANTING.

Up to the time of writing the land has remained too hard for ploughing and subsoiling a piece of land after Potatoes, intended for Apples and Gooseberries. The surface to the depth of 3 or 4 inches has been cultivated easily enough; but below that depth no plough will work properly. *A Southern Grower. October 2.*

NEW OR NOTEWORTHY PLANTS.

VIOLA COMOLLIA.

SOME years ago I said to Mr. Farrer, "You should go to the Coldella Finestra, not only for *Saxifraga florulenta*, but particularly for the very rare *Viola nummulariaefolia*, which is, I think, the best of all the Pansies." He went, and wrote his experiences in the *Gardeners' Chronicle* (see vol. xlviii., p. 214).

I saw lately in the Alps of Bormio (Valtellina) the exquisite carpets of flowers of the very rare *Viola Comollia* (Messara), which hides its charms in a very small part of the Orobian Alps, and the botanists of the country are not disposed to reveal the place where it grows. The species was described by Dr. Messara,* and the name is retained in the *Index Kewensis*. But Comolli gives it as a form of *V. nummulariaefolia*, and Bertolini as one of *V. alpina*, while some others consider it as an Orobian form of *V. cenisia*.

Now that I have seen the plant growing wild, I recognise its claims to specific rank, as the plant is quite different from the other species named. It runs over most of the moraines, and its stems creep between the iron-hard, rock-like stones; the leaves are elliptic or round, and quite entire; the stipules are linear, and also entire; the sepals are ciliate, and slightly hirsute; the flower is large, very fragrant, and of a deep rose colour, something like *V. bosniaca*, but of a good pink, the same shade as in Rose "Jules Margottin"; the outsides of the petals are yellowish-green; the spur is short and obtuse. The plant makes an exquisite picture when in flower in the gravelly ground where it grows. I think its cultural requirements will prove to be similar to those of *V. nummulariaefolia*, or of *V. cenisia*.

SANGUISORBA VALLISTELLINÆ.

THIS rare and beautiful plant is confined to small valleys of the beautiful and rich Valtellina. The road crossing the chain of the Bergamese Alps, between Sondrio and Val Brembana, leads through the little and very closed valley of Ambria. There, at a height of from 670 metres to 1,800 metres, in the bushes, and near to the streams, even in the hay fields, grows this white-flowering, elegant, and very big perennial. It has glaucous leaves, which are elegantly toothed, and its long spikes of white flowers are deliciously fragrant. I have had specimens of this plant at Floraire for many years, but I never saw it growing wild before. I was charmed with it, and asked the peasants there if many people noticed the plant. They said, "Nobody comes here; you are the first traveller this year"—(it was August 12)—"and probably you will be the last! We know well that this plant is a good thing for our Hay, and useful for cattle; but why does this plant not grow elsewhere as in our little valley? Can you explain how this is, and why we are the only possessors of it?" I could not answer; but, in fact, *Sanguisorba Vallistellinæ* (syn. *S. dodecandra*) is only to be found in the small district comprised between Sondrio and the Val Brembana†, at the northern foot of the Pizzo del Diavolo. It is one of the best herbaceous perennials for our gardens. *H. Correvon, Geneva.*

* Messara, *Prod. della Fl. Valtell.* 203.

† See *Revista Italiana di Scienze Nat.* vol. 1897.

NOTICES OF BOOKS.

PROGRESS IN THE BREEDING OF HARDY APPLES FOR THE CANADIAN NORTH-WEST.*

THE bulletin of the Experimental Farms, Ottawa, which bears the above title gives the results of 24 years work in raising new varieties of Apple with a view to obtaining sorts capable of withstanding the cold of the prairie districts of Canada. In 1887 seed of the "Berried Crab," *Pyrus baccata*, was obtained from the Imperial Botanic Gardens, St. Petersburg; this small wild Siberian Crab-apple grows abundantly on the shores of the Baikal Sea and in many parts of Northern Siberia. From these seeds young trees were raised, and, as soon as they were large enough to transplant, some were sent to stations in Manitoba and Saskatchewan, where, during a trial of about 20 years, they have never been injured by the winter, and have for many years fruited abundantly. The fruit, however, is, in most cases, small—not much larger than a Cherry, astringent and acid, and, in some cases, bitter. The tree is highly ornamental, both in blossom and fruit, rather dwarf in habit, low-branched and strongly built, the fruit is firmly attached to the tree, and well adapted to resist high winds.

Efforts were made to improve the size and quality of the fruit by crossing with the hardiest and best Apples grown in Ontario. Many of the young trees from these seeds fruited the fourth year after sowing. Of the crosses, five appeared worthy of propagation for more general test at the various experiment stations. These cross-bred sorts, grafted on roots of seedlings of *Pyrus baccata*, have produced trees which seem to be quite as hardy as the wild form of *P. baccata*.

In 1896 a series of crosses were started with *P. prunifolia* with seeds from St. Petersburg, and in 1902 crosses were made between *P. malus*, the wild Apple of Europe, with some of the best Canadian sorts. The resulting trees have stood several winters at Brandon and Indian Head without injury.

As a result of the trials, some 16 varieties have been selected as deserving of more extended trial. The weight of fruit of the crosses is twelve to fourteen times heavier than that of *P. baccata*; some are, so far, free from blight; they vary in colour and season, and are most of them sub-acid and of good flavour; one of the larger called "Columbia," a cross between *P. baccata* with "Broad Green" pollen, is 1.8 inch across and 1.6 inch deep.

Of crosses between *P. prunifolia* and some of the best cultivated Apples, there are 10 showing sufficient merit to justify more extended test. Many of the best crosses produced from *P. baccata* and *P. prunifolia* and their related forms have been re-crossed. Several of these are promising, including one named "Martin," the fruit of which is borne in clusters. The fruit is 2½ inches across and 1½ inch deep, nearly round, colour orange-yellow with an orange-red cheek, flesh white, pleasantly sub-acid, fine-grained, easily breaking, with an agreeable flavour; season, October to February, thus showing in 24 years the improvement on *P. baccata*.

Several promising crosses have also been produced between hardy Russian and other varieties; thus one named "Rideau" from "Wealthy" pollinated with "Duchess of Oldenburgh" seems likely to prove a good Apple.

The success achieved in relatively so few years is encouraging, and the indications are that, by persevering along the lines laid down, a number of varieties will presently be available, possessing hardiness, size, and quality suitable for the settlers in those northern portions of the country where ordinary Apples under average conditions cannot be grown successfully. *Cecil H. Hooper.*

* By Wm. Saunders, Director of Experimental Farms of Canada.

CLEMATIS THUNBERGII.

THIS is one of the most ornamental of the species of *Clematis* for the decoration of a corridor or large, cool house. It is extremely graceful in habit, hanging in long, perpendicular growths, which produce flowers at all the nodes, many together forming a curtain. It lasts in flower for several weeks. The accompanying illustration (see fig. 112) shows only a small part of a long shoot, and it may be imagined from this what the mass must be like. *C. Thunbergii* was introduced two or three years ago to the Cambridge Botanic Garden, where our photograph was taken, by seeds sent from South Africa by Professor Pearson. The flowers are white and very sweetly-scented. In the Cape flora it is said to be readily known from other Cape species by its lanceolate sepals and pointed and slightly twisted flower buds. In cultivation the buds are hardly twisted, but the sepals are slightly so. The leaves are described as pubescent, but here they are glabrous; they are sub-bipinnately parted, pinnæ distant, leaflets petiolate, broadly ovate, acuminate with three or more acute teeth on each side. The panicles are described as shorter than the leaf, but here they are considerably longer; the flower-buds are ovate and pointed, the sepals spreading, lanceolate acuminate, filaments hairy at base; anthers glabrous linear. This interesting and ornamental species is found in the woods of Adow, Uitenhage, where it forms a rambling climber. R. Irwin Lynch, Botanic Garden, Cambridge.

GRAPES AT ALDENHAM.

HAVING read with interest the recent correspondence in the *Gardeners' Chronicle* on the subject of syringing vines advocated by Mr. Beckett in his weekly calendar, and criticised by various writers, I took more than a passing interest in the methods of vine culture exemplified at Aldenham, on the occasion of a recent visit which I made to these celebrated gardens.

I believe I may say that it has never been suggested that vine culture is made a speciality in these gardens. Mr. Beckett endeavours to produce good fruit in conditions which are not ideal for the production of exhibition Grapes. The vineries—three in number—are of the ordinary lean-to type, and a fourth, with a span roof (devoted to late varieties) is situated in a faulty position under overhanging forest trees on the west side; conditions most unfavourable to the production of Grapes, especially late ones.

I was much impressed by the condition of the vines in the lean-to houses. One house, which was devoted to Black Hamburgh, ripening in June and July, had yielded an excellent crop of medium-sized, well-finished bunches of good flavour, and for the future also they made fair promise, judging by the appearance of the leaves, well supplied with chlorophyll, and by the wood, which, though small, looked thoroughly ripe. Another house, containing Muscat of Alexandria, had a similar appearance; the remaining few bunches were well furnished with amber-coloured berries, proving that the "setting" properties of the vines under their present method of treatment is perfectly satisfactory. I noted, also, that in all cases the vines had broken regularly; if they had a fault in this connection, it was that of having too many growths.

The third vinery I visited seemed to me worthy of the especial attention and interest of all engaged in Grape culture, embodying as it does an example of the results of long practice and sound commonsense. There is nowadays an increasing tendency to remove vines which are far from being exhausted, and to replant with young canes, in order to produce sensational results. The length of a vine's life is really determined by

the treatment it receives during the first four years. If vines are mismanaged and badly pruned during this period they cannot be expected to give satisfactory results subsequently; but, given good and sensible treatment, the cropping power of a vine at 30 years of age should be as good as at any other period of its existence. In the management of the vinery under notice, Mr. Beckett evidently keeps this idea prominently before him. In March, 1910, it was replanted with Muscat of Alexandria; an inside border was prepared, 4 feet wide, with a similar width outside, and 3 feet deep with ample drainage. The vines—year old canes—were pruned to

foundation for future success has been laid. Some might think such a plan would involve a waste of time and space, but this is far from being the case. Mr. Beckett utilises the roof space by the introduction of supernumeraries in a specially-constructed border, 12 feet from the front wall and 5 feet wide. These vines—of the same kind as the permanent canes—were planted and pruned in a similar manner, and their growth was perfectly satisfactory. At the time of pruning sufficient length of stem was left to enable each vine to give five, and in some instances six, bunches of fruit of from 2 lbs. to 3 lbs. each; such varieties as Muscat of Alexandria, Madresfield Court,

[Photograph by R. Irwin Lynch.]

FIG. 112.—CLEMATIS THUNBERGII: FLOWERS WHITE.

within an eye or so of their base. The subsequent growth was all that could be desired. Many gardeners in such a case would allow the canes to remain 6 feet long in order to cover the roof space quickly, and procure an early crop of Grapes, but Mr. Beckett cut them back to within 3 feet of their base, retaining a pair of buds above the lowest trellis wire, and a third one for the leader, content to forego all idea of a crop of Grapes the first year. The result was vigorous growth—not too gross—and short-jointed wood, 12 to 15 feet long, before the leader was topped with a view to plumping up the basal eyes, which, if required, will give good bunches of fruit next season.

By pursuing this method of pruning, a good

Prince of Wales, and Black Alicante being represented.

Such a result, from vines planted as recently as March, 1910, cannot be regarded as otherwise than satisfactory, and from the growth made this season, and the manner in which it has matured, the possibility of a crop double as large in 1912 is assured. It may at the same time be considered as certain that the permanent vines are also progressing in a satisfactory manner.

In conclusion, I should like to remark that overcrowding, which is so inimical to the well-being of the Grape vine, is never allowed at Aldenham, each leaf seems to be the object of individual care, and it gets a proper exposure to the daylight. E. Molyneux.

DOLICHODIERA TUBIFLORA.

THE Gesneraceæ includes many fine flowering plants suitable for decorating the conservatory in summer, and none is more charming than *Dolichodiera tubiflora* (see fig. 113), which is sometimes known as *Gesnera tubiflora*. The plant grows about 2½ feet high, and is slender and graceful in habit, especially when the inflorescences are allowed to arch over adjacent plants. The leaves are shortly petiolate, oblong or oval in shape, the largest 4½ inches long; they are pubescent on both surfaces, and, indeed, the whole of the plant is more or less hairy. The flowers are from 3½ inches to 4 inches long, and very sweetly scented; the corollas are pure white, and measure 1½ inch across the mouth. A batch of plants will furnish a succession of flowers over a period of several weeks. No greenhouse subject is more easily managed; the root-stock is tuberous, and propagation may be effected by removing and inserting offsets at the time of potting, or plants may be raised from cuttings, which form roots readily. The plant is best cultivated in an intermediate house, except for a period during the summer, when it does well in a conservatory or cool house. It should be rested at the proper season by placing the pot on its side under the bench or stage. A mixture of half peat and loam, enriched with well-rotted manure, and the usual addition of sand, forms a suitable compost. The species is figured in the *Botanical Magazine* as *Gloxinia tubiflora*, tab. 3971, and was introduced to Glasnevin by seeds sent to the late Dr. Moore by Mr. Tweedie. It is a native of Uruguay. In the *Generum Plantarum* the genus is placed under the section *Locheria* of *Achimenes*, but for garden purposes the name *Dolichodiera* should perhaps be preserved, since its general aspect does not suggest *Achimenes* and its root-stock is quite different from that of the latter. This opportunity may be taken of enquiring for the exceedingly beautiful *Gesnera Donklarii* introduced by Messrs. James Veitch & Sons about the year 1858. The plant has dark foliage and salmon-coloured flowers. It may not yet be entirely out of cultivation, but it is exceedingly rare. *R. Irwin Lynch.*

FLORISTS' FLOWERS.

"SWEET PEA STUDIES."

A BULLETIN issued by the U.S.A. Department of Horticulture from the Cornell University is devoted to "Sweet Pea Studies."

In 1909 a National Sweet Pea Society was established in America to encourage the cultivation and improvement of the Sweet Pea by exhibitions, field tests, conferences and publications, or in any other way determined by the society. Shortly after the foundation of the society an arrangement was made with the New York State College of Agriculture, whereby the society undertook to provide the seed and the Department agreed to conduct the field-plot and forcing-house tests, in conjunction with a committee on nomenclature appointed by the society. The immediate responsibility for the trial was entrusted to Mr. A. C. Beal, a member of the experimental staff of the University. We note that, during the flowering period, Mr. Beal had to spend practically all his time in the field during the day. There were 469 trials, 20-foot rows of each variety being planted. In addition to the Sweet Peas, 46 types of the genera *Lathyrus*, *Orobis* and the closely-allied form *Vicia* were obtained. In addition, there was at the disposal of the superintendent and committee the Government collection, which comprised all the trade species and varieties of the perennial Pea, and other genera and species allied to the Sweet Pea. These are furnishing material for the attempt to secure hybrids between the various forms.

Stocks from the following British firms were tried:—Messrs. Bath, Unwin, Deal, Stark, Wat-

kins and Simpson, Hemus, Dobbie, Bide, Miller, and Cole.

PROMISING VARIETIES.

The following varieties were "highly commended":—Senator Spencer, Marie Corelli, and Lottie Hutchins Spencer, from Burpee; Masterpiece and Mrs. Hugh Dickson, from Dobbie; and Mrs. W. J. Unwin, from Unwin.

These further varieties were "commended": Uncle Sam, Othello Spencer, from Burpee; Tenant Spencer, Lovely Spencer, from Morse; Rosebella Hoare, Jack Unwin, and Edna Unwin, from Unwin; Zebra, from Hemus; Florence Wright, from Stark; and Sunproof King, from Bide.

It will be seen that British varieties come out well among those singled out from 469 trials for commendation. There is an interesting discussion in the bulletin as to the effect of early sowing. It was found that the quality of the

FIG. 113.—DOLICHODIERA TUBIFLORA:
FLOWERS WHITE.

flowers was best from autumn-sown plants, but the difficulty of wintering them in America in the open ground (at Ithaca) is as great as in England.

There are interesting tables giving the dates of sowing, number of seeds planted, number which germinated, date of germination, and date of first bloom. For example, Countess Spencer, sown on March 12, germinated on April 15, and bloomed first on June 30—a result very similar to that which we get in this country.

The second and larger half of the bulletin deals with winter-flowering Sweet Peas. This type is distinct in its habit of growth and in its flowering character. The difference is well expressed by Mr. Beal in his report. He says: "Unlike the garden type, which apparently stands still for a time, when only a few inches high, while side shoots develop, the winter-flowering Peas grow rapidly until they attain a

height of 2, 3 or even 4 feet, when they begin to flower, after which time the side shoots develop."

The three well-known strains of early or winter-flowering Sweet Peas were grown, viz., "Zvolaneks," "Telemly or Arkwrights," and "Englemans." The tests were thorough, as all obtainable varieties were grown for two seasons under glass and out-of-doors one summer. It has often been stated that these early Sweet Peas are hybrids between the Sweet Pea and a Vetch, but this story has never been verified. This is how the Cornell authorities dispose of it. "In all trials thus far we have not discovered the slightest reason for believing that any variety was a hybrid between some species of the Vetch and *Lathyrus odoratus*. This conclusion was reached after growing the following species of Vetch—*Vicia sativa*, *V. villosa*, *V. Gerardii*, *V. fulgens*—side by side with the varieties of winter-flowering Sweet Peas, and studying them at all stages of development."

The decision as to the three different groups is that they all have the same habit of growth and the early-flowering propensity. The best varieties are:—White, Snowbird; primrose, Earliest Sunbeam; pink, J. F. Dolansky; crimson, Meteor; bicolor, Christmas Pink; lavender, Telemly Lavender.

It affords matter for reflection that these very complete trials are carried out in America in conjunction with a State department, which issues at the expense of the Government, a thoroughly informative bulletin. *W.*

EXPERIMENTS IN THE POLLINATION AND SETTING OF FRUIT.

THE following is a brief summary of experiments which I have conducted during the present year on the pollination and setting of fruit. To test the effect of excluding bees from Strawberry blossoms, the box portion of a hand-light was placed around a plant and muslin tied over the top; on other plants, single bunches of unopened flowers of several different varieties were placed in muslin bags, but in each case very little difference between the fruit of the enclosed flowers and those in the open was to be noticed; apparently the wind carries the pollen over the flower, as the ordinary Strawberries in cultivation set their fruits with pollen of the same flower.

In Raspberries and Loganberries, enclosed in muslin bags, the fruits set, but they were not quite as large or as perfectly formed as in the open.

In Gooseberries, and Red and White Currants, of which unopened blossoms were enclosed in muslin and paper bags, but few fruits set, and those apparently only where rubbed by the bags. In those bagged and hand-pollinated, the fruits of Gooseberries set fairly well, but as the blossoms open gradually, the flowers should have been pollinated several times. In Red Currants bagged and hand-pollinated, the fruits set quite as plentifully as in the open, and some of the berries were notably larger than the average.

The above-mentioned fruits are self-fertile, and though all are benefited by the visits of bees, with Gooseberries and Red and Black Currants bees are absolutely necessary for the production of fruit.

The fruit trees, namely, Apples, Pears, Plums, and Cherries, may be divided into those varieties that are self-fertile and those that are self-sterile; i.e., those that will set and mature their fruits when pollinated with pollen of the same variety and those that will not.

In Pears, no fruits matured on 15 varieties which were bagged but not pollinated; with those bagged and pollinated with their own pollen, Durondeau, Beurré Diel, General Todleben, Dr. Jules Guyot, Josephine de Malines, and Marie Louise set fruits, but they gradually fell, last of

all General Todleben; the only two varieties which matured their fruit were Duchesse d'Angoulême and Colmar d'Été.

Of Pears cross-pollinated, I have good results with Vicar of Winkfield with Winter Crasanne pollen, Williams's Bon Chrétien with Duchesse d'Angoulême, Conference with General Todleben and vice versa.

In Plums, trials were made with Victoria, Czar, Rivers's Early Prolific, Cox's Emperor, July Greengage, Greengage, Pond's Seedling, Bittern, Jefferson, Dennison's Superb, and Early Orleans; of those bagged and left untouched, only Victoria and Czar set and matured their fruit; of those bagged and pollinated with their own pollen, only Victoria, Czar, Dennison's Superb, Bittern, and Rivers's Early Prolific matured their fruit. These varieties would therefore seem to be self-fertile, but most of them appear to set fruit

fruits; Morello set nearly as well as in the open when pollinated with its own pollen.

In the cross-pollinated Cherries, fruit set in each case, showing the necessity of visits of bees and the advisability of mixing different varieties of Cherries in a plantation.

Out of 63 varieties of Apples tried, on which unopened blossoms were bagged and left untouched, only Irish Peach matured its fruit, and that was very good; of those bagged and pollinated with their own pollen by brush or anthers, the following matured their fruit:—Irish Peach, White Transparent, Newton Wonder, Ecklinville Seedling, Summer Golden Pippin, Baumann's Red Winter Reinette, Peasgood's Nonesuch, Christmas Pearmain, King of the Pippins (damaged by sawfly, eventually fell), and, I believe, American Mother and James Grieve, but am not certain of the two latter. Whereas, in nearly all the crosses made, good fruits have resulted; out

taken out with forceps, and were pollinated by camel's hair brush or anthers with the pollen of nine different varieties of Apple, to try and see which would give the best result; eight of these set fruit, namely, with High Cannons, Bramley's Seedling, Grenadier, Lady Heniker, Golden Spire, Duchess's Favourite, The Queen, and with its own pollen. In these trials only with Peasgood's Nonesuch did fruit not set. However, they have gradually fallen till the only ones left are those pollinated with High Cannons and Bramley's Seedling, the latter being one of the best fruits on the tree. It would be of interest and probably of value to find out a good polliniser to plant among Cox's Orange Pippin, which is a self-sterile variety, i.e., flowers self-pollinated will not mature fruit. One grower informed me that he found Worcester Pearmain a good variety to plant among Cox's Orange Pippin, and Mr. C. Martin, manager of the Toddington Orchard Co., in Gloucestershire, told me his best fruits of Cox's Orange Pippin came from a plantation interplanted with Duchess's Favourite.

We want more light on this subject in England. Messrs. F. J. Chittenden, W. O. Backhouse, Little, and Avery have added valuable information, but we still need much investigation and observation of fruit-growers and economic botanists, before we reach the knowledge already gained by American and Australian horticulturists as to which varieties to plant together. Cecil H. Hooper.

FIG. 114.—COLLETIA CRUCIATA: FLOWERS WHITE.

more plentifully and bear larger fruits when pollinated with pollen of another variety. I ought here to add that Mr. W. O. Backhouse, who has made trials with Rivers's Early Prolific on a large scale, finds it is the exception for this variety to set fruit when fertilised with its own pollen.

Of flowers that were cross-pollinated, I had good Plums on Pond's Seedling with Czar pollen, Rivers's Early Prolific with Victoria pollen, Victoria with Czar pollen, Dennison's Superb with River's Early Prolific pollen; the pollinations were made without emasculation.

With Cherries, out of some nine different varieties, no variety set fruit when bagged and left untouched; when bagged and pollinated with their own pollen, only one variety, Florence, beside Morello, set fruit, and it only bore one or two

of 64 crosses, some 48 were successful; among the best may be mentioned:—Brabant Bellefleur with Beauty of Bath pollen, Mr. Gladstone with Beauty of Bath, Alfriston with Beauty of Bath, Christmas Pearmain with Cox's Pomona. Mère de Ménage with Sandringham and Hormead Pearmain, Allington Pippin with Summer Golden Pippin, Beauty of Bath with Summer Golden Pippin, High Cannons with Grenadier, The Queen with Baumann's Red Winter Reinette, Lane's Prince Albert with The Queen, Cellini with Graham's Royal Jubilee. These crosses were made without taking out the stamens from the flowers, pollination being effected by brush or anthers; if the brush was used, it was dipped in methylated spirits and allowed to dry before using again; but in the case of a tree of Cox's Orange Pippin, nine bunches of unopened blossoms had their stamens

COLLETIA CRUCIATA.

THIS very interesting Chilian shrub (see fig. 114) is by no means generally met with in gardens. It is far hardier than its habitat would suggest, being rarely or never injured by the winter frosts in Devon or Cornwall. It was introduced into this country more than 80 years ago, and was also raised from seed of *Colletia horrida* or *spinosa*—a species bearing long, awl-shaped thorns—at Bicton in Devon in 1849, but the laterally-compressed spines were so dissimilar from those of *C. horrida* that for a considerable period it was thought that some mistake had been made and that the seeds sown could not be that of *C. horrida*. Eventually, however, it was proved that Mr. Barnes, the then head gardener at Bicton, was correct in his assertion; spines of the two forms, now known as *C. cruciata* and *C. horrida*, being found on the same branch. At the time that *C. cruciata* appeared at Bicton it was named *C. bictonensis* by Dr. Lindley, who failed to discover its identity with *C. cruciata*, which was introduced in 1824, one year after the introduction of *C. horrida*. A correspondent writing some years ago stated that the flowers did not add much to the effect of the shrub, and this assertion has, from time to time, been made by other writers. As a rule, it may be admitted that the small, white, urn-shaped flowers, which are waxlike in texture and very lasting, remaining fresh for a lengthened period, do not render the shrub a conspicuous object, since they are rarely borne in sufficient numbers to do so. But in instances, like the example from which the spray shown in fig. 114 was cut, the case is very different, the effect produced being distinctly beautiful and striking. The specimen in question is growing in a wide border at Kingswear, South Devon, and is about nine feet in height, its diameter being about the same, though a writer some time ago stated that *C. cruciata* rarely grew more than 4 feet high. In November and December this shrub was covered with flowers, and formed a charming picture, even at some distance, at a time when scarcely anything else was in bloom in the open. The spray illustrated was photographed during the first week of December, and represents faithfully the condition of the entire bush. The flowers exhale a pleasing, nutty aroma, which is noticeable on fine, still days at some little distance from the bush. It has before now been suggested that *Colletia cruciata* flowers in summer. Here, however, it invariably blooms during November and December. Curiously enough, though, I saw some years ago in the south of Ireland a bush of *C. horrida* in flower at the end of May. Wyndham Fitzherbert.

The Week's Work.

PLANTS UNDER GLASS.

By JAMES HUDSON, Gardener to LEOPOLD DE ROTHSCHILD, Esq., Gunnersbury House, Acton, Middlesex.

NYMPHÆA.—We have secured a good lot of seed of *N. gigantea*. The seeds were detected floating upon the surface of the water and were skimmed off. They were at once sown in muddy soil in a stove temperature, the soil being covered about an inch deep with water. The seedlings should, if all goes well, be fit to plant out in the spring, in which case they will flower next summer. Those who may have *Nymphæas* carrying seed-pods will do well to watch them closely now, and until the capsules burst. The blue-flowered varieties should seed well this autumn.

PLANTS FOR FORCING.—Now is the best time to attend to the necessary potting and repotting of plants, including shrubs, intended for forcing in the spring. *Deutzias*, deciduous *Rhododendrons* (*Azaleas*), and the various species of *Prunus* and *Pyrus* that are used for the purpose, need attention at the roots after they have been forced the previous season. It is not necessary to repot the plants every year, but if this is not done, a good top-dressing is essential. Remove as much of the old soil as possible without damaging the roots, and, if this is done carefully in the case of those that are to be potted, receptacles of the same size may be employed again. Select loam of good quality, and mix with it a quantity of leaf mould or well-decayed manure. Pot firmly, and, when the work is finished, give a thorough watering, afterwards plunging the pots in ashes to their rims, as a safeguard to the roots against frost and cracking of the pots. In the case of *Azaleas* peat must be employed, and for *Clematis* some fine lime rubble. A few fresh plants should be procured each season for forcing to keep up the stock, selecting, if possible, a few new kinds to provide greater variety. Of late years, deciduous *Magnolias* have been largely used for forcing, and they are very suitable for the purpose. It will repay for the extra trouble to do the work carefully, and, if it is done in good time, the roots will have a better opportunity to make a good start. Fresh plants should not be forced so early as the older ones; they should be allowed to grow steadily for the first season. Large plants of such kinds as *Lilac* that are still planted out should be well watered to encourage the development of the roots. *Astilbes* (*Spiræas*) and similar herbaceous plants, also *Fritillarias* (*Crown Imperial*), *Pæonies*, and such *Liliums* as *L. candidum*, are best potted early in the autumn.

THE GREENHOUSE.—There are several plants that will do good service between now and Christmas in the greenhouse. *Salvia splendens grandiflora*, for instance, blooms well in the late autumn, and is better than the other forms of this plant for the purpose. The bright colour of the flowers is especially pleasing in dull weather, and is as much appreciated as the colours of the *Zonal Pelargoniums*. These plants should be afforded a little warmth, but not more than is sufficient to dry up superfluous moisture in the house. It is always advisable to leave the ventilators open a little at night time, even if the weather is slightly frosty; in the daytime the side ventilators may be opened as well. During the winter season the ventilators near to the hot-water pipes should be employed, as the air is warmed when it passes over the hot-water pipes. This system of ventilation is especially necessary in the growing of winter-flowering *Carnations*.

PITS AND FRAMES.—Unheated pits and frames should be cleansed and made tidy before the winter arrives. The glass should be washed on both sides to allow all the light possible to reach the plants. Nothing is better for placing on the staging than ashes, which should be stirred at times to prevent *Algæ* making them unsightly. Intermediate Stocks in pots, such as those of the East Lothian kind, if well rooted and still in the open, should be brought under glass before the heavy dews affect them. Violets

should be lifted, and placed in frames if the work has not been done already. Beds formed of fallen leaves will afford a gentle bottom heat, inducing fresh root action, and, at the same time, supplying suitable moisture. Keep the plants as close to the glass as possible, remembering that the leaves are sure to sink closer together. Be careful with the watering, and remove the lights on warm days; the frames should never be shut completely unless frost prevails, rather cover the glass with mats than close the lights entirely.

FRUITS UNDER GLASS.

By E. BECKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Hertfordshire.

PEACHES AND NECTARINES.—Trees that furnished the earliest crops of Peaches and Nectarines are fast shedding their leaves, and when these have all fallen, the work of getting the house in readiness for forcing again may be commenced at once. A thorough cleansing of the roof, including the glass, is essential, but before this is commenced the branches should be tied up in large bunches and secured to the trelliswork. The pruning of the trees is one of the most important items. Aim at securing a well-balanced tree furnished with fruiting wood. The number of shoots to be removed will depend largely upon whether any were removed immediately after fruiting. Now that the branches are bare of leaves, superfluous growths may be cut out neatly and the tree generally examined. The pruning should be done with a sharp knife, making clean cuts, severing the shoots close to their origin, so that no unsightly snags are left. For large branches a small pruning saw should be used. If scale is present, the older parts of the trees may be scrubbed with a stiff brush, using an insecticide that has been warmed. Care must be exercised with the younger growth and buds; brush the branches well, and then apply Gishurst compound, which not only destroys insects but gives the trees a cleanly appearance. Remove the surface soil from the border and then apply a top-dressing of loam mixed with wood ashes, bone meal and lime rubble. If the trees are not making gross shoots a little artificial manure may be employed. Suckers are very troublesome, and should be traced as near as possible to their origin and removed with a sharp knife. The trees should afterwards be tied in position, laying in the old wood first. After the training is finished, the doors and ventilators should be opened until the time for forcing arrives.

THE VINERY.—Examine carefully and frequently Grapes in vineries and in bottles for decayed or otherwise defective berries. Vines that will shortly have to be prepared again for forcing should have the bunches removed and the growths shortened, so that the basal buds may become plump. Give the house a vigorous syringing. Outside vine borders will, in the majority of cases, benefit by much more rain, so that the covering of these, which is generally necessary at this season, may be deferred for a time. Keep a sharp watch for vermin, especially rats. The amount of damage that these creatures will sometimes do in a single night is hardy credible.

THE ORCHID HOUSES.

By H. G. ALEXANDER, Orchid Grower to Lt.-Col. Sir G. L. HOLFORD, K.C.V.O., C.I.E., Westonbirt, Gloucestershire.

IMPORTED PLANTS.—A striking proof of the ever-increasing popularity of Orchids may be found in the large quantities of these plants that are imported yearly from their native habitats. At this season large consignments arrive, but the specimens seldom present an inviting appearance. They are invariably much shrivelled, dirty looking, and, to the uninitiated, in such a general bad condition as to offer little hope of recovery. It is a mistake to start the plants into growth immediately they are received, although this is often done by those who have had little or no previous experience in their management. It should be borne in mind that the plants have been, perhaps, subjected for some considerable time to ill-usage, and any undue exposure to light, air, or warmth is almost certain to result in failure. All dead portions of leaves, pseudo-bulbs, and roots should be first removed, and the plants afterwards washed in some mild insecticide to free them from dirt and any insects that may be

present. Cool-growing kinds should be placed in a cool house, whilst an intermediate temperature will be better, to begin with, for the heat-loving kinds. In either case plenty of atmospheric moisture is necessary to get the leaves and pseudo-bulbs into a plump condition, and in order to do this it will be requisite to reduce the amount of ventilation and also to shade the houses on bright days. But on no account keep them in the dark or in a close and stagnant atmosphere. This plumping-up process may be effected in the case of nearly all pseudo-bulbous kinds by standing the plants on some material that absorbs moisture, such as a thin layer of *Sphagnum*-moss and partly-decayed leaves, but care must be taken not to keep the materials too wet, especially for the first week or so after the plants have been received. Orchids such as *Vandas*, *Aërides*, *Renantheras*, and *Phalanopsis* are best suspended from the roof, to allow the growths to hang downwards, in which position no water can lodge in them after syringing, but they should not be allowed to remain in this way too long after the leaves have commenced to plump up, as they are best potted before the roots become too active. Having no pseudo-bulbs, they are very impatient of injury to their roots. *Cattleyas*, *Lælias*, *Oncidium*, *Odontoglossums*, and other pseudo-bulbous kinds are best potted as soon as it is seen that the plants are sound and likely to grow. In potting newly-imported Orchids it is important to make them quite firm in their receptacles, for if they are so loose as to shake about when moved, the young roots may be injured. It is obviously necessary to pot the plants before the roots commence to grow, to prevent them being damaged through disturbance. If imported Orchids are encouraged in their first efforts at root-making, they will, in the majority of cases, soon become well established.

THE KITCHEN GARDEN.

By JOHN DUNN, Kitchen Garden Foreman, Royal Gardens, Windsor.

BATAVIAN ENDIVE.—Batavian Endive should be planted in cold frames before the plants are too large to be removed without injury. Give a liberal application of clear water to settle the soil about the roots as soon as the plants are placed in position. Young plants may still be put out on a south border to furnish supplies for use in spring; they may need some protection during the winter. Plants which have grown to their full size should be tied up for blanching as required; the leaves will become blanched in a fortnight.

LATE POTATOS.—Let there be no delay in lifting this crop, as the recent showers have caused many of the tubers to make growth afresh, and, unless they are lifted at once, the quality will be impaired. If the tubers are allowed to remain on the ground for a few hours after they are dug, the skins will become hardened and the danger from sweating reduced somewhat. If sheds are available they may be placed under cover for a week or two when they should be sorted, placed in heaps in the open garden, and covered with clean straw previous to protecting them with a layer of soil 9 inches deep.

CELERY.—Continue to earth up the main crop of Celery whenever the foliage is dry. Remove all the side shoots previous to giving the plants a good soaking of clear water. In earthing up hold the foliage together carefully with some soft material until the soil is worked round the plants with the hand, breaking it as finely as possible. Take care that no soil falls between the leaves in the centres of the plants.

SPRING CABBAGE.—The second plantation of Cabbage should be made as early in the month as possible in order that the plants may become established before cold weather sets in. Let the ground chosen for this crop be in good heart, but no fresh manure should be applied, or the plants may become too tender to withstand the winter. If the ground has been dug recently it should be trodden before the plants are put out; drills may be drawn 15 inches apart, and the same space allowed between the plants in the row. If slugs are troublesome the ground may receive a good dressing of lime before the drills are formed, which, together with light dusting over the plants in early mornings, will keep them in check.

SPINACH.—The plants of the second sowing of this vegetable should be ready for thinning, an

operation that needs to be done before the plants become crowded and drawn, or the crop will be of little value; a distance of 2 inches should be allowed between the plants in the row. In order to promote the growth of large, healthy leaves give frequent light dustings of soot, and hoe the ground between the rows as often as circumstances will permit. The largest leaves should be gathered from the early sown plants, whether they are required for cooking or not, to encourage the growth of young fresh leaves. Old leaves that have lost their deep green colour are of no culinary value whatever.

TOMATOS.—Plants of Tomatos in the open garden should be carefully watched in case of frost. Let the fruits be gathered as soon as they are coloured sufficiently, placing them in a cool storeroom, so that they may be kept in a good condition for as long as possible. Seeds should be sown to provide plants for fruiting early in spring. The seedlings should be placed as close to the roof-glass as possible to prevent them from becoming drawn. Pot the plants in 3-inch pots as soon as they are large enough to handle, and place them in a pit having a temperature of 55°. Give air freely as soon as they are established, and do all that is possible to keep them stocky and short-jointed.

ASPARAGUS.—Beds which will furnish the plants for forcing should be pricked over with a digging fork and receive a liberal watering. If the beds are raised above the level of the surroundings, the ground will be extra dry, and moisture will be especially necessary in order to plump up the crowns. As soon as the old stems are sufficiently ripe they should be removed from the bed. If early forcing is contemplated tree-leaves should be gathered as early as possible and placed in large heaps, in order to ferment before being placed in the forcing pit.

THE FLOWER GARDEN.

By R. P. BROTHERSTON, Gardener to the Earl of HADDINGTON, K.T., Tynninghame, East Lothian.

THE MIXED BORDER.—In my remarks this week and next I propose to deal with the mixed flower border. The term mixed border is applied to a variety of floral arrangements, and one of the advantages of this system of planting is that individual tastes may be secured without the gardener being considered old-fashioned. Provided ordinary attention is given and the colours of the various plants properly associated, no border of this kind can be a failure. If flowers are selected to provide a display for two or three months only, then it is possible to have a gorgeous show of colour at one time, but where it is essential that the blooming of the flowers should extend over a longer season the borders may be kept fairly gay at all times. The one kind demands as much labour, perhaps, as the other; the assumption that the mixed border of any kind may be left to take care of itself with just occasional attention is erroneous, for no other part of the flower garden demands more labour or unremitting attention. The preparation of the soil needs to be done most thoroughly, as it will be closely cropped at all times. But a thorough cultivation and enrichment of the soil are not enough by themselves, for during the period from March to September the plants must be assisted, as it is seen they need it, with surface dressings of artificial and other manures, as well as fresh compost. But besides all these, on the occasion of the annual tidying of the border in October, whether the whole border is to be replanted or only in part, a liberal dressing of well-rotted manure should be applied. Some believe that herbaceous plants are damaged by digging the borders close to the plants, but I have never found this to be the case. Roots that are destroyed by the spade can well be dispensed with by the plants, and where the clumps are very close together their removal may be regarded as in the nature of root-pruning. The question arises, how shall the border be arranged and of what shall it be composed? Besides hardy herbaceous perennials, hardy and half-hardy annuals and biennials, bulbs, and suffruticose plants are all admissible. As a rule the plants may be grouped, but it is not imperative that all of them should be disposed thus. *Anemone japonica*, *Statice latifolia*, *Astilbe Aruncus*, *Cimicifuga*, *Delphiniums*, *Tri-*

tomas, *Iris sibirica*, *Pæonies*, and *Funkias* may be planted singly as well as in groups. Nor need the rule be absolute in the case of those which are admittedly seen at their best in large masses; an odd plant of *Montbretia*, *Lilium*, and even *Michaelmas Daisy* does much to lighten the general effect of the whole. A suitable background is necessary. It may take the form of a high wall covered with climbers, a tall hedge of Yew closely trimmed, or a high trellis furnished with Roses. The width of the border may range from 7 to 15 feet: the wider it is, the greater is the variety of plants that may be included and better methods of arrangement may be adopted. In a wide border bays of considerable extent for planting low-growing subjects may be formed, and, while the general contour should be a slope from back to front, the slope need only be evident from either end, and never obtrusively apparent.

GENERAL WORK.—Any necessary trimming of permanent edgings and shrubs should be attended to at once. We have had frost at Tynninghame which has spoiled many flowers. These latter and the seed vessels have been removed. There has been a larger crop than usual this year of seeds of flowers and shrubs, and close attention is still required to gather as they ripen such as are required for next season. If the frost becomes severe, tender bulbous and tuberous-rooted plants, such as *Begonias* and *Cannas*, will need to be removed from the beds and dried preparatory to storing them. *Dahlias*, likewise, must be lifted under such circumstances and stored, unless it is intended to leave them in the ground until next season. Care must be taken to prevent damping amongst the stock of young bedding plants in the frames, removing dead and decaying foliage. The recent gales have disturbed many of the plants in the borders, and it will be advisable to examine the stakes and ties, making them secure again where such attention is needed.

THE HARDY FRUIT GARDEN.

By W. HEDLEY WARREN, Aston Clinton Gardens, Buckinghamshire.

FRUIT GATHERING.—Fruits that are fit for gathering should be harvested before the autumn gales set in. Pears should be gathered immediately they are ready, and laid singly on the shelves in the fruit room. Late Pears should be handled carefully, as they are very susceptible to injury. Apples should not be placed more than two or three deep in layers. Quinces, Medlars, and nuts may be gathered shortly. Fruit that is already stored should be examined, and damaged or decayed ones removed.

PLANTING.—Preparations for the planting of the hardier kinds of fruit trees should be commenced, as advised in a former calendar, taking into consideration the nature of the soil, sub-soil, and the situation. Damp, heavy soils may be improved by draining and working to lighten the texture. The ground is in an exceptionally favourable condition for planting, as it is warm and dry. When the soil may be worked freely, as at the present time, the fibrous roots are not so much injured during lifting and transplanting as when the ground is wet. Make the holes sufficiently wide to allow the roots to be spread out, avoid placing the latter too deeply, and never do the work when the soil is wet. Scatter some of the finer particles of the soil amongst the roots, and then tread gently in the hole with the feet. In exposed situations newly-planted trees should be secured to stakes to prevent disturbance by the wind, until the roots have taken a firm hold of the ground. Fruit trees that are lifted and planted carefully suffer little by their removal, but they should always be planted as soon as possible after being lifted, adequately protecting the roots meanwhile from the drying influences of cold currents of air.

WALL TREES.—In almost every instance the wood of wall trees is ripening splendidly, but if, through the district being cold as in the more northern parts of the country, the shoots are not yet mature, every means should be employed towards securing that end. It is imperative that all useless growths be removed at once, to admit the sun and air to the shoots that remain. All vacant places on walls should be furnished with young, healthy trees. Before planting, the old soil should

be removed from the border, and replaced with fresh turfy loam. If the soil is of a clayey nature, very little, if any, manure should be added to it, but if it is sandy or gravelly, with a porous sub-soil, then a moderate proportion of well-decayed manure may be mixed with it. When planting fruit trees in heavy land, it is advisable to plant on mounds, raising a heap of soil a little above the level of the surroundings, but when planting in a gravelly staple, plant in a slight depression, so that the roots may obtain all the moisture possible. These are small, but important, points that make all the difference in success or otherwise in after years. By planting on hillocks less robust growth is made, and the wood in ordinary seasons ripens properly. Fruit trees growing in hungry, poor soils require a liberal treatment to induce them to make moderate growth, but, as a rule, they fruit freely, the wood being usually well ripened, although the individual fruits are not usually large.

THE APIARY.

By CHLORIS.

PREPARATIONS FOR WINTER.—Very little artificial food should be required now, if the bees have received proper attention during September. As soon as possible take off the feeders, and, before putting on the quilts, place a few strips of wood, about half an inch thick, across the frames, to enable the bees to move from frame to frame for food without exposing themselves to the cold air in the bottom of the hive. Place a warm quilt over the frames, fitting each corner exactly; over this place two sheets of stout brown paper, and over all two or three good quilts. A cushion filled loosely with cork dust placed in the top of the hive ensures the bees being kept warm and snug all the winter. Sometimes Wheat or Oat chaff is used, at others sawdust, whilst dried leaves, free from all moisture, is an excellent material. The holes should be just large enough to admit only one bee at a time. The roofs of the hives should be made watertight. In many cases the wood has shrunk and cracked owing to the excessive heat. The cracks should be stopped with putty and the roof painted. After applying another coat of paint, some calico, or, better still, American cloth, should be stretched tightly across the roof, nailed securely along the edges, and then painted. The hives in general should be painted when the weather is suitable, and all cracks should be stopped in the same manner as those in the roof.

DRIVEN BEES.—Where bees may be obtained for the driving, bee-keepers should not lose the opportunity of utilizing them to strengthen existing colonies. Choose a warm day for the work, and, after dredging the new bees with flour or spraying them with peppermint water, smoke the old stock and treat all the bees on every comb similarly to the driven bees. They may then be united, first taking out the strange queen.

ISLE OF WIGHT DISEASE.—Generally speaking, the fine summer has ridded the country of this scourge. The Board of Agriculture, aided by the British Beekeepers' Association, have gained much valuable information about the complaint, and deserve the thanks of all bee-keepers. Dr. Lauder has discovered a parasite in the cell linings of the alimentary canal which causes malignant dysentery, so called because of its infective powers. Infection is due to spores which are discharged with the excrement. During the cold weather when the bees are unable to take their cleansing flights, the parasite grows and forms spores before killing the bees, but later, when the weather is warmer, the disease increases so rapidly that the bees often die before the spore stage is reached. The parasite has been named the *Nosema apis*. It is not considered that the disease is a new one, but the continued wet weather of the past few seasons has been the cause of the disease assuming an epidemic character. The experts seem to think that Paralysis, May pest, and the Isle of Wight disease are very closely related, although not quite the same. Badly-infected bees should be destroyed or treated as for foul brood. All feeders which have been in contact with diseased colonies should be thoroughly scalded and disinfected before being used again.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, as well as specimens of plants for naming, should be addressed to the EDITORS, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY, OCTOBER 9—
United Hort. Benefit & Prov. Soc. Com. meet.

TUESDAY, OCTOBER 10—
Roy. Hort. Soc. Autumn Fruit Exh. (2 days). Horticultural Club Dinner and Meeting at 6 p.m.

WEDNESDAY, OCTOBER 11—
Affiliated Mut. Imp. Soc. Ann. Meet. at R.H.S. Hall, at 8 p.m.

THURSDAY, OCTOBER 12—
Soc. Nationale d'Hort. de France (Paris) Exh.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last Fifty Years at Greenwich—50°9°.

ACTUAL TEMPERATURES:—
LONDON.—Wednesday, October 4 (6 p.m.): Max. 54° Min. 44°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—Thursday, October 5 (10 A.M.): Bar. 29°5°; Temp. 55°; Weather—Dull.

PROVINCES.—Wednesday, October 4: Max 53° Doncaster; Min. 48° Ireland, S.W.

SALES FOR THE ENSUING WEEK.

MONDAY, TUESDAY, WEDNESDAY, THURSDAY AND FRIDAY—
Dutch Bulbs, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 10.30.

TUESDAY AND WEDNESDAY—
Sale of Nursery Stock at Shortlands' Nurseries, Ash, Surrey, by order of M. & H. Sleet, by Protheroe & Morris, at 12.

WEDNESDAY—
390 cases Japanese Lilliums, miscellaneous bulbs, at 2; Palms and Plants, at 5; at 67 & 68, Cheapside, E.C., by Protheroe & Morris.

THURSDAY—
Clearance Sale of 21,000 Roses at the West of England Rose Farm, Henlade, Taunton, by Protheroe & Morris, at 12.

FRIDAY—
Orchids, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 12.45.

European Alpine Plants.

As the years pass, the interest in Alpine plants seems constantly to increase. No garden of any pretension is now without its "Alpine Garden," whilst many a suburban plot also possesses its rockery on which these most perverse of plants sometimes flourish exceedingly, in spite of all the apparent disadvantages of atmosphere and locality. It happens not seldom that the most successful cultivator is one who is bound by narrow limits of space; and the finest effects may be achieved, not on a rockery proper, but in shallow pans about 9 inches by 12 inches, in which the varied needs of soil, water, aspect and stone can all be readily satisfied. Such pans, when built up with appropriate material (and nothing looks better than pieces of the so-called Derbyshire "tufa"), enable the amateur to grow the very choicest Alpines with every chance of success. We have seen cushions of *Saxifraga valdensis* and *S. squarrosa*, not to mention *Eritrichium nanum*, and the more difficult species of *Androsace*, thriving in a measure to which they never attain when grown in the open rockery.

Such miniature "gardens" are specially adapted for rearing the spoils of a visit to the Alps, and anyone who has seen a plant of *Campanula Morettiana*, that most ex-

quisite species from the Dolomites, with little but a cluster of its bells showing between the tightly-wedged stones, can hardly fail to agree that the method is at least worth a trial.

There are many books which deal with the Flora of the Alps, and Mr. Thompson's volume* ought to rank high among them. The author knows his subject at first hand; and, moreover, he writes as a man who keeps one eye on botany and the other on the garden. His notes will be found useful to the traveller as well as to the stay-at-home cultivator who wishes to know something of the haunts and natural habits of his pets.

Mr. Thompson has not attempted to write a complete Flora, but rather has chosen—wisely, as we think—to emphasize those species which are of special interest from horticultural and other points of view. One could easily criticise omissions, but, after all, an author is entitled to ask for judgment on his work as a whole; and thus measured, Mr. Thompson's success is indisputable. The book contains many coloured plates, and the individual figures are for the most part good; although the colouring is often crude, and sometimes distinctly bad, for example, fig. 7, on plate xxv., where the tint of the petals of *Saxifraga aizoides* is represented as a rather violent red. Some of the figures of well-known species might also have been advantageously replaced by others of critical or less familiar forms.

Mr. Thompson gives useful hints on collecting the plants, but he does not include the mention of a sponge bag. We have found this simple contrivance of very great use, both in collecting and in transporting (in one's luggage) the smaller forms; and for most Saxifrages and Sempervivums it would be difficult to find a better. Sponge-bags are light, reasonably water-proof, and in every way more convenient than a tin. They can also be easily carried in a ruck-sack whilst the collector is on the mountains, where a vasculum often proves a decided nuisance, especially when a difficult bit of rock has to be traversed.

Nearly everyone who writes on Alpine plants has views with respect to their behaviour towards lime in the soil. Mr. Thompson has also something to say on the matter, and we do not find ourselves in complete agreement with him, although he is by no means unsupported by other authorities. For example, the common Ling (*Calluna vulgaris*) is really not, strictly speaking, a lime-hater. It is fairly common on the hillsides in the Dolomites, where it often grows mixed with *Erica carnea*, which affects calcareous soils. Closer investigation further shows that it is not merely an apparent congener, growing in such situations because a sufficient thickness of peat really separates it from the subsoil, as seems to be the case with *Rhododendron ferrugineum*, when this species also strays on to the calcareous slopes on which the allied species *R. hirsutum* is so common. It is, however,

* *Alpine Plants of Europe, together with Cultural Hints*, by H. S. Thompson, F.L.S., with 64 coloured plates. (London: George Routledge & Sons, Ltd.)

well known that certain plants avoid calcareous soil in some districts, while they tolerate it in others. Perhaps it will be found that the presence or absence of some other mineral constituent, along with the lime in the soil, may provide a solution to riddles such as this.

The fact is that Alpine plants, more than most others, bristle with difficult problems for anyone who endeavours to generalize about them; and the gardener, no less than the botanist, is always liable to encounter the unexpected in his dealings with them.

Therein lies much of their charm. They are creatures of contradiction and waywardness, and he is emphatically not a wise man who thinks he has mastered all there is to know even about any one of them.

There were some good Rose blooms at the show arranged at the Crystal Palace by the Council of the Festival of Empire—the last exhibition for the season. It had been intended to hold this show at the end of August, but, owing to the drought of the past summer, it was wisely postponed to the end of September. As was the case at the autumn Rose show of the National Rose Society, the Teas and the flowers shown in the decorative classes proved the features of the show. Amongst the purely exhibition blooms, there were few Hybrid Perpetuals, excepting those contributed from Scotland and Ireland, and even the Hybrid Teas were not of first-rate quality, the result being that the boxes as a whole were wanting in colour. Nevertheless, Messrs. Cocker & Sons managed to secure the prize for the best bloom in the show with a flower of *Gloire de Chedane Guinoisseau*, a Hybrid Perpetual introduced to commerce a few years ago, but which seems only recently to have come into general notice; while close beside it was a flower of the variety *Ben Cant*, in perfection of shape and colour, which, though not so large, was even more beautiful than the premier bloom. The colour also of the new Roses *Leslie Holland* and *Lieut. Chaures*, in Mr. Hugh Dickson's box, was welcome. This grower also had a very beautiful vase of the *Countess of Shaftesbury*; the flowers were a brilliant carmine, and shapely. Without criticising the award of the judges, who, doubtless, arrived at a correct conclusion in considering the merit of the individual flowers as exhibition blooms, this vase was, in a show somewhat deficient in colour, more pleasing than the vase of *Frau Karl Druschki*, to which it had to take second place. If the Rose will keep its colour in England—always a problem with Irish Roses—it ought to prove a valuable acquisition.

Many of the Roses in the exhibition boxes at the shows still bear evidence of a great deal too much "thumbing," by which we refer to the practice of pushing down the outer petals at right angles to the axis of the flower. This practice tends to reduce all the flowers to a uniform shape, and the beautiful imbrication of many varieties is

THE PLEASAUNCE, OVERSTRAND, NORFOLK, THE PROPERTY OF LADY BATTERSEA.
THE WATER GARDEN AND ROSE-GARDEN.

thereby lost. The practice is one condemned alike by the trade and by amateurs, and the National Rose Society specially direct that a point should be deducted for an over-dressed bloom, but whether it be that the judges ignore the direction given them or that the penalty is insufficient to prevent it, the practice of "thumbing" still obtains. It is difficult to say what should be the remedy. Whilst we have often known the penalty enforced by judges, there is considerable difference of opinion as to what amounts to over-dressing. It would be inexpedient to make the penalty severe, for that would only lead to it being ignored altogether. A light yet sufficient penalty persistently enforced would soon put a stop to this in-artistic practice. Yet we know, from Mr. Gilbert, how much thought is required "to make the punishment fit the crime." Let us hope that better taste may gradually prevail.

It is satisfactory to notice that no tendency in this direction has yet appeared in the decorative classes. Considering the time of the year, the Roses staged in these classes were really good, and vases of Gottfried Keller, Rayon d'Or, Mrs. Alfred Tate, and the Lyons Rose had a wonderful effect in brightening the stands.

Messrs. Paul & Son staged the new single Rose Adrian Riversham, which looked fresh and pretty next to a vase of General Schablikine of unusually good form and colour for this Rose.

In the ladies' artistic section the most noticeable Rose was Lady Hillingdon; it appeared in many of the successful exhibits. There was also a very fine vase of Papillon and another of Kaiserin Augusta Victoria. Irish Elegance appeared in three out of the four prize-winning exhibits for table decorations. Another Rose that appeared in many of the ladies' exhibits and in nearly every box was Maman Cochet. There were two other new Roses that are likely to prove valuable. Mrs. George Shawyer, H.T., looked well, staged in two large vases, and Alexander Hill Gray appeared in more than one stand. Both varieties may make good garden Roses on further trial.

R.H.S. AUTUMN FRUIT SHOW.—The autumn show of British-grown fruits will be held in the Society's Hall, Vincent Square, Westminster, on Tuesday and Wednesday next, the 10th and 11th inst. The prospects for a successful exhibition are exceptionally favourable; Apples are especially plentiful this season, whilst Pears, although fewer in numbers, are of good quality. The hot season has suited most indoor fruits, and, judging by exhibits seen at the provincial shows, there should be good bunches of Grapes in the ten classes provided for them. There are also classes for Plums, Peaches, Nectarines, and Cherries; but the exhibition will be mainly one of Apples and Pears. On the opening day the Fruit and Vegetable, Orchid, and Floral Committees will meet to adjudicate on novelties submitted for award, but there will be no exhibition other than fruit. Fellows will be admitted at 1 p.m. on the first day and the public at 2 p.m.; the show will close at 6 p.m. on both days. The lecture announced to be given by Mr. H. HOOPER, on "Science and Practice—Their relation in Horticulture," has been postponed.

HORTICULTURAL CLUB.—The autumn session will commence on Tuesday next, October 10, when a house dinner will take place at 6 p.m. at the Hotel Windsor, Victoria Street, Westminster. After dinner Mr. C. P. RAFFILL, of the Royal Gardens, Kew, will give a lecture on "Rhododendrons." The lecture will be illustrated by lantern slides.

RETIREMENT OF MR. JOHN GARDNER.—After 43 years service as gardener at Elsham Hall, Lincolnshire, Mr. JOHN GARDNER has retired, having been granted a pension by his employer, Sir FRANCIS ASTLEY-CORBETT, Bart. Mr. GARDNER was born at Newent, in Gloucestershire, in 1833, and has been employed at, amongst other places, Stoke Edith Park, Powis Castle, and Little Aston Hall, Staffordshire, where for a period of 5½ years he was head gardener. He was also engaged for a period of 18 months in the Pine Apple Nursery of Messrs. ARTHUR HENDERSON & Co., at Maida Vale. Mr. GARDNER went to Elsham in 1868. He has practically re-made the pleasure grounds and planned and erected new ranges of glasshouses. In his earlier days Mr. GARDNER exhibited largely at the Yorkshire and Lincolnshire shows with success. Mr. GARDNER's son is gardener at Batsford Park.

AGRICULTURAL RETURNS, GREAT BRITAIN, 1911.—The preliminary statement issued by the Board of Agriculture for 1911 contains the following items of special interest. The total acreage under all crops and grass shows a falling off as compared with 1910 of 51,272 acres, or a decrease of 0.2 per cent.; of this decrease, 20,786 acres is in arable, and the rest in grass land. The Wheat area shows a 5.4 increase, but Barley has been grown on 130,734 fewer acres than in 1910. There have been considerably larger areas under Beans and Buckwheat than in the previous year, the increase in Beans being 41,791 acres, and in Buckwheat, always a small crop in this country, 754 acres. Potatoes have been grown on 572,014 acres, which represent an increase of 6 per cent. The cultivation of small fruit and orchard produce shows no increase over last year. Flax shows an increase of 96.1 per cent., the acreage being 449, as compared with 229 last year. It is to be hoped that, with the attention the Development Commission is giving to this crop, something may be done to restore it to its former not unimportant position as a profitable crop.

AGRICULTURAL RETURNS, IRELAND, 1911.—The agricultural statistics issued by the Department of Agriculture for Ireland show that the total area under Corn and green crops represents a decrease in the current year of 22,213 acres, or 0.9 per cent., and that the area under green crops is 1,640 acres more than in 1910. As in Great Britain, Flax growing has increased very considerably, namely, from 45,974 acres in 1910 to 66,618 in 1911. The total area under fruit shows a marked increase, from 12,994 acres in 1910 to 14,045 in the present year—an increase of 8.1 per cent. The numbers of livestock show a considerable increase over those of 1910: horses, 3,087; cattle, 22,832; pigs, 215,114; and poultry, a truly remarkable increase of 1,108,786. The total numbers of poultry are for the present year 25,447,801.

"DEUTSCHLAND'S OBSTSORTEN."—Part 16 of this publication, which deals with the varieties of fruit trees grown in Germany, has just been issued. The work is issued by ECKSTEIN & STÄHLE, of Stuttgart, under the joint editor-

* *Deutschland's Obstsorten*. Published by Eckstein & Stähle, Stuttgart. Three parts published per annum at 5 marks 50.

ship of Messrs. F. MÜLLER, H. GRAU, and O. BISSMANN. Three parts are issued annually, and each part contains four large coloured plates and as many text figures. The varieties illustrated in Part 16 are the Pears:—Muskatelbirne, which is widely grown in Thuringen and Saxony; Clapp's Liebling (Clapp's Favourite), raised by THADDEUS CLAPP, of Dorchester, Massachusetts; Stuttgarter Gaishirtle; Andenken an den Kongress, which was introduced by Mr. MOREL, of Lyons, and was named in consequence of the year of its introduction (1867) being that of the International Pomological Congress (Paris).

APPLES IN EGYPT.—A Canadian travelling in Egypt has written to the Dominion Department of Trade and Commerce to say that Apples in Egypt cost 2s. each, and to express the opinion that there is a splendid opportunity for Canadian Apples in the Levant. *The Canadian Horticulturist*.

THE EXPORTATION OF FRUIT FROM CANADA.—The success of the exportation of Apples from Canada, has encouraged Canadian growers to seek European markets for other of their fruits. With the aid of the Government of the Dominion, experimental consignments of Peaches, Pears, Grapes, and Tomatoes have been sent to Britain, and have arrived in London, Glasgow, and elsewhere in excellent condition. Thanks to care in packing, to cold storage, and to continuous records of temperature during the journey, the difficulties of long-distance transport appear to have been so thoroughly overcome that Canadian Anjou Pears are to be bought in Birmingham.

IMPORTATIONS OF POTATOS IN SOUTH AFRICA.—We are informed by the Board of Agriculture and Fisheries that new regulations are issued by the Government of the Union of South Africa, whereby Potatoes will be admitted from any part of the British Isles, provided that each consignment is accompanied by a declaration from the consignor stating where the Potatoes were grown, and also a certificate from the Board of Agriculture and Fisheries declaring that, so far as they are aware, no outbreak of wart disease (black scab) has occurred within a radius of five miles from the locality where the tubers were grown. Applicants for the Board's certificate must forward a declaration signed by the grower, stating where the Potatoes were grown and giving the name of the parish and county in which the farm is situated. The grower must also declare that no case of wart disease has occurred on his premises.

THE PRE-COOLING OF FRUIT.—The ungainly word "pre-cooling" is used in America to signify the exposure of picked fruit before shipment to low temperatures. However ungainly the word, there appears to be no doubt that the practice which it denotes is of the first importance to those who consign fruits to distant markets. Mr. J. A. RUDDICK, of Ottawa, Ontario, the Dominion Fruit and Cold Storage Commissioner, emphasises, in the course of a contribution to the *Canadian Horticulturist* (vol. xxxiv., No. 9, September, 1911), the importance of this preliminary pre-cooling treatment of fruit destined for long-distance shipment. He points out that, for early, quick-ripening Apples and tender fruit, the importance of reducing the temperature quickly after the fruit is packed is of paramount importance. If the pre-cooling treatment is omitted, fruit destined for exportation must be picked in a green state, and such fruit is found by experience to be inferior to that which is allowed to become more mature before it is picked, and is

subjected at once to the cooling process. Pre-cooling is carried out in California by exposing fruit-laden cars in great refrigerators; but in Canada it is frequently carried out in the packing-house. In the former system, the laden cars are brought to the refrigerating plant and connected to the system so that a current of cold air is passed through the cars. With an adequate refrigeration power, the cooling is effected in from four to five hours. The advantage of the car-cooling system consists in the fact that, thereby, subsequent handling of the cooled packages and fluctuations of temperature therein are avoided.

ABERDEEN AND NORTH OF SCOTLAND COLLEGE OF AGRICULTURE.—At a meeting of the Governors of this college in the County Hall, Aberdeen, on the 21st ult., there was submitted a report by a sub-committee appointed to prepare an application for a grant from the Development Fund in connection with the purchase of the estate of Craibstone, situated near Aberdeen. The application is for £25,500: £18,500 for the purchase of the estate and £7,000 for the alterations and improvements. Sir JOHN STRUTHERS, head of the Scottish Education Department, has stated that, on the Aberdeen College providing one-fourth of the sum required for the purchase and equipment of the estate of Craibstone, the Governors may rely on the balance being provided—one-half by the Development Fund Commissioners and one-fourth by the Scottish Education Department. The sum which the local authorities in the north of Scotland will thus have to raise will be a little over £6,000. The grants now promised are not for forestry, nor agricultural research, but only for the equipment of an experimental farm and school of rural domestic economy. The assumption therefore is that the college will have a claim for further assistance.

ACREAGE UNDER HOPS.—In a return issued by the Board of Agriculture and Fisheries, the total acreage of Hops under cultivation in England is given as 33,056, compared with 32,886 in 1910, and 32,539 in 1909. In Kent there is a slight increase, the figures being for 1911, 20,191, and, for 1910, 20,078. Hereford comes next with 5,034 acres, which is a considerable increase on last year when the acreage was 4,987. Worcestershire, 3,061 acres; Sussex, 2,698 acres; and Hampshire, 1,444 acres, are other important Hop-growing counties.

SCOTLAND.

GIFT OF LAND TO MOTHERWELL.

A PORTION of the Burgh Park, Motherwell, embracing about 2½ acres, has been leased to the town council by the Duke of Hamilton at the nominal rental of its agricultural value. The land has hitherto been held on a sub-lease from a farmer, who held it on lease from the Duke of Hamilton. The park is to be renamed the Duchess of Hamilton Park.

PRESENTATION AT DUMFRIES.

MR. W. YOUNG, who is relinquishing his post as gardener to the Crichton Royal Institution, Dumfries, for fresh duties in Ireland, was recently presented with a smoker's outfit by his fellow-gardeners and friends at a meeting held in the Queensberry Hotel, Dumfries. *Correspondent.*

THE PLEASAUNCE, OVERSTRAND.

(See figs. 115, 116, 117, and Supplementary Illustration.)

LADY BATTERSEA's delightful garden at The Pleasaunce, Overstrand, is probably amongst the best known in the country, although it has been formed comparatively recently (the late Lord Battersea, I believe, bought the first portion of the estate in 1888). Cromer, Overstrand, and its surroundings are generally considered among the most beautiful and healthy seaside resorts on the east coast, and it would be difficult to imagine a more charming locality during the summer and early autumn months. But in winter and early spring the climatic conditions are anything but favourable to plant life, and fierce winds both from the north-west and the east cause great injury to vegetation. The gardens have an area of about 50 acres, and the planting has been carried out skilfully, the more tender subjects being effectually sheltered. In order to provide shelter, shrubs and trees have been planted thickly. The mansion is large and commands magnificent views of the country

several pergolas of great length, one of which is illustrated in fig. 116. Amongst the varied subjects I noticed *Vitis Coignetiae*, *V. Reine Olga*, *V. multiflora*, *V. flexuosa* major, *V. purpurea*, *V. Labrusca*, the sweet-scented vine, Grapes Black Cluster, Royal Muscadine, and Melton Constable; *Clematis flammula*, *C. Jackmannii*, *C. graveolens*, *C. purpurea elegans*, *C. Mrs. Hope*, *C. Belle of Woking*, *C. montana*, *C. m. rubens*, and *C. Countess of Onslow*; varieties of *Hedera*, *Lonicera*, and varieties of *Roses*. One pergola, 80 yards in length, was planted entirely with Laburnums.

A fine plant of *Wistaria multijuga*, in bush form, is reputed to be 350 years old; at the time of my visit the flowers were just past their best condition, but there was evidence of the plant having been a grand spectacle.

A "blue garden" was quite the best of its kind I have ever seen. Among the subjects employed were *Delphiniums* of sorts, *Anchusas* (these were very fine), *Veronicas*, *Centaureas*, *Larkspurs*, *Verbena Carter's Blue*, *Nemesia*, *Perennial Asters*, *Ceanothuses* of sorts, *Pul-*

FIG. 115.—THE PLEASAUNCE, NORFOLK, THE RESIDENCE OF LADY BATTERSEA.

and sea. The gardens are open to the public on Sunday afternoons during part of the summer and autumn months. A public road divides the pleasure grounds which are connected by a tunnel. The main entrance leads to the east front. Near the house is a handsome tower, with cloisters, and suitable plants about them. The shrubberies form a most important part of these charming gardens, the more common subjects being densely planted to provide windscreens. *Hippophæ rhamnoides* (the Sea Buckthorn) flourishes luxuriantly, and fruits abundantly. I noticed various kinds of *Olearias*, especially *O. macrodonta*, *Phlomis fruticosa*, *Escallonias*, *Ceanothuses*, and other flowering shrubs, with a wealth of blossom. In one part of the garden there is a glade 130 yards long, planted principally with trees and shrubs of a golden tint, intermingled with purple-leaved plants, especially various kinds of Japanese and other Maples. Golden Elms, *Prunuses*, *Parrotia*, scarlet-foliaged and other Oaks, Elders, purple *Berberis*, *Negundos*, *Cornuses*, *Aristotelia*, *Macqui*, and Golden *Alnus* form a beautiful combination of coloured leafage. There are

monaria cœrulea, blue *Violas*, *Echinops*, *Geraniums*, *Gladiolus Baron J. Hulot* and *Nepeta Mussini*. A sunken garden was another object of much beauty, and the various subjects were doing splendidly. Fine beds of *Lavender* in several varieties, *Heliotropes*, *Lobelia cardinalis*, and Ivy-leaved *Pelargoniums* were planted in large masses, the colours being harmoniously blended.

Walls were clothed with *Carpenteria californica*, *Sollya heterophylla*, *S. Drummondii*, *Corylopsis spicata*, *Abelia floribunda*, *Ceanothus*, *Indigofera*, *Stauntonia latifolia*, *S. hexaphylla*, *Clematis* of sorts, *Ivies*, *Escallonias*, *Jasminums*, and *Azara microphylla*.

The water garden (see Supplementary Illustration) in the centre of the grounds was constructed by the late Lord Battersea. It is somewhat extensive, is prettily planned, and contains a choice assortment of suitable plants. *Gunneras* and *Phormium tenax* were particularly fine. There were also Bamboos in variety, *Romneya Coulteri* (exceptionally fine), *Crinum Powellii alba*, hardy Palms, *Liberia formosa* (a very striking plant), *Senecios* of

sorts, Epimediums, large clumps of Ericas, Clematis Davidiana, Cimicifugas, Hydrangeas, Veronicas, many species of Iris, Tencrion fruticosus, Cistus of sorts, and, in the water, a fine collection of the newer Nymphaeas, including *N. gloriosa*, *N. odorata*, *N. rosea*, *N. Marliacea*, *N. earnea*, *N. lucida*, *N. Gladstoniana*, *N. Laycockeri*, *N. Robinsonii*, and *N. atropurpurea*.

Roses are cultivated largely at The Pleasaunce in two Rose gardens, one of which is shown in the Supplementary Illustration. One very striking bed, somewhat isolated from the rest, was planted with the variety *Leonie Lamers*, which is very distinct in colour, and most beautiful in the bud stage. Near by, were nine large beds of well-known varieties, mixed. Planted amongst them were specimens of weeping Roses, with stems fully 8 feet in height, the varieties including Longworth Rambler, *Rugosa repens alba*, Tea Rambler, Ruby Queen (quite one of the best), Lady Gay, Paul Transon, Mme. d'Arblay, Jersey Beauty, Hiawatha, and Dorothy Perkins. The whole of the paths in this garden are laid with old stone paving. A Rose garden in another part of the grounds had been lately replanted and rearranged. The beds are cut in the turf, and each bed contains one variety only. They were planted with Kaiserin Augusta Victoria, Frau Karl Druschki, Mme. Jules Grolez, Papa Gontier, Lady Roberts, Hugh Dickson, Mme. Lambard, White Maman Cochet, G. Nabonnand, Caroline Testout, and Lady Battersea (the original plants of this fine variety), General McArthur, The Lyon, Warrior, Queen Mab, Richmond, and Mme Ravary. The gardens contain hardy flower borders on an extensive scale, the principal one being known as the Tudor border (see fig. 117). This is arranged on either side of a path 9 or 10 feet in width, the length being 240 feet. The edging is composed of irregular, low rockwork, in which has been planted a variety of Alpines, among the most conspicuous being *Campanula bavarica*, *C. pusilla*, *C. p. alba*, *Gypsophila repens rosea*, *Armeria maritima*, *Aubrietias* in variety, *Achillea tomentosa*, *A. argentea*, *Dianthus deltoides*, *Ionopsidium acaule*, *Helianthemums* in variety, *Sedums*, *Saxifragas* (a path of *S. hypnoides Kingii* measured 9 feet by 3 feet), *Thymus coccineus*, and *T. lanuginosus*. This edging is not only attractive and full of interest, but is also much to be preferred to other kinds, as it requires little labour to maintain it in a proper

order. Hardy herbaceous plants are established in bold masses, and due consideration is given to colour effect. Many of the best varieties of Pyrethrum, including *Jas. Kelway*, *Pink Pearl*, *Mrs. H. Barnett*, *Princesse de Metterniche*, *Empress Queen*, and *Karl Volt la Vistale* were ob-

In the fruit quarters hardy fruits looked particularly promising in almost all cases. Peaches and Nectarines do remarkably well outside on walls, the trees seldom failing to perfect fine crops. Nearly all the best-known sorts are cultivated, and the trees are well trained. I have

FIG. 117.—THE "TUDOR" BORDERS AT THE PLEASAUNCE, OVERSTRAND.

served also Veronicas in variety, Anchusas, Trolliuses, Centranthuses, Erigeron "Quakeress," some of the best-named varieties of Papaver orientalis, Chrysanthemum maximum, Potentillas, Galtonia candicans, Montbretias, including the newer hybrids, many varieties of Phlox, Harpallium rigidum, Lilliums, Gypsophilas, Statice, and other plants for autumn flowering, including a good and choice collection of Michaelmas Daisies. The borders were also furnished with Dahlias, summer-flowering Chrysanthemums, Lepatorium Fraseri, and many annuals.

not noticed a better crop of Apples elsewhere this season. The trees are in large numbers, and in a great variety. A few of the best sorts noticed were Adams's Pearmain, Allington Pippin, Alfriston, Beauty of Bath, Bismarck, Blenheim Pippin, Cox's Pomona, Cox's Orange Pippin, Cumberland Favourite, Dumelow's Seedling, Domino, Emperor Alexander, Golden Spire, Gold Medal, Golden Noble, James Grieve, King of Tompkin's County, Lane's Prince Albert, Lord Burleigh, Newton Wonder, Norfolk Beauty, Peasgood's Nonesuch, Ribston Pippin, Rival, The Queen, Worcester Pearmain, Warner's King, and Yellow Ingestre. Standard, pyramid, espalier, and cordon trees were alike in a satisfactory condition. Pear trees generally were carrying capital crops of clean fruit. The best included Beurré Hardy, Catillac, Clapp's Favourite, Conference, Emile d'Heyst, Glou Morceau, Jargonelle, Louis Bonne of Jersey, Pitmaston Duchess, Williams's Bon Chrétien, Beurré Superfin, Doyenné du Comice, Josephine de Malines, and Beacon. All kinds of bush fruits, including Raspberries, Gooseberries, Currants, and Strawberries, were seen in a high state of cultivation, and effectively protected from birds.

The kitchen garden is about 2 acres in extent, and is divided into several divisions. Here, as elsewhere, good culture and cleanliness were in evidence.

The glasshouses are not extensive, but increased accommodation is contemplated. There are sufficient houses for maintaining a good supply of plants for decorative purposes. Melons, Cucumbers, and Tomatos are largely cultivated. On a well-kept cricket ground a large number of matches are played annually, many of them being important fixtures.

Mr. N. Naylor, the gardener, has held the appointment for about four years. He is to be congratulated on the manner in which he maintains the gardens and pleasure grounds. Edwin Beckett.

FIG. 116.—PLEASAUNCE, OVERSTRAND: ONE OF THE PERGOLAS.

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

EDINBURGH AUTUMN SHOW.—With reference to the letter of *A. Galloway Gardener* appearing in your issue of 30th ult., I may say that the arrangement between this society and the North British and Caledonian Railway Companies is, that within a radius of 60 miles from Edinburgh the companies will issue return tickets at single fare and a quarter for the double journey to persons intending to visit the show. These tickets are available to passengers travelling by ordinary trains. The Society has no arrangement with the companies regarding excursion trains from places outside the radius. For some years past, as your correspondent says, excursion trains have run from various places on the first day of the show, but the fact that they did not do so this year, while it is to be regretted, is not a breach of the understanding between the companies and the Society. I am communicating with the railway companies, with a view to getting them to run the excursion trains on the first day of the show. *Donald Mackenzie, Secretary Royal Caledonian Horticultural Society.*

THE SEASON AT ABBOTSBURY.—Many rare plants have flowered profusely in these gardens this season. The spring was noticeable for the profusion and extra quality of the blooms of hybrid Himalayan Rhododendrons, and also such species as *R. Thomsonii*, *R. cinnabarinum*, and *R. campylocarpum*, and the hybrids, such as *kewense*, were very fine indeed. Camellias and Azaleas were also better than usual, and our large tree of *Acacia dealbata*, 70 feet high, was one mass of bloom. *Cassia corymbosa*, *C. schinifolia*, and *C. floribunda* all flowered freely in the open. A large plant of *C. corymbosa*, planted at the foot of a south wall, has been particularly beautiful. One of the most striking plants in bloom is *Lagerstroemia indica*. The largest plant was originally intended as a climber, but it very soon reached the top of the wall, and is now a tree 25 feet to 30 feet high and fully 12 feet through. It has been in bloom for a long time. I estimate the number of flower-spikes at between 150 to 200. Another plant that has had, and still has, a few flowers on it is *Philesia buxifolia*, sometimes called the Creeping *Lapageria*. It has produced large numbers of the *Lapageria*-like blooms. Our largest specimen is more than 5 feet through, and the envy of all who see it. It needs to be planted in shade in a position facing north, and where it can have plenty of water. *Lapageria rosea* and its white variety have also flowered freely. *Buddleia paniculata* makes a beautiful dwarf bush about 4 feet high, and is covered with small rose-coloured spikes; *B. auriculatus* is still uncommon, although the flowers are deliciously scented. Another late-flowering *Buddleia*, *B. Lindleyana*, is not particularly striking, but the blossoms are very pretty when examined closely. *Desfontainia spinosa* flowers very freely here in the young state. A plant of *Callistemon salignus albus* (the flowers are yellow) has been a gorgeous spectacle, covered with its bottle-brush flowers. Magnolias are still flowering, including *M. Thomsonii* and varieties of *M. grandiflora*. A tree of *M. Campbellii*, 60 feet high and with 160 blooms, was a sight not soon to be forgotten. *H. Kempshall, Abbotsbury Gardens.*

HIGHER EDUCATION.—Quite recently I came to reside in the north of England, where I find the education of gardeners is receiving the interest of public men, and a scheme for their advancement being formulated. The subject of education embraces many practical means whereby a young gardener may procure knowledge more readily; amongst them is *travel*, not necessarily abroad, but in the British Isles. I have considered various plans which might more or less successfully be advocated: foremost is the formation of a "National Guild of Gardeners," or "The Institute of British Gardeners," or "The Horticultural Labour Exchange." These three titles have been put forth by three great enthusiasts in the horticultural world, either of which would be a step in the right direction for the ultimate well-being of the fraternity. I have been in communication with the Rev. J. Bernard Hall, the Secretary of the North of England Horticultural Society, a gentleman who has the welfare of gar-

deners and gardening at heart, and who would be pleased to receive any suggestions from gardeners and horticulturists of all ranks, with a view to the formation of a National Society; names for membership or any offers of assistance to formulate such a scheme. Such an institution should include young gardeners, nursery employees, under and head gardeners, nurserymen, and as hon. members the wealthy friends of gardening. A nominal annual fee would be demanded from young men, and an annual subscription or a good donation from others to form the nucleus of a fund. The object to comprise—(a) A method whereby a young or under gardener might improve his knowledge by interchange of work with a fellow member, either in a nursery or a private establishment, viz., a young man after spending 1½ years or thereabouts in a southern county might exchange places with another member in the eastern, midland, or northern counties. In this matter no better opportunity could be afforded to gain an insight into different methods of forcing, floral work, hardy fruit cultivation, or any of the numerous branches appertaining to the profession. (b) Arrange for an annual conference in a different large centre annually. (c) If sufficiently supported to establish branches in all large centres, or at least a branch in each county. (d) Formulate a circulating library. (e) Arrange for lectures, correspondence classes, facilities for the preparation for examinations in order to qualify for important posts; these and other suggestions may be arranged for, and a staff appointed to organise and carry to a successful issue such a scheme as is herewith set forth, which would tend to promote horticulture generally to a higher level. *John Smith, County Council Lecturer and Instructor in Horticulture.*

LARGE PEACHES.—I am sending you a Peach of the variety *Salwey*, that weighed 18½ ounces when gathered. Several fruits on the same tree have turned the scale at 12 and 14 ounces. *George Brown, The Gardens, Brownsea Island, Poole.* [The fruit was a remarkably fine specimen and measured 13 inches in circumference. It had lost three-quarters of an ounce since it was weighed by Mr. Brown. We have only one larger fruit entered in our "Record Book," a specimen of Dr. Hogg, weighing 23½ ounces.—Eds.]

AMPELOPSIS AND PULMONARY DISEASES.—In your "Answers to Correspondents" (see p. 216), there is a statement that you have never heard of any species of *Ampelopsis* causing pulmonary trouble. That is quite correct, and, so far as most of the species of *Vitis*, commonly known in gardens as *Ampelopsis*, are concerned, including the best-known and most useful *A. Veitchii* (*Vitis inconstans*), and the common Virginia Creeper, no other charge of a serious nature can be laid to their account. But the poisonous *Rhus Toxicodendron* is often called in gardens *Ampelopsis japonica*, and its dangerous properties have been frequently described in your pages. I have, on several occasions, seen the most serious consequence follow the handling of this plant, the latest instance being last year, when a gardener trimmed a large specimen of it which was growing against the house of his employer. Soon his arms, face, and other parts of his body began to swell, were very painful, and he had to lie up. His employer continued the work, and was similarly affected, and had to leave it until the gardener came back. By this time the so-called *Ampelopsis* began to be suspected; but the gardener finished the trimming of the shrub, and, in consequence, had another attack, from which he slowly recovered. The man is strong and healthy, but I think that, in the case of a weaker person or a child, the consequences might have been even more serious. Now if the poison from the plant is potent enough to cause swelling and cutaneous eruption, probably it is capable of affecting the internal organs. *Rhus Toxicodendron* is variable in the form of its leaves, but all the varieties are beautiful in autumn, when the foliage is coloured scarlet and yellow. The variety *radicans*, known in America as the Poison Ivy, is the form most commonly seen in gardens. In the *Gardeners' Chronicle*, July 23, 1892, p. 105, there are notes from Professor Sargent, who excuses his liking for this treacherous shrub on account of its

beauty. He remarks: "Yes, it poisons me badly, too." If a professor is content to get poisoned we cannot help it; but in these days when the public health stands foremost in our public administration, I think that the sale of this dangerous plant should be prohibited, or at least a notification of its danger given by the vendor to the purchaser. At the present time there are hundreds of unsuspecting persons endangered by the presence in gardens of this shrub. In the *Gardeners' Chronicle*, August 13, 1892, Mr. Chas. Noble gives an instance of poisoning by this shrub, and states that he has ordered the rooting up and burning of the whole stock. In the issue for September 12, 1891, p. 310, another case of blood poisoning from the same cause is noted, and your columns have frequent references to the subject. In view of these facts, I think it is time that prohibitive measures should be taken against this dangerous shrub. *James O'Brien, Harrow-on-the-Hill.*

GRAFT HYBRIDS.—In the interesting articles on graft hybrids which have recently appeared in these pages no mention was made of the fact that when the common *Laburnum* is budded with the golden-leaved variety (*Laburnum vulgare foliis aureis*), even when the bud of the golden variety dies, the foliage of the common *Laburnum* stock assumes a yellow colour, similar to the variety, and this character is retained by the stock. This season I saw a number of plants of the common *Laburnum* which showed this phenomenon, in Mr. David W. Thomson's nursery at Windlestrawlee, Edinburgh, and I understand the circumstance is well known in nursery practice here. *A. D. Richardson, Edinburgh.*

CALLIANTHEMUM "RUTÆFOLIUM."—The brilliant picture and description of *Callianthemum rutæfolium* in last week's issue make it quite certain that the plant described and figured is not *C. rutæfolium*, but the true and much rarer *C. anemonoides*. The habit, the pinkish colouring, every detail mentioned, all combine to give an accurate picture (to which the photograph adds the last touch) of *C. anemonoides*. I know acres of *C. rutæfolium* (Mont Cenis, Pasterze, Schlern): this is a much inferior plant, it flowers later, above fully developed leaves, in June, and its flowers are not only smaller, relatively to the foliage, but smaller absolutely than those of *C. anemonoides*. And, always at all stages, they are of a rather chill dead-white, with a green eye. The stems are much taller, the habit foliose and almost coarse. *C. anemonoides* is not a variety, but a genuine species, from damp open places in the lower levels of the Tyrolean Pine woods; I have never collected it, but very well know its lovely little variety, *C. a. Kernerianum*, which occupies all the high turf of Monte Balde. This is merely a starved development of the type, and is represented with perfect accuracy by last week's plate of *C. "rutæfolium,"* if you imagine the tuft there figured to be reduced to a single crown. For, densely as *C. a. Kernerianum* occupies the fine turf, it always does so in single plants only, and never grows on into the stout clumps characteristic of *C. anemonoides*. *C. rutæfolium* mats itself rather loosely, four or five crowns together, and is a plant of the grassy Alp, not of damp, stony places like *anemonoides*, or of the highest fine turf like *Kernerianum*. *Reginald Farrer.*

SOCIETIES.

ROYAL HORTICULTURAL.

Scientific Committee.

SEPTEMBER 26.—*Present:* Mr. E. A. Bowles, M.A., F.L.S. (in the Chair); Dr. A. B. Rendle, F.R.S., Dr. A. J. Voelcker, M.A., F.I.C., Sir Everard im Thurn, K.C.B., J. T. Bennett-Poë, M.A., J. Fraser, F.L.S., J. W. Odell, J. O'Brien, V.M.H., E. M. Holmes, F.L.S., and F. J. Chittenden, F.L.S. (hon. sec.).

Oxalis Ortgiesii.—Mr. J. W. ODELL showed a well-grown specimen of this Peruvian species from a cool house at Stanmore in a very floriferous condition. See *Gartenflora* (1875), t. 817.

Diseased plants.—Dr. VOELCKER showed specimens of *Celery* attacked by the fungus *Septoria petroselinii* var. *Apii*. This disease appears to be becoming increasingly prevalent each year, and, as pointed out earlier in the year in

the minutes of this Committee, a considerable number of samples of "seed" of Celery are attacked. Probably spraying with Bordeaux mixture or with potassium sulphide from early stages in the plant's growth onwards would keep the disease in check. Dr. Voelcker also showed cabbage leaves badly attacked by the fungus *Phyllosticta Brassicæ*, causing spotting of the leaves so as to render the plants useless.

Remarkable fruiting of *Ægle sepiara*.—Mr. BOWLES showed branches of *Ægle sepiara* fruiting remarkably abundantly. In most seasons in his garden the earliest flowers are staminate, followed a little later by some pistillate ones, some of which produce fruits, and the crop is a small one. This season, however, most of the flowers were hermaphrodite and practically all produced fruits.

Witches' Broom on Scots Fir.—A remarkable witches' broom on Scots Pine was sent by G. W. RICKETTS, Esq., of Foulis Court, Eastleigh. It was a dense growth about 12 inches in diameter. The growth was probably due in the first place to the attack on the tree of a species of *Æcidium*, and it had continued for several years, the leaves on the attacked portion being smaller in size than those on the normal shoots.

***Rubus innominatus* (S. Moore).**—Some fruiting shoots of this newly-introduced *Rubus*, from China, were shown by the Hon. VICARY GIBBS, under the name of *Rubus Kuntzeanus*. The fruits are insipid, small, and amber and black in colour. (See *Gardeners' Chronicle*, October 21, 1905, p. 290, where it is shown that these two names are synonymous.)

FESTIVAL OF EMPIRE ROSE SHOW.

SEPTEMBER 28, 29.—The autumn Rose show, arranged by the Festival of Empire at the Crystal Palace, Sydenham, was held on these dates. The entries were extremely good, especially in the nurserymen's classes. The classes for decorative Roses were not well contested.

The Gold Medal, offered for the best Rose in the show, was won by Messrs. J. COCKER & SON, Aberdeen, with *Gloire de Chedane Guinoisseau* (see fig. 118). A beautiful stand of the lemon-yellow Alexander Hill Gray won for Messrs. A. DICKSON & SONS, LTD., the 1st prize in the class for any variety not in commerce before November, 1910. Mr. HUGH DICKSON, Belfast, was placed 1st for 12 distinct varieties, not offered before 1909, staging Jonkheer J. L. Mock, Mrs. A. E. Coxhead, Lady A. Stanley, Leslie Holland, Lieut. Chaure, Col. Leclerc, Chas. de la Piece, Marquise de Ganay, Mrs. Herbert Stephens, Marchioness of Waterford, Miss Cynthia Ford, and Duchess of Wellington. Rayon d'Or and Mrs. Cornwallis West were also shown well in the same class. In the decorative classes the variety Lady Hillingdon had quite unusual prominence. It figured in the premier vase of cut Roses, shown by Mrs. J. BIDE, Cowley Road, Uxbridge, and in the best basket of Roses, which was arranged by Mrs. G. W. COOK, Whetstone. It was noticeable in the button-holes and sprays, and was employed in the best of six dinner table decorations.

The most prominent Rose in the show was Frau Karl Druschki. This variety was shown by eight of 11 competitors in the class for 12 blooms of any H.P. or H.T. variety, and won the three prizes, the best flowers being sent by Messrs. A. DICKSON & SONS, LTD., Newtownards. It was again first, shown by Messrs. J. COCKER & SONS, Aberdeen, in the class for nine blooms of any Rose exhibited in a vase.

In the amateurs' class for 12 blooms of any Rose, the 1st and 2nd prizes were awarded for this variety, the exhibitors being Rev. J. H. PEMBERTON, Round House, Romford, and W. BOYES, Esq., Middleton, respectively. A corresponding and scarcely less-marked pre-eminence amongst Tea and Noisette varieties was shared by Maman Cochet and White Maman Cochet. In the class for 12 blooms Maman Cochet, shown by Messrs. D. PRIOR & SONS, Colchester, was placed 1st, and White Maman Cochet 2nd and 3rd, shown by Mr. G. PRINCE, Oxford, and Mr. H. DREW, Longworth, respectively. White Maman Cochet, shown by P. S. DAVIES, Esq., Burgess Hill, Sussex, was the best Rose in the amateur's class for five blooms of any variety shown in a vase.

The principal class for exhibition Roses, that

for 36 blooms, distinct, was contested by five exhibitors. The awards were:—1st, Messrs. J. COCKER & SONS, Aberdeen; 2nd, Messrs. ADAM & CRAIGMILE, Aberdeen; 3rd, Mr. HUGH DICKSON, Belfast; and 4th, Messrs. A. DICKSON & SONS, LTD., Newtownards. It was noteworthy that Caroline Testout and Frau Karl Druschki were shown by each exhibitor, and the Lyons Rose and C. J. Grahame were shown finely on the four winning stands. There were nine exhibits of 24 blooms, distinct, Messrs. D. PRIOR & SONS, Colchester, winning the 1st, and Mr. G. PRINCE, Oxford, the 2nd prize.

The class for 18 blooms, in which there were 10 competitors, included the finest individual blooms in the show. Mr. HUGH DICKSON, Belfast, was awarded the 1st prize, having a magnificent collection, including Mme. Wagram, Lady Alice Stanley, Marquise de Ganay, J. B. Clark,

Ernest Metz, Souvenir de P. Notting, W. R. Smith, Molly S. Crawford, Mme. J. Gravereaux, Maman Cochet, and White Maman Cochet. 2nd, Messrs. J. JEFFERIES & SON, Cirencester. In the corresponding class for 12 blooms Messrs. ADAM & CRAIGMILE, Aberdeen, won the 1st prize.

GROUPS OF DECORATIVE ROSES.

There were two classes for representative groups of cut Roses, the one limited to a space of 18 feet by 6 feet, the other to 60 square feet. The 1st prize in the former class was won by Messrs. W. & J. BROWN, Peterborough, and in the latter by Messrs. J. JEFFERIES & SON, LTD., Cirencester. Messrs. BROWN had a bold centrepiece of the Lyons Rose with fine columns of Maman Cochet, Mrs. A. Ward, Joseph Hill, Earl of Warwick, and other sorts, relieved with Polyantha Roses and Rose Hips. Mr. J. MATTOCK, Oxford,

FIG. 118.—PREMIER ROSE BLOOM AT THE FESTIVAL OF EMPIRE ROSE SHOW, AWARDED THE GOLD MEDAL OFFERED BY MESSRS. CLAY AND SONS.

(The variety is *Gloire de Chedane Guinoisseau*.)

Hugh Dickson, Cardinal, and Mrs. David M'Kee. 2nd, Messrs. J. COCKER & SONS, Aberdeen, whose flowers included the best bloom in the show, the variety being *Gloire de C. Guinoisseau*. Mr. H. DREW, Longworth, was 1st in the class for 12 blooms.

Messrs. J. COCKER & SONS, Aberdeen, and Mr. HUGH DICKSON, Belfast, were 1st and 2nd respectively in both classes for 12 and 8 varieties, three blooms of each; whilst Messrs. S. TRESEDER & SON, Cardiff, and Messrs. D. PRIOR & SONS, Colchester, were placed 1st and 2nd respectively in the corresponding class for six varieties. Blooms of Tea and Noisette varieties were of fine quality, though rather small. The best 18 blooms were shown by Mr. G. PRINCE, Oxford, whose varieties included

excelling in the class for 24 varieties of decorative Roses, whilst Messrs. SPOONER & SON, Woking, were placed 1st in the corresponding class for 12 varieties, and Messrs. BEN CANT & SONS, Colchester, in the class for 12 dwarf Polyantha Roses.

AMATEURS' CLASSES.

The classes for amateurs followed the usual sub-division with sections according to the number of plants grown by exhibitors. The larger classes were weakly contested, and the keenest competition was seen in the classes for six exhibition blooms shown by growers of fewer than 500 and 1,000 plants. In the open section the best 24 exhibition blooms were shown by CONWAY JONES, Esq., Gloucester; 2nd, Rev. J. H. PEMBERTON. G. A. HAMMOND, Esq., Burgess

Hill, Sussex, had the winning collection of 12 blooms, and the Rev. J. H. PEMBERTON the best 36 blooms in 12 varieties. Mr. JONES was also 1st in the class for 18 Teas and Noisettes. In the section for growers of fewer than 2,000 plants, F. SLAUGHTER, Esq., Steyning, and RAMON DE ESCOFET, Esq., Kingsley Dene, Dulwich, were the principal winners, whilst E. B. LEHMANN, Esq., Ifield Lodge, Crawley, was the most successful exhibitor in the classes for growers of fewer than 1,000 blooms.

NON-COMPETITIVE EXHIBITS.

Messrs. JAMES CARTER & Co., Raynes Park, made an effective display of China Asters and Dahlias. (Gold Medal.) A Gold Medal was awarded to Messrs. SEABROOK & SONS, Chelmsford, for an exhibit of Apples and Pears. Messrs. H. B. MAY & SONS, Dyson's Lane, Edmonton, showed Ferns, and Mr. J. Box, Lindfield, a very fine group of early-flowering Chrysanthemums, Phloxes, Delphiniums and other border plants.

NATIONAL CHRYSANTHEMUM.

OCTOBER 4, 5.—The early autumn exhibition of this Society was held at the Crystal Palace on these dates. Whilst the number of entries was below the average, in the majority of instances there was no falling off in the quality of the flowers shown. Sixteen new varieties were submitted to the Floral Committee, and of these four received certificates and three were commended. As usual, Mr. CASELTON, Superintendent of the Crystal Palace Gardens, contributed to the general effectiveness of the exhibition by staging well-grown pot plants.

OPEN CLASSES.

There was only one exhibitor in the premier class for a display of Chrysanthemums and foliage plants in pots. It was exhibited by Mr. J. BRAZIER, The Nurseries, Caterham, and was a rather crude arrangement, although it contained some well-flowered Chrysanthemums. The foliage plants did not add to the general effect. The 1st prize for 12 Japanese blooms was won by A. TATE, Esq., Downside, Leatherhead (gr. Mr. W. Mease), for a selection of blooms which, although lacking in depth, were almost too broad for the show board. White Queen was the best bloom shown. The class for six Japanese blooms was disappointing, but the 1st prize exhibit from A. F. BLADES, Esq., Rookfield, Reigate (gr. Mr. F. Cordell), was distinctly superior to the other exhibits. Only one exhibit was staged in the class for 12 bunches of early-flowering Pompon varieties. The collection exhibited by Mr. J. SMELLIE, Pansy Gardens, Busby, Glasgow, contained a good selection, of which Scarlet Gem, Early Blush, and Bronze Bride were the most attractive. The 1st prize collection of 12 bunches, distinct, grown in the open air, and not disbudded, also from Mr. SMELLIE, was astonishingly fine. The fresh blooms of rich colours made a striking display. Leslie, rich yellow; Lillie, pink; and Caledonia, white, are three excellent varieties. Disbudded blooms, from plants grown in the open, did not make a good show, and from a decorative point of view were decidedly inferior to those grown more naturally. The 1st prize was awarded to Mr. W. A. BALLARD, Abbey Lane, Leicester.

Mr. J. SMELLIE won the 1st prizes in the classes for six bunches of early-flowering Pompons and six bunches of early-flowering Japanese or decorative varieties. A. TATE, Esq., won the 1st prize for a vase of three Japanese Chrysanthemums with immense blooms of White Queen. No fewer than four competitors, including Mr. C. Fox, who won the 2nd prize, staged this variety.

The vases of single-flowered Chrysanthemums were indifferently arranged, and Mr. BRAZIER's hand-basket of blooms and foliage, though containing fresh flowers of more than average quality, was decidedly too large. The same remark applies to the hand-baskets of hardy autumn foliage and berries. The 1st prize was deservedly awarded to Mrs. W. MOSTIN, for a bright and tastefully-arranged basket containing coloured sprays of Pear leaves, Barberry and several varieties of Pernettya mucronata.

AMATEURS' CLASSES.

The epergne offered for the best dinner-table decoration was won by R. GIRVIN, Esq., Ashbourne, Sydenham (gr. Mr. J. W. Harrison), for a neat arrangement. The large Silver Medal was awarded to Mrs. W. MOSTIN, Addlestone, Surrey, for a yellow and white arrangement which would not be so effective under artificial light.

There was a great disparity between the 1st prize exhibit shown by Mr. C. Fox, 12, Linden Gardens, Tunbridge Wells, and the other exhibits in the class for six bunches of early-flowering Chrysanthemums.

DECORATIVE CLASSES.

The only exhibitor (Mr. F. BRAZIER, The Nurseries, Caterham) in the class requiring a table of bouquets and other floral arrangements, composed of Chrysanthemum blooms, received the 1st prize for a conventional display. There were eight decorated dinner tables, and with one exception yellow and red (or bronze) Chrysanthemums with appropriate foliage were employed. Mrs. A. ROBINSON, Norhyrst, Carshalton, won the 1st prize, for an arrangement in which the berried sprays of Barberry added brightness.

Epergnes of Chrysanthemums proved a popular class. The premier arrangement from Mr. A. W. TROSSELL, 12, The Parade, Beckenham, would

THE LATE WILLIAM EARLEY.

have been better without the huge spray of Asparagus plumosus, which gave it a one-sided appearance.

Mrs. McDOWELL NATHAN, Little Heath Wood, Potter's Bar (gr. Mr. W. H. Newton), arranged the most attractive vase of single Chrysanthemums grown in the open air.

AWARDS.

FIRST-CLASS CERTIFICATE.

Chrysanthemum "Bronze Goacher," shown by Messrs. WELLS & Co., Merstham.

C. Miss E. Finch.—A single Chrysanthemum of terra-cotta colour, shown by Mr. F. BRAZIER, Caterham.

C. Emperor.—A decorative variety of bright crimson colour with golden reverse. This and an ivory-white variety to be renamed, which also received a Certificate, were shown by Messrs. LOWE & SHAWYER, Uxbridge.

The following varieties were Commended:—"Roundabout," a decorative variety of golden bronze colour; "Phoebe," a large Japanese bloom with broad florets of silvery-pink colour, both shown by Mr. H. W. THORP, Worthing; and "Eskimo," a creamy-white decorative variety shown by Messrs. LOWE & SHAWYER.

NON-COMPETITIVE EXHIBITS.

A large Gold Medal was awarded to Mr. NORMAN DAVIS, Framfield, Sussex, for a very attractive display of Chrysanthemums and Michaelmas

Daisies, tastefully arranged with Palms and brightly-coloured sprays of Barberry and Pæony growths with brilliant autumn colour. The Chrysanthemums included very fine blooms of White Queen, the golden David Ingamells, and Norman Davis, which has bronzy-yellow florets. This exhibit was set off by a good border of Asparagus in pots, and cut fronds of such Ferns as Woodwardia radicans.

Mr. H. J. JONES, Ryecroft Nursery, Hither Green, contributed a group of Chrysanthemums, Michaelmas Daisies and a few Phloxes. The large Japanese Chrysanthemum White Queen was shown in splendid condition, and the small-flowered Rio des Blancs was also noteworthy. (Small Gold Medal.)

A display of various Chrysanthemums, Carnations, Phloxes, and other flowers, arranged by Messrs. W. WELLS & Co., Merstham, Surrey, made a very bright show. (Small Gold Medal.)

Silver-gilt Medals were awarded to Messrs. J. CARTER & Co., Raynes Park, for a circular display of Dahlias and other flowers artistically arranged, and to Messrs. W. SEABROOK & SONS, Chelmsford, for a collection of Apples and Pears.

Silver Medals were awarded to Messrs. DAVID RUSSELL & SONS, Brentwood, for a group of ornamental trees and shrubs; Mr. FRANK BRAZIER, Caterham, for Michaelmas Daisies; Messrs. CRAGG, HARRISON & CRAGG, Heston, Middlesex, for Chrysanthemums; Messrs. J. CHEAL & SONS, Crawley, for an attractive display of autumn foliage and berries; and Mr. J. B. RIDING, Chingford, for Collarette Dahlias. Messrs. JAMES CARTER & Co. staged an interesting collection of dwarfed Japanese trees and other plants, which included such uncommon subjects as Cephalotaxus drupacea fastigiata, pans of a Bamboo only a few inches high, Euonymus, and a species of Carpinus.

Obituary.

WILLIAM EARLEY.—It was with feelings of profound sorrow that I learned of the death, after a short illness, of my old friend William Earley, which took place at his residence, Northampton Road, Addiscombe, Croydon, on the 27th ult. Mr. Earley, who had attained his 76th year, was one of the old school of gardeners, who were in practice 40 years ago. Mr. Earley was for many years head gardener at Digswell House, Welwyn, and the well-known Digswell Endive was of his raising. Later, he was gardener at Valentines, Ilford. During the Royal Horticultural Society's days at South Kensington, Mr. Earley was a member of the Fruit and Vegetable Committee. For 38 years he held the post of Gardening Editor to *Lloyd's Weekly Newspaper*, in succession to the late Mr. George Glenny, and during that long period has never failed to supply his customary weekly contributions. That is a remarkable record, and is probably approached more nearly by nobody other than myself, for I have had an exactly similar experience with *Reynold's Newspaper* for 31 years. It was a singular circumstance, and one which would seem to indicate premonition that, but a few weeks since, after some 10 or 12 years of silence between us, I was induced to write Mr. Earley through *Lloyd's News*, not knowing his address. As recently as September 11 he sent me a very cheery reply, full of good feeling and recalling a friendship which began fully 40 years ago. He said, "I have lately found it a tax leaving home to visit shows, undertake judging, and similar engagements, and so I have made up my mind to enjoy myself more and more at home. Still, am no less an enthusiast in horticulture." His older gardening instincts led him to deprecate the present common practice of setting up crowded groups at shows, and made him long for a return to exhibits of the noble specimens of his younger days. Referring to his garden editorial experiences on *Lloyd's News*, Mr. Earley wrote, "Here again the change is felt, as for many years I had to answer very simple questions in the correspondence. To-day, amateurs send most difficult questions, thus showing how great has been the growth of horticultural interest. Not a few want private replies making on one a severe tax." The letter concludes with the wish, alas! now never to be realised. "Let us hope we may meet at some future function." In the days of the old

International Potato Exhibitions Mr. Earley was an active and earnest member of the committee. He was a really good gardener of what would now be termed, perhaps lightly, the old school, but all his writings show him to have been a well read, as well as a practical gardener. Whilst largely unknown to a younger generation, there are yet some old contemporaries living who will remember our friend, and learn of his death with regret. His latest contribution to *Lloyd's News* appeared so recently as Saturday last—a posthumous production! For several years, from about 1864 onwards, Mr. Earley contributed a weekly Calendar of garden operations to the *Gardeners' Chronicle*, and in the early seventies published, through Messrs. Bradbury, Evans and Co., some useful little manuals entitled "How to Grow Mushrooms," "How to Grow Asparagus," "The Cottage Gardener's Guide," and last and most important of all, "High-class Kitchen Gardening," which his friends used to describe as his *magnum opus*. A. D.

FRANCIS O. CANNING.—The death, on September 1 of Mr. Canning, aged 44, of Villa Nova, Pennsylvania, from accidental poisoning by Mushrooms, is announced in the American gardening papers. Mr. Canning served his apprenticeship in the gardens of the Duke of Rutland at Belvoir Castle, Grantham. He emigrated to America 22 years ago, and for six years was in charge of the propagating and plant houses at Fairmount Park, Philadelphia. He was next engaged as superintendent of S. T. Bodine's estate at Villa Nova, and, after serving there some six or seven years, was appointed instructor in horticulture at the Massachusetts Agricultural College, which position he held for four years, returning to Mr. Bodine's employ in the same capacity as before.

CLEMENT DENAIFFE.—It is with regret that we learn of the death of Mr. Clément Denaiffe, the head of the firm of seedsmen at Carignan (Ardennes). Mr. Denaiffe, who was 76 years of age, had achieved a world-wide reputation as a raiser of new varieties of plants.

JAMES ALEXANDER.—Mr. James Alexander, of the firm of Messrs. Alexander & Brown, seedsmen, High Street, Perth, died on Friday, 15th ult., at his residence, Balhearty, Perth. Mr. Alexander, who was in his 57th year, had been ailing for some time from heart affection. He went to Perth 20 years ago in the service of Messrs. Dickson & Turnbull, nurserymen and seedsmen, and six years later, with Mr. Alfred W. Brown, commenced business as a seedsman and bulb importer.

JOB ELLETTSON.—Job Ellettson, florist and landscape gardener of Auburn, New York, died on August 17. He was a native of Yorkshire, and was born in 1833, his father being head gardener. After serving his apprenticeship and working as a journeyman he emigrated to America, and settled in Auburn in the early 50's.

JOHN FLOOD.—Mr. John Flood, who was at one time engaged in the seed department of Messrs. James Veitch & Sons, Chelsea, died recently at Woburn, Massachusetts, U.S.A. He settled in America 14 years ago, and worked in some of the largest seed houses in the country, ultimately engaging in business for himself at Montvale.

JOSEPH R. FREEMAN.—Mr. Joseph R. Freeman, nurseryman, Washington, U.S.A., died on August 22. He was a native of England, and emigrated to America 48 years ago. He built up a prosperous business in the country of his adoption, and became vice-president of the Society of American Florists.

JOHN LEAVY.—John Leavy, a native of Ireland, died at Creeley, Colorado, U.S.A., on September 1, in his 81st year. He was one of the founders of the town of Creeley, where he was engaged in business as a florist.

SCHEDULE RECEIVED.

Huntingdonshire Daffodil and Spring Flower Society's exhibition, to be held at Huntingdon on Thursday, April 18, 1912. Hon. secretary, Miss Linton, Stirloe House, Buckden, Huntingdon.

*** The Editors will be glad to receive, for consideration, large photographs of horticultural subjects, suitable for reproduction in this Journal.

BOWLING GREEN: Bowling. Your proposed method of ridding your green of Plantains and other weeds is undoubtedly the best. Hand-weeding may seem a slow process, but it is a sure one if the operation is methodically and thoroughly performed. The weeding and winter dressing might well be executed simultaneously. Mark out a portion of the lawn to be first treated by stretching a garden line across the green parallel with one side and 1 yard from the edge. All the weeds should be removed, and the broken places patched with fresh turf. Give the surface a dressing of fine bonemeal at the rate of 1 lb. per square yard, then apply fine, clean, sharp sand to level up any inequalities. By this method the progress of the work can be seen and no part missed. There is no special merit in sea sand, beyond that it is usually more uniform in grade and cleaner than pit sand. The chief value of sand on bowling greens is its suitability as a medium for levelling up inequalities which may form during the playing season, and on clayey soils to prevent the surface from caking. Further in rolling the sharp particles of sand are crushed into the fleshy crowned weeds, such as Daisies and Plantains, thus tending to exterminate them, and so improve the greens for playing. Regarding the best manure to apply for autumn dressing, we do not advise the use of any beyond the bonemeal already mentioned, though many employ dried blood and prepared fish manures. It is inadvisable to apply nitrogenous manures just previous to winter, these being more efficacious when applied in the spring. Stimulating manures of that description must be applied with great discretion. Two light dressings at intervals are better than one moderately heavy one. One to two ounces of chemical manure per square yard is amply sufficient for a bowling green, for while it is advantageous to have a thick sole of grass, it is most undesirable to have it growing like a crop of hay, hence the necessity for caution in the application of manures. To assist in the easy application and even distribution of artificial manures mix them thoroughly with three or four times their bulk of sand. Brush in the mixture with a flat brush down towards the operator as in light raking. Roll the turf with a roller of medium weight after rain. Local conditions are an important factor in all operations, and these must be studied closely in the management of bowling greens.

CORRECTION.—In the reply to H. Jones and Young Gardener in the last issue on making a vine border, the amount of $\frac{1}{2}$ inch bones and old mortar rubble should have read 1 cwt. each to every five loads of loam.

CROPS UNDER GLASS: W. H. H. Seeing that your Tomatoes were satisfactory, there would appear to be no reason for changing the crop. However, should your glasshouses be adapted to Cucumber growing, say from 12 feet to 15 feet wide and efficiently heated, it would be advisable to grow Cucumbers in the early part of the year, following with Tomatoes at the middle or end of July. In your case the culture of flowers would pay better than vegetables for marketing. The following kinds of herbaceous perennials would find a ready sale when well grown and presented at the shops in good form, namely, *Achillea Ptarmica* The Pearl, *A. P. plena*, *Aquilegia coerulea*, *Delphiniums*, *Galega officinalis*, *G. Her Majesty*, *G. Hartlandii*, *G. Niobe*; *Gaillardias* in variety, *Gypsophila paniculata alba*, *Helenium autumnale superbum*, *Helianthus rigidus* Miss Mellish, *Coreopsis grandiflora*, *Scabiosa caucasica*, *Thalictrum aquilegifolium*, *Solidago flexuosa*, white, scarlet, purple, and salmon-pink coloured *Phloxes*, *Pyrethrums*, both double and single varieties of distinct and

pleasing shades of colour; *Chrysanthemum* King Edward VII. (sometimes known as Giant Moon Daisy), *C. Li Hung Chang*, *C. Lord Roberts*, *C. maximum grandiflora*, *Irises*, *Daffodils*, and *Montbretias* in variety. Hardy and half-hardy annuals of the following kinds may also be included: *Centaurea odorata Imperialis*, *C. Chameleon*, *C. alba*, *Sweet Scabious* in variety, *Mignonette*, tall-growing varieties of *Asters*, *Stocks*, *Iceland* and *Shirley Poppies*, and *Sweet Peas*. It will be wise to grow in quantity the kinds of flowers which are most in demand, including a good planting of *Statice sinensis*, *S. sinuata*, and *S. Bonduelli*. Early, mid-season, and late-flowering *Chrysanthemums* of the best varieties should also be grown in considerable quantity. The flower you enclosed to be named is *Trachelium coeruleum*.

CULTURE OF SONERILAS, LOTUS, AND CEROPEGIAS:

W. Garwood. *Sonerilas* require to be grown in a high temperature under stove conditions. Cuttings root easily in spring, and the plants should be grown on in a compost of leaf-mould, loam, sand, and charcoal mixed in equal proportions. Afford water at the roots sparingly until the plants are well established, but take care not to allow them to become too dry. Afterwards feeding them liberally with a weak solution of cow-manure until the flowers appear. These are usually rose-coloured and highly decorative, lasting from some weeks if kept in an intermediate temperature. The *Lotus* (*Nelumbium speciosum*) is an aquatic plant during its growing period, which extends from early spring until late autumn, and during that period should be placed in a sunny place in a warm greenhouse or stove. A large tub will be suitable for the requirements of this plant, but if a heated tank is available so much the better. The compost should consist of rich turfy loam mixed with one-third its bulk of cow-manure and a good sprinkling of sand. The water should be constantly changed, so as to avoid a stagnant condition at the roots. After growth has ceased in autumn the water should be run off, and the rhizomes stored in a temperature of 50° to 55° F., taking care that the soil in which they are resting does not become quite dry during the winter. Certain species of *Ceropegia* require greenhouse treatment and others the hot atmosphere of a stove. The species which require a greenhouse, such as *C. dichotoma* and *C. fusca*, should be potted in rather small pots employing a compost of loam two parts, peat one part, and sand one part. Press the compost moderately firmly. Stand the plants in a sunny place in the greenhouse, and afford plenty of water at the roots during summer, when the plants are making their growth. As a guide, water only when the fleshy stems show slight evidence of shrivelling. The tropical and sub-tropical species are mostly climbers, and thrive best in an intermediate or stove temperature. Most of the species in cultivation, of which there are now about 30, are included in this class. A mixture of loam, peat (or leaf mould), sand, and charcoal in equal proportions suits them well, and the young growths, which are slender and twining in habit, should be trained up strings near to the roof-glass or over a trellis. The flowers are usually produced in abundance, and present extraordinary diversity in both their colouring and form. Beyond a slightly lower temperature during the winter months *Ceropegias* require no rest, as most of them continue growing during the whole year. See also note on *Ceropegia Sandersonii* in last issue, p. 249.

CYANIDING A VINERY: H. J. It is desirable to wait until the Grapes are cut and then give the house a thorough cleansing. If you employ cyanide of potassium, you must exercise great care, as it is a virulent poison.

INSECT: J. B. B. W. The arthropod sent is one of the pseudo-scorpions or false scorpions, and is known as *Chelifer geoffroyi* (Koch). It is found throughout Europe. The insect is harmless and lives in damp and moist places, and feeds on mites and woodlice.

LETTUCE ROOTS: G. F. M. The *Aphis* sent on the Lettuce root is known as *Pemphigus lactucarius* of Passerini. It is common on light sandy soils on many roots, and it also makes cavities in the earth.

LINNEAN SOCIETY: A. R. R. No examination is required for admission to Fellowship of the Linnean Society. Every candidate must be proposed by three or more Fellows, who shall state his qualifications, name in full, rank, profession, and residence. Before a candidate is proposed, it is the duty of the proposer to make known to him that, if elected, he cannot be admitted until he shall have paid the admission fee of £6, and one annual contribution of £3, and he may compound at any time by one payment of £45, in lieu of all future annual subscriptions; but if he be not usually resident in Britain, the composition of £45 must at once be paid, or an order given upon a London agent for the payment of the annual subscriptions as they become due. Every person elected a Fellow is required to appear personally to be admitted within six months after his election, or within such further time as the council may grant. Annual contributions become due in advance on the 24th of May for the year ending on that day; but no Fellow elected on or after the 1st of March in any year is required to pay a second annual contribution in the same year. The general meetings of the Society are appointed to be held on the third Thursday in January, the first and third Thursdays in February, March, and April (no meeting is held in the week before or after Easter), the first Thursday in May, and on the first and third Thursdays in June, November, and December. Any member may introduce a friend by inscribing his name in the list of visitors.

MEALY BUG ON VINES: W. H. H. As soon as the vines have shed their foliage prune the lateral growths back in the ordinary way, and then remove all the loose bark from the individual rods and spurs; burning the prunings and bark thus removed. Next wash the vines with soapy water made by dissolving $\frac{1}{4}$ lb. soft soap in one gallon of hot water. Keep the mixture well stirred, and apply it with a stiff brush to every portion of the vine. After this has been done smear the vines thoroughly with a mixture of coal-tar and clay, consisting of one part of the former to nine parts of the latter. The clay should be dried and powdered, so that it may be passed through a $\frac{1}{4}$ -inch sieve. Measure the pulverised clay into a large flower-pot (having a lump of stiffish clay put into the hole in the bottom), using a 3-inch flower-pot as a measure. Put the measure of tar into the vessel after the specified quantity of clay has been deposited therein. Work the mixture well together, afterwards adding sufficient boiling water to give it the consistency of ordinary paint and applying it to the affected vines, as indicated above, with a stiffish paint brush, keeping the mixture well stirred meanwhile. Prior to doing this the glass and woodwork of the vinery should be well washed with soft soapy water, and the plaster and brickwork close down to the vine border with hot liquid lime. This done, replace the loose surface soil with new compost, following with a surface dressing of horse-droppings and a good watering at the roots. The vines may be allowed to "break" into growth of their own accord in February or early in March.

NAMES OF FRUITS: Dr. K. French Crab.—*F. E. C.* 1, Radford Beauty; 2, Gascoyne's Scarlet Seedling.—*R. Corbay.* Beurré d'Amanlis.—*J. J.* Both fruits are Malster.—*Kingston.* 1, Blenheim Pippin; 2, Cox's Orange Pippin; 3, Sturmer Pippin; 4, Hoary Morning; 5, Court-pendû-plat; 6, Norfolk Beefing.—*A. Williams.* 1, Small's Admirable; 2, Stirling Castle; 3, Hoary Morning; 4, Dumelow's Seedling (Wellington); 5, not recognised; 6, Tom Putt; 7, Wealthy; 8, King of the Pippins.—*W. T. M.* 1, Yorkshire Greening; 2, Ribston Pippin; 3, Herefordshire Pearmain; 4, American Mother; 5, Schoolmaster; 6, Tower of Glamis.—*H. Martin.* 1, Baldwin; 2, Batchelor's Glory; 3, King of Tompkins County; 4, American Mother; 5, Golden Noble; 6, Beurré Capiaumont.—*Bonjou.* 1, Dumelow's Seedling (Wellington); 2, Lord Suffield; 3 and 4, Blenheim Pippin; 5, Lady's Finger; 6, Old Nonesuch.—*H. T. Lobel.* 1, Sugar Loaf; 2, Bismarck; 3, Welford Park Nonesuch; 4, King of the Pippins; 5, Bramley's Seedling; 6, Roundway's Magnum Bonum.—*T. A. Hall.* 1, Wilson's Prolific; 2, Schoolmaster.—*H. C.* 1, Lord Burghley;

2, Reinette Franche; 3, Sandringham; 4, Alfriston; 5, Whiting Pippin.—*A. W. D.* We cannot undertake to name such badly developed fruits.—*Rutland Cottage.* 1, Dean's Codlin; 2, Potts's Seedling; 3 and 5, King of the Pippins; 4, Cox's Orange Pippin; 6, Lord Derby; 7, Stirling Castle.—*W. Cornwall.* Jolly Beggar.—*D. Cunningham.* 1, Potts's Seedling; 2, Golden Noble.—*William Yandell.* We do not recognise your Apple, which must be a local variety. It has a fine appearance, and earlier in the season might possibly possess a better flavour.—*J. L.* 1, King of the Pippins; 2, Claygate Pearmain; 3, Fearn's Pippin; 4, Baxter's Pearmain; 5, New Hawthornden; 6, Summer Strawberry.—*F. Edgington.* Apples: 1, Lady Derby; 2, Yorkshire Greening; 4, Chelmsford Wonder; 6, Minchull Crab; Pears: 3, Beurré d'Amanlis; 5, Gratioli de Jersey.—*F. Ellis.* 1, Cullen; 2, Royal Russet; 3, not recognised, a local variety; 4, Tower of Glamis.—*F. A. A.* 1, General Todleben; 2, Duchesse d'Angouleme; 3, Beurré Sterckmans; 4, Pitmaston Duchess; 5, Marie Louise; 6, Brockworth Park; 7, Doyenné du Comice; 8, Glou Morceau.—*G. K. P.* We do not undertake to name more than six fruits at one time. 1, Cellini; 2, Blenheim Pippin; 3, Potts's Seedling; 4, Cox's Pomona; 5, Quarrenden; 6, Cox's Orange Pippin; 7, Malster; 8, King of the Pippins; 9, Dumelow's Seedling (Wellington); 10, Mank's Codlin; 11, Wykin Pippin; 12, Radford Beauty; 13, Dumelow's Seedling (Wellington); 14, Yorkshire Greening; 15, Broad-Eyed Pippin; 17, Worcester Pearmain; 18, not recognised.—*Harry Williams.* 1, Newton Wonder; 2, Kerry Pippin.—*F. Dunn.* 1, Small's Admirable; 2, White Westling; 3, Royale d'Angleterre.—*A. W. D.* Cox's Orange Pippin.—*Barvelwith.* 1 and 4, Beurré d'Amanlis; 2, Pitmaston Duchess; 3, Gansel's Late Bergamot; 5, not recognised; 6, Comte de Lamy.—*A. S. K.* Aston Town.—*J. R. M.* Tom Putt.—*C. S. R.* 1, Annie Elizabeth; 2, King of the Pippins; 3, a very small fruit, not recognised.—*E. S.* 1, Peasgood's Nonesuch; 2, American Mother; 3, Red Ingestrie.—*H. Spight.* 1, Knight's Monarch; 2, Fondante d'Cuene.—*G. B.* 1, Lady Derby; 2, Duchess of Oldenburgh; 3, Scarlet Napoleon; 4, Potts's Seedling; 5, not recognised; 6, King of the Pippins.—*M. B.* 1 and 2, Worcester Pearmain; 3 and 7, Cox's Orange Pippin; 4, Beauty of Hants; 5, Ribston Pippin; 6, Tom Putt; 8, Pitmaston Pine Apple.—*Mrs. Batson.* 1 and 2, Blenheim Pippin; 3, 9 and 10, Lord Derby; 4, Belle Dubois; 5, The Queen; 6, 7 and 8, Annie Elizabeth; 12, Cox's Orange Pippin; 13, Bedfordshire Foundling.—*H. M. Onez.* 1, Franklin's Golden Pippin; 2, Bedfordshire Foundling; 3, Radford Beauty; 4, King of the Pippins; 5, Scarlet Golden Pippin.—*W. H. B.* 1, Warner's King; 2, Grenadier.—*Glenering Park.* 1, Souvenir du Congrès; 2, Beurré d'Amanlis; 3, Doyenné du Comice; 4, Durondeau; 5, Gansel's Bergamot.

NAMES OF PLANTS: W. Harris. 1, Clematis Viticella; 4, Herniaria glabra; 5, Helxine Solierolii. Nos. 2 and 3 were too scrappy to identify.—*A. C.* Datura Stramonium (Thorn Apple).—*Ernestii.* No. 4, Senecio tanguticus.—*A. W. S.* Pittosporum tenuifolium.—*F. W. Bond.* Indigofera Gerardiana.—*M. Cornwall.* West Norwood. 1, No specimen found; 2, Lycium chinense; 3, Spiraea japonica; 4, Heuchera sp. (cannot name leaves only).—*Tom Harris.* 1, Helianthus giganteus; 2, Helianthus autumnale; 3, Helianthus rigidus var.; 4, Pueraria Thunbergiana; 5, Silphium perfoliatum; 6, Borago laxiflora.—*M. Helianthus* Miss Mellish.—*Kingston.* 1, Euphorbia virosa; 2, E. splendens; 3, Phyllocactus sp.; 4, Opuntia Scheeri; 5, O. mesacantha; 6, O. Kleiniae.—*E. Semper.* 1, Phlox subulata var.; 2, Sambucus racemosa.—*J. H. Hard.* We do not undertake to name varieties of Pelargonium or other florists' flowers.—*L. M. R.* Poterium tenuifolium.—*W. G. B.* 1, Jasminum odoratissimum; 2, Achimenes longiflora; 3, Euphorbia splendens; 4, Hibiscus Cooperi; 5, Hymenocallis speciosa; 6, Acalypha hispida (Sanderi).—*J. B.* Cornus Spathii.—*F. H.* 1, Pleurothallis Grobyi; 2, Odontoglossum Lindleyanum.—*A. E. A.* Cryptomeria japonica.

NOTICE TO TERMINATE EMPLOYMENT: Brewer. (a) It has been decided by the Courts that, in

the absence of any special agreement, a head gardener is entitled to one month's notice and no more. There must have been some special circumstances in the 1903 case to which you refer. (b) Even if your employer has taken offence unreasonably you cannot refuse to accept the notice. (c) As to the extra pay at the end of each year, the question turns on whether this was intended to be a free gift or whether it represented deferred pay given annually by mutual agreement (instead of increased monthly or weekly salary). If your recollection of the arrangement is accurate we should look upon it as deferred pay in respect of which you could claim a proportion up to the date of your leaving, but the fact of your having taken no steps to enforce payment of it during the past nine months would weaken your case.

OUTDOOR FIGS: W. E. B. The immature fruits of which you send a sample, will not ripen, and should be removed from the tree in order to favour the development of the embryo fruits which will form the crop of next year. Another season you may remove in September any fruits that are not likely to ripen.

REFERENCES: H. W. We consider that, as you wrote asking for an interview in reply to the advertisement, you must be taken to have applied for the situation and that legally the advertiser was at liberty to write to your present employer without first communicating with you. At the same time it was very inconsiderate of the advertiser to write to your employer unless he definitely intended to engage you subject to your references being satisfactory. In applying for a situation it is always well to ask that your employer shall not be troubled unless it is intended to give you the situation subject to your employer's references being satisfactory.

ROOKS: I. S. E. The natural way of getting rid of the large colony of rooks which has established itself in your garden would be by shooting the birds. We do not know of any satisfactory method of so scaring them that they may be trusted never to return.

SHAKESPEARE'S FLOWERS: Aigburthensis. Information of the kind you require will be found in a volume entitled *The Plant-Lore and Garden-Craft of Shakespeare*, by Rev. Henry N. Ellacombe, published by Mr. Edward Arnold in 1878. Copies are not now obtainable except at second-hand booksellers.

SHRUBS FOR PLANTING ON THE TOP OF A WIDE WALL: Seacoast. Any of the undermentioned species and varieties may be planted on the wall with fair hopes of success. *Juniperus sabina*, *J. s. prostrata*, *J. s. tamariscifolia*, *Taxus baccata ericoides*, *Cytisus albus*, *C. praecox*, *C. scoparius*, *Genista hispanica*, *G. prostrata*, *Euonymus radicans*, *E. r. Silver Gem*, *Colutea arborescens*, *Buxus sempervirens*, *B. japonica*, *Gaultheria Shallon*, *G. procumbens*, *Cotoneaster microphylla*, *C. congesta*, *Fuchsias*, and *Ulex europæus fl. pl.*

TOMATO AND MELON ROOTS: A. S. B. and G. G. The roots are badly infested with eelworm. It is too late to save the plants, and, after the fruits have been gathered, they should be destroyed by burning, taking care to see that every portion of the roots is destroyed. The soil is affected, and must not be used for similar plants again, but buried in some out-of-the-way part of the garden.

TOMATO ROOTS: A. G. B. The creatures sent in the pieces of decayed roots are (1) the small Snake Millepede (*Blanjulus guttulatus*), (2) small Mites (*Glyciphagus* sp.). The cause of the damage has been the Knot Root Eelworm, *Heterodera radicola*, which is microscopic. The two creatures you send have not caused the disease, but the Snake Millepede does some damage to roots of various plants.

THE MYSTERY OF THE FIG UNRAVELLED.*

THE life history of the common Fig has been a subject of investigation ever since man turned his attention to natural history, from Theophrastus, who flourished three centuries before the commencement of the Christian era, down to the present day. The substance of some of the later writings has appeared in the *Gardeners' Chronicle* from time to time. Noteworthy among comparatively recent papers on the subject are those by Solms Laubach and Fritz Mueller†, reviewed in the *Gardeners' Chronicle*, n.s. xix., 1883, pp. 529 and 572. Solms discussed the subject from the point of view of the Caprifig being the wild condition of the species, and the cultivated Fig as having been selected from wild forms which had developed some succulence in the fruit, which had been further increased and improved by cultivation. Mueller, on the other hand, argued that the Caprifig, standing alone, did not possess all the attributes of a species, but, taking it as the male and the cultivated Fig as the female, the combination presented a complete species. Neither of these explanations was satisfactory, and Prof. Tschirch's interpretation, as unfolded below, is much more

convincing. He claims to have discovered the clue and solved the problem of the interrelations of the wild Fig, the cultivated Fig, and the Caprifig, and to have followed all the phases of the life-history of the insect concerned in the pollination of the Fig. In these prolonged and comprehensive investigations, Prof. Tschirch was assisted by a former pupil, Mr. Ravasini. Tschirch set himself the task of deciding certain moot points by means of exact experiments. The first was whether parthenogenesis, which has been observed in other species of *Ficus*, actually occurs in *Ficus Carica*. Next came the question of the utility or necessity of caprification, even as a factor in the successful cultivation of the Fig. Then the real relations of the so-called wild Fig and the Caprifig, and the nature of seedlings, raised from the cultivated Fig. Italy was chosen as the field of operations, because all the materials necessary for the purpose exist there. From a variety of causes, it was impossible for a foreigner to carry out the work unaided, and Tschirch was fortunate in securing the enthusiastic co-operation of Ravasini. The latter undertook the whole of the literary researches, and travelled through Italy, from Emilia to Calabria and Sicily for the purpose of visiting the Fig gardens to make observations and collect specimens and information from the growers themselves. He spent a year and a half visiting various establishments, examined some 3,000 trees belonging to 100 different varieties, and investigated the contents of upwards of 20,000 receptacles or fruits. The materials were, in all cases, preserved, and his observations controlled by Tschirch. A large number of carefully conducted experiments with young Fig fruits, from which the insect (*Blastophaga*) was excluded by gauze coverings, resulted in no seed being formed. Therefore it was assumed, though not absolutely proved, that parthenogenesis does not take place in the cultivated Fig. The next thing to determine was whether the wild Fig and the Caprifig were identical, and it was found that they are always easily distinguishable. The conclusion arrived at was that, the wild Fig was the progenitor of the Caprifig and the cultivated Fig, and Tschirch proposes naming the wild Fig *Ficus Carica*, L., the male Caprifig, *F. Carica α caprificus*; the female cultivated Fig, *F. Carica β domestica*. It was further proved that all seedlings raised from the wild Fig and the cultivated female Fig (visited by insects), were the wild Fig, none Caprifig, none female cultivated Fig, "which can only be propagated true by cuttings or grafting." Cultivators unanimously confirmed these conclusions. The cultivated Fig gives rise to new varieties; but the offspring is never Caprifig, never the genuine wild Fig. The wild or primeval Fig tree of Italy produces three generations of infrutescence (or fruit) as shown in the accompanying diagram (fig. 120), where are given dates of inception and ripening. The first generation, the profichi, which appears in February or March, in the axils of the leaves of the previous season's

wood, contains only male flowers and gall-flowers. This is not an edible fruit. The second generation, the fichi, is borne on the lower part of the young branches and contains only fertile, long-styled female flowers. This is an edible fruit. The third generation, the mamme, which appears on the upper part of the young shoots in September, but does not mature until March or April of the following year, contains only gall-flowers, and is not eatable. Gall-flowers occupy the base and sides of the receptacles of the profichi, and the male flowers are limited to a zone at the top around the base of the orifice. The profichi represent the male generation. The receptacles remain hard and milky almost to the ripe stage, and then only soften partially without the secretion of sugar. Apart from the absence of sugar they would not be edible, because each receptacle contains from 200 to 300 individuals of the *Blastophaga*. It is in the profichi that the inquiline, or insect, passes through its first stage or generation. The fichi represent the female generation of the wild Fig. The mamme, which always remain small, serve only to preserve the insect through the winter during its second stage. They shrivel and fall from the tree as soon as the insects emerge in the spring. The development of the flowers of the wild Fig and the development of the insect are admirably adapted to each other. It is an instance of the most marvellously organised symbiosis imaginable; for the development of the insect without the plant is just as impossible as the formation of the seed of the latter without the intervention of the insect. Tschirch and Ravasini followed every stage of this symbiosis or united life. After the copulation of the sexes of the *Blastophaga* in the mamme, the females leave the receptacles and fly to the still quite small profichi; the wingless males remain behind and perish. At this period the females are able to enter the orifice of the receptacles of the profichi, where they find the so-called gall-flowers in exactly the right stage for receiving their eggs. The gall-flowers are imperfectly formed, having the appearance of short-styled females, in which, however, the conducting-tissue of the style is replaced by an open channel, and the ovule by a slightly differentiated knob of tissue which offers a suitable nidus for the eggs. The female insects are exceedingly productive, and capable of depositing an egg in each of hundreds of gall-flowers. Some of the eggs develop into males, some into females. The wingless males are able to gnaw through the shell of the gall and reach the females, whom they impregnate, and then die. Soon the female insects free themselves and make for the orifice of the receptacle. Meanwhile, the male flowers around the orifice have ripened their pollen, with which the female insect becomes covered as it passes out. She carries the pollen to the fichi, and as she enters through the orifice, the pollen is transferred to the long-styled, perfect, female flowers. A solitary female insect can convey sufficient pollen to fertilise all the numerous flowers

Tschirch. Separatabdruck aus der Schweizerischen Wochenschrift für Chemie und Pharmazie, 1911, Seiten 1-11.

† *Die Herkunft, Domestikation und Verbreitung des gewöhnlichen Feigenbaums, Ficus Carica*, von H. Graf zu Solms-Laubach. Abhandl. Gesell. Wiss., Göttingen, vol. xviii., 1882. *Caprificus und Feigenbaum*, von Fritz Mueller. Kosmos, vol. vi., 1882.

in a receptacle. But the insect cannot lay a single egg in the perfectly-formed flowers. Later the orifice of the fichi is completely closed, but the pregnant female insect finds another asylum in the growing mamme. Here the process of depositing eggs is repeated and the cycle completed. *Ficus Carica* α *Caprificus*, like the wild Fig, normally produces three generations of infrutescences, none of which is edible. The diagram shows the nature of the contents of the three generations of infrutescences or receptacles, and the directions in which fertilisation may be effected. Each generation contains gall-flowers with male flowers in the upper part of the receptacle. Occasionally a few isolated female flowers are present. But they practically never

able conditions, all three are capable of so doing, though perhaps never in the same season. Tschirch derives the cultivated Fig from the fichi generation of the wild Fig. Having lost in transit the power of producing both male flowers and gall flowers in all its generations, it is incapable of maintaining the symbiosis. With regard to caprification, it is well known that it is not necessary for the ripening of the Fig, the ripening of the receptacle, or pomological ripening, as Tschirch terms it. But he explains that not only is caprification necessary for the production of seed, but it is also necessary for the production of fruit suitable for drying. This is an important point. Prof. Tschirch's papers, particularly the full memoir in the organ of the Naturforschende

RHODODENDRON WIGHTII.

SIR JOHN LLEWELYN, in his kindly notice (p. 72) of my little treatise on *Rhododendrons*, (Present-Day Gardening Series) asks for information about *R. Wightii*, and at the same time expresses a doubt that it has ever been introduced into cultivation. As represented by the coloured plate in Hooker's *Rhododendrons of the Sikkim Himalaya*, this species has large compact heads of strikingly handsome flowers, coloured straw yellow, with a crimson blotch and spots on the upper portion of the corolla. I am inclined to believe that, whilst this plate is generally correct, it is inaccurate with respect to the flower heads. Herbarium specimens collected in the Himalaya show that the pedicels are several inches long and consequently the flower heads are loose, the flowers being inclined to nod. I have also seen plants in flower in this country, and they showed the same looseness of head, the pedicels being from 2 to 3 inches long. Sir Joseph Hooker's description of this species is as follows, a few non-essential particulars being omitted:—

R. Wightii, Sikkim-Himalaya; wooded valleys and on spurs of all the mountains, elevation 12,000 to 14,000 feet; abundant. Flowers in June, fruits in November.

A small shrubby tree, yielding to none in the beauty of its inflorescence amongst that yellow-flowered group of which it is the pride. The trunks are as thick as the thigh in the large specimens, and branch very much both upwards and outwards, forming a thick-set shrub of 10 feet high. Branches very thick and woody. Leaves 6 to 8, rarely 10 inches long, and $2\frac{1}{2}$ to 3 inches broad, very coriaceous, deep bright green above, the underside covered with a felt-like tomentum of a more or less rufous colour. Flower head much larger than in *R. arboreum*, 12 to 20 flowered, but looser; scales brown, coriaceous and viscid; pedicels $1\frac{1}{2}$ inch long, slender, corolla large and very beautiful, truly bell-shaped, five-lobed, the lobes recurved, over 2 inches across, sulphur yellow, blotched and spotted in the upper portion with crimson; stamens 10; stigma capitate; ovary 10-celled, covered with glandular hairs. The flowers have a faint honeyed smell. This exceedingly handsome and abundant species replaces *R. Hodgsoni* in ascending the mountains, and is the most prevalent species at 12,000 to 13,000 feet, conspicuous at all seasons by its large leaves, of a rusty cinnamon colour underneath, and its viscid buds. Flowers in June, fruit in November.

Sir John and other *Rhododendron* fanciers also will be pleased to learn that *R. Wightii* has been in cultivation in a Surrey garden probably for many years, and that it is quite hardy. Miss Alice Mangles has a sturdy bush of it growing in the open at Littleworth, and she believes it was obtained and grown by her brother, the late Mr. J. H. Mangles, in his garden at Valewood, near Haslemere. After his death many of his *Rhododendrons* were transferred to Littleworth, and it is more than likely that *R. Wightii* was among them. The plant bears evidence of a bad branch rip some years ago, but it is now in good health. It has flowered several times, and at present there are about 20 fat buds upon it, promising a good display for next year. There is also a plant of *R. Wightii* at Kew, where it flowered last April, when the accompanying drawing was made (see fig. 121). This plant, which is growing in the Himalayan house, was raised from a graft presented to Kew by Miss Mangles.

With respect to the hardiness in this country of *R. Wightii*, the behaviour of the plant at Littleworth is conclusive. There is further collateral evidence of its hardiness in the behaviour of other species of *Rhododendron* which are found at, roughly, the same altitude in the Himalaya as *R. Wightii*, namely, *R. campanulatum*, *R. campylocarpum*, *R. Thomsoni* and *R. cinnabarinum*. These are hardy at Kew and elsewhere, and I have no doubt that *R. Wightii* will be happy in the open at Kew also.

Another piece of interesting information which I am able to give to Sir John and others is that I know there are plenty of seedlings of *R. Wightii* to be had in England now, for I saw boxes of them in the nursery of Messrs. R. Gill and Sons, Falmouth, a year or two ago, and there is no mistaking the species when once its characters of foliage, &c., are known. W. W.

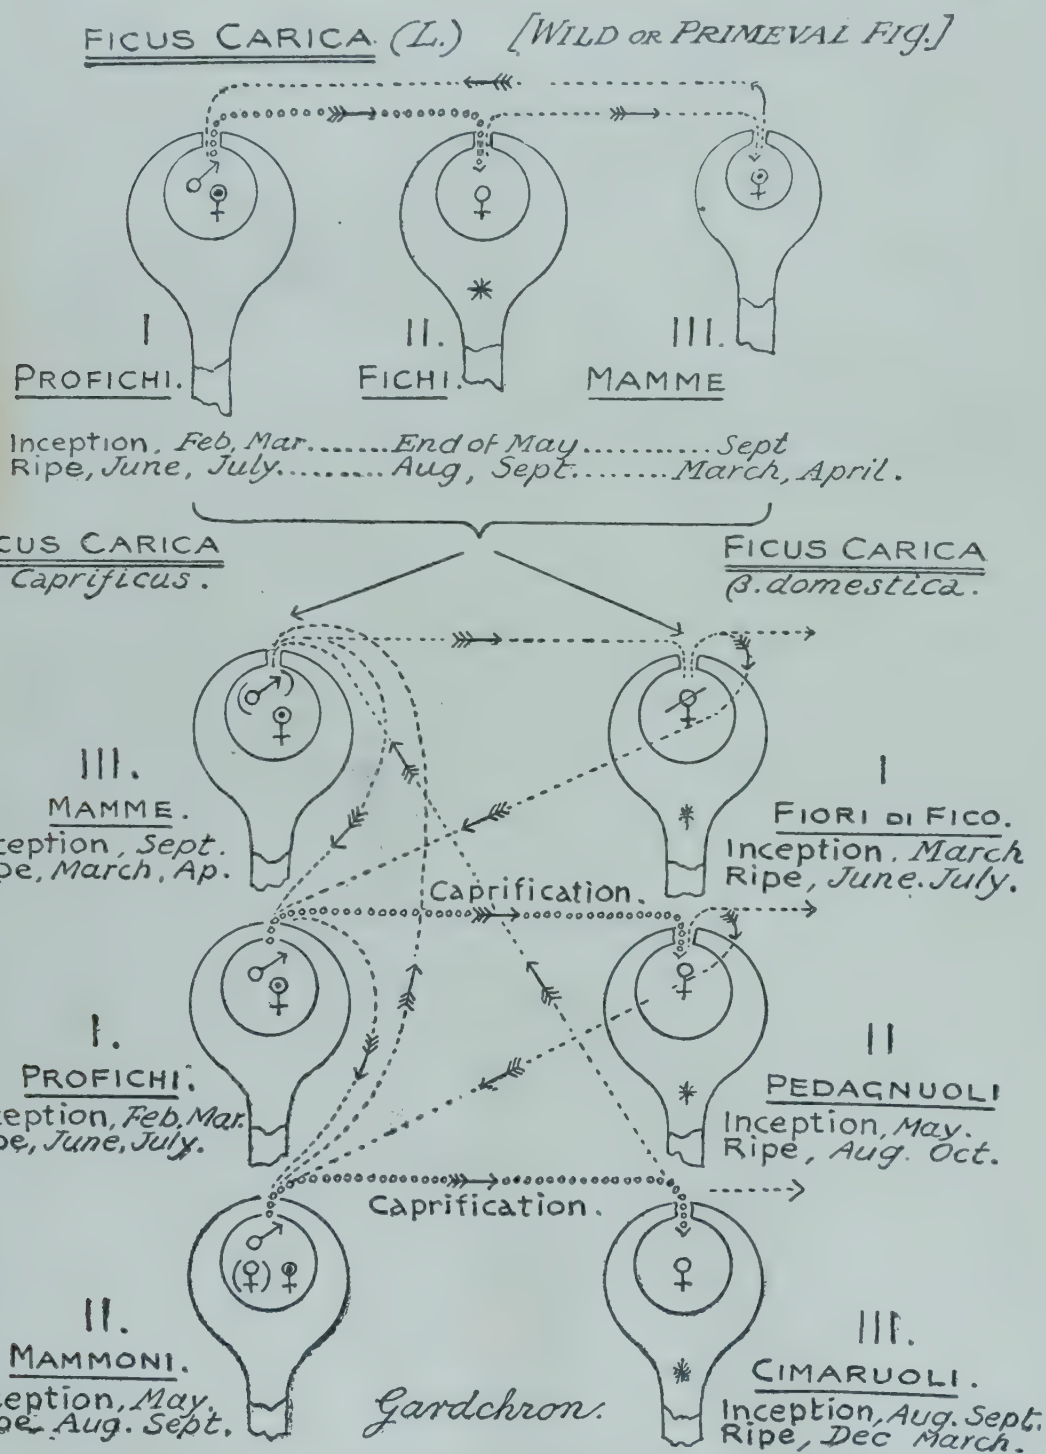

FIG. 120.—INTERRELATIONS OF THE THREE TYPES OF THE COMMON FIG, AFTER TSCHIRCH AND RAVASINI.

Explanation of the signs:—♂, male flowers; ♀, female flowers; ♂♀, gall flowers; ♂♀♂♀, sterile flowers; (♀), isolated females; (♂), isolated males. Direction of insect movements without pollen ———. Direction of insect movements with pollen ○ ○ ○ ○ ○ ○ ○ ○. The * indicates the edible generations. Explanation of the Italian names:—Profichi=a generation bearing male and gall flowers. Fichi=eatable Figs. Mamme and Mammoni=false Figs. Fiori di Fico=summer or main crop. Pedagnuoli=autumn crop, borne on the lower part of the shoots. Cimaruali=winter crop, borne on the ends of the shoots.

ripen seed, and can only be propagated vegetatively. The female-cultivated Fig (*Ficus Carica* β *domestica*) forms two or three generations. All are exclusively female and all are eatable. Male and gall-flowers are absolutely wanting, so that it is dependent on caprification for the production of seed. As a rule only the second generation, the pedagnuoli, ripens seed; but, given favour-

Gesellschaft of Zurich, June, 1911, contain many details of interest. In conclusion, it may be mentioned that no trustworthy evidence appears to exist of seedlings having been raised from English-grown Figs, though general statements in some gardening books would lead one to suppose that new varieties have been raised in this way. W. B. H.

FIG. 121.—RHODODENDRON WIGHTII: FLOWERS YELLOW, WITH CRIMSON MARKINGS.

NEW OR NOTEWORTHY PLANTS.

A NEW COLCHICUM.

WE have received from Mr. Amos Perry, Enfield, a flower of a species of *Colchicum*, bulbs of which were collected in Syria last year. In regard to the identity of the species, Mr. Irving, of Kew, writes us as follows:—"So far as can be determined from a single bloom, it is evidently quite distinct, although closely allied to *C. Parkinsonii*, from which it differs in that the flowers are of a primrose-yellow colour—tesseled as in *Parkinsonii*—with rosy-purple markings towards the base of the segments. The flowers are from 4 to 5 inches in diameter, the segments being nearly 1 inch across at their widest part. Yellow flowers are rare in the genus, the only other yellow-flowered species being *C. luteum*, a native of the Himalaya. As a provisional name *C. Parkinsonii* var. *flavum* would be suitable."

NOTICES OF BOOKS.

BRITISH RAINFALL FOR 1910.*

THIS, the fiftieth annual volume dealing with the rainfall of the British Isles, has recently made its welcome appearance, and, as usual, contains additional matter and new methods of treatment of the subject as compared with those given in previous issues. To the horticulturist the volume cannot fail to be of unusual interest after the exceptionally hot and dry summer. Such a season must have caused every gardener to realize more than ever before what a very valuable asset rain is in bringing to perfection the plants under his care, and how helpless he is in many cases without a sufficient supply. Such statistics as form the subject matter of this book take a long time to prepare for publication, consequently the volume before us treats more particularly of 1910, which, unlike the present year, proved very wet. Taking that year as a whole, the departures from the average in the total fall of rain were, we are informed, greatest in Wales, next greatest in England, less great in Ireland, and least in Scotland. The aggregate rainfall for the whole of the British Isles was, with the two exceptions of 1900 and 1903, heavier than in any year since 1882, or for 18 years. The gardener, however, is more particularly concerned with the rainfall of the summer half of the year, as it is during that period that vegetation is in a more or less active condition of growth. The total rainfall for those six months is stated to have been in excess of the average, and would have come out more largely in excess than it did, but for the extraordinary dry weather in September. Keeping in mind the influence of rain upon our gardens, it becomes necessary to enquire still further and to ascertain something about the fall in each month during the summer half of the year. We find that April was decidedly wet, May rather wet, June and July wet, August very wet, and September singularly dry. So fickle, however, is our climate that even then an erroneous conclusion may be formed as to the character of some of those months. For instance, taking any two successive months, the whole of the rain may have been deposited at the beginning of one of those months and at the end of the next one, leaving the six intervening weeks without any rain at all. Turning therefore to the chapter on what the author aptly terms "rain spells," that is to say, periods of more than 14 consecutive rainy days, we find that last year, in the British Isles, taking 100 rainfall stations, there were 235 of such rain spells, or more than in any year since 1903, while the number of absolute and partial droughts at the same stations was only about half the average. The work includes a very

* By H. R. Mill, Director of the British Rainfall Organization. (Edward Stanford.) Price 10s.

interesting article on the greatest fall of rain which has been recorded in a single day in every county in the United Kingdom, the conclusion come to being that there is no part of the British Isles where 4 inches of rain, equivalent to 18½ gallons on each square yard of surface, may not be deposited in a single day. Those who are thinking of starting a rain gauge should read the article entitled "The Rain Gauge in Theory and Practice." Enough, however, has been said to show the complete character of the information given in this work, which, in addition, contains the amount of rainfall recorded in the British Isles in 1910 by nearly 5,000 observers. There are numerous maps and diagrams, illustrating the rainfall, and several pictures on art paper. *Edward Mawley.*

REPORT ON THE SEED CROPS.

PEAS are very deficient in all countries, and are likely to be at famine prices. The crop is a very disappointing one; in fact, one of the worst in living memory, many crops producing not more, and in some cases less, than the seed sown. The demand is far in excess of the supply both at home and abroad.

BROAD BEANS.—In most English counties and in Holland, Broad Beans have been scorched by the sun and smothered with black fly; many acres have been ploughed in. In some few districts, on deep holding ground, however, they have produced very medium crops, and they may not be quite so scarce as Runner Beans and Peas. The plants of Runner Beans have grown and done fairly well, but, owing to the heat, most of the blooms have dropped, and consequently few pods have formed. The very recent rain has started the production of pods again, but it can hardly be expected that these will ripen.

BRASSICA.—The Cabbages supply an exception to the rule. The plants, having been in the ground since last year, were well established, and able to withstand the early drought; they ripened off well before the excess of drought could affect them materially. Crops of this kind of seed are therefore fairly good, and the seed is in splendid condition. There was, however, but a small acreage, and seeds cannot be very plentiful next year. Amongst Brassicas, however, Turnips have yielded extremely short and disappointing crops, the white-fleshed varieties in particular.

BEET.—The Beet crop is very deficient everywhere. The plants did not get a chance to grow and branch out, and many plantations failed entirely. Seeds of Beet are not usually ready to harvest until the end of October, sometimes later, but this year they have long since been cut, although not yet cleaned. The seeds will probably prove to be very small and somewhat light, but of good quality.

CARROTS.—The crops of Carrot seed are very light indeed. The roots, having suffered from the wet season of last year, kept badly through the winter, and the drought during the summer completed the undoing of this crop. Consequently the prices rule very high.

ONIONS.—The remarks on Carrots apply equally to Onions, and the outlook for these two important vegetables is anything but a rosy one, plants and bulbs being very scarce indeed.

MANGOLDS.—Although these gave promise of a fairly good crop at one time—in the early stages—being more robust growers than Beets and more able to withstand drought, yet before the plants developed seed the black fly appeared, and gradually smothered most of the plantations, stopped the growth of the seed, and killed many of the plants. Hence the yield will prove to be less than for many years.

LETTUCES are not so bad generally as some vegetable seeds. The plants in some places have suffered severely, but where they have stood, the yield may be put probably at not much more than half a crop.

RADISHES.—The Continental crops of Radish seeds are extremely poor, and in England, although somewhat better, they are yielding badly. The promise was good, and plantations looked like yielding well from the appearance of the pods, but none contains more than a few seeds, and many pods are quite empty. The yield barely comes up to half what was expected.

FLOWER SEEDS.

Flower seeds have fared, as a rule, somewhat better than vegetable seeds, and in a very few cases the plants have produced good crops. In many instances they have suffered considerably, and have yielded little or no seed, Asters being amongst the worst failures. Sweet Peas are also a very moderate crop, although the quality of the seed is considerably better than in the last two years.

Nasturtiums suffered from the great heat, with the result that the crop is a very light one.

Many perennials and biennials have suffered severely, such as Canterbury Bells, *Myosotis*, and others, and the crops are deficient, whilst the prospects for next year are very bad on account of the shortage of plants and the necessarily very late planting.

After three unsatisfactory seasons following each other, the two first with excess of rain and cold and the last spoiled by excess of heat and lack of rain, it may well be wondered what may be the result of next season should the summer of 1912 unfortunately prove to be unfavourable for the production of seeds. It would be so disastrous that we may well hope that seed growers and gardeners may be saved from the experience. *Seedsman.*

THE ALPINE GARDEN.

ERODIUM MACRADENUM.

ERODIUM MACRADENUM, the large-glanded Heron's Bill, is a native of the Pyrenees, and of much value for planting in the rock-garden. The plant delights in a dry, sunny place, never seeming to suffer from the effects of too much sunshine or drought. It forms a pretty plant, having very finely-divided leaves, covered with a glandular pubescence, which gives a feature of some beauty. The flowers are of a pale-violet colour, the broadest petals having generally a dark-purple marking at the base. The flowering period is given as June and July, but this year plants have flowered after the middle of August. The plant is considered a lime-lover, but it will do well in soil free from lime. A free drainage and full exposure to sunshine are essential for its success. *S. Arnott.*

HARDY FLOWER BORDER.

DATISCA CANNABINA.

ALTHOUGH of highly ornamental habit and foliage, *Datisca cannabina* is rarely found outside botanic gardens. It grows about 6 feet high. The pinnate leaves are 1 foot in length; the pinnae in about six pairs, with an odd one, are lanceolate, acuminate, and lacinate. The plant belongs to the small Order Datisceae, which is placed between the Begoniaceae and Cactaceae, but with neither of these has it any evident affinity, unless it be in the unisexual flowers—of which, as in *Begonia*, the males are polyandrous, the females with inferior ovary—and in the numerous anatropous ovules, capsular fruits, sub-exalbuminous seeds, and straight, cylindric axile embryo. But the points of disagreement are perhaps no less striking. It is dioecious, and the female plant is much the more ornamental from the graceful disposition of the swelling ovaries. The species is a native of the Himalayan region, and the East. It is perfectly hardy, and sends up new shoots strongly every year with the most perfect regularity. There is one other species, *D. glomerata*, a native of California. *R. Irwin Lynch.*

NURSERY NOTES.

THE MAIDSTONE NURSERIES.

IN accordance with an old-established custom, Messrs. G. Bunyard & Co., Ltd., Maidstone, recently invited a party of gardeners, fruit-growers, and others interested in fruit growing, including some members of the Royal Horticultural Society's Fruit Committee, to inspect the firm's nurseries in the Maidstone district. The party, 50 in number, visited the several branch nurseries at Maidstone, where many things of interest were seen, including a grand collection of pot vines. They drove subsequently to Allington Nursery, which embraces some 170 acres. The nursery is devoted to the cultivation of trees, shrubs, plants, fruit-trees, and bushes. Luncheon was provided in the large packing shed, at which Mr. George

Apple are found in all quarters, and in a season of unparalleled heat and drought. A plantation of bush trees was especially interesting to those who intend to plant suitable varieties of this form of tree. All the sorts were heavily cropped, and it was a difficult matter to make a selection amongst such large numbers of good varieties. Of dessert varieties, the most attractive were Adams's Pearmain, Cox's Orange Pippin, James Grieve, Transparent de Croncels, Foster's (a very handsome, richly-coloured variety), Winter Ribston (a fine late-keeping Apple), Farmer's Seedling (a little-known, but exceptionally good Apple), Allington Pippin, Rival (exceptionally beautiful fruits), Lady Sudeley, Blue Pearmain (well named as seen on the trees), May Queen (a heavy cropping and late keeping Apple), King of the Pippins, and Ben's Red. Of culinary sorts the following represent a good

The varieties included Baumann's Reinette, Charles Ross, Coronation, James Grieve, Rival, Allington Pippin, The Houblon, Twenty Ounce, and Emperor Alexander. In a large span-roofed house various Pears were planted out against pillars and trained transversely under the roof. Fondante de Thirriot, Beurré Diel, Durondeaux, and Belle des Arbres were all fruiting finely. The intervening spaces on the floor are filled later in the season with pot fruit trees. In another glasshouse Pear trees in pots were carrying fruits of splendid quality. In orchards attached to the nursery Cherries grow luxuriantly in grassland and give abundant crops. In other orchards, where the ground is cultivated, trees of Worcester Pearmain Apple presented beautiful pictures, the great heads being brilliantly coloured with fruits. The visitors passed quarter after quarter, each containing many thousands of young Apple, Pear, Plum, Cherry or other fruit trees, including large numbers of dwarf and standard flat-trained Peaches, Nectarines, Plums, and Pears. In a large plantation of Boskoop Giant Black Currant not a single big bud was to be seen. Gooseberries also were exceptionally healthy, and only the Raspberries appeared to have made less growth than usual. D.

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

FRUITING OF THE POMEGRANATE (see pp. 209, 228).—A tree of Pomegranate growing on a south wall in these gardens is carrying 39 fruits. During the 11 years I have been here it has never failed to produce a few fruits each season. The shoots were cut to the ground level by frost about 20 years ago, but the stem is now about 20 feet high. No protection is afforded the tree during the winter. I am sending a fruit (see fig. 122), which is a fair sample of the crop. Thomas Stiling, Livermere Park Gardens, Bury St. Edmunds, Suffolk.

EDINBURGH AUTUMN SHOW.—I am indebted to Mr. D. Mackenzie for the information he gives on p. 262, but the fact remains that the cheap excursion fares which have for many years been granted on the first day of the show were not allowed this year until the second day. It is in every way probable that the concession was originally granted at the request of the Society, and continued without their direct request. It must be said that the concessions within the 60-mile limit are made to those who have least need of them, and that a fare and a quarter is not a great concession after all, even to those within the distance, who, alone, can take advantage of it. But the gardeners who reside over 60 miles away can only reap this slight benefit by taking an ordinary return ticket to a station within the 60-mile radius and re-booking from there if there should be time to do so. The Council of the Society would do well to study and cater for those at a distance, as well as for those near Edinburgh, and the question of railway facilities is one of considerable importance. I have learned since I wrote you that there is no distance limit with the cheap fares for the Chrysanthemum Show of the Scottish Horticultural Association. A Galloway Gardener.

MARKET - GARDENING IN SOUTH - EAST SCOTLAND.—Mr. Taylor's remarks on market-gardening in South-east Scotland (see p. 233) were highly instructive to those interested in intensive cultivation, as there are many points in common between the methods employed by these northern market men and "French" gardeners. The choice of the strain of seeds seems to be, as in France, a very important item, for in both cases not only are suitable varieties grown, but special care is taken to improve them by selection. The manuring of the ground is also a parallel worth noting. If we accept the figures given by Mr. Taylor, viz., 100 to 110 tons per annum per acre, this represents at the lowest estimate an expenditure of £25, yet Scotch growers do not consider this extravagant, and, as with French growers, the results seem to justify the means. It may be noticed that

FIG. 122.—FRUIT OF THE POMEGRANATE, *PUNICEA GRANATUM*, GROWN AT LIVERMERE PARK, BURY ST. EDMUNDS.

Bunyard, on behalf of the firm, tendered to the guests a hearty welcome. Notwithstanding the heat and drought of the summer, all the trees looked exceptionally well, and had made a free, robust growth. Before planting, the ground is deeply worked and well manured, and this culture, together with a constant use of the hoe, has resulted in a moist rooting medium, so that the influence of the dry weather was not visible in the plants. The value of a loose surface in such a dry season cannot well be over estimated, for in addition to preventing the escape of moisture by evaporation, all weeds are destroyed. The crop of Apples was so large as to amount to several thousands of bushels, the variety Cox's Orange Pippin being specially good. In some quarters there is a complaint that this fine variety is becoming exhausted, yet, although last autumn was so unfavourable for the ripening of the wood, grand crops of this

selection:—Early Victoria, Norfolk Beauty, Warner's King, Lord Derby, Tower of Glamis, Emperor Alexander, Chelmsford Wonder, Sanspareil, Brabant Bellefleur, Mrs. Barron, Beauty of Kent, Gascoyne's Scarlet Seedling, Baron Wolseley, Lord Castlereagh (a new variety), Mère de Ménage, Belle de Boskoop and Royal Jubilee. A number of trees of Red Quarrenden had been cut down and re-grafted three years ago last spring, with Ben's Red and May Queen. All the heads had been summer pruned, the trees were compact, and each was carrying a large crop. The fruits of Ben's Red were of a glorious colour, and the marvellous crops of May Queen were the subject of general comment. Mr. Bunyard has a high opinion of this variety as a dessert Apple for use in midwinter and spring. In a wire-covered enclosure were some 200 Apple trees in pots, all carrying richly-coloured fruits.

whereas in Scotland the manure is only used once by digging it into the ground, in intensive cultivation it is available for further use after having been employed in the making of hotbeds. The financial results quoted by Mr. Taylor are worthy of the consideration of those who doubted the profits obtained from intensive gardening, but no doubt much of the success obtained in Scotland is due to the long hours and persevering care of the growers. *P. Aquatias.*

STOCK AND SCION IN FRUITS AND ROSES.—

Some little time ago, for the first time, I had the great pleasure of a somewhat hurried look round the gardens and grounds at Gunton Park in Norfolk. Fortunately I was accompanied by the well-known gardener, Mr. William Allen, who, I learned, had been in charge since 1867. There was abundant evidence of his well-known skill as a practical gardener. Having seen some Gunton Muscats exhibited in Manchester a good many years ago, and hearing of them in the interval, I was anxious to see them growing. The house is an ordinary, somewhat old-fashioned lean-to structure with plenty of light, yet not glazed with such large squares as characterise modern vineries. There was a splendid crop of good-sized, well-set bunches just beginning to colour. One vine practically occupies the whole house, say about 40 feet in length by 14 feet wide. It was originally inarched on a Foster's Seedling vine, and succeeded so well that the remaining vines in the house were gradually cut out to make room for it. As is known to many Grape growers Foster's Seedling vine has a good constitution, and in most soils makes fibrous roots freely, hence is a good stock to use for other better flavoured varieties. I have never seen a clearer instance of this than at Gunton. A few days afterwards when walking through the well-stocked nurseries belonging to Messrs. Daniels & Co., Norwich, my attention was attracted to a good-sized break of tall standard rambler Roses in variety. They were the results of last year's budding, and seemed to me to have made extra good growths. On asking my attendant how they managed to get hold of such tall briars he pointed to a side growth, and said "You ought to know this; you suggested its suitability as a stock for Roses in the *Gardeners' Chronicle* nearly 20 years since." I at once saw it was my old friend Rosa Rugosa, of which I once sent you some notes as suitable for group planting in home woodlands for beauty and cover for rabbits, incidentally suggesting its use as a stock for Roses. I replied, why not use the same variety as a stock for standard Roses in general, more especially as briar stocks with fairly good roots are getting scarcer every year! *Yorkshire Gardener, September 25.*

RHUS TOXICODENDRON (see p. 262).—We have a very fine specimen of *Rhus toxicodendron* growing against terrace walls, near to the Castle, and in October, when the leaves change colour, it is by far the handsomest specimen with coloured foliage. The plant is an old one, and was probably planted 50 years ago or more, yet, strange to say, no one knew of its poisonous properties or its proper name when I was appointed gardener. The old foreman, who had pruned and trained it for upwards of 30 years, was quite surprised when I explained the poisonous properties of the plant to him. This proves that there is no great danger in growing it in this country if reasonable care is taken, because, as in the case of *Humea* and *Primula obconica*, only a very few persons are susceptible to its poison. I have been informed by American visitors that the plant is much more poisonous in America. *W. H. Divers, Belvoir Castle Gardens, Grantham.*

DR. HOGG'S "FRUIT MANUAL."—In these days when the making of gardening books seems to have no end, is there not some risk of really important ones been overlooked? I am reminded of this now by seeing an advertisement in your columns recently for copy of the last edition of the *Fruit Manual*. The writer has been on the look out in the usual channels for a similar copy, but without success. If a new edition were brought out on the same lines with the addition of all new fruits, there can be no doubt it would sell in due course. Without for one moment wishing to cast any reflection on similar books published in the interval, I do not think they meet the same need as the *Fruit Manual* did in its day. *Yorkshire Gardener.*

The Week's Work.

THE HARDY FRUIT GARDEN.

By W. HEDLEY WARREN, Aston Clinton Gardens, Buckinghamshire.

SPUR - PRUNING.—Considerable advantages are gained by shortening, from time to time, the spurs on fully or almost fully-developed fruit-trees trained on walls or as espaliers in the open. This is especially necessary in the case of the Pear, which, under good management, will be fruitful for a great number of years. By periodically cutting back these frontal growths, not only is the general health of the tree improved and the tree made more productive, but the fruit also is of a much better quality. Other advantages are that the blossom is less affected by changes in the weather and the fruits are produced nearer to the wall and consequently under warmer conditions. Spurs that have extended to a considerable length often blossom profusely, but more frequently than not the greater number of such flowers turn yellow and drop. As a rule, long, ungainly spurs are infested with lichen and moss to the detriment of the tree. They also offer hiding places for the larvæ of insects, making it a difficult matter to cleanse the trees thoroughly by insecticides. It is the practice of some to reduce the length of a few of the spurs at one time, extending the operation over several seasons, ultimately replenishing the whole of the tree with new fruiting wood. Others shorten all the spurs at the same time, heedless of any risk of the tree receiving a somewhat severe check. Each method may have some advantages, and the operator must decide which course to adopt, after taking into careful consideration the general condition of the individual trees. It will sometimes be found that where the spurs have been allowed to grow unchecked for many years some of the buds at their bases have started feebly into growth, and ultimately perished through the old spurs receiving most of the sap. It is wise, therefore, whenever any of these buds show signs of breaking into growth to assist them by removing a portion of the old spur. An advantage derived by removing the extended spur at a fairly early date is that the wound caused by its removal is not large, and consequently soon healed, and also the regularity and fruitfulness of the tree are assured the sooner. With some trees it has been noticed that, when the old spurs are removed, the young spur which takes its place forms a fruit bud, which is productive during the second year. But it more frequently happens that, when the spurs that have been cut back are very old, the new spur will for two years produce little else than wood buds. The cause of this seems to be that, when a spur is allowed to become unduly large and extended, drawing a large amount of sap, the latter is checked at that part where it is severed, causing dormant buds to push forth. Thus the energies of the tree are expended at that part in the production of wood, instead of fruit-buds, which probably would not have been the case had the pruning been done gradually and at an earlier period in the life of the tree. This teaches us that the spurs must not be allowed to extend too far before being pruned, either wholly or partially, in order to obtain a new succession of fruiting spurs. In following this method many advantages may be obtained which will compensate for the extra care and attention bestowed upon the trees.

FRUITS UNDER GLASS.

By E. BECKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Hertfordshire.

TOMATOS.—Tomato plants intended for supplying fruit during the winter months will, as their pots become filled with roots, require more water, but it must be applied with discretion, and, for preference, in the forenoon. Afford a free circulation of fresh air whenever the conditions are favourable, to promote a sturdy growth. A top-dressing of good, turfy loam, mixed with either artificial manure or fermented horse droppings, will be extremely beneficial when the fruits of the first truss are set. Ram the fresh

soil firmly. Keep the leading shoot properly tied, and remove the side growths. If a difficulty is experienced in getting the flowers to set, artificial pollination must be resorted to, dusting the flowers about mid-day. A little artificial heat should be employed at this season, as the plants require a warm, buoyant atmosphere.

POT VINES.—The house in which pot vines are accommodated should receive a thorough cleansing, including the glass, and be otherwise got in readiness to receive the plants. The vines should be thoroughly matured this season, therefore there should be no delay in cutting back the canes. Wash the pots thoroughly, and see that the drainage is in perfect order. Remove some of the surface soil carefully, and afford a top-dressing of rich materials; but, before doing this, see that the soil in the pots is not dry. Stand the plants where they will receive plenty of fresh air. A week or so before the time arrives for placing the pots in position, prepare the material in which they are to be plunged. This should consist of long stable litter and tree leaves—of Oak or Beech for preference. The manure and leaves should be well mixed and turned several times in a place where they will not get too wet, but not where they will be dried by winds. Before being brought into the house, a suitable stage of fermentation must be reached.

MUSCAT OF ALEXANDRIA.—No pains should be spared to keep "Muscat" Grapes as long as possible in a good condition. The bunches in the latest house should now be well finished, and any light shading that may have been used should be removed, so that the berries may receive all the sunlight. Ventilation must be afforded carefully, especially during cold or stormy weather, and a suitable temperature maintained with the aid of fire-heat. Water must be applied to the roots carefully, for whereas an excess of moisture in the soil must be guarded against, dryness at the roots will cause the berries to shrivel. A layer of clean straw applied as a mulch over the border will prevent undue evaporation, as well as give a neat and tidy appearance to the house.

GENERAL REMARKS.—Make sure that all the valves of the hot-water system are in a good order. It often happens, after disuse in the summer, that they become stiff and difficult to turn, in which case they will need to be oiled. The same remarks apply to the air taps; it is an excellent plan to make a practice of turning these once each week. The present is a good time to overhaul trellises and make good any defects in them. Shelves in glasshouses should be placed in order and well painted.

THE KITCHEN GARDEN.

By JOHN DUNN, Kitchen Garden Foreman, Royal Gardens, Windsor.

AUTUMN CAULIFLOWERS.—Plants of autumn Cauliflowers should be protected carefully from frost. Covering the curds with the foliage is sufficient to ward off a few degrees of frost, but, as time advances, some other protection should be provided. At Frogmore, we lift as many plants as possible when the crowns are formed, and place them in convenient batches for protecting. The plants are lifted carefully, and placed within 15 inches of each other, in trenches, which are made sufficiently deep to allow a few inches of the stem to be covered with soil. Great care is taken to retain as much soil about the roots as possible. If the ground is still dry, the plants should be copiously watered as each row is planted. The work should be done as soon as the crowns are formed, or the crop may be injured by frost before the covering is applied. If these directions are attended to carefully, the supply will be maintained for some time after the ordinary crop is over.

FRENCH BEANS.—Plants of French Beans growing in cold pits will also require protection from frost. Close the pits early in the afternoon, in order to retain as much sun-heat as possible. Ventilation should be afforded freely in the early part of the day, so that the atmosphere may become dry before the lights are closed, or damping may prove troublesome. When water is necessary, it should be applied early in the morning, and the lights left off until the foliage is dry again. Further sowings of this vegetable should be made in pots to provide pods in December. Pots 7 inches in dia-

meter are large enough for late crops of Beans, and they should be filled with turfy loam mixed with a small quantity of leaf-soil to keep the soil open. The plants should be grown in a temperature of 65°, and exposed fully to the sunlight in order to promote a sturdy growth. Beans in pots which were sown a month ago will be benefited by frequent applications of weak liquid manure. Top-dress the plants with loam and decayed horse manure before the growth is too far advanced to be benefited by it.

SEAKALE.—Crowns intended for early forcing may be divested of some of the lower leaves to allow the light and air to reach the centres of the plants. While they are still growing actively, a copious watering may be given with advantage, as Seakale roots force better after a moist season than a dry one. Tree leaves should be collected and placed in large heaps and allowed to ferment.

PLANTS UNDER GLASS.

By JAMES HUDSON, Gardener to LEOPOLD DE ROTHSCHILD, Esq., Gunnersbury House, Acton, Middlesex.

STOVE PLANTS.—There should still be a good supply of flowers in the stove, including, amongst the climbers, Allamandas and Dipladenias. In the case of the Allamanda, all weakly shoots should be removed, whilst the growths of Dipladenia must be kept free from mealy bug. Clerodendron fallax will continue to bloom well if the plants receive proper attention, and care is taken to remove the faded blossoms. The old flowers of Vincas should also be removed. Stove Vincas, if well looked after, will continue to present a gay appearance all through the present month. The late-flowering Aphelandra cristata is a noble-looking subject when in blossom, and is one that repays for careful attention. Where the dwarf A. aurantiaca Roezlii is grown for winter blooming, afford the plants plenty of light, so that they grow robust and do not become drawn. For this reason, I prefer to place them on a shelf near to the roof-glass. Ixoras should still continue to develop a number of flower-trusses. The Ixora is a valuable plant for the stove, and may be grown either as large specimens or as small plants, with single "heads," in 4½-inch pots. Gardenias that have made good growth should be producing occasional flowers. These plants need the warmest place in the house. In order to have Eucharis in flower during the Christmas season, it will be advisable to keep the plants somewhat rested now. Let them be kept moderately dry at the roots until the first week in November, but afterwards afford water more freely, then, in about six weeks time, a crop of flowers may be expected. These remarks apply to specimens planted out. Give every possible attention to plants of Euphorbia pulcherrima (Poinsettias), and E. jacquinæflora. A moderately dry house or warm pit will suit both species, the stove proper being generally too moist for their requirements. If the plants of E. pulcherrima are checked by a chill when the bracts begin to develop, the immature bracts will often drop. Too much water at the roots, or a sluggish root-action will bring about the same result. Where Eranthemum pulchellum is grown for winter flowering, the plants should now be accommodated in the stove house, and afforded plenty of water at the roots. When grown in a cold temperature, numbers of white excrescences develop on the under surfaces of the leaves, causing the foliage to curl up and lose colour. Plumbago coccinea, which is preferable, perhaps, to P. rosea, does best in a moderately warm house, where it lasts for a long time in bloom. The flowers are very attractive when seen by artificial light. Thysacanthus rutilans, which may be grown under comparatively cool conditions in the summer, should be placed in heat, but not sufficient to produce excessive leaf growth.

MANAGEMENT OF THE STOVE.—The intermediate house is an extremely useful house, and may be formed by dividing the stove proper in two with a partition. The intermediate house may be maintained at a temperature of about 60°, or 5° lower than the ordinary stove. In both cases a rise of from 10° to 15° may be allowed in the daytime. Ventilation must be given carefully, as these figures must not be exceeded unduly. The amount of moisture in the atmosphere should be reduced, as there is no

need at present for much fire-heat, and moisture should not be allowed to accumulate. This, however, may be regulated by careful ventilation. Shading is not necessary now, therefore anything employed for the purpose should be removed, and the glass washed thoroughly. It will be advisable to give the interior of the house a thorough cleansing, to make the conditions as bright as possible during the dull season. The hot-water pipes should be freed from accumulations of dirt of any kind.

BEGONIAS.—Begonias of the Gloire de Lorraine type are coming into flower, and should be given occasional applications of weak liquid manure. The plants should be afforded all the light possible, and this remark applies also to those of B. socotrana. A cool house will suit both kinds much better than a very warm one. B. Lucerna, a somewhat tall-growing variety, but an almost perpetual bloomer; B. Knowsleyana and B. insignis are also useful plants for winter blooming. When grown in small pots, the plants are useful for decorative purposes in the dwelling house. B. Moonlight is another good variety. The three last-named may be cultivated in cold frames and pits during the summer.

THE FLOWER GARDEN.

By R. P. BROTHERSTON, Gardener to the Earl of HADDINGTON, K.T., Tynningham, East Lothian.

THE MIXED BORDER (continued).—The trained gardener has usually a decided preference for arranging his plants in lines or symmetrically-shaped groups, and many must have sympathised with Elizabeth in her frustrated hopes to get her German garden arranged informally, although it could have been accomplished quite easily. The furnishing of vacant spaces is also a matter of difficulty which some never overcome. Close planting is essential, and, in the case of many plants, it is preferable to employ small portions planted closely rather than large species at wider intervals. Single crowns of Aconitum, small side growths of Chrysanthemum maximum, individual shoots of Solidago, Helianthus, and many sorts of Aster are sometimes to be preferred to large clumps of these. A modification of this method permits of the association of a few or more plants which either flower at separate periods or simultaneously. A few combinations may be cited: Stenactis speciosa major, and Heliotrope; Aconitum autumnale, Helenium grandicephalum striatum, and Phlox paniculata alba; white-flowered Hollyhocks and old-rose coloured Antirrhinums (a tall variety); Montbretia Vulcan and Blue Cornflowers; Montbretia Rayon d'Or, and Achillea Ptarmica The Pearl; single blue-flowered Chinese Asters, and light blue-flowered perennial Asters. With regard to colours it will be found that a well-arranged border changes its dominating tints naturally with the seasons. At the present time yellow is strongly in evidence, as it is also in the spring. But when the Delphiniums are in flower they give a blue tone to the borders, and at other times red flowers are prominent. To ensure success with the mixed border, it is imperative to select the plants with the greatest care. The general effect must always be studied, and the individual plants must be subservient to the general scheme. This is especially necessary in the case of small borders, and even in large borders it is possible to detract from their effectiveness by employing too much variety. It is better to plant novelties in the reserve garden and employ them for filling gaps rather than to give them a place in the border before they have been proved. It is a simple matter to transfer them to the border when in flower if they realise expectations, and much better than having to remove them because they have been unsatisfactory. The removal of plants that have failed to please when in flower and the substitution of others is not so often practised as it might be, probably because the facility with which this may be done is not generally understood. Some plants are well worth preserving for the effect of their seed vessels and fruits; examples may be given in Astilbe Aruncus, Bocconias, Cimicifugas, and Phlomis Samia. In other subjects the foliage lends an additional charm, and such plants as Megasia cordifolia and broad-leaved Irises may be included for this reason. There are a few stately plants which, though tall of habit, should be arranged near to the front of the border; Lilium Martagon and its varieties, L. candidum, L. tigrinum, L. Henryi, Gladioli, and Montbretias are examples. Nor should sweet-smelling flowers,

such as Carnations, be arranged elsewhere than along the front. Although the mixed flower border is by many considered a very simple form of flower gardening, a perfect arrangement is very rarely accomplished even by the most expert gardeners.

TUBEROUS-ROOTED PLANTS.—As soon as the foliage of Begonias is frosted the tubers should be lifted and placed in one of the vineries to dry. I do not remove the whole of the soil from the roots, believing that it acts as a preservative. They may be stored in a cool store. Dahlias, however, should be stored where a uniform temperature of about 50° is maintained. As in the case of Begonias the soil should not be wholly removed from the tubers, which need not be dried previous to storing them. Gladioli are also ready to be shifted. The leaves, if not decayed, should not be cut off, but the entire plants laid out on the borders of a Peach house till the foliage turns yellow, when it should be removed, the soil cleaned off the corms, and the bulbils removed for increasing the stock. The corms of Gladioli will keep well in an ordinary fruit room.

THE ORCHID HOUSES.

By H. G. ALEXANDER, Orchid Grower to Lt.-Col. Sir G. L. HOLFORD, K.C.V.O., C.I.E., Westonbirt, Gloucestershire.

VANDA CÆRULEA.—Vanda cærulea is one of the most beautiful of Orchids, and it is not surprising that it is one of the most popular with cultivators. The blossoms are always of a much better colour where the air is pure than in gardens in the neighbourhood of large towns. The plants will sometimes bloom during the summer, but the flowers that are produced during the autumn months are usually the finest, and they last six weeks or more in perfection. It is no easy matter to maintain a large number of plants of this beautiful species in a robust condition. They thrive best where there is a constant supply of fresh air, a humid atmosphere, and plenty of light. Grown under these conditions they are not so liable to be affected with leaf spotting, which gives them an unsightly appearance. Spotted leaves are most prevalent during the winter months when the plants are least active, and the only method of combating the trouble is to avoid excessive moisture, both at the roots and in the atmosphere and at the same time to afford an abundance of fresh air whenever the conditions are favourable. A cool, intermediate temperature is suitable for the plants, which may now be exposed to full sunshine, no shading of any kind being needed.

V. KIMBALLIANA AND V. WATSONII.—These Vandas are two of the most charming and fascinating plants in the whole Orchid family. Their habits of growth are similar, and the flowers also are alike, except in colour, those of V. Watsonii being pure white. The flower-spikes of both species are well advanced, but before the blooms commence to expand, the plants should be placed in a slightly warmer and drier house, where the flowers will develop better and not be so likely to become spotted as in a cool, moist house. After the flowers are over, the fleshy roots should be afforded less water, reducing the amount gradually. During winter the plants may be rested in company with V. cærulea, affording water to the roots only when the leaves show signs of shrivelling.

DWARF LÆLIAS.—The dwarf-habited Lælia præstans, L. Dayana and L. pumila, are most valuable little Orchids for flowering at this season. All the plants succeed best when grown in shallow pans suspended in the cool, intermediate house, and the roots require a firm grip of the soil. As these kinds produce their flowers before the new growths are fully developed, the water supply must not be diminished until the little pseudo-bulbs are quite filled out, but when the thickened growths are ripe and plump, little water will be needed in winter, although shrivelling must be avoided. The small white scale, so destructive in the case of large Cattleyas and Lælias, is doubly injurious to these small species.

LÆLIA MONOPHYLLA.—This beautiful little species, which is now flowering, is distinct from the majority comprising the genus. The plant, having no pseudo-bulbs, needs a moist atmosphere, and a certain amount of water at the roots during the whole year. L. monophylla succeeds best in small, shallow pans suspended in a light position in the cool house, but it must be shaded from the direct rays of the sun.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, as well as specimens of plants for naming, should be addressed to the EDITORS, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

APPOINTMENTS FOR THE ENSUING WEEK.

WEDNESDAY, OCTOBER 18—
R.H.S. Ireland Winter Sh. (2 days). North of England Hort. Soc. Sh. at Leeds. (Lecture, at 8 p.m., by Mr. H. Somers Rivers on "Fruit-Growing in Orchard Houses.")

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last Fifty Years at Greenwich—49.1°.

ACTUAL TEMPERATURES:—

LONDON.—Wednesday, October 11 (6 p.m.): Max. 58°; Min. 50°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—Thursday, October 12 (10 a.m.): Bar. 30°; Temp. 53°; Weather—Slight fog.

PROVINCES.—Wednesday, October 11: Max. 53° Cambridge; Min. 48° Hull.

SALES FOR THE ENSUING WEEK.

MONDAY—

Sale of Nursery Stock, at Royal Gardens, Hampton Court, by order of Mr. J. Naylor, by Protheroe & Morris, at 12.

MONDAY, TUESDAY, WEDNESDAY, THURSDAY AND FRIDAY—

Bulbs, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 10.30.

MONDAY, WEDNESDAY AND THURSDAY—

Bulbs, Rose Trees, Shrubs and Perennials, at Stevens's Auction Rooms, 38, King Street, Covent Garden, W.C., at 12.30.

TUESDAY, WEDNESDAY, THURSDAY AND FRIDAY—
Nursery Stock, at The Nurseries, South Woodford, by order of Mr. John Fraser, by Protheroe & Morris, at 11.30.

WEDNESDAY—

34,000 Maiden Apples, at Ladd's Court, Chart, Sutton, near Maidstone, by order of Mr. A. Miskin, by Protheroe & Morris, at 12.

Palms and Plants, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 5.

THURSDAY AND FRIDAY—

Collection of Orchids formed by H. Little, Esq., at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 1.

The fourth international conference on genetics was held at Paris on September 18 to September 23, under the auspices of the Société Nationale d'Horticulture de France. The conference was opened by a reception, at which the foreign members were welcomed by their French colleagues; the inaugural addresses were followed by a lantern display, given by M. Gaumont, who showed, among other things, some remarkably vivid and accurate examples of photography in colours, as applied to plants. M. Gaumont also showed an interesting series of cinematograph pictures depicting in detail the technique of emasculating and cross-fertilising Wheats.

The communications brought before the conference will be dealt with in detail in a later issue; for the present we shall only refer briefly to a few papers of more general scientific or practical interest.

Miss Saunders, whose experiments in the inheritance of doubleness in flowers are well known, gave a résumé of some of her work on this subject. In some cases the inheritance of doubleness follows simple Mendelian lines; in others it is of a very complex type, which, however, Miss Saunders has shown to be capable of inter-

pretation on the hypothesis that simple-ness is due to the presence of two factors. She confirms in some degree the common opinion that old seeds give a higher proportion of doubles, the explanation being that the seeds destined to give doubles possess a greater vitality than those which give rise to singles.

The behaviour of hybrids between different species was dealt with by Professor Baur and Professor Lotsy. Antirrhinum majus was crossed reciprocally with A. molle, A. sempervirens, A. latifolius and other species. The F₂ and F₃ generations from these crosses give the clearest possible evidence of segregation; the number of factors involved may be judged from the fact that of 500 plants, scarcely any two were of identical appearance. A further point of interest was the appearance of a new type of flower in the F₂ from A. majus × A. molle. In these flowers the lips of the corolla are unlike the usual Antirrhinum type, recalling rather the shape of the corolla of Rhinanthus.

The papers dealing with cereals were sufficiently numerous to provide the entire programme for one sitting of the conference. Dr. Nilsson-Ehle described experiments which go to show that resistance to cold and precocity in Wheat and Oats depend upon combinations of Mendelian factors, successful selection for these characters signifying a re-grouping of the factors into combinations more and more advantageous under the given conditions.

Mr. Surface gave the results of selecting Maize for protein-content. An analysis of the pedigree of the selected Maize showed that the last generation consists entirely of the descendants of the same original stock, that is to say, the result of selection has been to isolate a "pure line" of high protein-content.

Mr. Orton described the results of selection for immunity from "or resistance to" fungous and bacterial diseases in varieties of Cotton, in the Cow Pea, and the Water Melon. The "wilt" of all these plants is caused by species of Fusarium, while the Cow Pea is also liable to the attacks of "eel worm" (Heterodora radicola). It may be mentioned that no resistant plants of the Water Melon were to be found. The Water Melon was, therefore, crossed with a non-edible Melon resistant to "wilt." F₁ gave an intermediate form, and F₂ gave a great diversity of types. From the later generations there has been selected a type combining the edible qualities of the Water Melon with the greater power of resistance to disease derived from the non-edible parent.

Professor Swingle described some interesting crosses between species of Citrus, in which several distinct types appeared in F₁. M. Gard also gave instances of a similar phenomenon in Cistus crosses.

Results of great importance from the theoretical standpoint were announced by Mr. Bateson and Professor Punnett. These results, of which it is almost impossible to give a brief summary, will be described later. Suffice it to say here that all students of genetics are aware that the F₂ generations of certain di-

hybrid crosses show marked numerical departures from the normal ratio of 9 : 3 : 3 : 1. Though the departure is marked, it is quite regular, and can be accounted for on the hypothesis of gametic coupling. This year, Professor Punnett's experiments with Sweet Pea, in which the characters concerned were sterility and a curious malformation of the flower (Cretin Pea), have shown that just as partial coupling may occur, so may partial repulsion take place between the factors for separate characters.

During the course of the conference, visits were paid to the Institut Pasteur in Paris and at Garches, to the Museum of Natural History, and a day was also set apart for an excursion to the famous establishment of Messrs. Vilmorin, Andrieux and Company, at Verrières-le-Buisson, where the members of the conference were entertained at lunch by M. Ph. de Vilmorin. The scientific and horticultural work of M. de Vilmorin is too well known to need any eulogy from us, and we need only say that the objects of interest found in the gardens and in the admirable museum and library at Verrières were appreciated to the full by the members of the conference.

It is a great pleasure to add a word of congratulation and of thanks to the members of the Committee of the Société Nationale d'Horticulture de France, who were entrusted with the organisation of the conference, and specially to M. Ph. de Vilmorin, whose indefatigable activities contributed so greatly to the success which attended the conference.

The year 1911 will long be remembered as one of the most disastrous seed seasons on record, not so much from the quality of the seed, but from the extreme shortage of many crops. This great deficiency, as will be seen from the detailed report on p. 270, is not confined to any particular country, but is universal; moreover following, as it does, the poor seed harvest of the two previous wet and cold seasons, nearly all seeds are this year particularly scarce and dear. Hot, almost rainless, summer weather prevailed all over Europe, particularly in Germany, France, Holland, and England. Germany and some parts of France seem to have suffered even worse than England. Denmark, on the contrary, has not suffered so keenly.

The one redeeming fact is that what few seeds are or will be harvested are very good in quality. Sunshine is very necessary for maturing seeds of all kinds, and a good vintage year is sure to be a good seed year, but in the past summer there has been too little rain for the vines and for the seeds. The drought commenced in March, and the plants had but little time to get fairly established and well rooted before the struggle commenced. Still, some plants were able to live and produce very good seeds, although somewhat smaller than usual.

The season has not only been a disastrous one for this season's seed-producing plants, but the outlook for next

Photograph by H. N. King.

WOODLAND WITH RHODODENDRONS AT LEONARDSLEE, HORSHAM, SUSSEX.

season is extremely bad so far as biennials and perennials are concerned, growers being unable either to get the seed to germinate owing to the drought, or to plant out what they managed to grow from seed owing to the dry state of the land.

The harvest of seeds has been particularly early as crops have been hurried by the heat. In consequence, seedsmen are realizing the shortages of their crops some weeks sooner this year than is usual.

OUR SUPPLEMENTARY ILLUSTRATION.—No more charming woodland scenes are to be met with in this country than those at Leonardslee, Sussex, the seat of Sir EDMUND LODER, Bart. Our Supplementary Illustration represents not only the natural beauty due to the well-spaced Scotch Pines and other trees, but the enhanced effect produced by a judicious planting of under shrubs, including Rhododendrons, of which plants Sir EDMUND LODER is, as is well known to our readers, one of the most distinguished amateur raisers.

ROYAL HORTICULTURAL SOCIETY OF IRELAND.—The winter fruit and flower show of this Society will be held at Ballsbridge, on Wednesday and Thursday, October 18 and 19. Special prizes are offered by the Department of Agriculture and the Royal Dublin Society. A fruit conference will be held under the auspices of the Department of Agriculture, Ireland, on the second day of the show. Particulars may be obtained from the secretary, Mr. EDWARD KNOWLDIN, 5, Molesworth Street, Dublin.

THE "JOURNAL OF HORTICULTURE."—We are informed that Mr. J. HARRISON DICK, who has filled the office of assistant editor of our contemporary since the retirement of Mr. H. J. WRIGHT, has been appointed editor of that journal. Many of our readers will join with us in wishing Mr. DICK all success in his new post.

CULTURE OF VEGETABLES IN SHROPSHIRE.—In a recent article in the *Times* on agriculture in Shropshire the writer makes the following remarks in respect to the market cultivation of vegetables on a particular farm:—"Potatoes formed one of the most profitable crops on the farm, and were looking extremely well at the time of our visit, showing no effects of the drought, which, indeed, did not seem to have hurt the Swedes, though the Mangolds appeared a little short of growth. Potatoes sell well in the neighbouring markets of the Potteries and of the Black Country, the distant chimneys of which we could just see; and with this market at hand a good deal of vegetable growing was done on the root break, even some of the Swedes being sold for table when there was a scarcity of other vegetables. Carrots were a speciality; they required a deeply-worked fine soil that had been manured in the autumn, and they needed a great deal of labour because they had to be weeded and pulled by hand as well as repeatedly moulded up. As we saw them they were a very even crop, wonderfully clean, but they had not yet covered the ground as they would have done with a little more rain. Off the fine red land the Carrots pull with a good shape and a clean red colour, so that they can be bunched up straightaway without any washing. The cost of the crop is great, as much as £30 an acre, and there are years in which it sells very badly; not only must trade be good but Potatoes ought also to be cheap, for the working-man's household buys Potatoes first and Carrots only if there is some money left over. Another breadth was in Parsnips, again a speculative crop, even more so than the Carrots."

"THE ORCHID WORLD."—The October number of this useful publication gives a good account of the Glebelands collection of Orchids, together with an excellent portrait of its owner, J. GURNEY FOWLER, Esq., treasurer of the Royal Horticultural Society, and chairman of the board of directors of the International Exhibition of 1912. Illustrations of some of the rare *Odontoglossums* in the collection are also given, and notes on various new and rare Orchids, seasonable cultural directions, and reports of the Orchids shown at the exhibitions during the previous month. The present issue is the first of the second volume, and it may be said that the work, which was well commenced, has been well sustained.

FLOWERS AND FRUITS IN SEASON.—A box of autumn-tinted leaves, fruits, and flowers has been sent us by Mr. T. SMITH, of Daisy Hill Nursery, Newry. We were not surprised to find that it contained many interesting and uncommon subjects. In a note on the various plants enclosed, Mr. SMITH states that "autumn tinting has been very beautiful this season, especially in *Ribes aureum*, *R. floridum*, *Vaccinium stamineum*, *Berberis virescens*, and *Pyrus arbutifolius* Brilliant. The bluish-black fruits of *Cornus Amomum* have been very plentiful. Plants of *Delphinium* "Fanny Stormouth" are flowering as freely as they did in July; the variety is an improvement on *D. Bella Donna*. *Crocus speciosus Aitchisonii* is one of the most beautiful of the autumn-flowering sorts; its white form is very pure. *Viola bosniaca* is a gem for a shady nook in the rock-garden, where it will continue to flower for several months. *Kniphofia modesta*, with wand-like spikes of white flowers, is blooming very freely. It requires a warm corner against a sunny wall. *Clerodendron trichotomum* has been in flower for almost a month, the hot summer having suited it. *Escallonia langleyensis* is flowering again, and very freely. Its pink counterpart, *E. hybrida* Edinburgh, is also a beautiful shrub. *Rosa nitida* is charming with its fruits and autumn colour as an edging plant, or for a dwarf group in the shrubbery border. *Colchicums* have all been good this season, and much earlier than usual. None has lasted so well as the double white form of *Colchicum autumnale*."

METROPOLITAN PUBLIC GARDENS ASSOCIATION.—The Metropolitan Public Gardens Association, at its monthly meeting, held at 83, Lancaster Gate, decided to plant trees at Wormholt Park, Hammersmith, and to grant requests made by local authorities for seats for thoroughfares in Greenwich and Malden, and for recreation grounds in Poplar and Cubitt Town.

ENGLISH GARDENS AND SCOTCH MOORS.—At the Ryder Gallery, Albemarle Street, Piccadilly, Miss HELEN M. BULKLEY is holding an exhibition of broadly-treated garden and landscape scenes in water-colour, which she calls "Impressions from Nature." These are interspersed with some clever studies of culled and garnered flowers, such as "Wallflowers and Primroses," "Daisies and Delphiniums," and, especially to be noted, a well-rendered study of "Rhododendrons." Of the garden scenes, perhaps the most delightful, in its fresh and sweet colour scheme, is the one which the artist found nearest home and at hand in the garden of "Blacknest Cottage." Tall, white Lilies vie with sky-blue Delphiniums in representing "Heaven's Colours on Earth," and at the same time illustrating that line of Tennyson which the artist has applied to another picture in her collection, "Hyacinths—that seemed the heavens upbreking through the earth." Both these pictures charm by the harmonious blending of the sky colours of white and blue with the cool and

dark-green background of the trees and shrubs which surround them. But Miss BULKLEY's broad method and wide outlook at Nature find a truer field and scope when she goes for her subjects to the wide and wind-swept, mist-blurred Scottish moors and highlands—bounded by grey hills in ever-fading distances to the dim horizon; but, in the near foreground, upheaving at one's feet, in splashes and waves of bright crimson or russet heather against the grey, mouldering rocks; in the middle distance sometimes a touch or curve of silvery, winding river or line of sea. Of such subjects in her little collection are to be specially noted: "A Soft Day in Perthshire," "Heather and Mountains, Morar," "Morar Hills from Arisaig," "Rocks and Heather near Brocara," and several other scenes, the names quite familiar to lovers of Scotland and fine scenery. Nearing home again, Miss BULKLEY lands us in "The New Forest near Brockenhurst," where, doubtless, she painted her "Old Beech Tree," and then back again to peaceful, rural Berkshire, and on "Crookham Common" (of which she shows several excellent sketches, notably "Clearing, after Rain"), again we find the familiar Ling or Heather, which from Iona to Land's End crimson the grey rocks of the British Isles in summer and clothes them in winter with that russet mantle which the true landscape artist prefers to the more showy summer glory. And though the banks and braes, the muirs and mountains of "Bonnie Scotland" are not to be gainsaid of their beauty, England can still hold her own in charms which are peculiar to herself, and shake hands with Scotland over the Heather which favours both countries in due season. Before leaving the gallery, the visitor should note three or four "interior" sketches, which show the artist's achievements in another genre.

THE "TIMES" EXPERIMENTAL STATION.—Mr. HARRY FOSTER, son of the late Mr. CHARLES FOSTER, has been appointed Director of the *Times* Experimental Station, Sutton Green, Guildford. Mr. FOSTER has experience of the work, for during the long illness of his father he superintended the general work of the Station, as well as the trials of the National Sweet Pea and Vegetable Societies. Mr. FOSTER completed his education at the Reading Collegiate School, subsequently gaining experience at Wisley and under his late father at the Station to the directorate of which he is now called.

SMALL HOLDINGS CONGRESS AT THE FESTIVAL OF EMPIRE.—A small-holdings congress will be held at the Crystal Palace, on October 18, 19, 20, in connection with the Festival of Empire exhibition. Lord CARRINGTON, the President of the Board of Agriculture and Fisheries, will deliver the inaugural address. Subjects for discussion have been arranged in the following order: Opening day, Lord CARRINGTON's address and a discussion on "Credit, as Applied to Small Holdings." October 19, "Production and Co-operation," "Marketing and Transportation." October 20, morning, "Equipment of Small Holdings"; afternoon, "Education, from the Small Holder's Standpoint." The secretary of the congress is Mr. W. H. JONES, Festival of Empire, Crystal Palace.

THE ULLSWATER FORESHORE.—In a letter to the *Times* on Saturday, October 7, Canon RAWNSLEY announces that the purchase money for the Ullswater foreshore has been raised, and that the beautiful strip of Glencoin woodland that runs northward from Stybarrow Crag, between the main road and the lake, will henceforth be open to the public under regulation of the National Trust. Among the subscribers are cottagers and miners in Patterdale and factory hands at Leeds.

YORKSHIRE FUNGUS FORAY.—The members of the Mycological Section of the Yorkshire Naturalists' Union held their annual fungus foray on September 23-27, thanks to the continued kindness and interest taken in the subject by the Rev. the Marquis of NORMANBY, in Mulgrave Woods, at Sandsend, near Whitby. These ancient and charming woods, situated near the sea, and intersected by streams, are practically independent of weather conditions, so far as moisture is concerned, and, contrary to the experience of mycologists working in other parts of the country, the number of species discovered was practically equal to that observed on previous visits; in fact, many of the larger species, that would have been most affected by the severe drought, were very much in evidence. Many luxuriant specimens of *Tricholoma patulum*, some measuring 8 inches across, were collected, also fine specimens of the rare and beautiful *T. hordum*. *Entoloma lividum* was also found. The number of species observed exceeded 450, of which 150 were additions to the district. Three species new to Britain were collected—*Collybia phaeopodia*, Fr., *Pluteus sororius*, Karst., and *Hypholoma aelopodium*, Fr. Two species new to science, belonging to *Phiteolus* and *Clavaria* respectively, remain to be described. The primary object of the frequent visits to Mulgrave Woods is not so much to add new county or British records, as to endeavour to gain some insight into the ways and doings of fungi, matters which, up to the present, have been neglected. On Wednesday afternoon the members were entertained at tea at Mulgrave Castle by Lord and Lady NORMANBY.

PUBLICATIONS RECEIVED.—*New York Agricultural Experiment Station, Geneva, N.Y.* Bulletins: A Contribution to the Life-History, Parasitism, and Biology of *Botryosphaeria Ribis*, by J. G. Grossenbacher and B. M. Dugger; and Is It Necessary to Fertilise an Apple Orchard? by U. P. Henrick. (Geneva, N.Y.: New York Agricultural Experiment Station.)—*New Hampshire Agricultural Experiment Station.* Bulletin: Fruit Bud Formation, by B. S. Pickett. Obituary.

SIR CHARLES LAWES-WITTEWRONGE.—Sir Charles Lawes-Witte wronge, son of Sir John Lawes, of Rothamsted, died at Rothamsted on Friday, October 6. The deceased baronet, who was in his 68th year, achieved distinction as an athlete and as a sculptor. He was keenly interested in the work of the Rothamsted Experimental Station, and was at the time of his death chairman of the Lawes Agricultural Trust. He is succeeded by his only child, John Prennet Fountaine, who was born in 1872.

JOHN E. HAINEs.—John E. Haines, one of the oldest florists in the State of Pennsylvania, U.S.A., died on September 11 at his home at Bethlehem. He raised many varieties of Carnation and was a prominent member of the American Carnation Society.

NICHOLAS P. REDDY.—Mr. Nicholas P. Reddy, florist, Fall River, Massachusetts, U.S.A., died at his residence, 32, Laurel Street, on September 17, following a brief illness. Mr. Reddy was born in Dublin, and settled at Fall River about 40 years ago.

SOCIETIES.

MANCHESTER AND NORTH OF ENGLAND ORCHID.

SEPTEMBER 28.—*Committee present:* Rev. J. Crombleholme (in the Chair); and Messrs. R. Ashworth, W. R. Lee, C. Parker, H. Thorp, Z. A. Ward, J. Cypher, J. Evans, W. Holmes, A. J. Keeling, D. McLeod, W. Stevens, and H. Arthur (secretary).

W. R. LEE, Esq., Heywood (gr. Mr. Woodhouse), was awarded a Silver Medal for a group of plants, consisting of *Cattleyas* and *Cypripediums*, the most noticeable being *Cattleya* St. Gothard, *C. Iris* var. "Caesar," *C. Iris* var. "Ixion," *Cypripedium* Boltonii and *C. gigas* "Corndean Hall" variety.

Z. A. WARD, Esq., Northenden (gr. Mr. Weatherby), was awarded a Silver Medal for a group of *Odontoglossum grande*, with *Cattleyas* and *Cypripediums*, making a fine display.

J. MCCARTNEY, Esq., Bolton (gr. Mr. Holmes), exhibited a good group, to which a Silver Medal was awarded. It consisted principally of *Cattleyas* and their hybrids, including John Baguley, Mrs. Pitt, Princess Patricia, and Minuca; several *Cypripediums*, including *C. callosum* Sandere, were also exhibited by Mr. MCCARTNEY.

COL. J. RUTHERFORD, M.P., Blackburn (gr. Mr. Lupton), was awarded a Bronze Medal for a small mixed group, in which were observed a fine form of *Cattleya Maronii*, *Odontoglossum ardentissimum*, *O. crispum*, *Lycaste Skinneri* alba, and several choice *Cypripediums*.

J. J. HOLDEN, Esq., Southport (gr. Mr. Johnson), staged splendid forms of *Cattleya Iris* var. "Golden Queen," *C. Adula* "Auburn House" variety, and a plant of *Cypripedium* Juliet.

WM. THOMPSON, Esq., Walton Grange, Stone (gr. Mr. Stevens), showed *Cypripediums* Germain Opoix and Gaston Bultel, both very fine forms.

H. J. BROMILOW, Esq., Rann Lea (gr. Mr. Morgan), staged a good plant of *Cypripedium* Germain Opoix.

MESSRS. STUART LOW & CO., Bush Hill Park Nurseries, Enfield, exhibited a fine form of *Cattleya Hardyana* var. "Enfieldensis" and *C. Gaskelliana* var. "Delight," both of which received Awards.

MESSRS. A. J. KEELING & SONS, Bradford, showed *Cypripedium* Actæus "Westgate" variety, and a hybrid from *C. Curtisii* × *C. vexillarium*.

AWARDS.

FIRST-CLASS CERTIFICATES.

Cattleya "St. Gothard."—A noble flower, very evenly coloured, and with a rich lip.

C. Iris var. "Caesar."—A well-formed flower, the almost round sepals and petals being Plum colour, with a deeper-coloured lip. Both from W. R. LEE, Esq., Heywood (gr. Mr. Woodhouse).

C. Hardyana var. "Enfieldensis."—A fine large flower, of good colour, and well marked in the lip. From Messrs. STUART LOW & CO.

AWARDS OF MERIT.

Cattleya Iris var. "Ixion," from W. R. LEE, Esq., Heywood (gr. Mr. Woodhouse). *C. Germania*; *C. Iris* var. "G. Weatherby," one of the largest forms of the type yet seen; *Cypripedium Euryades* × *Parkerianum*, a massive bloom, following almost entirely the *Parkerianum* parent, these three from Z. A. WARD, Esq., Northenden (gr. Mr. Weatherby). *Cattleya Iris* var. "Golden Queen," and *C. Adula* "Auburn House" var., these two from J. J. HOLDEN, Esq., Southport (gr. Mr. Johnson). *C. Gaskelliana* var. "Delight," a pleasing flower with white sepals and petals and faintly marked lip, shown by Messrs. STUART LOW & CO., Enfield. *Cypripedium* Actæus Westgate var., and *C. Curtisii* × *vexillarium*, both from Messrs. A. J. KEELING & SONS, Bradford.

SCOTTISH HORTICULTURAL.

OCTOBER 3.—The monthly meeting of the above association was held in the Goold Hall, 5, St. Andrew Square, Edinburgh, on this date. Mr. Massie, the President, was in the Chair, and there was an attendance of 105 members.

The evening was devoted to a conference and discussion on early-flowering Chrysanthemums,

and, notwithstanding the unfavourable season for outdoor plants, there was a fairly good representative display of these flowers exhibited by Messrs. DOBBIE & CO., Mr. JAMES BRUCE, Messrs. TODD & CO., and Mr. JOHN DOWNIE. The discussion was opened by Mr. Berry, Edinburgh, and East of Scotland College of Agriculture, and the other speakers were Messrs. Todd, Cuthbertson, D. W. Thomson, Bruce, Wood, Smale, Fraser, Proctor, Porter, Taylor, and Miss Burton. At the conclusion of the discussion, Mr. Cuthbertson suggested that the members and others should send to the secretary the names of what they considered the best dozen early-flowering varieties, and that when these returns were tabulated the result be sent to the Press. Mr. Cuthbertson's suggestion was adopted, and the Chairman invited those present to act upon it. There was some difference of opinion as to whether the single early-flowering varieties were much wanted, but all agreed that the late-flowering singles grown under glass were much finer than the early out-door sorts.

Mr. Todd drew attention to the excellent qualities of the early-flowering varieties of the exhibition type, such as El Draco, and Mr. Cuthbertson referred to areas of several acres of these being grown in special frames near London for market purposes. Several advocated the planting to be done in the beginning of June, but the majority were in favour of doing it at the end of April or the beginning of May.

MESSRS. DOBBIE & CO. showed Collarette Dahlias and a new early-flowering Chrysanthemum named "Cynthia." The adjudicating committee awarded First-class Certificates to Collarette Dahlias "Holyrood" and "Prince Charlie," and Certificates of Merit to "Diadem," "Prince de Venosa," and "Maurice Rivoire."

At the meeting on November 7 a paper on "Propagation" will be given by Mr. Wm Roadley, Comely Bank Nursery, Edinburgh.

NATIONAL FRUIT GROWERS.

At a recent meeting of the National Fruit-growers' Federation, the report of the committee on railway agreements and amalgamations urging, amongst other things, important alterations in reference to owners' risk and other clauses in the railway rates, was adopted, and the President (Mr. C. S. Martin) and the Secretary were appointed delegates to attend a special conference with the President of the Board of Trade on the subject.

The report of the deputation to the Treasury with regard to the giving of increased facilities for the growing of Tobacco for insecticidal purposes was approved and adopted.

Several members complained of the serious loss resulting from the delay in the transit of fruit and marketable produce during the past season, and especially in the return of growers' "empties." A resolution dealing with this subject and also a protest against any increase in the rates for the carriage of English fruit and vegetables was passed.

NATIONAL DAHLIA.

OCTOBER 1.—Members of the Executive Committee of the above Society inspected, on this date, the trials of decorative and garden Dahlias carried out on behalf of the Society by Messrs. H. Cannell & Sons, Swanley, Kent. The plants were in an excellent condition, notwithstanding the hot, dry season. Awards of distinction (xxx.) were given to the following varieties for their free-flowering habit and their decorative effect in the garden:—

Pæony-flowered varieties: Golden West, South Pole, Geisha, Glenton, Mme. J. Coissard, and Dr. Hogg.

Collarette varieties: Negro, Mme. Porrier, Mons. Hugonard, A. Normene, H. Tarne, Mr. E. D. Till, and Souvenir de Chanbanne.

Giant decorative varieties: Ethel May, F. Grinstead, Le Grand Maniton, Papa Charmet, Phenomane, and Gloire Lyonnaise.

Giant single varieties: Mrs. W. C. Jackson, White Cloud, and Evelyn Jackson.

Garden Cactus varieties: Amos Perry, Effective, Decorative, and Kaiserin Augusta Victoria.

Exhibition of British-Grown Fruits.

OCTOBER 10, 11.

THE Royal Horticultural Society's autumn show of British-grown fruits was held on Tuesday and Wednesday last in the Society's hall, Vincent Square, Westminster. Apples dominated everything else, there being marvellous exhibits of these fruits, although it was a matter of surprise to some visitors that the colour was not more pronounced. Pears also were very good, and the Grapes rather better than usual. But dishes of Apples and Pears repeated in almost unlimited numbers do not lend themselves to making an exhibition capable of attracting many visitors beyond traders and exhibitors. The two displays of pot fruit trees, relieved by dishes of gathered fruits, made a pleasing change from the long rows of dishes, and there were two classes for collections of dessert fruits cultivated indoors, but other than these there was very little to provide good effects. Decorated tables of dessert fruit are always popular, and a class for these would add to the attractiveness of the show. Baskets of choice fruits arranged in the same manner as they are so temptingly displayed by the florists in their windows might provide further variety. The ornamental value of fruits is overlooked by the schedule, for no provision is made for the great number of Crabs and species of Prunus, which are very beautiful objects when seen in sprays.

The Fruit and Vegetable, Floral, and Orchid Committees all met at noon on the first day for the purpose of considering novelties.

The FLORAL COMMITTEE gave an Award of Merit to a market variety of Chrysanthemum and a dwarf decorative Dahlia, whilst the ORCHID COMMITTEE granted three First-class Certificates. The arrangements were, as usual, perfect, and being always so at these R.H.S. shows, there is a danger of the hard work of the superintendent, Mr. Wright, the secretaries, and other members of the staff, being overlooked.

DIVISION I.

COLLECTION OF HOTHOUSE FRUITS.

(OPEN TO GARDENERS AND AMATEURS ONLY.)

In the class for a collection of nine dishes of ripe dessert fruits, to include six kinds at least, and not two dishes of the same variety, there were five exhibits, the whole making a magnificent display of choice fruits. There were two outstanding collections, those shown by the Earl of HARRINGTON, Elvaston, Derby (gr. Mr. J. H. Goodacre), and the Duke of NEWCASTLE, Clumber, Worksop (gr. Mr. S. Barker). The 1st prize was awarded to the Earl of HARRINGTON, whose bunches of Muscat of Alexandria were amongst the finest in the show. The other Grape was Black Alicante, with solid, compact bunches, and a fine bloom on the berries. Amongst the other kinds was a splendid dish of Cox's Orange Pippin Apples, a beautiful fruit of Countess Melon, a good sample of Doyenné du Comice Pears (not quite ripe), Princess of Wales and Golden Eagle Peaches (the latter variety having the finer appearance), Victoria Nectarine, and Pitmaston Duchess Pear. The Duke of NEWCASTLE was awarded the 2nd prize, his Grapes being smaller, but the bunches of Madresfield Court were well matched and Muscat of Alexandria had rich, amber-coloured berries. Very large fruits of Doyenné du Comice and Emile d'Heyst Pears, a scarlet-fleshed Melon, good Golden Eagle and Nectarine Peaches, large Cox's Orange Pippin Apple, and mellow fruits of Ribston Pippin Apple completed the collection. 3rd, C. A. CAIN, Esq., The Node, Welwyn, Hertfordshire (gr. Mr. W. Pateman).

In the similar but smaller class for six dishes, there were four competitors, the 1st prize being awarded to G. MILLER, Esq., Newberries, Radlett (gr. Mr. J. Kidd), whose Grapes were very large bunches, although not over large in berry. Those of Muscat of Alexandria looked very tempting, the berries being perfectly ripened. The other Grape was Black Alicante. Countess Melon

was arranged in the centre of the collection, with dishes of Cox's Orange Pippin and Ribston Pippin Apples and Pitmaston Duchess Pears in front. The 2nd prize was awarded to the Marquis of SALISBURY, Hatfield House, Hertfordshire (gr. Mr. H. Prime). There was an excellent dish of Souvenir du Congrès Pears in this exhibit. 3rd, Lord HOWARD DE WALDEN, Audley End, Saffron Walden (gr. Mr. J. Vert).

GRAPE CLASSES.

The exhibits of Grapes were better than is usual at these exhibitions, and very good competition resulted in the 10 classes. The most important one was for two bunches each of five distinct kinds; there were three exhibits, and all were so good, the judges recommended an extra prize. The premier collection was shown by the Earl of HARRINGTON, the varieties being Madresfield Court, Muscat of Alexandria, Black Alicante, Muscat Hamburgh, and Chasselas Napoleon, which were very choice. The "Muscats" were large and the black kinds very finely finished. 2nd, the Duke of NEWCASTLE, whose exhibit was dominated by two exceptionally big bunches of the Barbarossa or Gros Guillaume variety. Madresfield Court was perfectly finished, but the bunches lacked size. Black Hamburgh was excellent. 3rd, Mr. G. MILLER, whose bunches were matched well, those of Lady Downes being very even in this respect; they were long, tapering bunches. Black Alicante and Appley Towers were shown well by this exhibitor.

In the class for four varieties, Lord HILLINGDON, The Wilderness, Sevenoaks (gr. Mr. J. Shelton), was the only exhibitor, and was awarded the silver cup offered as the 1st prize. Muscat Hamburgh was excellent, and the other sorts were Muscat of Alexandria, Madresfield Court, and Mrs. Pince, in each case compact and well-finished bunches were staged.

The following classes were for stated varieties; two bunches of each variety:—

Black Hamburgh.—This popular Grape was shown by eight exhibits, and the 1st prize was awarded to the largest bunches shown by Lord HILLINGDON; 2nd, Rev. W. BECKER, Newark (gr. Mr. A. Heald); 3rd, Earl of HARRINGTON.

Mrs. Pince.—Much the finest bunches of this variety were shown by Lord SAVILE, the berries being well coloured, whereas in most cases they had a "foxy" appearance; 2nd, Mrs. O. E. GOLDSMID, Tonbridge, Kent (gr. Mr. C. Earl), whose berries were the largest shown.

Black Alicante.—This proved a strong class, there being ten exhibits, and all were uniformly good, the berries being a dark colour with good bloom. The 1st prize was won by Mr. MILLER, and the 2nd prize by W. JAMES, Esq., West Dean, Chichester (gr. Mr. W. H. Smith).

Madresfield Court.—Amongst five competitors in this class, the Earl of HARRINGTON proved successful in gaining the premier position with small bunches of magnificent quality. The Duke of NEWCASTLE, who showed larger bunches, was placed 2nd, and Lord HILLINGDON 3rd.

Prince of Wales.—This large-berried variety was best shown by Lord SAVILE, the individual berries being as large as small Plums; 2nd, Earl STANHOPE, Chevening, Sevenoaks (gr. Mr. J. C. Sutton). There were four exhibits in this class.

Muscat of Alexandria.—There were six exhibits of this variety, the premier exhibit being shown by Sir E. DURNING LAWRENCE, Bart., King's Ride, Ascot (gr. Mr. W. Lane); 2nd, the Earl of HARRINGTON; 3rd, Mrs. O. E. GOLDSMID.

Any other black Grape.—The best variety in this class was Muscat Hamburgh, shown by the Earl of HARRINGTON; 2nd, Appley Towers, shown by Mr. MILLER.

Any other white Grape.—The winning variety was Dr. Hogg, shown by Lady TATE, Park Hill, Streatham Common (gr. Mr. W. Howe); 2nd, Buckland Sweetwater, shown by the Duke of NEWCASTLE; 3rd, Foster's Seedling, shown by Mr. H. W. HENDERSON, King's Langley (gr. Mr. F. L. Pike).

COLLECTION OF HARDY FRUIT.

This class was for a collection of hardy fruits, comprising 30 dishes, arranged in a space of 12 feet by 3 feet. There were three exhibits, the same number as last year, and the 1st prize-winner of last year, Col. A. C. BORTON, Cheveney, Hunton, Kent (gr. Mr. J. Whittle), was again successful. He showed magnificent fruits, especially Apples. Emperor Alexander, Lord Derby, Mère de Ménage, Peasgood's Nonesuch, Belle Dubois and Bismarck (culinary), and Cox's Orange Pippin, Charles Ross and Rival (dessert), being all outstandingly good. Splendid Pears were seen in the varieties Durendieu, Marguerite Marillat, and Doyenné du Comice. The best Peaches were Walburton Admirable and Gladstone. There were also Quinces, Damsons, Blackberries, and Nuts. The 2nd prize was awarded to Sir MARCUS SAMUEL, Bart., Maidstone (gr. Mr. W. H. Bacon), who had greater variety, the kinds including Apples, Pears, Figs, Cherries, Peaches, Apricots, Plums, Damsons, and Nuts. The best dishes were Coe's Golden Drop Plums, Lord Derby, Warner's King, Harvey's Wiltshire Defiance, and Charles Ross Apples; Marguerite Marillat, Doyenné Boussoch and Souvenir du Congrès Pears, and Pineapple Nectarines. 3rd, Major POWELL COTTON, Quex Park, Thanet (gr. Mr. F. Cornford), who had very large Apples, good Monarch Plums, and Princess of Wales Peaches.

DIVISION II.

NURSERYMEN'S CLASSES.

FRUITS GROWN ENTIRELY OUT-OF-DOORS.

The five large exhibits of fruit grown entirely out-of-doors, each occupying 30 feet run of 6 feet tabling, contained an enormous number of excellent fruits. Apples largely predominated. The huge, brilliantly-coloured varieties such as Gascoyne's Scarlet Seedling, Mère de Ménage, and Bismarck were cheek by jowl with very rosy, smaller-fruited sorts such as Duchess's Favourite, Worcester Pearmain, and Rival; all of these catch the eye and for the moment eclipse the Apples of more sober exterior, but often of greater dietetic value. As was also the case with very many of the Apples shown in other classes, the fruits bore an attractive covering of bloom, which in former years would have been assiduously polished away. It was a good sign of the trend of the times to notice that the leading growers do not now stage dishes of which one or two fruits are disproportionately large, but confine themselves to even sets of fruit which are of high quality and good finish. Pears were comparatively few in numbers, but those shown were nearly all very fine and of good shape. It was remarkable that this premier class for hardy fruits would give the impression that, beyond Apples and Pears, there was really no other fruits in season worth exhibiting. A few Medlars were shown in most of the exhibits in a somewhat apologetic manner, and these were decidedly small; whilst one exhibitor was sufficiently enterprising as to include Walnuts and Cobnuts. A stranger visiting this show would probably conclude that our leading nurserymen only find it profitable to grow Apples or Pears, and that late Plums, the hardy Grapes, Nuts of various kinds and the Quince were not worth cultivation.

The exhibit shown by Messrs. GEO. BUNYARD & Co., Maidstone, for which the Gold Medal of the Society was awarded, included three candelabrum-like stands, holding choice dessert Apples, raised above the level of the other dishes, which were arranged in three tiers. These stands very effectively broke the level, and added a dignity to the exhibit. The many brilliantly-coloured Apples included perfect examples of Calville Rouge Précôce, The Houblon, Rival (which is an Apple with a promising future), Lady Sudeley (useful for table and kitchen alike, and uncommonly well-coloured). Sops in Wine, as shown, is a most attractive Apple, the rich, deep-red colour being very tempting. The name, however, seems to be

employed for many distinct Apples in various localities. Transparent de Croncelles was represented by a splendid dish of delicately-tinted golden fruits.

Besides containing many very fine fruits of well-known varieties, the exhibit from Messrs. CANNELL & SONS, Swanley, had an interesting sprinkling of rarer sorts. Neidwetziana is a Russian Apple, the fruit is small and somewhat uneven, but it possesses a very rich red colour, which permeates the flesh. It is a dessert fruit, of very fair quality. Ligne Tillisch is another Russian variety. The large, yellowish fruits are said to be very good cookers, and above the average for dessert purposes. Blue Pearmain is a large cooking Apple, which has a dense blue bloom. Brabant Bellefleur is also covered with a delicate bloom. London Pippin is a very old Apple and an excellent keeper. Fraise d'Hoffinger is a handsome fruit, possessing a dense bloom. Medlars, Walnuts, and Cobs were also shown in this collection.

The KING'S ACRE NURSERY Co., Hereford, relied chiefly on their fine Apples. Queen Caroline, Cherry Pearmain, and Devonshire Red (with intense colour), Lady Henniker (a good dish of fruits, of typical shape), Bielo Borodawka (a golden fruit, medium size, striped with red), Credenhill Pippin, and Rosemary Russet (a fine, late, dessert Apple) were all well shown. This exhibit included some very large Uvedale's St. Germain Pears.

Messrs. W. SEABROOK & SONS, The Nurseries, Chelmsford, had rather more Pears than most competitors; the varieties Louise Bonne of Jersey, Fertility, and Marie Louise d'Uccle were excellent, as also was a good basket of the stewing variety Vicar of Winkfield. Amongst the many good Apples, Royal Jubilee (with golden colour), The Queen, Lady Sudeley, and a very fine dish of Annie Elizabeth were particularly noticeable.

Messrs. J. CHEAL & SONS, Crawley, relieved their table with pot plants of various kinds. Their Apples included Colonel Vaughan, Lord Lennox, Mabbott's Pearmain, and Cowan's Victoria amongst the smaller and brightly-coloured dessert kinds. The cooking varieties Bismarck, Dumelow's Seedling, Loddington Seedling, Yorkshire Beauty, and Atalanta were noteworthy.

Collection of hardy fruits on a space of 20 feet by 6 feet.—There were only two exhibitors in this class, but from a spectacular point of view the arrangement of Messrs. LAXTON BROS., Bedford, which received the Hogg Memorial Medal, was the finest in the show. Graceful specimens of Cocos Weddeliana surmounted a fine display of attractive fruits, tastefully blended with autumn foliage. Of the many choice Apples, we especially noted Paroquet, Allington Pippin, King of the Pippins, Early Strawberry, Summer Golden Pippin (which fruits so regularly in the West of England), immense fruits of Peasgood's Nonesuch, and a splendid dish of Ribston Pippin. The Pears included very large Marguerite Marillat, Williams's Bon Chrétien (just fit to be eaten), and Triomphe de Vienne. In the collection shown by Mr. R. C. NORCUTT, Woodbridge, for which a Silver Knightian Medal was awarded, the yellow-coloured Apples were most noticeable. These included Royal Jubilee, Golden Noble, Potts's Seedling, and Yorkshire Beauty.

Collection on a space of 12 feet by 6 feet.—This class attracted four competitors. Messrs. COOLING & SONS, Bath, were awarded a Silver Knightian Medal for a well-arranged collection. It was difficult to pick out a weak dish in this exhibit, which contained several dishes of Medlars and Barcelona Cobnuts, in addition to the Apples and Pears. The variety of Apple Tom Putt, which is not so much grown as formerly, was shown in almost perfect form and colouring. Hoary Morning is another desirable kind, as also is Evry's Seedling, both of which were very well shown.

Messrs. PAUL & SONS, Cheshunt, brightened their display with fruiting sprays of Crataegus Pyracantha, and with leaves of a scarlet Oak. Besides splendid fruits of the standard varieties of Apple, we noted Betty Geeson (a good kitchen Apple, which will keep till May), Colonel Vaughan (a small, bright, dessert Apple), Pomme de Neige (an old variety, often shown as Royal Snow), Herefordshire Beefing, and Cellini, as being especially good.

Messrs. JOHN PEED & SON, West Norwood, staged their collection on high stands interspersed with Palms and Codiaums. Although

small in numbers, this collection contained meritorious fruits. The Apples were of good form and well coloured. Grand Duke Constantine, a handsome Apple, which, however, soon becomes mealy, and Wadhurst Pippin, a late, cooking Apple, of good size, were very striking in appearance.

Messrs. SPOONER & SONS, Hounslow, included in their collection Vicar of Beighton, Golden Spire, Brownlee's Russet, and Hollandbury, a very old, handsome Apple, which is in season from now until Christmas.

ORCHARD HOUSE FRUIT AND TREES.

The two collections of orchard house fruit and trees attracted two exhibitors, each exhibit being characterised by the wonderful colour of the Apples.

The exhibit from Messrs. T. RIVERS & SON, Sawbridgeworth, made a fine show. The pot trees bore good crops of high-class fruits; the high colour of such Apples as Gascoyne's Scarlet Seedling, Cox's Pomona and James Grieve were the subject of general comment. The Pear trees included such sterling kinds as Conference, Pitmaston Duchess and Durondeau, besides a heavily-fruited example of St. Edmund. The growing Plums shown were Monarch and President. In front of the pot trees there were many baskets of ripe Apples, Pears and Plums. Here, again, the high colour, especially that of some excellent specimens of Cox's Orange Pippin astonished many of the visitors, who were not aware of the cultural conditions. Emperor Alexander, Reinette Descarde, a good basket of Ribston Pippin and King of Tompkins County also bore very high colour. Other varieties of Apple, Allington Pippin and The Queen, for example, had a beautiful transparency. Amongst the Pears were Parrot with bright colour, Marguerite Marillat, and Souvenir du Congrès, especially good. Two varieties of Peach, Salwey and Golden Eagle, were shown. The 2nd prize collection, from the KING'S ACRE NURSERIES, Hereford, was brightened by autumn foliage of many kinds. Here, again, the pot trees shown had clean, healthy growth, which bore numbers of well-coloured fruits. Apples predominated, and included American Mother, Cox's Orange Pippin, Jonathan, and James Grieve of high quality. One bush bore several very large fruits of Gloria Mundi. Several single-stemmed plants of Fig Black Bourjassotte with ripe fruits added to the value of this exhibit. Amongst the dishes of gathered fruits Gascoyne's Scarlet Seedling, Charles Ross, Wealthy and a quantity of Ribston Pippin Apples were especially noteworthy.

Messrs. T. RIVERS & SON were the only exhibitors of vines growing in pots. This firm showed two well-fruited plants of Black Alicante, two of Gros Colman, and two of Golden Queen.

DIVISION III.

(OPEN ONLY TO MARKET GROWERS.)

The class for 20 baskets of cooking and dessert Apples made a splendid display. The Society's Silver-gilt Medal was awarded to Mr. H. T. MASON, Hampton Hill, Middlesex, for an exceedingly meritorious collection, such varieties as Cox's Orange Pippin, The Queen, and Barnack Beauty were as good as one could wish.

Mr. E. W. CADDICK, Ross, Hereford, was awarded a Silver Knightian Medal; his collection was also very good, and contained fruits which would find a ready sale at remunerative prices. The varieties Wellington, Warner's King, Caradoc Scarlet, and Cox's Pomona were especially choice.

Mr. MASON also won the Silver-gilt Medal presented by the Fruiterers' Company for the best 12 baskets of Apples with another highly-coloured collection of good fruits, the outstanding varieties being Ribston Pippin, James Grieve, Peasgood's Nonesuch, Cox's Orange Pippin, and Bismarck.

The SWANLEY HORTICULTURAL COLLEGE was awarded a Silver Knightian Medal for an exhibit which included fine fruits of Royal Snow, Peasgood's Nonesuch, and Worcester Pearmain.

A Silver Banksian Medal was awarded to Mr. H. LUMLEY WEBB, Sittingbourne, whose round hampers showed good packing. The variety Worcester Pearmain was especially fine. There were no baskets of Pears exhibited in this division.

DIVISION IV.

FRUITS GROWN ENTIRELY IN THE OPEN.

(OPEN TO GARDENERS AND AMATEURS ONLY.)

In this division the premier class for 24 dishes of Apples, 16 cooking and eight dessert varieties grown in the open air, brought together such remarkably fine collections that the judges awarded prizes to each of the five competitors. The exhibit from Col. BORTON, Hunton (gr. Mr. J. Whittle), was a superlative effort, and deservedly received the 1st prize and the Hogg Memorial Medal. Many of the varieties shown were of great size, but at the same time were of typical shape and free from coarseness. Emperor Alexander, Allington Pippin, King of Tompkins County, King of the Pippins, and Gascoyne's Scarlet Seedling are a few of the very best of this excellent exhibit. The 2nd prize was awarded to Sir MARCUS SAMUEL, Bart., Maidstone (gr. Mr. W. H. Bacon), whose fine collection included remarkably good fruits of Washington, Rival, Mère de Ménage, Blenheim Pippin, Ribston Pippin, and Charles Ross. Equal 3rds, Mr. H. W. WHITELEY, Torquay, and Mr. C. R. ADEANE, Cambridge.

Eighteen dishes of Apples, distinct, twelve culinary, six dessert.—The 1st prize in this class was won by C. A. CAIN, Esq., Node, Welwyn (gr. Mr. Pateman), who showed Cox's Pomona, Emperor Alexander, The Queen and Gascoyne's Scarlet Seedling (cooking); Rival, Barnack Beauty, Wealthy, and some very fine Cox's Orange Pippin (dessert Apples); 2nd, J. G. WILLIAMS, Esq., Pendley Manor, Tring (gr. Mr. Gerrish), with immense fruits of Peasgood's Nonesuch and Gascoyne's Scarlet Seedling.

Twelve dishes of Apples, distinct, eight culinary, four dessert.—The 1st prize was won by Major POWELL COTTON, Quex Park, Thanet (gr. Mr. F. Cornford). Here again Peasgood's Nonesuch was the outstanding cooking Apples. Fruits of Lady Henniker were of good size and very typical in shape. There were also good dishes of King of the Pippins and Charles Ross. The 2nd prize collection, from J. LIDDELL, Esq., Sheffield Manor, Basingstoke (gr. Mr. R. Learmouth), contained immense fruits of Peasgood's Nonesuch with very fine colour, whilst Cox's Orange Pippin looked as though they would keep firm for many months. King of the Pippins were very bright and good.

Six culinary Apples of distinct varieties.—The six dishes of cooking Apples from Col. BORTON were exceedingly fine. Emperor Alexander, Mère de Ménage and Belle Dubois being unusually good. The 2nd prize exhibit, shown by C. GURNEY, Esq., contained brightly-coloured fruits of Gascoyne's Scarlet Seedling and Peasgood's Nonesuch, whilst the comparatively rare Loddington Seedling was also good.

Six dishes, distinct, of dessert Apples.—Col. BORTON also had the best six dishes of dessert Apples. This was an astonishingly fine collection; all the varieties (King of the Pippins, Allington Pippin, American Mother, Rival, Cox's Orange Pippin, and Wealthy) were worthy of mention. Mr. C. GURNEY's 2nd prize exhibit included a fine dish of the variety Wealthy.

Eighteen dishes of dessert Pears, distinct.—Although there were only two exhibitors in the class for 18 dishes of dessert Pears, there were many fine dishes of fruits displayed. The 1st prize was awarded to Sir MARCUS SAMUEL for a collection containing some unusually large Pears. The varieties Marguerite Marillat, Marie Benoist, and Pitmaston Duchess were immense specimens. Of the smaller and better-flavoured Pears Emile d'Heyst, Beurré Hardy, and Princess were especially fine. There were also good dishes of Durondeau and St. Luke. Col. BORTON was awarded the 2nd prize; his collection contained a good percentage of ripe fruits, Marie Louise, Beurré Superfin, Beurré Hardy, and Durondeau looked especially tempting.

Twelve dishes of dessert Pears, distinct.—Major POWELL COTTON was awarded the 1st prize for a good, even collection. Such varieties as Marguerite Marillat, Beurré Alexandre Lucas and Beurré Baltet Père were of high quality. 2nd, F. PATEMAN, Esq., who had very good dishes of Fondante Thirriot, Conseiller de la Cour, and Doyenné Boussoch.

Nine dishes of dessert Pears, distinct.—The premier exhibit, from the gardens of the Rt. Hon. W. H. LONG, was very attractively displayed on brightly-coloured Vitis leaves. This

1st prize collection included good dishes of Doyenné Boussoch, Marie Louise, and Beurré Hardy. 2nd, A. P. BRANDT, Esq., Bletchingley (gr. Mr. J. W. Barks).

Six dishes of dessert Pears.—The 1st prize in this class was awarded to C. GURNEY, Esq., for a collection of handsome fruits. Pitmaston Duchess and Marguerite Marillat were very fine. 2nd, Mr. G. MACKINLEY, West Park Gardens, who had good, ripe fruits of Fondante d'Automne.

Three dishes of stewing Pears, distinct.—The Rt. Hon. W. H. LONG won the 1st prize for

wich (gr. Mr. W. Messenger), who had good dishes of President, Coe's Golden Drop, and Reine Claude de Bavay. That excellent variety Coe's Golden Drop was staged by 8 of the 12 exhibitors. Rivers's Late Orange, Diamond and Grand Duke were also shown in several instances. Colonel BORTON, the only exhibitor in the class for Damsons or Bullaces, staged three varieties (Bradley's King, Prune, and Crittenden's) of Damsons.

Cherries.—The 1st prize fruits of Morello Cherries, from J. G. WILLIAMS, Esq., were very creditable, but the other exhibits were poor.

The Houblon, Charles Ross, Allington Pippin, Ribston Pippin, Cox's Orange Pippin and James Grieve were the dessert Apples; Lane's Prince Albert, Mère de Ménage, Emperor Alexander, Peasgood's Nonesuch, Warner's King and Bramley's Seedling the cooking varieties. The Pears comprised Conference, Doyenné du Comice, Pitmaston Duchess, Durondeau, Hacon's Incomparable and Marguerite Marillat. 2nd, THE IPSWICH AND DISTRICT GARDENERS' AND AMATEURS' ASSOCIATION (Mr. F. W. Salmon, 65, Brooks Hall Road, Ipswich). The affiliated societies challenge cup, however, may be won

FIG. 123.—APPLE CHARLES EYRE: A CULINARY VARIETY.

Received R.H.S. Award of Merit on September 12 (see p. 212 *ant.*).

three dishes of stewing Pears with typical, good-sized fruits of Catillac, Bellissime d'Hiver, and Beurré Clairgeau. Major POWELL COTTON was a close 2nd with the varieties Uvedale's St. Germain, Gilgil and Catillac.

Plums.—The class for three dishes of Plums was keenly contested, and there were many very good dishes of fruit staged. The 1st prize collection from Lord HOWARD DE WALDEN, Audley End, Saffron Walden (gr. Mr. J. Vert), was excellent. The variety Coe's Violet, which has a violet line running longitudinally around the fruit, attracted a deal of admiration. Primate and Coe's Golden Drop were also excellent. 2nd, C. H. BERNERS, Esq., Woolverstone Park, Ips-

AFFILIATED SOCIETIES CLASS.

There was a special class open only to horticultural societies in affiliation with the R.H.S. Societies, however, were not allowed to combine, and the fruits exhibited must have been collected only from the members of the affiliated society. The schedule required six dishes, distinct, each of cooking Apples, dessert Apples and dessert Pears, six fruits to each dish. Six societies competed, and the judges made the awards as follow:—1st, THE EAST ANGLIAN HORTICULTURAL CLUB (Mr. W. L. Wallis, 12, Royal Arcade, Norwich), for an unusually fine collection, of which the only defect was the over-large size of some of the dessert Apples.

only once in three years by any one society, and as the EAST ANGLIAN CLUB were the winners last year, the challenge cup passes to the IPSWICH ASSOCIATION, and a special silver cup was awarded with the 1st prize to the EAST ANGLIAN CLUB. The other exhibits were contributed by the Isle of Wight Horticultural Association, the Addlestone, Chertsey and Ottershaw Gardeners' Mutual Improvement Association, the Croydon and District Horticultural Mutual Improvement Society and the Colchester and District Gardeners' Association. The Colchester Society's exhibit (Mr. W. H. Tanner, 43, Earl Street, Colchester) included very fine fruits, and was highly commended by the judges.

DIVISION V.

SPECIAL DISTRICT COUNTY CLASSES.

For the purposes of this division, the country is divided into 11 groups of counties, each group comprising a number of neighbouring units, in which the climatic conditions are approximately uniform. All fruit must have been grown entirely in the open. The classes for Apples required six dishes of distinct varieties, four cooking and two dessert, and the Pears six dishes of distinct varieties. On the whole, the quality and colour of the fruits were excellent. The home counties and the eastern and southern counties were well represented, but from the west and north and Scotland and Ireland the competition was weak.

KENT.—*Apples*: The importance of Kent as a fruit-growing centre has won for it a separate class. There were, however, only three entries, and the 1st prize was awarded to W. E. S. ERLE DRAX, Esq., Wye, Kent (gr. Mr. J. Bond), for finely-coloured specimens of Allington Pippin, Charles Ross, Peasgood's Nonesuch, Hambling Seedling, Lord Derby, and Mère de Ménage. H. G. KLEINWORT, Esq., Wierton Place, Maidstone (gr. Mr. B. J. Mercer), was a good 2nd, his collection including Cox's Orange Pippin and Allington Pippin as dessert varieties.

—*Pears*.—The only exhibit staged was from Mr. ERLE DRAX, who was awarded the 1st prize. His fruits were Beurré Superfin, Beurré Diel, Beurré Alexandre Lucas, Doyenné du Comice, Duchesse d'Angoulême, and Pitmaston Duchess.

SURREY, SUSSEX, HAMPSHIRE, DORSET, SOMERSET, DEVON, AND CORNWALL.—*Apples*: There were six entries, but there was little difficulty in selecting the magnificent fruits from the Duke of RICHMOND AND GORDON, Goodwood (gr. Mr. F. Brock), as the best. Cox's Orange Pippin and Allington Pippin were the dessert varieties, and Lane's Prince Albert, Lord Derby, Royal Jubilee, and Gascoyne's Scarlet Seedling the culinary sorts. Mr. JOHN COPP, Ferndale, Teignmouth, was a good 2nd, his collection including some splendid fruits of Charles Ross variety.

—*Pears*.—There were only two collections staged. F. J. B. W. DIGBY, Esq., Sherborne Castle (gr. Mr. T. Turton), was placed 1st with Beurré Alexandre Lucas, Beurré Baltet Père, Charles Ernest, Conseiller de la Cour, Doyenné du Comice, and Durondeau. 2nd, CHAS. H. COMBE, Esq., Cobham Park, Surrey (gr. Mr. A. Tidy).

WILTS, GLOUCESTER, OXFORD, BUCKS, BERKS, BEDS, HERTS, AND MIDDLESEX.—*Apples*: Four collections were staged, and the fruits from the Earl of SUFFOLK, Charlton Park, Malmesbury, Wilts. (gr. Mr. T. J. Finch), which were placed 1st, were particularly clean and brightly coloured. Rival and Cox's Orange Pippin were the dessert sorts chosen, Royal Jubilee, Bramley's Seedling, Mère de Ménage, and Peasgood's Nonesuch the culinary varieties. 2nd, J. B. FORTESCUE, Esq., Dropmore, Maidenhead (gr. Mr. C. Page).

—*Pears*.—There were also four collections of Pears, the 1st prize being won by Lord HILLINGDON, Hillingdon House, Uxbridge (gr. Mr. A. R. Allan), with Doyenné du Comice, Durondeau, Emile d'Heyst, Marie Louise, Pitmaston Duchess, and Thompson. 2nd, Viscount ENFIELD, Wrotham Park, Barnet (gr. Mr. H. Markham).

ESSEX, SUFFOLK, NORFOLK, CAMBRIDGE, HUNTS, AND RUTLAND.—*Apples*: Of the three collections shown, Col. PETRE's, Westwick House, Norwich (gr. Mr. G. Davison), were awarded the 1st prize, and the Hon. W. LOWTHER's, Campsea, Ash, Suffolk (gr. Mr. A. Andrews), the 2nd prize. Col. PETRE's varieties were Ribston and Allington Pippins, Bramley's Seedling, Bismarck, Mère de Ménage, and Peasgood's Nonesuch.

—*Pears*.—Col. PETRE, showing Conference, Doyenné du Comice, Durondeau, Emile d'Heyst, Marguerite Marillat, and Pitmaston Duchess, won the 1st prize against three other competitors; 2nd, C. H. BERNERS, Esq., Woolverstone Park, Ipswich (gr. Mr. W. Messenger).

LINCOLN, NORTHAMPTON, WARWICK, LEICESTER, NOTTS, DERBY, STAFFS, SHROPSHIRE, AND CHESHIRE.—*Apples*: Four exhibitors showed in this class. The 1st prize was awarded to the Duke of PORTLAND, Welbeck Abbey, Worksop (gr. Mr. J. Gibson), who showed Cox's Orange Pippin and Ribston Pippin, Lord Derby, Gas-

coyne's Scarlet Seedling, Peasgood's Nonesuch, and Tyler's Kernel. F. BIBBY, Esq., Hardwicke, Shrewsbury, followed closely.

—*Pears*.—There were only two collections of Pears, and the awards were: 1st, Duke of PORTLAND, and 2nd, Mr. F. BIBBY. The varieties from Welbeck were Charles Ernest, Beurré Diel, Doyenné du Comice, Emile d'Heyst, Marie Benoist and Pitmaston Duchess.

WORCESTER, HEREFORD, MONMOUTH, GLAMORGAN, CARMARTHEN AND PEMBROKE. *Apples*: Only one collection of Apples was shown from this group of counties, and there were no Pears. The Apples, James Grieve, Cox's Orange Pippin, Bismarck, Bramley's Seedling, Lord Derby, and Newton Wonder, were from F. P. NORBURY, Esq., Malvern, who was awarded the 1st prize.

OTHER COUNTIES OF WALES.—The entries in this section were again weak, only one collection of Apples and Pears being staged, both from Col. CORNWALLIS WEST, Ruthin (gr. Mr. H. Forder), who was awarded the 1st prize in each class. None of the varieties was labelled.

THE SIX NORTHERN COUNTIES OF ENGLAND AND THE ISLE OF MAN.—J. BRENNAND, Esq., Baldersley Park, Thirsk (gr. Mr. J. E. Hathaway), was the only exhibitor, and was awarded the 1st prizes for both Apples and Pears. *Apples*, which were not very well finished, were Rival, King of Tompkins County, Bismarck, Mère de Ménage, Lord Derby and Bramley's Seedling. *Pears* included Beurré Diel, Beurré Hardy, Durondeau, Marechal de la Cour, Pitmaston Duchess and Souvenir du Congrès.

SCOTTISH COUNTIES.—The Apples from Col. GORDON, Castle Douglas (gr. Mr. J. Duff), formed the only exhibit from Scotland, and were awarded the 1st prize. The varieties were Allington Pippin, King of the Pippins, Warner's King, The Queen, Cox's Pomona and Peasgood's Nonesuch.

IRISH COUNTIES.—One collection of Apples was the only entry. It was shown by the Earl of BESSBOROUGH, Piltown (gr. Mr. T. E. Tomalin), who was awarded the 1st prize, having Cox's Orange Pippin, American Mother, Bismarck, Peasgood's Nonesuch, Loddington Seedling, and Lord Derby.

There was no entry from the CHANNEL ISLANDS, which constituted the 11th county division.

DIVISION VI.

SINGLE DISH CLASSES.

DESSERT APPLES.

There were 27 classes for dessert Apples, and in every case, whether there were 2 or 30 dishes in a class, two prizes only were awarded.

Allington Pippin: This variety was shown by 23 exhibitors, and, generally, the fruits were handsome and true to form. The best dish was shown by the Earl of DEVON, Powderham Castle (gr. Mr. T. H. Bolton), Lord HOWARD DE WALDEN, Saffron Walden (gr. Mr. J. Vert), being placed 2nd.—*Adam's Pearmain*: This conical Apple was shown splendidly by all the nine exhibitors, and made an excellent class. Earl STANHOPE, Sevenoaks (gr. Mr. J. C. Sutton), won the 1st prize, and W. E. S. ERLE DRAX, Esq., Wye, Kent (gr. Mr. J. Bound), was 2nd.—*American Mother*: There were 12 dishes of this variety, and the fruits generally were richly coloured. Mr. DRAX was placed 1st, and Mr. A. BASILE, Weybridge, 2nd.—*Belle de Boskoop*: This third-rate variety brought but four dishes, as it is little grown. Mr. BASILE was placed 1st with rather large samples, and the Earl of LYTTON, Knebworth (gr. Mr. H. Brotherston), 2nd.—*Ben's Red*: Only two dishes were staged, and both were inferior. The best was shown by Mr. R. LAMBERD, Aylesford; 2nd, the Rev. H. A. BULL, Westgate-on-Sea.—*Blenheim Pippin*: This popular variety was represented by no fewer than 28 dishes, the fruits varying greatly in size, shape, and colour. Mr. C. O. WALTER, Wantage, was well 1st, having medium-sized fruits; 2nd, Earl STANHOPE.—*Charles Ross*: This comparatively new variety was seen in nine dishes, all the fruits being well coloured and clean. The Rev. H. A. BULL was awarded the 1st prize, and Mr. BASILE the 2nd prize.—*Christmas Pearmain*: This valuable late variety was shown by seven exhibitors, the best dish being staged by H. C.

KLEINWORT, Esq., Maidstone (gr. Mr. B. J. Mercer); 2nd, Mr. J. VERT, with very russety fruits.—*Claygate Pearmain*: Eleven entered in this class, though several staged the wrong variety. It was appropriate that the 1st prize fruits came from Lord FOLEY's garden at Ruxley Lodge, Claygate (gr. Mr. H. C. Gardiner), where the Apple originated; 2nd, Mr. C. O. WALTER.—*Coronation*: This new variety was shown in three dishes. Mr. C. COPP, Sittingbourne, had handsome but rather large fruits, and was awarded the 1st prize; 2nd, Mr. DRAX.—*Cox's Orange Pippin*: No fewer than 31 exhibitors competed, many of the samples being of great excellence, and meriting many more prizes. The Rev. G. H. ENGLEHEART, Dinton, Salisbury, was well 1st with very handsome, even, and good fruits, of a medium size; 2nd, the Hon. Col. HARBORD, Gunton Park (gr. Mr. W. Allan).—*Duke of Devonshire*: Colonel PETRE, Norwich (gr. Mr. G. Davison), had the best dishes amongst seven; 2nd, Mr. W. A. VOSS, Rayleigh, Essex.—*Egremont Russet*: There were nine dishes of this sort, the best being shown by Mr. DRAX, Mr. BOLTON being 2nd.—*Houblon*: The better of two dishes was shown by J. BRENNAND, Esq., Baldersby Park, Thirsk (gr. Mr. J. E. Hathaway); 2nd, J. B. FORTESCUE, Esq. (gr. Mr. C. Page).—*Jas. Grieve*: The best of seven dishes was shown by Mr. F. P. NORBURY, Malvern; Mr. R. LAMBER, Aylesford, followed closely.—*King of Tompkins County*: The Duke of RICHMOND, Goodwood (gr. Mr. Brock), had superb samples, and was awarded the 1st prize; 2nd, C. A. COOMBE, Esq., Cobham Park, Surrey (gr. Mr. A. Tidy).—*Lord Hindlip*: Only three dishes of this variety were staged, Mr. R. M. WHITING, Hereford, having very good but much-netted specimens; 2nd, Mr. DRAX.—*Old Margil*: There were five somewhat inferior dishes, Mr. C. O. WALTER being awarded the 1st prize, and Mrs. O. E. GOLDSMID, Tonbridge, the 2nd prize.—*Ribston Pippin*: There were 15 dishes, and they formed an excellent collection of choice fruits. The best were shown by Mr. H. EDGEELL, Norfolk; 2nd, Col. PETRE.—*Rival*: Of nine dishes, very richly-coloured fruits shown by Mr. A. BASILE were well 1st; 2nd, Lord HILLINGDON (gr. Mr. W. Allan).—*Ross Nonpareil*: Only one dish represented this little-known Apple, the exhibitor being Mr. LAMBIER, of Aylesford.—*St. Edmund's Pippin*: F. J. B. W. DIGBY, Esq., Sherborne Castle, Dorset (gr. Mr. Turton), excelled with this variety, Mr. J. COPP being placed 2nd.—*Wealthy*: The best of eight dishes was shown by Mr. A. BASILE; 2nd, Mr. J. VIVIAN, Cornwall.—*William Crump*: The better of two dishes was shown by Lord LYTTON; 2nd Earl BEAUCHAMP (gr. Mr. W. Crump).—In the class for any other early variety of dessert Apples, there were 24 exhibits, and King of the Pippins, was selected, after tasting, as being the best. The exhibitor was E. MOCATTA, Esq., Addlestone (gr. Mr. T. Stevenson); Autumn Pearmain, from Mr. J. COPP, was 2nd; and King of the Pippins was awarded the 3rd and 4th prizes.—In a similar class for late varieties there were 32 dishes. The 1st prize was awarded to a beautiful dish of Fearn's Pippin, shown by the Hon. W. LOWTHER, Campsea, Ash (gr. Mr. A. Andrews); 2nd, Cornish Aromatic, from Mr. TURTON; 3rd, Winter Ribston (very much resembling Blenheim Pippin), shown by C. H. BERNERS, Esq.

CULINARY APPLES.

There were 30 classes in this section. *Annie Elisabeth*: H. G. KLEINWORT, Esq., Maidstone, had the best of 15 dishes, Mr. T. TURTON being placed 2nd.—*Beauty of Kent*: Seven dishes were shown in this class, Sir JEREMIAH COLMAN, Gatton Park, Reigate (gr. Mr. J. Collier), showing the best, Mr. C. PAGE being placed 2nd.—*Bismarck*: There were 13 dishes of this variety. Mr. J. VIVIAN, Cornwall, was awarded the 1st prize, and the Hon. W. LOWTHER 2nd.—*Bramley's Seedling*: The fruits were of great size and very clean. Mr. J. VIVIAN was placed 1st of 17 dishes with grand fruits, Mr. A. BASILE being 2nd.—Only four dishes of *Byford Wonder* were shown. Mr. J. LEE, Higher Bebbington, was 1st, and Mr. J. COPP 2nd.—*Dumelow's Seedling* (*Wellington*) was shown in 11 dishes. Mr. C. PAGE and Mr. C. O. WALTER won the prizes in this order.—Seven dishes of *Ecklinville Seedling*, much speckled, were shown. 1st, Mr. DRAX; 2nd, Mr. STEVENSON.—*Edward VII.*: The best

of three dishes was shown by Mr. WHITING; 2nd, Mr. J. COPP.—*Emperor Alexander*: There were eight capital exhibits of this variety, Mr. J. VIVIAN having the best fruits; 2nd, Earl of SUFFOLK, Malmesbury (gr. Mr. Finch).—There were also eight dishes of the variety *Gascoyne's Scarlet Seedling*, Colonel PETRE and Mr. DRAX taking the 1st and 2nd prizes respectively.—*Golden Noble* was shown in nine dishes, Mr. TURTON having the best specimens in yellow, clean fruits; 2nd, Mr. J. COPP.—*Grenadier*: The best of seven dishes was shown by Mr. J. VIVIAN, Mr. DRAX following.—*Hambling's Seedling*: 1st, Mr. T. E. TOMALIN; 2nd, Mr. DRAX.—*Lady Henniker*: Mr. A. BASILE had the best among 14 dishes; a new competitor, Sir G. HOWELL, Dunster (gr. Mr. Little), was placed 2nd.—*Lane's Prince Albert*: Mr. STEVENSON was well 1st for this sterling variety, and Col. PETRE (gr. Mr. Davison) was a good 2nd.—*Lord Derby*: Eleven dishes were shown, although the samples were not equal to those of some previous years. Mr. B. J. MERCER was placed 1st, and Mr. J. VIVIAN 2nd.—*Mère de Ménage*: Fruits of this variety were of large size and rich colour. Mr. J. VIVIAN was 1st of eight exhibitors, and Mr. H. MARKHAM, Wrotham Park Gardens, 2nd.—*Newton Wonder*: No fewer than 18 dishes represented this fine late variety. The Hon. W. LOWTHER was 1st, and Mr. A. BASILE 2nd.—*Norfolk Beauty*: Only four lots were staged, Lord SUFFIELD, Gunton Park, Norfolk, and the Hon. W. LOWTHER, Suffolk, being awarded the prizes in this order.—*Peasgood's Nonesuch*: The Hon. W. LOWTHER had the best dish of six, and Mr. J. VIVIAN the 2nd best.—*Potts's Seedling*: This variety was shown in two lots, the prizes being won by (1st) Mr. F. W. PLATT, Highgate, and (2nd) Mr. T. TURTON.—*Royal Jubilee*: Some very large fruits of this variety were shown. Mr. F. BIBBY, Shrewsbury, was placed 1st, and Colonel PETRE 2nd.—*Stirling Castle*: Mr. J. COPP excelled with this variety, Mr. BOLTON winning the 2nd prize.—*The Queen*: Of eight exhibitors, Mr. DRAX was placed 1st, and Mr. J. VIVIAN 2nd.—*Tower of Glamis*: Seven dishes were staged, the finest by the Earl of BESSBOROUGH (gr. Mr. Tomalin), Mr. TURTON taking the 2nd place.—*Warner's King*: This variety was seen in indifferent condition, many fruits being speckled. The Hon. W. LOWTHER won the 1st, and Mr. T. STEVENSON the 2nd prizes.—*Any other variety*: Twenty-four dishes were staged in this class, Clark's Seedling, a little-known Apple, shown by W. B. M. BOND, Esq., Chichester (gr. Mr. A. Gooding), being awarded the 1st prize.

PEARS.

Beurré Alexandre Lucas: There were dishes of fine, even-sized fruits of this variety; the 1st prize was won by A. BASILE, Esq., Weybridge; 2nd, F. J. DIGBY, Esq., Sherborne Castle.—*Beurré d'Amanlis*: The only dish shown of this variety was overripe.—*Beurré d'Anjou*: 1st, C. H. COMBE, Esq., Cobham Park; 2nd, J. CHARLESWORTH, Esq., Nutfield Court, Surrey.—*Beurré Bosc*: A. BASILE, Esq., was placed 1st; 2nd, F. BIBBY, Esq., Hardwicke, Shrewsbury.—*Beurré Dumont*: A. BASILE, Esq., who was the only exhibitor, showed a fine dish of this variety.—*Beurré Hardy*: 1st, Lord HILLINGDON; 2nd, A. BASILE, Esq.—*Beurré Superfin*: The competition was good, but unfortunately two dishes were overripe. The 1st prize was awarded to A. BASILE, Esq.; 2nd, Lord HILLINGDON.—*Blickling*: Col. HARBORD was the only competitor in this class.—*Charles Ernest*: 1st, A. BASILE, Esq., with exceedingly fine Pears; 2nd, F. J. DIGBY, Esq.—*Comte de Lamy*: The four competitors in this class staged very good fruits. The 1st prize was awarded to J. T. CHARLESWORTH, Esq.; 2nd, Lord HILLINGDON.—*Conference*: There were seven competitors and the leading dishes were excellent. 1st, Col. PETRE, Norwich; 2nd, Mrs. BANKS, Wimborne.—*Directeur Hardy*: The 1st prize was won by C. H. BERNERS, Esq., and the 2nd by F. BIBBY, Esq., both competitors having fine fruits.—*Doyenné du Comice*: Most of the seven competitors in this class staged good typical fruits. The 1st prize was awarded to Col. PETRE; 2nd, F. J. DIGBY, Esq.—*Durondeau*: This popular Pear was well shown. There were nine exhibits. The winner of the 1st prize was Col. PETRE; 2nd, Col. HARBORD.—*Emile*

d'Heyst: The eight competitors showed very variable fruits, but they were mostly of good shape. The Duke of NEWCASTLE excelled in this class; 2nd, Col. PETRE.—*Fondante d'Automne*: There were three competitors, Col. HARBORD being placed 1st, and Lord HILLINGDON 2nd.—*Fondante Thiriot*: The two competitors, Lord HILLINGDON (1st) and J. B. FORTESCUE, Esq., Dropmore (2nd), deservedly received the prizes.—*Glou Morceau*: This class brought six competitors, which resulted in Col. HARBORD receiving 1st prize; 2nd, A. BASILE, Esq.—*Josephine de Malines*: There were 10 dishes of this Pear, this being the best-contested class in the division. The 1st prize was awarded to Col. HARBORD; 2nd, F. DIGBY, Esq.—*Le Brun*: The only com-

2nd, Col. PETRE.—*Olivier de Serres*: 1st, Lord HILLINGDON; 2nd, F. BIBBY, Esq.—*Pitmaston Duchess*: Of the 10 dishes of this variety several contained very large fruits. 1st, R. LAMBIER, Esq., Aylesford; 2nd, Hon. W. LOWTHER, Suffolk.—*President Barabé*: Col. HARBORD was successful in this class; 2nd, Lord HILLINGDON.—*Souvenir du Congrès*: There were six competitors in this class, J. B. FORTESCUE, Esq., having the best dish; 2nd, J. EDMONDS, Esq.—*Thompson*: The 1st prize was won by J. B. FORTESCUE, Esq.; 2nd, Col. HARBORD.—*Triomphe de Vienne*: W. ERLE DRAX, Esq., excelled in this class; 2nd, Lord HILLINGDON. Three exhibitors in this class staged very fine Pears.—*Winter Nelis*: Of the nine dishes, the

[Photograph by John Gregory.]

FIG. 124.—CYPRIPEDIUM ROYAL GEORGE.

Received R.H.S. First-class Certificate on Tuesday last (see p. 282).

petitor, A. BASILE, Esq., staged very fine Pears.—*Le Lectier*: There were six competitors, most of whom staged very good fruits, Lord HOWARD DE WALDEN receiving the 1st prize; 2nd, C. H. COMBE, Esq.—*Louise Bonne of Jersey*: Of eight competitors, the most successful was W. ERLE DRAX, Esq., Wye; 2nd, Col. HARBORD.—*Marie Benoist*: Two competitors only in this class staged very fine Pears. The 1st prize was won by C. H. BERNERS, Esq.; 2nd, A. BASILE, Esq.—*Marie Louise*: Col. HARBORD and Lady TATE were the winners of the 1st and 2nd prizes respectively. The six collections staged showed great diversity of form.—*Nouvelle Fulvie*: There were six competitors in this class. 1st, Mrs. BANKS;

best was shown by Lord FOLEY, Claygate; 2nd, Col. HARBORD.—*Eight fruits of any early variety not included above*: 1st, B. E. RICHARDSON, Esq., Stanstead Abbots, who staged very good fruits of Mme. Treve; 2nd, F. W. BIRKINSHAW, Esq., Sandy, with Princess; 3rd, F. DIGBY, Esq., who showed the highly-perfumed Pear Seckle.—*Eight fruits of any late variety not named above*: 1st, A. BASILE, Esq., with very big fruits of Roosevelt; 2nd, Lord FOLEY, who showed *Beurré Bachelier*; 3rd, Lord HOWARD DE WALDEN, whose *Beurré Diel* were very fine fruits. Col. PETRE showed, not for competition, immense fruits of General Todleben, Catillac, and Uvedale's St. Germain.

Floral Committee.

OCTOBER 10.

AWARDS OF MERIT.

Dahlia Brentwood Yellow.—A dwarf decorative variety of the colour indicated by the name. It is recommended for planting in beds and borders on account of its freedom of flowering and dwarf habit, the growths being only from 2½ to 3 feet high. Shown by J. T. WEST, Brentwood.

Chrysanthemum Cranford Yellow.—A market or decorative variety of buttercup-yellow colour. Shown by Mr. ROOTS, Cranford.

Orchid Committee.

Present: J. Gurney Fowler, Esq. (in the Chair); and Messrs. Jas. O'Brien (hon. sec.), Sir Jeremiah Colman, Bart., Harry J. Veitch, Walter Cobb, J. Charlesworth, A. A. McBean, W. P. Bound, T. Armstrong, J. Cypher, W. H. Hatcher, H. G. Alexander, J. E. Shill, F. J. Hanbury, Gurney Wilson, W. Bolton, J. S. Moss, and C. J. Lucas.

The show of Orchids was confined to plants submitted to the Committee, and several very interesting novelties were staged, the two fine Cypripediums which secured First-class Certificates well opening the coming Cypripedium season.

AWARDS.

FIRST-CLASS CERTIFICATES.

Cypripedium Lucifer (*Niobe* "Westonbirt" variety × *Euryades*), from Lieut.-col. Sir GEORGE L. HOLFORD, K.C.V.O., Westonbirt, Tetbury (gr. Mr. H. G. Alexander). A superb flower of fine shape and substance and attractive colour. In the general aspect of the flower *C. Niobe* predominates, but it is much larger and broader in all its parts. The upper sepal is broad and flat, clear white, heavily tinged and veined with rose-purple, the central line being the darker; the base is emerald green with a few blackish spots. Petals broad, ciliate, purplish-brown on a primrose-yellow ground, a few dark spots being displayed at the base. The lip is well rounded and tinged with mahogany red.

Cypripedium Royal George (*Harrisianum superbum* × *Minos Youngii*), from Messrs. ARMSTRONG & BROWN, Tunbridge Wells. One of the finest of large-flowered Cypripediums, in which both the parents can be well traced. The dorsal sepal shows much of *C. Minos Youngii*. The petals are broad and coloured like *C. Beckmannii*. Dorsal sepal broad and flat, white with a small green base, from which extends dotted lines of purple with a rose-purple flush between. Petals yellowish-green, the upper halves purplish-brown. Face of the lip tinged with purplish-brown. A very remarkable hybrid, notwithstanding the great variety in this large genus. The stock goes to the collection of Francis Wellesley, Esq., Westfield, Woking.

Odontioda Euterpe (*Cochlioda Noezliana* × *Odontoglossum Uro-Skinneri*), from Messrs. CHARLESWORTH & Co., Haywards Heath. A neat and effective new hybrid of bright colour. Sepals and petals orange-scarlet. Lip rounded in front, closely mottled with rosy-mauve. A promising hybrid for early-winter flowering.

OTHER EXHIBITS.

E. H. DAVIDSON, Esq., Borlases, Twyford (gr. Mr. F. Cooper), showed *Lælio-Cattleya Davidsoniæ* (*L.-C. Bella* × *C. labiata*), a showy hybrid with blush-rose sepals and petals, and ruby-purple lip with a yellowish disc.

Messrs. ARMSTRONG & BROWN, Tunbridge Wells, showed *Cypripedium Thyone* (*Prewettii* × *Fairrieanum*), *C. Dallas* (*Curtisii* × *Fairrieanum*), and *C. Thisbe* (*Beechense* × *Fairrieanum*).

Messrs. HASSALL & Co., Southgate, showed *Cattleya Hassallii* (*labiata* × *Empress Frederick*), a showy flower of fine shape, and *C. Parthenia* Prince of Wales.

Messrs. CHARLESWORTH & Co., Haywards Heath, showed *Odontoglossum grande aureum* Charlesworth's variety, the largest and best of the yellow forms of *O. grande*; the handsome and rare *Stanhopea platyceras*, and the true *Gongora maculata* of Lindley.

Messrs. MANSELL & HATCHER, Rawdon, Yorks., showed *Miltonia candida superba*, a remarkably beautiful form of the grandiflora section, with an open white lip with purple blotch; and a spike of a very handsome, white-petalled form of

Cattleya aurea, nearly identical with that known as *Countess of Derby*.

J. BRIDSON SEATLE, Esq., Fairfield, Richmond Road, Putney (gr. Mr. T. W. Paice), sent a very fine specimen of *Miltonia Karwinskii*.

Mr. E. V. Low, Vale Bridge, Haywards Heath, sent *Cattleya Thurgoodiana* "Wivelsfield" variety, of fine colour, and *C. Norba* (parentage unknown), in which *C. granulosa* was evident. The sepals and petals were pale buff with a rose shade; the lip rose-purple with a white base, and chrome-yellow disc. Also *C. labiata Italia*, white with a pink tinge on the lip.

Messrs. J. & A. A. McBEAN, Cooksbridge, showed a very fine specimen of *Miltonia vexillaria Leopoldii* with very dark colour in the mask of the lip, the rest of the flower being bright pink.

Fruit and Vegetable Committee.

AWARD OF MERIT.

Apple Ellison Orange.—A medium-sized fruit, with yellowish exterior of excellent flavour. It ripens in October. The parentage is stated to be Cox's Orange Pippin crossed with Calville Blanc. It was raised by the Rev. C. C. Ellison, Bracebridge, Lincoln, and shown by Mr. W. CRUMP, Madresfield Court Gardens, Malvern. Mr. H. Markham also grows the variety, and holds it in high esteem.

UNION OF HORTICULTURAL MUTUAL IMPROVEMENT SOCIETIES.

OCTOBER 11.—Representatives of the horticultural debating societies affiliated with the R.H.S. held their annual conference on the above date in the Lecture Room of the R.H.S. Hall, Vincent Square, Westminster. Amongst the subjects dealt with at the meeting were: (1) A paper on "Errors in Flower Show Schedules," by the secretary, the Rev. W. Wilks, M.A. (2) A letter from the Brewood Horticultural Society concerning queen wasps. (3) A discussion on what should "Union" mean, introduced by Mr. Mark Webster, of the Beckenham Horticultural Society, and Mr. Gill, of the Wimbledon Society. (4) The formation of country flower shows, introduced by Mr. Cawte, of the Highgate Society.

ANSWERS TO CORRESPONDENTS.

APPLES SPECKED: L. L. The Apples are attacked by Bitter-pit. This is caused by climatic conditions. There is no cure known.

BEGONIAS UNHEALTHY: A. B. C. and F. A. D. There is no disease present in the Begonias sent, but the damping of the foliage and shrivelling of *Begonia Gloire de Lorraine* are very common occurrences. They are due to an excessively moist and close atmosphere. Ventilate the house freely, and keep the plants and their surroundings drier, standing the pots well apart.

CUCUMBERS DISEASED: S. S. The injury to your Cucumber leaves is caused by *Cercospora melonis*. If any fresh planting is contemplated spray the leaves with liver of sulphur at an early stage, and repeat the sprayings on seedling plants next season.

CYCLAMEN LEAVES: G. R. The leaves of your Cyclamen plants are badly blistered by mites. Use an insecticide, and sponge the leaves with a soft soapy water.

GRAPES SPOTTED: X. Y. Z. There is no disease present in your Grapes, the rust or spotting being due to the presence of moisture on the fruit late in the day. Ventilate the house earlier in the morning so that the moisture may evaporate.

NAMES OF FRUITS: W. J. B. 1, Louise Bonne of Jersey; 2, decayed; 3, Ribston Pippin; 4, French Crab, Plum Reine, Claude de Bavay. —W. G. W. 1, Mère de Ménage; 2, Beurré Hardy; 3, Marie Louise; 4, Madame Treyve; 5, Beurré Diel; 6, Dutch Codlin. —Chilton. Bergamotte d'Automne, Calville Rouge. —Reader. Sandringham. —W. P. 1, Golden Spire; 2, Dumelow's Seedling; 3, probably a local variety; 4, Warner's King; 5, not recognised. —T. M. N. 1, Hambledon Deux Ans; 2, Bismarck; 3, Radford Beauty; 4, Melon Apple; 5, Cox's Pomona. —J. J. 1, Rymer;

2, Directeur Hardy. —F. Herbert. 1, Hanwell Souring; 2, Kentish Deux Ans; 3, Prince Albert; 4, Melon Apple; 5, Newton Wonder; 6, Sheep's Nose; 7, Norfolk Beefing. —W. H. Wells. 1, Brabant Bellefleur; 2, Calville St. Sauvier. —W. H. Mabbott's Pearmain. —L. Leake. 2, Blenheim Pippin; 3, Mabbott's Pearmain; 4, Duchess of Oldenburg; 5, a poor specimen, cannot be named. —A. B. 1, Doyenné Boussoch (not a first-rate variety), Brown Beurré. There are many superior to these for including in a collection of six varieties. —W. C. 1, Court-pendu-plât; 2, Reinette Van Mons; 3, King of the Pippins. —A. G. Stone Pippin. —J. MacD. 1, Probably a local variety; 2, Wyken Pippin; 3, Small's Admirable; 4, Golden Spire; 5, Yorkshire Greening; 6, King of the Pippins. —W. Miles. 1, Braddick's Nonpareil; 2, Beauty of Kent; 3, Lady Henniker; 4, Ross' Nonpareil; 5, Dumelow's Seedling (Wellington); 6, Broad End. —J. Lawrence. 1, Round Winter Nonesuch; 2, Cox's Orange Pippin. —Chilton. 1 B, Braddick's Nonpareil; 1 M, Duke of Devonshire. —O. W. Hunt. 13 and 14, Old Hawthornden; 15, Duchess's Favourite (Duchess of Gloucester); 16, Prince Albert; 37, Newton Wonder; 12, 20, 22 are all too small to name. —A. T. 1, Josephine de Malines; 2, Thompson's (a very fine fruit); 3, Marie Louise; 4, King of the Pippins; 5, Tom Putt. —G. E. Large Apple, Ribston Pippin; 2, Kerry Pippin; Pear, Louise Bonne of Jersey. —Blackdown. 1, King Edward; 2, Beurré Diel; 3, Fertility; 4, Brockworth Park; 5, Bergamotte d'Automne; 6, Alfriston; 7, Scarlet Nonpareil; 8, Yorkshire Beauty. —E. H. S. 1, Lord Derby; 2, Pile Russet; 3, Sturmer Pippin; 4, Reinette du Caux; 5, Mère de Ménage; 6, Fearn's Pippin. —J. G. Sandwich. 1, Belle de Pontoise; 2, Emperor Alexander; 3, Blenheim Pippin; 4 and 7, Bramley's Seedling; 5, Ribston Pippin; 6, King of the Pippins. —T. W. 1, Pitmaston Duchess; 2, Uvedale's St. Germain; 3, British Queen, 4, Chaumontel; 5, Easter Beurré; 6, Beurré Bosc. —S. Horton. 1, Lady Sudeley; 2, Wealthy. —Buchlyvie. 1, Warner's King; 2, Beauty of Kent; 3 and 4, Stirling Castle; 5, Waltham Abbey Seedling; 6, The Queen.

NAMES OF PLANTS: T. D. H. 1, *Lupinus arboreus*; 2, *Salvia Grahamii*; 3, *Linaria repens alba*; 4, *Helianthemum vulgare* var. *cupreum*; 5, *Ceratostigma plumbaginoides*; 6, *Tamarix gallica*. —H. W. S. *Escallonia montevidensis*. —T. *Ulmus montana* var. *crispa* (*U. urticæfolia*). —R. Sumner. 1, *Ligustrum japonicum coriaceum*; 2, *Arbutus Unedo*; 3, *Thuya plicata* var. *zebrina*; 4, *Cupressus Lawsoniana lutea*; 5, *C. l. erecta viridis*; 6, *C. pisifera squarrosa*; 7, *C. p. plumosa argentea*; 8, *Juniperus communis* variety; 9, *Biota orientalis* variety; 10, *Cupressus Lawsoniana* variety; 12, *C. Lawsoniana*; 13, *C. pisifera plumosa*; 14, *C. pisifera*. —P. T. 1, *Vanda alpina*; 2, *Oncidium oblongatum*; 3, *Stelis ophroglossoides*; 4, *Pleurothallis lateritea*. —T. H. 1, *Gongora quinquenervis*; 2, *Cataseum maculatum*; 3, *Dendrobium Phalæopsis*. —Barncluith. *Ilex Aquifolium* var. *ferox*.

VINE BORDER: W. R. You do not read your *Chronicle* carefully. Directions for making a vine border were given in the issue for September 30, p. 250; the amount of lime-rubble and half-inch bones should be 1 cwt. each to every five loads of loam.

WORK ON GARDEN DESIGNING: G. J. There is no book dealing with the formation and designing of flower-gardens, except such as are out of print. Books on landscape gardening deal with the subject, and there is also a useful chapter in the Supplement to *Nicholson's Dictionary of Gardening*. A book on geometrical drawing may be obtained from any of the scholastic publishers.

LONGFORD CASTLE.

(See Supplementary Illustration.)

THE Wiltshire seat of the Earls of Radnor is pleasantly situated on the bank of the Avon, about 3½ miles nearly south of the city of Salisbury. The way thither lies through a portion of the city, with its strangely-named streets. "Pennyfarthing Street," near the famous cathedral, records the daily rate of pay of the workers who assisted in erecting this wonderfully beautiful ecclesiastical edifice.

With the town at our back we drive over gently-undulating roads towards Longford Castle. Already the wooded hills, which distantly flank the highway, give promise of one of the great charms of Longford; that of broad, undulating parks, framed by belts of fine forest trees full of leafy splendour. The fields are burnt brown, but the woods, which are composed chiefly of Elm and Beech trees, look cool and green. Our first view of the castle was that depicted in the supplement. A castle without forbidding grimness is artistically blended with an Elizabethan style of architecture. The latter is held by some authorities to lack repose and dignity, but in this instance it is the Elizabethan portions which give repose and make the building so sugges-

tive of a home. The original castle at Longford was built over 300 years ago—a manor house had stood near the site for several centuries previously—with three towers in triangular form, each tower being named after one of the Persons of the Trinity. There were difficulties and expense with respect to the foundations, which were "sett soe neare the River, and upon soe many springs," that they had to be laid on piles and woolpacks. This was about the time of the Spanish Armada, and, in consequence, the work proceeded slowly for a while, but was expedited later. In 1765 the first Earl of Radnor was created, and he laid the foundations of the famous Longford Castle collection of pictures. The castle in its present form was the result of alterations commenced towards the close of the 18th century, and completed in 1874. The lower illustration in the supplement shows the formal flower garden which is immediately in front of the castle. As will be seen, this garden is in the form of a huge sunken panel, and is partly surrounded by clipped Yew hedges, with terrace walks beyond them. This garden, with its geometrically-shaped flower beds enclosed by banks of turf, is the brightest and best that it has been our fortune to see during the present season. There was plenty of gay colour, and, indeed, the position, backed by the grey walls of the castle, with the deep green of large trees at its other end, and the river flowing gently seawards, demands the colour which rioted gaily in the brilliant sunshine. The newest mode of summer bedding—largely that of big plants massed thickly together—does not find a place at Longford. Here the flower beds are too small for large plants of any kind to be effective, and so comparatively small plants are employed. They are disposed, however, with such taste and skill that there is none of the flatness which might have been anticipated. In such a garden as this, where all the many beds are under review at once, the arrangement of the colours becomes a matter of careful forethought, for any other than a trifling mistake remains in evidence throughout the entire season. In the Royal Parks of London many of the flower beds are replanted several times during the season, but even in such a large private establishment as that of Longford it is not possible to adopt such a practice. Whilst there is no striving after extravagant effects, the plants are harmoniously blended. The pink-flowered species are nicely graded on to the deeper reds, and away from the yellow and mauve shades; whilst the blues are separated from the bright colours by flowers of a yellow or terra-cotta shade. A catalogue of the plants which contributed towards this blaze of colour would serve no useful purpose. It is sufficient to remark that much of the brightness was obtained from such plants as a dwarf and floriferous strain of *Salvia splendens* and *Coleus Verschaffeltii*, which unfortunately is not nearly so often seen in flower gardens as was the case 20 or more years ago. We do not know of any other summer bedding

plant which gives such a rich, velvety crimson colour, despite the contentions of the admirers of Begonias of many forms. Scarlet Pelargoniums are indispensable when prolonged bright colour is desired, and at Longford the fine variety Paul Crampel is grown, though tuberous Begonias also find a place for the sake of variety. The deeper-coloured Heliotropes are especial favourites of the Countess of Radnor, and bushy plants are largely planted in the beds. *Calceolaria amplexicaulis*, the best of the genus for late summer and autumn display, is also grown in quantity.

On leaving the gorgeous flower garden, the scene changes completely. Behind us lies the castle, its broad terrace walk and garden of flower beds marked out with precision and enclosed either by stone balustrading or clipped Yew hedges. Everything speaks of the art of man, the castle bears evidences of the taste of the architect and the skill of the builder, whilst the garden is a testimony—perhaps not so lasting, for another "Capability" Brown may come again and sweep it away, as happened to a previous formal garden here—to the art of the landscape gardener: and so we pass out through the gateway into the cool restfulness of woodland walks. We do not know the extent of this most delightful feature of Longford, but it gives the impression of limitlessness; no matter how long one saunters there would—it seems—still be lofty trees of Beech and Oak, with clean straight trunks, and ever and anon, in the subdued light, would appear little glades with an old summer-house at the end of one, or some unusually fine tree prominent in another. Here beneath the trees rest countless numbers of bulbs, waiting for their own particular spring-time; when they will stud the ground thickly with their flowers. Lady Radnor has taken this delightful phase of gardening under her own care, and has planted the most suitable kinds of all the spring flowers in great numbers: of Snowdrops alone there are seven miles.

A sharp turn to the right brings into view a very fine specimen of *Taxodium distichum*, 76 feet high, with a girth of 8 feet 8 inches at 5 feet up. A splendid pyramid of feathery branches, so well proportioned that its height, as determined by a dendrometer, astonished us. From this tree a well-kept lawn gently slopes to a brook which joins the Avon river in its placid journey southwards. On this lawn Mr. Tucker pointed out several "knees" of the *Taxodium*. This is a good instance of the formation of these woody swellings far from water. Such growths are common when the tree grows in moist or swampy ground, but they have not often been recorded as occurring on dry ground. Near by, there is a summer-house covered with *Hiawatha* and *Dundee Rambler* Roses. In the background there are two fine old Judas trees (*Cercis Siliquastrum*), which must be very beautiful when in flower. Beside the stream is a shady walk, where the pied wagtail flits from

boulder to boulder with quaint ceaseless motion of its tail, and where the speckled trout darts through the water like a ray of light. So great is the fascination of running water that we pause to lean on the railing of a rustic bridge, and note how on the right a huge Horse Chestnut overhangs the bank, its large leaves dipping into the stream; on the opposite bank there is a grass-grown slope, where numbers of Primroses have been planted, and we speculate as to their powers of withstanding the unaccustomed drought. A fine bush of the Carolina Allspice (*Calycanthus floridus*), which bears such pleasantly-scented flowers of quaint brown colour, claims attention. We emerge from the wood into an extensive park with a rolling sweep of greensward, losing itself in broad belts of enormous trees. Here the ancestral Oaks, Elms, and Beeches are feathered to the ground. This uncommon feature is a tradition at Longford, and whilst the cattle are grazing herdsmen are always in attendance to prevent any browsing on the leaves of the trees. On a level portion a fine cricket ground has been made, and the young men practice and play matches in full view of the castle. A football ground is marked out alongside, so that the winter game may be indulged in. Nearer to the castle there is a lawn of magnificent proportions—lawn keeping is important work in these grounds, and, beside several small machines, a large motor lawnmower is in use—with many Roses planted alongside the broad gravel walk. On one side, the carriage drive is shut off by a closely-clipped Yew hedge, and parallel with the hedge is a long pergola made of Oak posts set on roughly-hewn stones hidden by *Saxifraga hypnoides* and similar lowly-growing plants. The pergola itself, which is sufficiently high to allow a tall person to walk beneath it in comfort, is well furnished with various climbers, Clematis, Ceanothus, *Pyrus japonica*, Honeysuckles, climbing Roses, *Escallonia macrantha*, the sweet-scented *Lippia citriodora*, and species of *Vitis*. *A. C. Bartlett.*

(To be continued.)

ORCHID NOTES AND GLEANINGS.

LÆLIO-CATTLEYA URSULA.

EUSTACE F. CLARK, Esq., Evershot, Dorchester, sends a flower of this brightly-coloured hybrid, first flowered by him in 1907. The hybrid is from a cross between *Lælia crispa* and *Lælio-Cattleya corbeillensis* (*C. Loddigesii* × *L. pumila*), made by him in 1898. The flower is as large as *L. crispa*, and somewhat similar to it in shape, but the sepals and petals are purplish-mauve, darker in the veining. The side lobes of the lip are white, tinged with purple, the front lobe, purplish-crimson, the base veined with orange. Although it is not massive, it is a very bright and attractive flower.

PLEUROTHALLIS HEMIRHODA, LINDL.

CONSIDERING that this very pretty species is enumerated in the extensive and interesting catalogue of the Schiller (Hamburg) collection (February, 1857), it is strange that but little has been heard of the plant in recent times, and that it is now only to be found in one or two collections. For a long time it has been producing its pretty white and purple flowers in the Orchid houses of Sir Frank Crisp, Friar Park, Henley-on-Thames (gr. Mr. Knowles), where the genus and its allies are well represented. It is of the section *Restrepioides* of Lindley, and is identical with *Restrepia biflora*, Regel, *R. nuda*, Klotzsch, and *R. vittata*, Lindl. The flowers are solitary or in pairs, in shape and size approaching those of *Pleurothallis scapha* and *P. Birchenallii*, illustrated in the *Gardeners' Chronicle*, June 19, 1909, p. 391.

CIRRHOPE TALUM CAUDATUM.

THIS pretty and rare species has flowered well this season in the gardens of the Hon. N. Charles Rothschild, Ashton Wold, Oundle (gr. Mr. Wright). The umbels, each about 2 inches across, bear many flowers, the long, narrow, lateral sepals being gracefully curved outwards. The colour is cream-white. Lindley described the species over 70 years ago from Wallich's specimen collected in Nepal as *Bulbophyllum caudatum*, a name which is sustained by most authorities, who consider that *Cirrhopetalum* is merely a section of *Bulbophyllum*. There is a charm about these

[Photograph by J. Edwards.]

FIG. 125.—YUCCA ELLACOMBEI IN MR. ELWES' GARDEN.

pretty and curious plants which command for them a more lasting interest than many of the showy species.

DENDROBIUM PHALÆNOPSIS.

THE fact that even minor departures from the normal form are constant in many Orchids is well demonstrated in a flower of a very fine form of *Dendrobium Phalænopsis* sent by Mr. H. Haddon, gardener to J. J. Neale, Esq., Lynwood, Penarth. Last year Mr. Haddon sent a flower from the same plant, a very striking feature in which was a raised, fringed, purple line down the middle of each petal. The flower sent this year from the same plant has the same peculiarity, although not so pronounced as in last year's specimen.

DENDROBIUM FORMOSUM GIGANTEUM.

THIS is one of the most handsome and satisfactory large-flowering Orchids in the collection of Leopold de Rothschild, Esq., Gunnersbury House, Acton, and the great success attained in its culture by Mr. Jas. Hudson is noteworthy, because it has been sustained for many years. Even seedling plants which came up on the imported specimens have been grown into strong-flowering plants. For some time past the plants have borne from two to three hundred pure white flowers, with the discs of the lip varying in tint from chrome yellow to rich orange colour, each flower being about 4 inches across.

YUCCA GLORIOSA VAR. ELLACOMBEI.

WE are indebted to Mr. Elwes for the opportunity of figuring this handsome Yucca (see fig. 125), a plant of which bloomed in his garden at Colesborne this summer. With the flowers Mr. Elwes sends the following particulars:—

"Though I have, through the kindness of Canon Ellacombe, had this plant in my garden for many years, I have never flowered it till this season, when, favoured by a continuous sunshine such as I have never known, it has, at the foot of a hot wall, produced a spike about 5 feet long, of which 3 feet at least are covered with flowers, now in the height of their beauty. The original plant was procured by Canon Ellacombe's father from Loddiges' nursery many years ago, and is described and figured in *Refugium Botanicum*, t. 317, as a species, probably from the Southern United States. In the *Kew Index* it is referred to as a synonym of *Yucca gloriosa*, of which Baker and Trelease afterwards made it a variety. Canon Ellacombe considers that it is a cross between *Y. recurva* and *Y. superba*, as it has the reflexed leaves of the former and the red-backed petals of the latter species. Whatever its origin may be, it surpasses in beauty any Yucca that I have seen, except perhaps *Yucca Whipplei*, which, so far as I know, has not yet flowered in this country, though both Mr. Goodman and myself brought it from South California as long ago as 1888."

THE ROSARY.

SOME ORANGE-YELLOW ROSES.

THE purpose of the notes which follow is a brief review of some of the orange-yellow Roses, with the object of considering some of the new Roses of this colour which seem worthy of notice. With two or three exceptions the novelties come to us from Continental hybridisers. I propose to confine myself to Roses of dwarf habit of growth, and shall therefore exclude varieties of a climbing or semi-climbing habit, like *Billard et Barré* and *Mme. Hector Leuilliot*.

Mme. Ravary (H.T.), the first, and one of the best, of the group was brought out by Mons. Pernet Ducher, in 1899. Having a hardy constitution and short, sturdy growth, it makes an excellent bedding Rose, and is sufficiently free-flowering to give a fair succession of flowers throughout the summer and far into autumn. The flowers come a better colour in dull than in very hot weather, such as we have had this year, and, like all the Roses of this class, the buds are particularly beautiful. The flowers withstand a certain amount of rain, as they are not very full, and will also tolerate shading. Some amount of heat, however, seems necessary to the proper development of the blossoms, for the cold nights and rains of autumn appear to take away much of their colour, and this is the weak point of this Rose. Notwithstanding its dwarf growth, it makes a good standard, and will grow into a fine head 3 or 4 feet through if, as it should be, it is allowed to do so. Though not full enough for exhibition, the flowers and

buds are most useful in the decorative classes and for arranging in the house.

In the following year—1900—the same raiser brought out his great Rose, *Soleil d'Or*—great not in itself, for it has little to recommend it but its colour, but in its progeny, which are both numerous and beautiful. The colour is a fine, deep orange-yellow, and the outside of the petals are characteristically splashed with pink or red; but the form of the flower is flat and unsatisfactory, and I can find no place for it in the garden. It is not good enough for the beds or borders, and, though I have often tried it, I find it will not grow in the shrubbery. When planted there, it always disappears after a year or two. The best plant of this variety known to me is growing in a neighbour's garden, planted under a south wall. It is growing magnificently and flowering well. The Rose evidently requires warmth, and those who wish to grow it should take note of the fact.

In 1905, Mons. Pernet Ducher sent out two interesting Roses of this group, both H.T.s—Mme. Mélanie Soupert and *Instituteur Sirdey*. Mme. Mélanie Soupert was a great acquisition to gardens. It is decidedly taller in growth than Mme. Ravary, leaves thicker and larger, whilst the flowers, though not very full, are often good enough for exhibition. Two years ago a flower of this variety obtained a Medal at the N.R.S. summer show for the best H.T. exhibited. The colour is a delicate mixture of pale fawn and gold, with a slight tinge of peach. In the early part of this hot year I had flowers almost pink in colour; but this is unusual. As in the case of Mme. Ravary, the colouring in autumn is apt to become somewhat washed out. Fairly hardy, it often makes a fine standard, and is a really useful Rose, both in the garden and for exhibiting. *Instituteur Sirdey* is of a still more striking colour, the orange hue of the early flowers being very pronounced. It is beautiful in the bud, but as the flowers expand they quickly lose their charm, and become flat and uninteresting. Nor is it quite as hardy as the last-named Rose. Some short time ago I planted a bed, intended to take about 30 Roses, with Mme. Ravary, Mme. Mélanie Soupert, and *Instituteur Sirdey*, in order to compare their values as garden Roses. After a short trial, I became convinced that *Instituteur Sirdey* was inferior to the other two, and replaced it by Mme. Ravary, and I find the combination of Mme. Ravary, with Mme. Mélanie Soupert in the centre, quite satisfactory.

In 1906 came *Marquise de Sinety* (H.T.), also from Mons. Pernet Ducher. It is a Rose of gorgeous colour. Golden-yellow, shaded coppery red, is the N.R.S. description, and it is not inappropriate; but the amount of the red tinge varies a good deal. Sometimes it suffuses the petals, making them of a glowing orange colour, sometimes it is confined to a suspicion of colour, merely giving the yellow a warm effect. Like many of these Roses, it is most beautiful as an opening bud, the expanded flower wanting form and coming too flat. As a garden plant, this Rose leaves a good deal to be desired. It is not very profuse in flowering; and its habit of growth is described as moderate, which often means, as in this case, that it is somewhat weak in constitution in this country. I find in my own garden that it is not long-lived, and often requires renewal.

In the same year (1906) Messrs. A. Dickson & Sons brought out the Tea-scented Rose *Lena*. This beautiful little Rose has many of the qualities that are lacking in *Marquise de Sinety*. It has long, pointed buds, opening to a shapely little flower of bright apricot colour, and is in flower the summer through. I have no Rose in the garden that more frequently provides me with a flower for my buttonhole. Its defect is that it is of a very weak growth: the stems are thin and spindly, so much so that it is most difficult to bud, and though I have not yet

lost a plant of it, I fear it must be put down as tender. I doubt if I have a poorer grower in the garden.

In 1909, Messrs. A. Dickson & Sons brought out the *Duchess of Wellington* (H.T.), a deep-yellow Rose, with an orange or reddish tinge on the outside of the petals. This Rose seems to be an excellent bedding variety, of good habit, and specially useful in autumn. It has a long, pointed bud, and the flowers are at their best when just expanding; when fully open it is less beautiful. I planted a bed of it last autumn, and have found it most satisfactory; but I have no experience of it in a wet year. I fear it is not a Rose that will stand much rain; but this is only surmise. It is certainly a most useful Rose, and deserves a welcome and a full trial.

I now come to the Roses of 1910, and will mention five of them:—*Arthur R. Goodwin* (H.T., Pernet Ducher), *Lady Hillingdon* (Tea, Lowe & Shawyer), *Herzogin Maria Antoinette* (H.T., Welters Jacobs), *Recuerdo de Antonio Peluffo* (Tea, Soupert & Notting), and *Reine Mère d'Italie* (H.T., Bernaix). *Arthur R. Goodwin* is one of the progeny of *Soleil d'Or*. The buds and half-expanded flower are bright orange, and really beautiful. The blossoms open to a rather flat flower, with somewhat small, symmetrically-disposed petals, often having a faint tinge of salmon colour suffusing the orange. Many admire the Rose in its mature form, but, to my taste, its beauty is past when it has expanded. I have grown the plant for two years and find it a good grower and hardy.

Lady Hillingdon has long buds of a rich, dark orange, often splashed with red, opening to a beautiful flower. It is, however, rather thin, and its beauty is, therefore, fleeting. It is a good grower for a Tea-scented Rose, and does well in the garden; but the best and most decorative flowers seem to come when it is grown under glass. I have had *Lady Hillingdon* and *Lena* growing side by side this year, and have been more than once struck with the similarity of their remarkable colour; but *Lady Hillingdon*, being a much better doer, seems likely to make the better garden Rose of the two. The hot sun of this summer has been very trying to it, as to all thin Roses, and I hope next year it may prove even more satisfactory.

Herzogin Maria Antoinette I have seen only as maiden plants, and therefore speak of it with some reserve. In the bud stage, it is very like *Lady Hillingdon*, of a rich orange colour, splashed with red. The open flower is, perhaps, hardly so intense in colour, but seems to be somewhat more full than *Lady Hillingdon*. Being a H.T., instead of a Tea Rose, the petals may be a little thicker, if not quite so satiny in appearance. Next year I hope to be able to compare these Roses under more equal conditions. They are certainly both well worth a trial.

Of the two Roses I have next to mention, I have no actual experience in my own garden. *Recuerdo de Antonio Peluffo* should be worth trying, if only from its parentage, which is Mme. Mélanie Soupert × Mme. Constant Soupert. As shown, it would seem a fine Rose, of better form than most varieties of its colour, which is a pale orange, with a slight tinge of pink; perhaps the colour is hardly deep enough to compare with the other Roses in these notes.

Reine Mère d'Italie I have not yet seen in this country, but, from report, the flowers should be a fine, deep, orange colour, perhaps only semi-double.

Of the new Roses of 1911 I have as yet only seen one that might come into this list, and that is *Sunburst*, raised by Mons. Pernet Ducher. This Rose was exhibited both at the summer and autumn shows of the N.R.S., grown by Messrs. Beckwith, under glass. As shown, it was certainly a lovely Rose, the centre as bright and deep as *Lady Hillingdon*, getting paler towards the edges of the outer petals. No very definite

opinion of its merits can be formed till we have been able to grow it in our gardens; but we may feel fairly satisfied of its beauty as a pot Rose when properly grown, and all who are fond of experimenting with new Roses should procure a plant for trial when it becomes obtainable.

Glancing back at these notes, the weakness of the Roses in this section seems to be in the want of form in the open flowers. Only in Mme. Mélanie Soupert and in those members which belong to the Teas do we find much beauty in the fully-expanded flower. Nevertheless, they form a wonderful group, and one in which the advances made in recent years have been notable and of good augury for the future.

White Rose.

FRANCE.

CO-OPERATIVE SOCIETY FOR THE CARRIAGE AND SALE OF FRUIT AND VEGETABLES.*

In the Departments of Provence and Languedoc, where the cultivation is varied and there is a large quantity of early-produce grown, a fruitful co-operative movement has been developing of late years. Under the authoritative guidance of the Union of Agricultural Syndicates of the Alps and of Provence, which comprises 250 syndicates and 250,000 members, numerous societies have arisen side by side with the co-operative wine vaults, oil works, and dairies, for the sale and carriage of fruit, vegetables, &c.

The *Bulletin of Economic and Social Intelligence*, published by the International Institute of Agriculture, gives, in the June number, an interesting account of these various forms of co-operative association. We may mention first of all the syndicates of Cuges, Lascours, Rocquavaire, which concern themselves with the sale of pickles; in the last mentioned place, the society has also started the manufacture of Apricot jam, and is doing business to the amount of 400,000 frs. a year.

The agricultural syndicate of Vallauris has organised the distillation and sale of Orange flowers; it has 1,700 members, and has an establishment at Golfe Juan which cost 200,000 frs. to set up. Thanks to its exertions, producers have seen the price of Orange flowers rise from 0.30 frs. to 1.10 and 2 frs. the kilogram.

For some time past the co-operative exportation of table Grapes has been attempted with equal success. At Cabrières-d'Aigues (Vaucluse) the growers of these Grapes have joined together in a society with a capital of 2,000 frs., and have obtained a loan from the State fund for agricultural co-operative credit of 400 frs. The Grapes are packed in baskets holding 10 kg., and are sent for the most part to the markets of Cologne and Geneva. In 1909 there were 350 quintals of Grapes exported at the net price of 18 frs., and 1910 the quantity was 250 quintals, the price being 45 frs. per quintal.

Another interesting form of association has been started with success in this region for the carriage in common of fruit and vegetables, and is likely to put the growers in a position to take advantage of the reduced tariffs granted for the expedition of complete wagon loads. There are already five societies of this kind in the Gard and Vaucluse. We may mention, for example, the syndicate of Rochefort-du-Gard, which confines itself to collecting together, at the station near the hills, the Tomatos already packed by the members, and sending them to the Paris markets. The consignment is made to a transport agency in the capital, which agency delivers the goods at their destination, collecting the sums indicated in the various invoices for the account of the syndicate.

This system has reduced the carriage expenses by half, and has been the means of lengthening the season for the expedition of Tomatos by

* Summarised from the *Bulletin of Economic and Social Intelligence*, Year II., N. 6, published by the International Institute of Agriculture.

three months. In 1910 the syndicate sent off more than 1,000 tons of produce, the railway expenses for which were 60,000 frs., and those for unloading and distribution in Paris about 8,700 frs.

The neighbouring syndicates have adopted similar measures for the consignment of Cauliflowers, Potatos, &c., which are sent to England and Switzerland.

A new association which has arisen at Carpentras for the sale of grafted vines which have been grown by the members is worthy of mention. The Nurserymen's Co-operative Society of Vaucluse has a capital of 7,500 frs. at the present day, and 2,000 members who have 150 acres of land out in nurseries. In 1910 about 18,000,000 wild vines were planted, the total expenditure being 300,000 frs., and 5,500,000 plants of first quality were sold for 550,000 frs. The society supplies its members with manure and vine cuttings, and pays each member 60 frs. on account for every 1,000 vines delivered. Within a very short time it has succeeded in regulating and improving the trade in these products, which is daily acquiring greater importance in connection with the reconstitution of vineyards in France and Algiers.

THE FOURTH INTERNATIONAL CONFERENCE ON GENETICS, PARIS.

SEPTEMBER 18-23.—A general account of the proceedings at the recent conference on genetics has been given already in these pages (274-5). This account we now supplement by somewhat more detailed reference to certain of the memoirs which were presented to the conference.

THE RAISING OF DISEASE-RESISTING PLANTS.

Mr. W. A. Orton, Pathologist to the Department of Agriculture, Washington, dealt with the problem of disease in plants, and described the results of experiments in breeding varieties resistant to specific diseases. The experiments concerned, mainly, the group of diseases known as wilt diseases, which are due to parasitic species of the genus of fungi known as *Fusarium*. Thus *Fusarium vasinfectum*, Atk., is responsible for wilt in Cotton; *Fusarium tracheiphilum*, Erw., Sm., gives rise to the wilt of the Cow Pea (*Vigna unguiculata*), and *Fusarium nivium*, Erw. Sm., to the wilt of the Water Melon (*Citrullus vulgaris*). *Fusarium* is a genus of parasitic fungi the species of which are highly specialised, and live in the vascular tissues of their respective hosts. Infection takes place from the soil through the young roots, and occurs independently of conditions, favourable or otherwise, in which the host-plant is growing.

Among Cotton plants, the degrees of resistance to wilt is generally but slight, though occasionally a Cotton plant is met with which is immune. By self-fertilisation of such a resistant plant, strains of plants have been raised which have maintained their powers of wilt-resistance for several years. The photographs showing the ravages caused by this parasite (fig. 129) among ordinary Cotton plants, and the resistance of a strain Dillon (fig. 130) are remarkable illustrations of the power which would appear to lie at the hands of horticulturists to mitigate disease by raising resistant strains. It should be added that the illustrations (figs. 129 and 130) show contiguous fields in S. Carolina, the soil of which is known to be thoroughly infected with *Fusarium vasinfectum*. Indeed, with respect to the ground shown in fig. 130, the preceding year's crop was entirely destroyed by wilt.

RESISTANCE TO EEL WORM.

Mr. Orton's experimental breeding work with the Cow Pea is peculiarly interesting and important, inasmuch as he has shown that, in the first place, a variety may exhibit resistance to the at-

tack of more than one kind of parasite. Thus, a variety, Ivon (fig. 127), has proved to be immune from the attack of the wilt fungus (*Fusarium tracheiphilum*), and also from root-knot, the disease caused by the eel worm (*Heterodera radicicola*). When the resistant variety, Ivon, is crossed with high-yielding but susceptible varieties, the resulting hybrids (F_1)

FIG. 126.—MENDEL MEDAL TO COMMEMORATE THE FOURTH CONFERENCE ON GENETICS HELD IN PARIS IN SEPTEMBER, 1911.

are resistant, and in F_2 plants are obtained which combine this quality with that of the high yield characteristic of the other parent.

WATER MELONS AND WILT.

The problem of discovering wilt-resistant varieties of Water Melon (*Citrullus vulgaris*) was rendered difficult by the fact that none of the edible varieties is immune. It was therefore necessary to start with a non-edible resistant variety, and to cross it with the better varieties in cultivation. In F_1 the hybrid showed qualities intermediate between those of the parents, F_2 exhibited great variability; but in the third

generation. We hope that, with the encouraging results of Mr. Orton's work before them, experimenters in this country will turn their attention to the problem which Mr. Orton has investigated so ably, and that, before long, we shall learn that strains of Potato resistant to dry rot (due to *Fusarium solani*), Holyhocks resistant to rust, and Sweet Peas immune from streak have been raised in this country.

DISEASE RESISTANCE IN POTATOS.

Mr. Salaman, in the course of a paper on the breeding of the Potato, described the results which he has obtained by raising seedlings from

FIG. 127.—COW PEA FIELD IN SOUTH CAROLINA.

On the left, the variety "Ivon" which resists root-knot and wilt; on the right, another variety decimated by these diseases.

generation (F_3) a race was obtained which was resistant to wilt and of edible quality. Subsequent selection during five years has resulted in the isolation of a variety, Conqueror, which leaves nothing to desire with respect to resistance and general quality. It is noteworthy that the variety Conqueror is not resistant in all

Solanum tuberosum, among which a certain number of plants immune from late blight (*Phytophthora infestans*) were obtained. Our readers are already familiar with Mr. Salaman's work, an account of which has been published already in these pages (see *Gard. Chron.*, December 24, 1910, p. 461).

RESISTANCE TO COLD.

Dr. H. Nilsson-Ehle, of Svalof, Sweden, contributed a paper entitled "Acclimatisation by Recombination of Mendelian Factors." In the period previous to exact experimental work in genetics, much loose talk was heard on the subject of acclimatisation. It was known that when, for example, cereals are grown in a country the climate of which is colder than that of the country of their origin, the "race" might become hardier. It was assumed that the race, as a whole, had undergone a change in response to the change of climate—in short, that a mutation had occurred. Nilsson-Ehle has shown, however, that what really happens is that the climate acts as an eliminator of the more delicate members of the original race, and that the supposed new and hardier race is composed of the descendants of the original small band of plants which possessed factors for hardiness. The old assumption that, because a race is pure with respect to certain characters, it is pure with respect to others, has been shown to be erroneous, and, in the case under consideration, the original "race" was composed of members

critical importance in a new region of harder climate. There natural selection will begin to do the work left undone by artificial selection, and will destroy those which have not the powers requisite to resist the climate of the new region.

How selection—natural or artificial—works in such cases is the problem which Dr. Nilsson-Ehle sets himself to solve. He gives evidence to show that qualities such as resistance to cold, precocity of flowering, &c., each depend gener-

resistance experiments—for the first generation may well be susceptible to cold, and hence suffer destruction. All that is necessary in such experiments is to raise an abundant second (F_2) generation, and to subject the members of that generation to the test of cold or drought.

IN-BREEDING AND CROSS-BREEDING.

Mr. Bruce, Superintending Inspector of the Board of Agriculture, contributed a paper on the

FIG. 128.—ROOT-KNOT ON COW PEA (*VIGNA UNGUICULATA*).

1, A variety badly affected with root-knot caused by eelworm; 2, the variety "Ivon" which is immune from the disease.

which differed widely from one another with respect to hardiness.

An example of this newer and more correct way of looking at things may be given. Of garden Peas, Autocrat and Bountiful are as fixed as any with respect to the characters with which growers are immediately concerned. They are both middle races, one late, the other early, and so on; but with respect to characters which do not immediately concern the gardener or the grower, Autocrat and Bountiful, and any other varieties of Peas on the market are not pure. A keen eye will distinguish in a row of any variety of Peas minor differences, particularly in size and tint of foliage, degree of branching, &c. Since, however, many of these "points" are of no practical importance, they are properly ignored by the raisers and growers. So, in the case of cereals we have referred to, if a *high degree* of cold-resistance is a matter of indifference to the grower who raises the variety for use in a given locality, the variety is practically sure to be "impure" with respect to this character. What is a matter of indifference in the original locality may become of

FIG. 129.—COTTON FIELD IN SOUTH CAROLINA DESTROYED BY "WILT" (*FUSARIUM VASINFECTION*).

ally, not on single Mendelian factors, but on a series of factors: hence the business of the breeder is to bring about, by cross-breeding and isolated raising of F_2 and subsequent generations, the various combinations of these factors, some of which combinations will result in increased hardiness or other desired quality. The practical importance of this view lies in this, that, if the Mendelian factors concerned are but few, the desired result may be obtained in a few generations; but if they are numerous, it may take many generations before the best set of factors come together and combine to produce the desired result.

subject of Heredity of Quantitative Characters. He pointed out that many of the characters which are of the greatest practical importance are not qualitative, but quantitative in nature; for example, milk yield, seed yield, and so forth. From experiments which he had made with Barley, he had not been able to discover that the characters which he had investigated were susceptible of Mendelian analysis. To determine whether the Mendelian hypothesis of unit characters is applicable to quantitative, as well as to qualitative characters, and also to ascertain whether increased vigour attributed to cross-breeding and reduced vigour, said to accompany

FIG. 130.—COTTON FIELD IN SOUTH CAROLINA PLANTED WITH THE WILT-RESISTING VARIETY "DILLON."

A point of practical importance in connection with the raising of cold-resistant varieties was made by Dr. A. L. Hagedoorn, in the course of a communication on "Genetic Factors and Environmental Factors in the Improvement and Raising of Varieties." When the object of the breeder is to raise by hybridisation a cold-resistant variety, it is not necessary to subject the first (F_1) generation to the test of culture in a cold situation—and the same applies in drought-

in-breeding are Mendelian phenomena, would mark a great advance in our knowledge of Genetics.

BROCHETTE PEAS.

Mr. M. de Vilmorin described a variety of Pea in which the ends of the pod adhere to one another in a row. This "brochette" character segregates normally.

(To be continued.)

The Week's Work.

THE KITCHEN GARDEN.

By JOHN DUNN, Kitchen Garden Foreman, Royal Gardens, Windsor.

MUSHROOMS.—Beds which were spawned about the middle of August should be producing plenty of Mushrooms, and will require careful attention. The temperature of the house should not be allowed to rise above 65° in mild weather; during cold weather it may be allowed to drop to 55°. When the surfaces of the beds become dry, a gentle watering with rainwater should be applied through a fine rose. Damp the floor and walls of the house to create a moist atmosphere, but avoid a stagnant one by opening the top ventilators when the house appears overcharged with moisture. This is especially necessary when fresh beds are being made. It frequently happens that the moisture arising from fresh manure introduced to the house is injurious to the existing crop, unless sufficient top ventilation is provided to allow it to escape. Collect horse droppings for successional beds, and place them in a dry, airy shed, where they may be turned daily until they are ready for removal to the Mushroom-house. They may be turned once or twice when in the house to prevent sourness, after which they should be beaten tightly together, and the spawn inserted when the temperature of the bed has declined to 80°. After a few days, if the temperature of the bed is still declining, the surface should be covered with a layer 1 inch deep of finely-sifted loam, made firm by beating with the back of a spade.

CUCUMBERS.—Plants which were put out early in August will now be coming into bearing, and they will require very careful treatment in regard to cropping if they are expected to yield the main supply during winter. If, however, one or more houses have been planted for succession, the August plants may be allowed to bear more freely. In private gardens, it is better to maintain a small, regular supply than to have a large quantity at one time, and none at another. The best way is to remove all young Cucumber fruits over and above those required for the daily supply, before they become large enough to affect the plants adversely; by this means the plants will be kept in a healthy condition throughout the winter. Keep the growth well thinned out, and remove some of the oldest leaves in order to make room for the young shoots, which should be allowed a little more freedom of growth in winter than in summer. Encourage the roots near the surface by affording frequent light top-dressings of loam and leaf mould in equal quantities throughout the winter months. Whenever the weather is favourable air should be admitted, even if only for a short time during the early part of the day, in order to keep the atmosphere sweet; but cold draughts must be prevented, and the temperature of the house should not be permitted to fall. Maintain an atmospheric temperature of 70° at night during mild weather; and in the day the temperature may be allowed to rise, with sun heat, to 85°.

RHUBARB.—A number of roots should be dug up as soon as possible, and allowed to remain in the open, in order to prepare them for forcing. This plant is a very easy one to treat in this way, provided the roots are in a good condition when placed in the forcing pit. "Daw's Champion" is the variety grown for forcing purposes at Frogmore. The roots are allowed to remain in the ground three years from the time of planting, and they are then forced in slightly heated pits over a bed of leaves, which produces a mild bottom heat. Fine soil is spread over the bed, a few inches deep, and the roots are placed closely together, any spaces between them being filled with fine, sifted earth, which is watered in among them with clear water applied at a temperature of 70°. A large quantity of fermenting material is unnecessary, but just sufficient should be used to create a mild bottom heat. The number of roots to be placed in heat at one time will depend on the quantity of Rhubarb which will be required daily, but probably 12 to 18 roots will be sufficient.

THE FLOWER GARDEN.

By R. P. BROTHERSTON, Gardener to the Earl of HADDINGTON, K.T., Tynninghame, East Lothian.

PERPETUAL-FLOWERING CARNATIONS.

Cuttings of perpetual-flowering Carnations may now be taken for raising plants to flower in the open garden next season. It is usual to make the cuttings of side shoots, taken off with the heel attached, but longer and stronger growths are also suitable, and these, if cut directly beneath a joint, will root in even less time than the others. A large number of cuttings may be inserted closely together in an ordinary cutting box, in which a 2½ inch layer of sharp sand has been placed. Let the sand be thoroughly soaked with water, and then simply push the cuttings into it. The temperature of the house in which the cutting box is placed need not exceed 60°. The sand must be kept very wet until the roots are formed, but afterwards the plants may be transferred to other boxes filled with a sandy compost.

HOUSING TENDER PLANTS.—It will not be safe to allow tender subjects to remain in the open after this date. In the case of those in pots that have been plunged in the soil, all that is necessary is to cut back any roots that have grown through or over the pots, trim the shoots, remove rambling growths, and after the pots have been cleansed place them in a cool house. Exercise great care in watering the plants. Those that have been planted out must also have their roots trimmed before they are potted, selecting the very smallest receptacles that will accommodate the mass of soil and roots. It is an advantage to allow them to remain in a sheltered position out-of-doors for a week or 10 days after they are lifted, but it must be somewhere near cover so that they can be brought indoors easily if frost sets in. A very satisfactory way of keeping these over the winter is to plant them in soil in a glasshouse or in borders of cold fruit houses. *Lobelia cardinalis* may be placed on the hard bottom of a cold frame, filling in the intervening spaces between the clumps with leaf-mould, and covering them with a 2-inch layer of the same material. If only a small number is grown the plants may be placed in cutting boxes and covered with leaf soil; in either case sufficient moisture will be provided by the leaves until the spring. Anthericum needs a warmer house. The Hollyhock is so often treated as an annual or biennial that the value of old stools is overlooked. Yet the plants will live and thrive for many years, and some of these old specimens are now flowering a second time and producing new foliage from the base. My practice is to cut the stems down to about a foot from the ground, and cover the roots with a mound of soil about a foot deep. The soil is removed in the spring, and the plants flower earlier than seedlings.

GILIA CORONOPIFOLIA.—There is yet time to raise a batch of plants of *G. coronopifolia* for next season, although the seeds are best sown in the summer. In the south, January is a good time to raise a stock of plants for flowering in the following autumn. The plant may be used very effectively as a dot plant or for grouping near the front of a mixed border; in the latter case carpeting with some other plant will be necessary as *Gilia* does not cover the ground unless very closely planted. At the present time the plants are flowering at Tynninghame, and they may be easily singled out by their brilliance. In these gardens *Gilia coronopifolia* attains a height of from 4 to 5 feet.

TRANSPLANTING SHRUBS.—The transplanting of shrubs, particularly of evergreen shrubs, may now be proceeded with. This is the best season for the work, because the plants will have time to recover from the disturbance before winter. I have examined some that had their roots cut early in the year, and it is worthy of notice that they bristle with new fibrous roots, and do not appear to have suffered from the drought. Where the soil is still dry, it will be necessary to give a good soaking of water after planting, making a basin around the stem of each plant for the purpose. Place a stout stake on the side opposite to that whence come the strongest winds, and make the plants secure to it. In the case of tall specimens three stakes should be used, placing them obliquely to form a triangle. In the case of specimens occupying prominent positions iron rods with triangular feet are superior to any other method of staking.

PLANTS UNDER GLASS.

By JAMES HUDSON, Gardener to LEOPOLD DE ROTHSCHILD, Esq., Gunnersbury House, Acton, Middlesex.

STOVE FOLIAGE PLANTS: CALADIUM.

Those who grow Caladiums have sometimes found to their cost that, upon shaking out the bulbs for re-potting early in spring, the latter are decayed or sufficiently injured to impair their vitality to a serious degree. It is in the autumn that the mischief is most frequently done, when, for want of room, and because the plants are unattractive they are placed for a time in a cooler house—perhaps in a vinery or some such place—where no warmth whatever is maintained. Caladiums are easily injured by this sort of treatment, even if kept upon the dry side. On examining a decayed plant, it will be perceived that what appears to be a kind of "dry rot" has set in; this impression is, however, erroneous, the fact being that when the plants have been subjected to a severe chill the whole of the root becomes a mass of rotten matter, the apparent "dry rot" being only a secondary consequence. All Caladiums which are being dried off should therefore be retained in the stove, but should be laid upon their sides. If, however, there is a lack of space, they may be shaken out after a few weeks, and the bulbs placed in sand, still keeping them in a warm place; in this way I find that they keep well and require very little room.

ALOCASIA.—Plants of evergreen Alocasias may now have the older leaves removed, and those leaves which are still fresh can be tied into a smaller space. During this operation it is well to look out for any signs of red spider on the under surface of the leaves, and also for thrips. The deciduous species may now be gradually dried off, but should not be shaken out as the Caladiums.

CODIÆUM (CROTON).—I have often been very successful in the propagation of Crotons, at this season of the year, without depending upon any previous ringing, although this latter method of propagation is by no means to be despised if sufficient heat is not available. For the rooting of cuttings I cut off the shoots to the required length and insert each one in a thumb pot in firm, sandy soil. I then place the pots containing the cuttings on a hot-bed of a close pit, and protect them by standing one square garden hand light upon another, with one on the top to cover the cuttings. This impromptu arrangement has always been kept full of cuttings at this season. In average conditions it takes about six weeks to root the cuttings, and they are afterwards hardened off gradually.

ARALIA.—Plants of Aralia which have grown too tall should be cut down to make more room. These, if kept dry for a time, will usually put forth fresh growth. When these shoots are long enough, they may be removed with a heel attached for propagation; each plant will supply several such cuttings.

THE ORCHID HOUSES.

By H. G. ALEXANDER, Orchid Grower to Lt.-Col. Sir G. L. HOLFORD, K.C.V.O., C.I.E., Westonbirt, Gloucestershire.

VALUE OF LIGHT.—The agreeable warmth and sunshine cannot be expected to last much longer, and may now at any time be succeeded by more seasonable weather. Taking the season as a whole it has perhaps been unparalleled for its beneficial effects upon all Orchids that appreciate more or less a good clear light, and most cultivators can happily congratulate themselves upon the good results attained. The value of light is of the greatest importance, yet this factor is often neglected especially by amateur growers. Plants afforded the maximum of light are not only more free-flowering, but they are less susceptible to the effects of slight errors of treatment in other ways. Orchids are easily grown under a heavy shade all through the summer months, and the fresh green appearance of some of the plants would doubtless deceive any but the practical eye, but the growth made under such conditions is not the kind to withstand the least check. Even shade-loving Orchids may easily be ruined, by keeping them too heavily shaded, for the growths suffer during winter if there is a fall in the temperature of only a few degrees below the normal. The time of year is

now fast approaching when light is of vital importance, and too much thought cannot be given this matter. Anything that can be done in the way of shifting plants to bring them nearer the glass, or any other alteration that can be made to give each one room to stand clear of its neighbour, will repay the trouble. Especially is this the case with plants that are at all backward in growth, for light, even more than heat, is necessary to harden the tissues, and give the pseudo-bulbs, and foliage that robust and finished appearance so well known to be the forerunner of satisfactory flowering. Orchid growers in the neighbourhood of large towns will have a difficult task before them for the next few months, the heavy atmosphere retaining in it all kinds of impurities. This trouble is the worst, but even in country places where the houses are in proximity to deciduous trees, the falling leaves in autumn make a lot of work in keeping the glass clean. This cleanliness is, however, absolutely necessary for the plants. The glass should be well washed down frequently on the outside; the inside does not get coated over so quickly except during foggy weather, when this ought also to be cleaned by using a sponge and rinsing it frequently in clean water.

CALANTHES.—Plants of the *C. vestita* and *C. Veitchii* groups are now showing their flower spikes. Expose the plants fully to the light and admit plenty of air whenever the outside conditions permit. Water should not be withheld until the foliage has nearly decayed for if the plants are allowed to become dry, the roots perish and the pseudo-bulbs are much smaller next year than they ought to be. If a little manure water has been given to them occasionally the spikes should be strong, and produce richly coloured, well-formed flowers. After the flower-spikes are visible, water should be carefully applied until the flowers are fully developed, decreasing the amount from now until the foliage has decayed, very little being required during the flowering period.

PLATYCLINIS COBBIANA.—When the flowers of this Orchid are passed, no time should be lost before examining the roots, and any that require repotting should have immediate attention. The same kind of potting mixture as that recommended for *P. glumacea* in the calendar for April 15 should be employed. The forming pseudo-bulbs soon begin to root freely after being disturbed, and entering the soil they soon become re-established. The plants should be afforded a light position in the warmest house with ample moisture at the roots, and in the atmosphere, until they have completed their growth. When the pseudo-bulbs are fully matured, less root moisture and a cooler temperature will suffice during the resting period.

FRUITS UNDER GLASS.

By E. BECKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Hertfordshire.

CUCUMBERS.—The bright weather experienced during this month has favoured the growth of Cucumber plants; it has been possible to ventilate the house and apply frequent syringings. Light top-dressings may be applied as the plants seem to require them, to encourage further root action. The heavy mixtures which are used with advantage earlier in the season should now be avoided, employing a lesser quantity of a dressing of a lighter nature. Growth must be carefully regulated, and more space allowed than heretofore; whilst the fruits should be cut directly they are ready. The glass outside should be well washed from time to time, in order to admit all the light available. Maintain a night temperature of from 65° to 70° if possible, without unduly heating the pipes. Less moisture will be required after this date, therefore damping must be done with the utmost care, and it should be governed by the amount of fire-heat employed, for while it is disastrous to allow the atmosphere to become arid, an excessive amount of moisture is not less injurious.

MELONS.—Late crops of Melons must be the object of special care as the fruits ripen; a certain amount of fire-heat must be maintained, and the house kept thoroughly ventilated and dry by a circulation of air both day and night. Remove any superfluous foliage, so that the fruits may be exposed as much as possible to the sun. As the fruits mature, cut them and place

them in the fruit room; before the fruits are sent to table they should be exposed in a warm house near the glass for a couple of days.

PEACHES AND NECTARINES.—The usual routine during the successive ripening of these fruits should be carried out—washing the houses, cleansing the trees, and so on. The planting of young trees, or the removal of any for which a change of position is thought desirable—whether in late or early houses—may now be effected with advantage. Planting the trees, especially if they are of a fair size, is an operation which needs great care. The fibrous roots must be preserved by gently working away the soil with a fork, but a good ball of soil should always be retained round the roots, and this can best be insured by lifting the root system on to a strong mat and tying it up. The hole for replanting must be sufficiently large not to cramp the roots; they should be laid out carefully, and after the soil is filled in, it should be made thoroughly firm by treading (with the sole of the foot, not the heel). A good soaking of water and a mulch should afterwards be applied, and no attempt made to tie the branches until the soil has settled. When practicable, it is a good thing to grow a few young trees out-of-doors against a wall, or in unfurnished spaces in cool cases; if they have to be transplanted every year so much the better. Young trees thus treated can always be well trained and brought into good shape against a trellis.

POT PEACHES.—Trees in pots, intended for supplying early fruits, should now be placed in position for forcing. Arrange the plants so as to avoid overcrowding, and in order to prevent the ingress of worms, whether the pots are plunged or not, see that they stand on a firm bottom. Allow an abundance of fresh air both by day and night, until the time arrives for closing the house, and gradually reduce the amount of air allowed at night until it is shut up. Very little fire-heat should be employed in the early stages—the temperature should be kept at about 40°.

THE HARDY FRUIT GARDEN.

By W. HEDLEY WARREN, Aston Clinton Gardens, Buckinghamshire.

WINTER DRESSINGS FOR WALL TREES.—The application of preparations for the destruction of insects on wall trees is very necessary, because insects are apt to lodge and deposit their larvæ in various parts of the trees, or in holes and crevices in the wall. If these survive the winter months they issue forth in spring, increase rapidly, and may do serious injury to the trees. If the trees are found to be infested with insect pests at the time the leaves and shoots are tender, attempts to destroy the pests often result in injury to the trees, whereas if a winter dressing is applied whilst the trees are in a dormant state, the risk of such injury is avoided. The wisdom of applying a suitable dressing at the proper season of the year is therefore obvious. The trees should be pruned before being dressed, and every branch entirely loosened from the wall. The insecticide is best applied with a painter's brush of suitable size, and when dealing with the young wood, especially Peaches or other stone fruit, the brush must be drawn towards the end of each shoot, and not in a contrary direction, or the soft buds may be loosened or otherwise damaged. The preparation should be worked well into the rough bark and the older parts of the tree, for this is where the insects usually deposit their eggs. Espalier trees may be treated in exactly the same manner. A winter dressing on all kinds of fruit trees, whether by this method or by spraying, is not only necessary for the destruction of insect pests, but clears the trees of lichen which is detrimental to perfect growth. The walls also must be brushed and cleansed, and all holes and crevices filled with cement before the trees are again tied or nailed into position. Many kinds of suitable compositions for winter dressing are now offered for sale. Most of them are reliable, if used according to the directions given by the manufacturers, and in no instance should the strength of the dressing be exceeded, or serious damage may be done to the trees, and a valuable remedy condemned because of careless handling by an inexperienced person. In matters of this kind careful measurement is essential.

The following is an excellent dressing, safe to use, and it has the advantage of being of a less creamy consistency than most home-made insecticides. To six gallons of boiling water add 1 lb. of soft soap, 2 lbs. of flowers of sulphur, and 2 ounces of common shag tobacco. Boil the tobacco and sulphur in the water for 30 minutes, then add the soap. When quite dissolved, strain the whole mixture through a fine hair sieve, or a piece of coarse muslin. The dressing might be prepared in a more concentrated form and diluted accordingly.

STOCKS FOR FRUIT TREES.—This is a matter that must be left largely to the judgment of the planter, but it may be well to mention as a guide for those intending to plant trees in special positions that Pears for planting at short distances apart must be worked on the Quince stock, Apples on the Paradise stock, and Cherries on the Mahaleb stock. Pears for planting at wider distances should be worked on the Pear stock, Apples on the Crab, and Cherries on the common Cherry stock. Pear and Crab stocks root deeper, and are more suitable where large and stronger trees are required, whilst the Quince, Paradise, and Mahaleb stocks are more adapted for restraining growth, their roots being of a fibrous, surface rooting character. Where any doubt exists as to the suitability of any stock, for any soil or district, it is wise to seek local advice upon the matter, generally most readily given by those in the trade.

THE FRENCH GARDEN.

By PAUL AQUATIAS.

WINTER CROPS.—A quantity of soil should be sifted in readiness for covering the crowns of Chicory Witloof late in November when forcing is commenced. The soil should be placed in a dry shed till it is required. Curled and Batavian Green Endives planted in August must be sheltered from frost by covering the beds with old hay, straw or mats. Cabbage Lettuces that were planted in frames or under cloches early this month are well established, and a little ventilation may be afforded in bright weather. Guard against injury by frost by spreading mats over the frames when necessary.

SPRING CROPS.—The batch of Spinach sown in August for furnishing an early supply of leaves in the spring should be kept clean, and the plants thinned where necessary. If the growth of the foliage is too luxuriant the coarsest leaves should be removed, as they are generally attacked by mildew. The principal work in this department requiring attention is the pricking out of the Lettuces in their winter quarter. Where decayed manure has been employed liberally as a top-dressing, transplanting with the fingers is recommended, as it is not only expeditious, but prevents the bruising of the tender stems which is so frequent when a wood dibber is used. The Lettuces are pricked out as soon as the cotyledons are expanded. Thirty plants are generally placed under each cloche, but when there are plenty of bell glasses available, 24 plants will be sufficient. A sowing of Lettuces "White Passion" and "Paris White," the latter of the Cos type, should be made now to produce plants for planting out in the early spring. The Onions sown in August are ready for putting in their final quarters. Select clean and rich ground, and plant them in rows at a distance of 6 inches apart, allowing 3 inches between the plants in the row. Small and weakly plants should be allowed to remain for the present in the seed-bed; they can be planted out in the early spring.

GENERAL WORK.—The old manure beds should be broken up to supply the soil for the hotbeds next spring. The wettest material should be placed on the top to dry. The collecting of manure must be continued without delay. We have been fortunate in obtaining a regular weekly supply of five tons all the year round, and this has proved a great advantage, as the stacking of such a small quantity every week does not disturb the routine of general work, and there is always a good quantity in hand for an emergency. Manure collected in the summer remains absolutely dry. From the end of this month another stack will be started to form the "fresh" manure. It will have time to sweeten and become free from fungous growths before it is used early in January.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, as well as specimens of plants for naming, should be addressed to the EDITORS, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Local News.—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Illustrations.—The Editors will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c., but they cannot be responsible for loss or injury.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY, OCTOBER 23—
Nat. Chrys. Soc. Executive Com. meet.

TUESDAY, OCTOBER 24—
Roy. Hort. Soc. Coms. meet. (Lecture at 8 p.m. by Rev. Prof. Geo. Henslow, on Prof. Hugo de Vries' "Origin and Structure of Flowering Plants in Dry Situations.")

WEDNESDAY, OCTOBER 25—
Croydon Chrys. Sh. (2 days). Irish Gard. Assoc. and Benev. Soc. meet. Hereford Fruit and Chrys. Sh. (2 days).

FRIDAY, OCTOBER 27—
Maidenhead Chrys. Sh. (2 days).

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last Fifty Years at Greenwich—47°.

ACTUAL TEMPERATURES:—

LONDON.—Wednesday, October 18 (6 P.M.): Max. 68°; Min. 47°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—Thursday, October 19 (10 A.M.): Bar. 29.9°; Temp. 58°; Weather—Dull.

PROVINCES.—Wednesday, October 18: Max 57° Land's End; Min. 52° Perth.

SALES FOR THE ENSUING WEEK.

MONDAY, TUESDAY AND WEDNESDAY—
19th Annual Sale of Nursery Stock, at Milford Nurseries, near Godalming, by Protheroe & Morris, at 12.

MONDAY, TUESDAY, WEDNESDAY, THURSDAY AND FRIDAY—
Dutch Bulbs, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 10.30.

MONDAY, WEDNESDAY AND THURSDAY—
Bulbs, Lilioms, Roses, Shrubs, Perennials, &c., at Stevens's Auction Rooms, 38, King Street, Covent Garden, London, W.C., at 12.30.

WEDNESDAY—
An importation of 1,000 cases Japanese Lilioms, also Miscellaneous Bulbs, at 2; Palms and Plants, at 5; at 67 & 68, Cheapside, E.C., by Protheroe & Morris.

THURSDAY AND FRIDAY—
37th Annual Sale of Nursery Stock, at Hollamby's Nurseries, Groombridge, near Tunbridge Wells, by Protheroe & Morris, at 11.30.

Orchids from the Harefield Hall Collection, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 1.

The *Scientific Bulletin* of the Royal Agricultural College, Cirencester, contains a "Preliminary Report on Forestry Investigations at Colesborne, Gloucestershire."

At the outset, the authors of the report pay a well-deserved tribute to Mr. H. J. Elwes, who has given yet another indication of his interest in forestry by putting at the disposal of the College one of his experimental plantations and by helping the investigators in many other ways.

There is thus available for observation and experiment a plot of ground, some of which has been planted already and the history of all of which is known.

The altitude of the land under observation ranges from 574-670 feet, and the soil is a very shallow, brashy loam varying from 4-10 inches in depth, overlying broken-up, inferior oolite rock.

Briefly stated, the problem which those

in charge of the forestry experiments have set themselves to solve is the following:—Experimental plantings of a considerable number of different trees on land which, apart from its thin soil, might be expected to grow timber satisfactorily, have led, on the whole, to very poor results. Few of the many species of trees which have been planted have succeeded. Among the most conspicuous failures or partial failures are Austrian Pine, Tyrolese and Japanese Larch, Birch, Beech, Spruce, Weymouth and Douglas Pine. What have been the causes of the failures and of such successes as are exhibited?

The problem is worthy of a thorough scientific investigation, and if the work is carried out well it is bound to lead to valuable results.

At the same time the results so far obtained do not appear to throw any very clear light on the question. We take it that the most casual observation would of itself suffice to show that tree growth on the plot is not strikingly successful. Till, therefore, the results of the scientific investigation now in progress have produced certain evidence as to the reason for the existing state of affairs we do not think it is necessary for the investigators to bother about the light which their observations may some day throw on the general problem of afforestation. The time for that will come when they have passed beyond the preliminary stage of the investigation. If we may venture on a further and friendly criticism we would remark that the programme which the investigators have drawn up for themselves might be simplified. They propose to make what may be called an ecological survey of their experimental plot, and to investigate all the meteorologic, climatic, and edaphic conditions thereof. In so far as this can be done by mere routine observations—of rain and wind gauges and of the ordinary meteorological apparatus—particularly of soil thermometers, this is all to the good. But we are inclined to think that an absolutely thoroughgoing examination of what would appear to be one or two limiting factors of tree growth would be more likely to provide a solution of the problem which the forestry staff at Cirencester has set itself. The most cursory examination of the data provided by the Report suggests that among these limiting factors are thinness of soil and hence also poorness of water content, richness of the soil in lime (one plot contains 19.25 of lime reckoned as oxide), and range of soil temperature. To investigate any one of these factors *experimentally* and thoroughly over the area of the land under observation would tax the resources of a considerable staff for at least a couple of years, and probably a good deal longer. Yet, unless the effects of each factor, which commonsense suggests to be of prime importance in limiting tree growth, are probed in fundamental manner, no considerable or certain advance in our knowledge of the *practical* physiology of tree growth is likely to be made.

Whole batteries of instruments, rain gauges, thermometers, anemometers, &c., may yield up their records daily for years

and years without necessarily throwing light on the factor which limits the proper growth of the trees in a given situation. All they can do is to suggest an explanation, and in the long run experiment will have to provide the certain answer. Everyone knows the complexity of the conditions which beset the life of a plant, and hence it would appear necessary to endeavour to unravel this complexity by paying attention to all the numerous factors which combine to produce it. In point of fact, however, this is not the true method of science. That method is as simple in principle as it is difficult of practice. We must guess—like a detective guesses—as to the prime agent of this environmental crime against tree growth, and then call in the aid of experiment to confirm or disprove our surmise.

The problem which the foresters at Cirencester have set themselves to solve is a fine problem, and we wish them well in their efforts to resolve it.

On another page we publish **Sweet Peas**, the official lists of the National Sweet Pea Society.

For a number of years the Society has carried out extensive trials, which are inspected by a committee of experts having power to make awards. In drawing up the classification, which is the work of the same committee, all varieties in commerce are considered, and, after discussion and divisions, the list is published. It may be taken for granted that no variety is placed at the top of the list, or even attains to second or third place, which does not possess real merit. A remarkable feature of this list is that it shows how the old type of Sweet Pea has been discarded. In the approved list of eighty-one varieties only four old-type varieties appear, all others being Spencer or waved flowers. Several new colour classes have been added, and some of the old classes sub-divided. Many notable new varieties appear for the first time in the lists. At the top of the bicolors is Mrs. Cuthbertson, a flower of remarkable purity of colour. Mrs. Routzahn, an American introduction, takes first place in one of the cream-pink sections, and Doris Usher, raised by Mr. Usher, is first in the other. Dobbie's Sunproof Crimson now comes to the top of the crimsons. In the section known as "Fancies," three of Mr. Bolton's introductions hold the field, with Afterglow at the top. Mauve Queen, a new variety this season, has received the Award of Merit of the National Sweet Pea Society. May Campbell, a very distinct, marbled variety, also distinguished this year with an Award of Merit, stands at the top of its section, supplanting the old-type marbled variety, Helen Pierce, which hitherto has been the sole representative of the marbled class. New colour classes are maroon-purple and maroon-red, in which respectively Arthur Greep and Red Chief are pre-eminent. In the important section of mauve, Queen of Norway supplants Tennant Spencer and others. Edrom Beauty and Helen Grosvenor are first and second in orange-

pinks, where Helen Lewis held for years undisputed sway. Thomas Stevenson, a magnificent flower, is in its right place as first amongst orange-scarlet varieties. In the pink or Countess Spencer section, Elfrida Pearson is first and is followed by Hercules. Rosabelle, quite a new-comer, supersedes Marie Corelli and Marjory Willis. No class of Sweet Peas is more beautiful and none more difficult to cultivate than the salmon shades. Earl Spencer is the best-known variety, but it now takes fourth place, those placed above it being Stirling Stent (a Silver Medal variety of last year), Barbara (First-class Certificate this year), and Melba. Red Star, which gained an Award of Merit this year, is the best scarlet flower. In stripes and flakes, Loyalty (blue flake), W. R. Beaver (chocolate flake), and the charming Mrs. W. J. Unwin (salmon flake) are considered best.

Many well-known and well-tried varieties remain in their old positions, notably Etta Dyke at the top of the whites and Clara Curtis at the top of the creams. The list will be helpful to growers all over the world. The inexperienced have only to decide what colours they would like to grow, and choose from the list before them the best varieties in the sections which they fancy.

The University of London is issuing through the Chancellor, Lord Rosebery, and the members of the Galton Laboratory Committee, an appeal for £15,000, in order to provide a building which shall serve as a laboratory for the study of eugenics. It will be remembered that Sir Francis Galton left a considerable sum of money—some £45,000—for the endowment of a professorship in eugenics and for the maintenance of a laboratory. According to the wishes of Sir Francis, the professorship has been offered to Mr. Karl Pearson, who finds, however, that the present laboratory accommodation at University College is inadequate. A site is available at Gower Street, and it is estimated that £15,000 will suffice to provide for the erection of laboratory buildings. It cannot be doubted that this sum will be immediately forthcoming, for no science is more worthy of support than that which seeks to discover the means whereby "the nation shall be, in every sense of the term, well bred, free as far as possible from inherited defects, and retaining the largest possible proportion of ancestral merits."

The appeal will come with particular force to horticulturists, who know better than anyone else that these aspirations are capable of realisation with respect to cultivated plants, and will, therefore, not forgo the hope that what they are accomplishing with respect to the simpler organisms with which they are concerned, may prove possible of accomplishment in the case of human beings and societies. Though genetics and eugenics are, in great measure, identical terms, it is well that both terms should be employed, for though both seek to discover what may be called the laws of breeding, eugenics must occupy itself not only with the problems of producing the best individuals, but also with the

multifarious questions which concern not only the individual, but also the complex society composed of multitudes of individuals. As a consequence of this need for investigation of the social as well as the individual aspect of human affairs, and also because of the obvious difficulties of applying the direct experimental methods adopted by students of genetics with respect to plants and animals, the methods of eugenics must differ widely from those of genetics. Thus, though both strive toward the same goal, the routes which must be followed are different. That pursued by eugenics must be far more tortuous, progress must be vastly more tedious, and for a long time we can hope for little more than the assembling and dissemination of authoritative data with respect to the causes that are at work contributing to or detracting from the health and vigour of the nation.

It is a great step forward to recognise, as humanity has now recognised, that its destinies are not altogether beyond its own control, and this indeed is the object of eugenics, to control as far as may be the destinies of mankind. It is to be hoped that the appeal of the University will meet with a prompt response, though it is surely a somewhat pitiable reflection that what should be our greatest university is compelled by poverty to go begging for such a sum as this and for such a purpose.

ROYAL HORTICULTURAL SOCIETY.—The next meeting of the Committees of the Royal Horticultural Society will take place on Tuesday, the 24th inst. At three o'clock a lecture on "Origin and Structure of Flowering Plants in Dry Situations" will be delivered by Rev. Prof. G. HENSLOW.

INTERNATIONAL HORTICULTURAL EXHIBITION, 1912.—A meeting was held at the Hotel Windsor, Victoria Street, on the 10th inst., for the purpose of electing a committee for the County of Surrey to help in promoting the interests of the exhibition. Those present included Sir TREVOR LAWRENCE, Bart., President of the Royal Horticultural Society, Sir ALBERT ROLLIT, a member of the Board of Directors charged with the management of the exhibition, Messrs. F. A. WELLESLEY, E. G. MOCATTA, W. A. BILNEY, A. HARTMAN, T. WANT, LEOPOLD SALOMON, J. CHEAL, J. GOATLEY, J. COLLINS, M. MILLS, R. B. LEACH, G. CARPENTER, J. SUMMERS, W. P. BOUND, A. SMITH, THOMAS STEVENSON, Hon. Secretary, and others. Sir TREVOR LAWRENCE, who presided, and was subsequently elected President of the committee, made a very interesting speech on the work which was being done in all quarters on behalf of the exhibition. He moved a resolution pledging the committee to do its utmost to forward this work.

FLOWERS AND FRUITS IN SEASON.—Fruits of *Kœlreuteria paniculata* and *Periploca græca* have been forwarded by Mr. A. HILLMAN, The Nurseries, Hailsham, who states that he has grown *Periploca græca* for upwards of 30 years, and this is the first time he has known the plant to fruit. An illustration of the fruits of *Kœlreuteria* was given in *Gardeners' Chronicle*, November 5, 1887, p. 561, fig. iii. It will be remembered that the summer of 1887 was a very hot, dry one, and, like this season, many plants fruited which seldom ripen fruits in this country. The fruit of *Kœlreuteria* is a membranous capsule, opening by three valves to liberate the seed. A box of *Pentstemons* has been

forwarded by Messrs. JOHN FORBES, LTD., Hawick, representing varieties of their excellent strain of this useful border flower. Messrs. STUART LOW & Co. send us flowers of Carnation "Lady Abington," which they describe as one of the most perfect all-round varieties in cultivation. It is salmon-rose in colour, deeper in shade than the variety Mrs. Leopold de Rothschild. It possesses a real clove scent, and the flowers are produced freely in winter.

THE RECENT FRUIT SHOW.—We are informed that in the section for market-garden produce a Gold Medal was awarded to Mr. R. A. WHITING, Faversham, for a collection of 20 baskets of cooking and dessert Apples. Mr. A. E. MASON, Hampton, was awarded the 1st prize in the class for 12 baskets of Apples, and G. HANBURY, Esq., Blythewood, Maidenhead (gr. Mr. Branson), a 3rd prize in the class for two bunches of Black Alicante Grapes. In the single-dish competitions, R. SAUBER, Esq., Aylesford (gr. Mr. Edward King), was awarded 1st prizes in Class 67 for Apple Ross Nonpareil, and Class 133 for Pear Pitmaston Duchess, and 2nd prize in Class 61 for Apple James Grieve.

CUCUMBERS FROM SOUTH AFRICA.—An attempt to send Cucumbers from South Africa to this country last winter resulted in failure. Forty-five cases were sent from Durban per R.M.S. "Briton," the Cucumbers being packed six to eight in a case, in single layers of wood-wool, and carried in the steward's cool chamber. When the cases arrived in Covent Garden there was not a single sound Cucumber amongst them, which bears out the experience of market men that it is very much more difficult to retard vegetables in cool chambers than fruit.

A NEW HYBRID CALCEOLARIA.—Mr. F. BLOT, writing in *Le Jardin* (September 20, 1911), describes a new hybrid Calceolaria, which is named *Gloriosa*. It resembles, in some respects, the English type of hybrid Calceolarias, which is generally characterised by an almost round, small, and finely-striped or punctate flower, as opposed to the flat, large, and boldly-striped flower of the French type. *Gloriosa* has the globular form of flower characteristic of the English type, but the flowers are much larger. It is, moreover, almost unicoloured. The new type occurs in a wide range of colours, white, cream, yellow-cream, yellow, sulphur-yellow, canary, orange, rose, and carmine. It secured, in May of last year, for Messrs. VILMORIN, ANDRIEUX & Co., a Certificate of Merit from the Société Nationale d'Horticulture de France. Though it was then fixed, it was not put into commerce till it had undergone further tests, but it will be obtainable in commerce in the spring of next year.

"NEW ZEALAND PLANTS AND THEIR STORY" is the title of a charming educational book by Dr. L. COCKAYNE. It consists of a series of chapters in popular language, and is admirably illustrated by photographs of the author's own production. In designating it as educational, we do not mean in the narrow sense of juvenile education. Even grown-up botanists will find much of interest, and much, maybe, that is new to them. It is full of the right sort of botany to teach children and persons who are not aiming at becoming professional botanists, as it is explanatory of objects and phenomena commonly within range of observation in the country for which the book is intended. It is published under the auspices of the New Zealand Department of Education. We do not know of any one book treating of the British flora in an equally entertaining and instructive manner.

HORTICULTURISTS AT A CIVIC BANQUET.

The annual Oyster Feast of the ancient borough of Colchester, which took place on the 12th inst., was invested with unusual interest from a gardening point of view, for the 300 guests included many who are well known in the world of horticulture, and especially rosarians. These were invited by Mr. FRANK CANT, head of the firm of FRANK CANT & Co., who, as Mayor of the town, presided over the proceedings. The president (Rev. J. H. PEMBERTON), secretary (Mr. EDWARD MAWLEY), and several other officials of the National Rose Society were present, and the guests also included Sir ALBERT KAYE ROLLIT, president of the National Chrysanthemum Society; Sir JEREMIAH COLMAN, Bart.; Councillor WALLACE, of Messrs. R. WALLACE & Co., Messrs. ARTHUR CANT, WALTER CANT, F. SYDNEY CANT, CLIFFORD CANT, R. F. FELTON, J. GREEN, GEORGE GORDON, H. B. MAY, Rev. F. PAGE ROBERTS, S. MORTIMER, W. D. PRIOR and J. HUDSON. The feast, which marks the approaching termination of the Mayor's year of office, was held in the Town Hall. The city's connection with the oyster industry dates from the time of RICHARD I., who conferred a charter on the burgesses, granting them the right to the fishery in the Colne from North Bridge in the borough to West Ness, at the entrance to the Colne Estuary. Many thousands of pounds have been received by the Town Council from the profits of the fishery. The tables at the feast were decorated with Roses and trophies won at horticultural shows by Messrs. F. CANT & Co., D. PRIOR & SON, R. WALLACE & Co. and Mr. O. G. ORPEN. Responding to the toast of "Horticulture and Science," proposed by Mr. L. WORTHING EVANS, Sir JEREMIAH COLMAN said there had never been a time when the advancement of horticulture had made more phenomenal strides than at the present. The LORD MAYOR of London proposed the health of Alderman CANT amid a scene of great enthusiasm. The following extract is taken from the local paper:—"Mr. CANT has had a most successful year of office. Alderman CANT is a native of Colchester, and, moreover, was born on Corporation property, the Severalls estate. He is a member of a family which has been honourably known in the borough for very many generations, and his great success as a Rose grower—an industry which has done so much to make the fair name of Colchester known throughout the world—is well known. His Worship is a man of keen business ability and a thorough sportsman; and his great geniality on all occasions has won for him a very wide popularity. For many years he has taken an active part in the public life of the borough, and until a few months ago was a member of the Town Council for the North Ward. In November last he was again returned for the North Ward, but on the decease, a short time afterwards, of Alderman E. J. SANDERS, a gentleman who had served the town as Mayor on three occasions, the members of the Council unanimously elected his Worship to the vacancy on the Aldermanic Bench."

LETTER FROM CHINA.—Messrs. BEES LTD. have handed to us the following interesting letter from their collector, Mr. F. KINGDOM WARD, Batang, Saw-chuan, W. China, dated August 5, 1911:—"A curious circumstance brought me up here. On returning to A-tun-tsi from camp on Pei-ma-shan I found a pessimistic message from the French priest at Tsw-kow, the translation of which was:—'The English are in Lhasa; the Chinese army has capitulated. A British officer went in from Ya-ka-o on secret service. The Chinese are exasperated and swear to exterminate the English. I fear you will be

killed before the end. You must leave A-tun-tsi at once.' The cause was incredible, but the result might not be. To return south might be to ruin my work for nothing: to sit still and passively await whatever might happen is against all my principles; I therefore did the obvious thing and came up here for news. There does not seem to be a vestige of truth in the extraordinary story, which is probably a garbled account of the Chine-Tibetan fighting at Bomed, and the 'British invasion (peaceful) of Mekong.' We wired to Cheng-tu, but no answer has come through, Chinese electricity being incredibly slow. I got two more Primulas, a Lily, a Potentilla and a few other good things. Am starting for Garthek to-morrow, and intend to spend a few days on those mountains before returning to A-tun-tsi. I have to return to Dokerla and the Salwen yet to get half-a-dozen good things, but it will be a difficult task. However, I intend to go, even if I have to disguise myself as a Tibetan. My best plants are now so widely scattered that I require a flying machine to finish up the work satisfactorily. I found a good blue Gentian on Pei-ma-shan, rather like *G. acaulis* in size, colour and habit. I got the common *Meconopsis*, of course, and added three or possibly only two more species, all blue (1) an Oxford blue sp. with white anthers and having entire leaves, the flowers on rather long pedicels (*M. aculeata*, the Kashmir Poppy?); (2) an Oxford blue sp. with prickly pinnatifid leaves and the flowers on short pedicels—these two species are distinct enough in their extreme forms, but show transitions, average altitude 14,000-15,000 feet; (3) a Cambridge blue sp. with golden anthers, not occurring below 16,000 feet, and almost the highest *Phanerogam* in these regions. I think this must be a little discovery of my own. All the blue ones are much finer in colour than the jaundiced-looking one (*a species previously collected, Bees*), though the latter has the habit. You might be able to get some valuable hybrids from these. I hope so, anyhow, for I have got very little to show for the country I have covered during the season—a dozen or fifteen Primulas and a few other things, exclusive of Rubi and Rhododendrons, of course. The Yangtze Mekong is not as rich as the Salwen-Mekong, but it did not seem advisable to change my centre then. I shall be satisfied if I contrive to get the six first-class things I saw on the latter, which certainly do not occur on the former. I have had a trying task to make my men understand the work, and have been a little unfortunate in some respects. One of them is always getting a stomach-ache or something, and my Tibetan takes a jaunt home, gets across the Mekong, and waits for a flood to come along so that he cannot get back. Of course, they will know the work by the end of the season and be useful next year, but, as it is, I have to superintend them all the time. I am sending by post specimens of a scarlet Primula, but hardly expect they will survive. However, I shall probably be able to collect seed of this species."

PLUM RUST.—An account of some recent investigations on this disease by Mr. F. T. BROOKS, of Cambridge, appears in the current number of the *New Phytologist*. He has shown that the fungus causing this disease is heteroecious in this country, i.e., lives on two different hosts at different stages in its life-history, the alternate host being *Anemone coronaria*. When spores from *Aecidium punctatum* occurring on *Anemone coronaria* last spring were applied to the leaves of a young Victoria Plum tree the rust appeared in almost every case, thus showing that the *Aecidium* on *Anemone* is really a stage in the life-history of Plum Rust (*Puccinia pruni*). During the last few years there have been severe epidemics of

Plum rust in fruit-growing districts, the attack in places being so severe as to cause premature defoliation of the trees. Hitherto there has been doubt as to the manner in which the fungus survives the winter in this country. Two kinds of spores are produced on Plum leaves, uredospores and teleutospores. The former are the first to be produced and serve to propagate the rust rapidly during the summer. Bearing in mind other rust fungi these uredospores may possibly survive the winter and give rise to the rust again the following summer. It is, however, as yet uncertain whether this is a frequent means of propagation from season to season. Indeed, if re-infection the following year were due only to uredospores one would rather expect Plum rust to develop soon after the foliage had appeared, whereas this rust is frequently not in evidence until the summer season is well advanced. Experimental proof is lacking that the teleutospores or resting spores can re-infect Plum leaves and such a result is unlikely, for the primary function of these spores is to infect plants of *Anemone coronaria*. Brooks' experiments show that there is another means by which the fungus can survive the winter and thereby cause a recurrence of the rust. *Anemone coronaria* is a plant frequently found in gardens, and the mycelium of *Aecidium punctatum* is perennial in its tissues. Thus a plant once affected with this fungus gives rise to crops of aecidiospores year after year so that a few plants affected by the *Aecidium* are sufficient to account for the recurrence of the disease. After the first crop of uredospores of the season has been produced on Plum leaves the fungus may spread rapidly because successive crops of these spores may be formed about every fortnight under favourable conditions. Plants of the *Anemone* affected by the fungus have more fleshy leaves than have healthy plants, and diseased plants very rarely flower. It is obvious that the eradication of plants of *Anemone coronaria* affected by the *Aecidium* will be of assistance in the control of this very common rust.

AMERICAN "GOOSEBERRIES."—The introduction to *Seeds and Plants Imported*, Bulletin No. 205, Bureau of Plant Industry, U.S.A., contains a reference to the attempts which are being made to remedy the deficiency of Gooseberries in America by raising hybrids which shall be—unlike the Gooseberry proper—capable of resisting mildew. With the object of finding a substitute for the large-fruited English Gooseberry, Dr. W. VAN FLEET has raised hybrids between *Ribes missouriense*, *R. cynosbati* and *R. rotundifolium*, and the tests which have been applied indicate that among the hybrids are some which possess in a high degree the power of resisting Gooseberry-mildew.

THE FRUITING OF THE POMEGRANATE.—We may supplement the remarks which have already appeared in these pages respecting the fruiting of the Pomegranate this season by the following information sent us by Mr. GILBERT, late head gardener at Charlton House, Kent. Our correspondent states that a plant growing in bush form against a south wall in his garden has been cultivated in this position for 50 years, but it has never fruited until this year. During August and September the plant was literally covered with flowers and one fruit ripened.

HIGH PRICE FOR CABBAGES.—We are informed that Mr. ROBT. NEWMAN, at a sale by auction of growing crops, held recently at Harlington, Middlesex, sold a crop of Christmas Cabbage at the record price of £41 per acre.

PUBLICATIONS RECEIVED.—*Vine-Growing in England*, by H. M. Tod. (London: Chatto & Windus.) Price 1s.—*The Journal of the Board of Agriculture*. October. (London: Board of Agriculture.) Price 4d.

CYPRIPEDIUM LUCIFER.

OUR illustration (fig. 131) represents this handsome *Cypripedium*, for which Lieut.-Col. Sir George L. Holford, K.C.V.O., Westonbirt (gr. Mr. H. G. Alexander), was awarded a First-class Certificate at the Royal Horticultural Society's meeting held on the 10th inst. It gives a fresh proof of the benefit to be derived by using the finest varieties obtainable for crossing. In the composition of *C. Lucifer* (*Niobe* "Westonbirt" variety \times *Euryades*) the best forms of *C. Fairrieanum* and *C. Spicerianum magnificum* were used, producing *C. Niobe* "Westonbirt" variety; and of *C. Boxallii* and *C. Leeana* as parents of *C. Hera Euryades*. In its general aspect *C. Lucifer* shows the influence of *C. Niobe* most. In shape and substance it is one of the best of its class. The dorsal sepal is white, heavily tinged and veined with rose-purple; the petals and lip are darkly coloured with purplish brown, the primrose-yellow ground colour showing through on the margins and lighter-coloured parts.

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

ORIGIN OF THE CULTIVATED FIG AND THE CAPRIFIG.—Sir William Thiselton-Dyer has kindly called the writer's attention to a contradictory statement in the summary of Dr. Tschirch's investigations of this subject at p. 267. It is in relation to the seedling offspring of the female cultivated Fig, which is there described as "never Caprifig, never the genuine wild Fig." The last clause is incorrect, and arose from a misinterpretation of the original German. What Dr. Tschirch says is: "Theophrastus was only wrong in asserting that both the wild Fig and the Caprifig were so raised." Briefly stated, Dr. Tschirch's conception of the relations of the cultivated Fig, Caprifig, and the wild Fig is that one and two are the issue of the third; the first being purely female and the second male; and they can only be propagated true by cuttings or grafting. The fertilised seeds of the cultivated Fig may give rise to new varieties or reversions to the wild Fig, but never to the Caprifig. Dr. Tschirch is further of the opinion that both cultivated Fig and Caprifig were introduced into Italy from the East. As bearing on this subject, reference may be made to the description and figures of the wild Fig in the late Dr. Aitchison's paper on the "Botany of the Afghan Delimitation Commission," in the *Transactions of the Linnean Society*, second series, *Botany*, vol. iii., p. 109, t. 46. W. B. H.

THE RECENT FRUIT SHOW.—A visitor to the show, and a capable critic asked me whether the markings seen on many of the larger and higher-coloured Apples, produced by the netting that is used to suspend them whilst on the trees, ought not to be made a reason for disqualification. The disfigurement is seen only on some of the highly-coloured fruits, hence it is clear that the finest of Apples can be grown without the aid of netting. If it be a fault to wipe off the bloom, any artificial markings should be a fault also. It was interesting to note, and it shows how possible it may be for judges to overlook stipulations in the schedule, that now Blenheim Pippin has been removed entirely from the list of cooking Apples, and is found only in the dessert list, yet in the class for "Any other cooking variety," Blenheim Pippin was regarded as eligible for competition, and it received a prize. That again was criticised. It was also asked whether, in judging the Blenheim Pippin dessert class, in which were small and large fruits, the judges acted on the condition that dessert fruits should be capable of being passed through a 3-inch ring. No such condition was enforced; but the prizes were given for those fruits which, in size and finish, accorded the most closely with what are held to be dessert requirements. Although there were many new competitors this year, yet it seems as if the prizes in the open classes fell into too few hands. In the long array of single-dish classes, just three or four names constantly cropped up. That may be unavoid-

able, but it would be better if the open classes were fewer, and more of both treble, double, and single dishes of both Apples and Pears, allotted to the respective county groups, as in such cases new men must come to the front. It is a question also whether the huge collections set up by traders are quite as useful as they are thought to be. If each firm were invited to set up respectively 60 varieties in one class, 40 varieties in another, and 20 in a third, specifying half cooking and half dessert varieties, we should then see in each case only the very best samples and varieties, and the general public would get from those collections valuable lessons. At present, intending purchasers are overwhelmed with the numerous varieties staged, many of them, perhaps, rarely planted by anyone. The superb yet very restricted collections set up by the market growers were far more valuable, especially as competitors largely repeated the best varieties. It would add much to the interest of the show if there were a few classes for fruits obtained from trees cultivated in

SEEDLING APPLES.—The raising of seedling fruits has probably been carried out from prehistoric times, but in the early days of last century the work of Knight in England, and Van Mons and others on the Continent, gave an immense impetus to the production of new varieties. In England, the great popularity of the Apple, and the growing markets which modern industrialism has opened up, have led to a definite attempt to raise new varieties which should possess a higher standard of fruitfulness and quality. Notwithstanding the large amount of evidence which had been thus furnished, the question, "Do Apples come true from seed, or do they 'revert' to the Crab?" remains as unanswered in the twentieth century as it was in the eighteenth. The general opinion of the present day would probably incline to the reversion theory, and the reason for this is not difficult to conceive. If a number of Apple seedlings are examined in a young state, some small proportion will show the bold foliage and wood which are nearly always correlated with fruit of good size. The

FIG. 131.—CYPRIPEDIUM LUCIFER.

(From a cross between *C. Niobe* "Westonbirt variety" and *C. Hera Euryades*.)

grass orchards, and similar classes for garden-grown fruits, which are so often the products of very high feeding. A.

THE LATE WILLIAM EARLEY.—I first became acquainted with Mr. Earley in connection with the International Horticultural Exhibition of 1866. At that exhibition he contributed a "Paper" to the Congress, and exhibited a patent tree guard. In 1866, and for some years afterwards, he was gardener to Felix Pryor, Esq., Digswell House, Welwyn. He was a most successful exhibitor of vegetables at the Royal Horticultural Society's shows at South Kensington. In writing the gardening matter for *Lloyd's Weekly News*, Mr. Earley succeeded the late George Glenny, of Fulham, who wrote so well on the "Properties of Florists' Flowers." In his reply to a correspondent as to a question asked regarding "Roses," Mr. Earley in the very last notes he wrote, after giving his correspondent some cultural advice, ended with this remark "Repeat question to us in the spring." Alas! the hand that wrote those words has written its last. J. B.

larger number, however, will show the growth associated with the "Crab," namely, a profusion of spines, wood of thin and tough character, and branches leaving the stem at more or less right angles, giving the plant a straggling appearance. The characters of leafage are well seen in every bed of so-called "free" stocks, that is, stocks raised from all kinds of Apple seeds, and not from genuine Crabs, and the small proportion of boldly-leaved plants has, no doubt, aided the formation of the opinion so generally held. There is, however, some evidence that this Crab-like form may be regarded as a juvenile stage of growth rather than a permanent character of the tree. The writer has under observation a seedling which shows this character in an extreme form, and might, when leafless, have been taken at a distance for a plant of *Crataegus oxyacantha* in its early years. It bears, however, this year fruits of a medium size, and will, no doubt, as is generally the case, lose its spiny growth with age, and more rapidly when propagated by buds or grafts. Many new varieties have borne an unpromising appearance when young, and not only is the growth of the tree

subject to a gradual change, but the fruits increase in size with age. The Pears "Passe Crasane" and also Marie Benoist were at first very small fruits, but increased with years, until they reached their present respectable proportions. (See Carrière's *Semis et Mise en Fruit des arbres Fruitières*.) It is likely, therefore, that this peculiar habit is rightly to be considered a juvenile stage, and no evidence as to reversion to Crabs can safely be deduced from seedlings until they have fruited. The evidence that Apples may come true to seed is, so far, very slight, but it is worth consideration. The great popularity of the "Golden Pippin" in the early part of the 19th century led to many seedlings being raised from this variety, such as the "New," "Cluster," "Elford," "Franklins," "Hughes," "Camberwell," and others. There is a resemblance between all these varieties, and, in some cases, a striking approximation to identity with the parent is reached. A more recent instance is the production of "Charles Ross" ("Cox's Orange Pippin" × "Peasgood's Nonesuch"): this variety so closely approaches in its fruit the latter parent that the difference is often almost imperceptible. Certain small differences of habit, shape, and season do, however, exist. Better evidence, however, is provided by one of my own seedlings which has fruited this year. Seeds were taken from an Apple, "Lord Derby," on which the flowers were not protected, and were, therefore, liable to chance cross fertilisation. Three plants were raised, and No. 1 has produced this year small, round fruits, with red stripes, on a pale-yellow ground. No. 3 bears no fruit. No. 2 bears fruits which are practically identical with Lord Derby, and the wood and leaves are also so much like this variety as to be indistinguishable. The details of the flower remain to be determined. These cases are evidence at least that a very near approach to identity to parents may—and does—occur in the reproduction of cultivated Apples, and that the evidence of so-called "reversion" to "Crabs" needs to be carefully tested. Another seedling is of some interest, as it may throw some light on the origin of the Apple "Cox's Orange Pippin." This well-known fruit was raised by a Mr. Cox, a builder, at Langley, about 1830. It was generally said that two pips from one fruit produced "Cox's Orange Pippin" and "Cox's Pomona." In 1900, however, Mr. Chas. Dennis stated (*Gardeners' Chronicle*, 1900, p. 334) that he had heard from Mr. Chas. Turner, who put the first-named into commerce, that one of the two plants died, and only the Cox's Orange survived. The seedling which now fruits for the first time in our nursery was raised, like the "Lord Derby," from a seed taken from a fruit of "Cox's Orange," the flower of which was unprotected from chance cross-fertilisation. The fruit and growth reproduce almost exactly that of "Cox's Pomona." *Edward A. Bunyard.*

BELLADONNA LILY.—The hot weather of the past summer has suited this plant. We have had several hundred spikes of bloom, which have been very valuable during the dry season. Spikes that were not cut have produced a quantity of seed, and I shall be pleased to distribute this to your readers on payment of the postage. We have three varieties. *C. Capp, Leiston Old Abbey Gardens, Saxmundham.*

PRIMULA CAPITATA.—One may go into scores of gardens and yet never see this Primula, which is one of the loveliest of Himalayan Primoses. Everyone who sees it is attracted by its extraordinary beauty. I suppose its scarcity is owing to its tendency to biennial habit, or, at least, to flowering itself to death. It differs from other Primroses in its season of bloom. Beginning in August, it continues sending up its clustered head of richest violet-purple until the first severe frost. The flower-stems and leaf-backs are densely covered with white meal, and it has a delicious odour of Jargonelle. It is now (October 14) in the height of beauty, and although usually reckoned a moisture-loving species, it has withstood the prolonged drought of this season in a south-west border, the soil being loam, with an addition of peat and sand. In general figure and habit it follows the spring-flowering *P. denticulata*, but it is less robust and more delicate in all its parts. It is very easily raised from seed in a cold frame. *Herbert Maxwell, Monreith.*

LARGE PEACHES.—I should be glad if any readers would send me records of the largest Peaches and other fruits, especially Figs, grown in the open during this unusual summer. The name of the variety should, if known, be stated. *E. G. Aldridge, F.G.S., 2, Hills View, Barnstable.*

RIPENING OF WOOD IN FRUIT TREES.—Your correspondent, *Southern Grower*, on page 251, in summing up the advantages of the recent summer, places as last, but not least, "the thorough ripening of the young wood and fruit buds of all kinds as a good augury for next year." *Southern Grower* is always interesting and instructive, and I am his debtor for much useful information, so that I hesitate to question such a generally-accepted theory; but I have come to the conclusion that ripened wood—necessary as I admit it to be—is not so much a factor in the production of a good fruit or flower crop as a sufficient rainfall. The summer of 1910 was anything but favourable to the production of ripened wood; yet 1911 has produced such a bumper crop in this district as "gives one to think." Never were flowering shrubs more floriferous, yet, on the assumption that the season of 1910 was unsuited to the proper ripening of the wood, such ought not to be the case. I have been told (but have no data by me to verify) that, although we had a succession of damp summers, the rainfall was under the average. May it not be that nature, restoring the balance in 1910, had more to do with the heavy yield of fruit and flower in 1911 than is due to the ripened wood? *C. J. Bailey, Cranbrook, Kent.*

DOLICHODIERA TUBIFLORA.—I can endorse all that Mr. Lynch says in praise of this plant on p. 254, and would add that it is very easily grown, and can be had in flower at Christmas or any other period of the year. I am very much surprised that it is so seldom seen. May I appeal to the authorities and experts in the naming of plants to retain the generic name of *Achimenes* as our late friend Nicholson has it in the Supplement to the *Dictionary of Gardening*, edition 1900, p. 8, instead of using *Dolichodiera*? Words such as this are not easily remembered for spelling correctly by beginners, and too often lead to rechristening with so-called English names, which are in many instances a source of confusion. *W. H. Divers, Belvoir Castle Gardens, Grant-ham.*

HYDROCYANIC ACID GAS AS A FUMIGANT.—May I be allowed to point out to your readers the great value of hydrocyanic acid gas as a fumigant? I have under my charge two plant stoves which for many years past have been infested with mealy bug. Many methods for destroying the bug have been tried, including paraffin emulsion, with varying success, but all have failed, for, after the most thorough cleansing, bug was always to be found. I first fumigated a house containing *Codiaeums* (Crotons), *Caladiums*, *Panax*, *Begonias*, *Dracenas*, *Gesneras*, and other stove plants, with *Stephanotis* covering a portion of the roof and *Adiantum* planted in rockwork beneath the stage. This was in August, when it was impossible to reduce the temperature of the house below 68°. I used a patent machine now on the market, which eliminates all possible danger to the operator. I employed 1½ ounce of sodium cyanide, 2½ ounces of sulphuric acid, and 5 ounces of water to every 1,000 cubic feet of interior space. The water was first poured into a bowl and the acid mixed with it. The fluid immediately became very hot, and it was allowed to cool; then the cyanide was emptied into it, by means of a string passed through the keyhole of the door. The gas generated in 40 or 50 minutes, when the ventilators were opened from the outside, and care taken to exclude all persons from the house for at least a quarter of an hour. After this treatment the mealy bug was killed, and although some young ones appeared in the course of a few days, this operation repeated in two successive weeks completely eradicated the pest. On examination I found that none of the plants had suffered the slightest injury, not even the young fronds of *Adiantum*, which are easily injured by fumes of nicotine preparations. The other house contained Palms, Ferns, and *Cypripediums* with *Stephanotis* trained on the roof, and it was treated in the same way, with the same gratifying result. *E. R. Janes, Abbey Gardens, Banbury.*

GALE ON THE EAST COAST.—The recent gale experienced in this district was very harmful to vegetation. The wind, which blew from the north, raged throughout Saturday and Sunday, September 30 and October 1, at times attaining to a hurricane. It not only destroyed many plants by its violence, but had a serious effect on practically all vegetation with which it came in contact. Many trees were blown down, others lost large limbs, and still others were partially uprooted in ground made soft by the heavy rain. The swaying motion of some trees was so great that the main stem, especially in the case of bush orchard trees, worked themselves loose in the soft soil. Deciduous trees were, in many cases, partially defoliated. Evergreens did not escape injury, Portugal Laurels, Privets, and Escallonias being badly damaged where the wind reached them. The severity of the gale may be gauged somewhat by the fact that such hardy plants as Holly, Ivy, and Sea-Buckthorn (*Hippophae rhamnoides*) were injured; the Sea-Buckthorn is used extensively here as a wind break. The greater part of the Apple and Pear crops was still ungathered, and the loss in this direction is very great. Pergolas clothed with Roses, Laburnums, Clematis, and similar subjects present a very singular appearance, as the foliage on the side exposed to the wind is shrivelled, while that on the lee side is still green. The summer bedding was quite spoiled. Many half hardy plants still out-of-doors, such as Lippia, Hydrangea, and Fuchsia, were also badly injured. The herbaceous borders are now devoid of flowers. The kitchen quarters fared as badly as the other sections of the garden. French and Runner Beans in bearing were, for the most part, killed, whilst Brussels Sprouts were almost torn out of the ground. *H. W. Abbiss, The Pleasance Gardens, Overstrand, Cromer.*

DR. HOGG'S "FRUIT MANUAL" (see p. 272).—It is not a new edition of this excellent book that is needed, as it is already far more bulky than is desirable, but a supplement to include the newer fruits, up-to-date, omitting the many worthless varieties and those no longer in cultivation, so many of which are found in Hogg's *Manual*. Whether anyone has kept a close record, descriptive and historical, of all the fruits that have been certificated or put into commerce since Dr. Hogg's death, is doubtful; but probably the Council of the Royal Horticultural Society, assisted by a small consultative committee, could furnish a work of the kind at a comparatively moderate cost. It is waste of space to particularise worthless varieties. I believe the matter has been before the R.H.S. Council for some time, but so far the proposals have not been entertained. *A. D.*

SCOTLAND.

THE HEATING OF THE WAVERLEY MARKET, EDINBURGH.

EXHIBITORS at the Chrysanthemum Show of the Scottish Horticultural Association in the Waverley Market, Edinburgh, will be glad to learn that the work of heating the market is at length definitely arranged. It will be carried out at a cost of £2,754 by Messrs. Mackenzie & Moncur, Edinburgh. Oil fuel and not coal will be employed, as the oil is expected to be more convenient and prevent smoke. The work is not to be undertaken until December.

VALUATION OF PUBLIC PARKS.

At the annual valuation court for the city of Dundee recently an attempt was made by the Assessor and the Parish Council of Dundee to overturn the former valuation of £1 each on the nine public parks, fixed in accordance with a decision of the Court of Session in 1909, a decision which has been generally acted on since that time. It was contended that a later judgment respecting museums, picture galleries, &c., should now be applied to public parks, and that their total values should be fixed at a comparatively high amount. The assessor put this at £938 and the Parish Council at £1,053. After considerable discussion, it was moved by Treasurer Soutar that each park be entered at the nominal value of £1. He held they must stand by the decision now obtaining. This was seconded by the Lord Provost and agreed to. *Correspondent.*

COLCHICUMS AT MADRESFIELD COURT.

THE accompanying illustration (fig. 132) shows one of a large number of natural gardening effects at Madresfield Court. The Colchicums are an exceptionally fine type of *C. speciosa maxima*, much deeper in colour than the ordinary type, of great substance, and the foot stalks are 10 inches to 12 inches in height.

The bulbs were planted about 10 years ago in large, irregular patches in the turf, in well-prepared holes about 9 inches square and as much deep. The holes were filled with a compost of friable loam, a little lime rubble, and bone dust. One bulb was planted in each hole, and there are now five or six bulbs in each, whilst their appearance seems to promise that they will increase and improve for years to come. As the bulbs become crowded a clump is taken up here and there, dividing them singly, and so the area is increased. At this time of year when the summer bedding has become stale and uninteresting, these lovely Colchicums, Cyclamen, Sternbergias, and the true autumn Crocuses produce most beautiful effects in the natural garden, springing up here and there in all their glory and freshness year by year.

SOCIETIES.

ROYAL HORTICULTURAL.

CONFERENCE OF AFFILIATED SOCIETIES.

OCTOBER 11.—As stated in these pages last week, the annual conference of the affiliated societies took place on the second day of the Fruit Show at the Royal Horticultural Society's Hall. The Rev. W. Wilks, M.A., presided during part of the proceedings, and Mr. James Douglas afterwards. A paper on "Errors in Flower Show Schedules" was read by Mr. Wilks, which should prove very profitable to those members representing exhibition societies. Friction often arises between exhibitors and committees of flower shows through incomplete definitions of the classes in the schedules. In one schedule a class was described as one for the "Best display of preserved fruits." Exhibitors might reasonably assume that any mode of preserving was admissible, but in this instance it was not so, for the committee really meant "Best display of bottled fruits," and jams and dried fruits other than bottled fruits were disqualified. Another error was cited in a class offered for the "best collection of fruit, six varieties. White and black Grapes allowed." Now it happened that the successful exhibitor staged two dishes of Peaches, distinct varieties, and the attention of the committee was called to this by an unsuccessful exhibitor, who contended that two dishes of Peaches should not be allowed in the class. Yet the schedule said six "varieties" not six "kinds," and although the committee in framing the class thoroughly understood amongst themselves that it should be six different "kinds" of fruit, yet they did not express themselves clearly when offering it to the exhibitor. In the classes for Sweet Peas the instructions are often too meagre, and unpleasantness has resulted from the judges awarding prizes to vases of Sweet Peas relieved with sprays of Asparagus. The addition of Asparagus or similar light foliage lends attraction to the vase, but if the class reads "for the best 18, 24, or 36 sprays of Sweet Peas" and mentions nothing about the use of any foliage, the sprays themselves should be staged and judged on their merits. These are only three defects in schedule-making, and no doubt the separate committees would gladly have rectified them had they given sufficient thought to the wording. Mr. Wilks mentioned others erring just as much in their separate classes, and emphasised the fact that in drawing up a schedule of prizes every committee should examine the wording from the quibbler's point of view.

Mr. James Douglas in taking up the chairman's duties asked Mr. Mark Webster, of the Beckenham Society, to introduce his subject "What should 'Union' mean?" Mr. Webster somewhat depreciated the value affiliated societies gain from the R.H.S., and suggesting that, amongst other things, there should be a circulating library for members of affiliated societies. To this proposal the chairman remarked that access to the R.H.S. library is always open if any member wishes to avail himself of it, and notice of this is printed in the book of arrangements issued by the R.H.S. Another point raised was the alleged absence of mutual fellowship existing between members of different societies when visiting each other, but this experience appeared not to be shared by other speakers who stated that they had been received with every welcome by other societies. Mr. Boshier, of the Croydon Society, remarked that, from his experience, he had found the fault, if any existed, must be laid at the door of the individual society and not the R.H.S. It

In the discussion following this suggestion, it was asked why should not the R.H.S. hold their two principal shows now held in London in different provincial centres, and Mr. Douglas, in reply, said that years ago when this was attempted the show was successful the first year at Ipswich, but the second attempt at Liverpool resulted in a loss to the R.H.S. of something like £1,100.

Time would not allow the reading of a letter from the Brewood Horticultural Society concerning queen wasps.

Scientific Committee.

OCTOBER 10.—*Present*: Mr. J. T. Bennett-Poë, M.A. (in the Chair); Messrs. E. M. Holmes, F.L.S., A. Worsley, W. Hales, W. C. Worsdell, J. O'Brien, and F. J. Chittenden (hon. sec.).

Variation in Elm.—Mr. W. C. WORSDELL drew attention to the variation which had occurred this year, both at Kew and at Cambridge, in the foliage of *Ulmus glabra*, Miller. At the base of many leaf-blades, from one to three extra small leaflets had developed on the petiole. These, when on the side of the leaf in which the blade is usually less well developed, appeared to be

FIG. 132.—GROUP OF COLCHICUMS IN MADRESFIELD COURT GARDENS.

was for societies to make suggestions, and the Council of the R.H.S. would give such suggestions consideration. A member of the Wimbledon Society complained that in the list of lecturers compiled by the R.H.S. for use at gardeners' meetings, some of the lecturers were incompetent on the subject forming their lecture, and he complained of the cost of an illustrated lecture supplied by the R.H.S. Mr. Douglas stated that the lecturers' names are contributed by the mutual societies themselves, who recommend the names as being authorities on the different subjects. The reduction in cost of illustrated lectures would be carefully considered by the Council of the R.H.S.

One other item on the agenda, introduced by Mr. Caute, of the Highgate Society, was a proposal for the formation of county shows, so that gardeners in each district may keep themselves up-to-date as to the newer productions of fruit, flowers, vegetables, &c., by holding a central show in each county. The meeting was in full sympathy with the movement, but it was thought that financial reasons would prevent the idea being carried out.

complementary growths, but in several of the leaves the blade was symmetrical. A second variation, of considerable frequency, was seen in the forking of the midribs of the leaves, sometimes to the base, so as to produce apparently two leaves at a node, sometimes less deeply. In some few cases also some of the leaves formed ascidia.

Rudbeckia triloba malformed.—Mr. WORSDELL also showed an inflorescence of *Rudbeckia triloba*, with foliage leaves developing from the apex, through the centre of the capitulum.

Menthol plant.—Mr. HOLMES showed a specimen of the true *Menthol* plant from his garden. The plant was derived from one growing in Berlin. It is a form of *Mentha arvensis* called *piperascens*, and is a native of Japan.

Fasciation in Chrysanthemum maximum.—Mr. J. R. JACKSON sent an example of a fasciated stem and inflorescence in this plant from Lympstone. This species appears to be very subject to fasciation.

Onion bulb with lateral growths.—Mr. E. E. TURNER sent from Coggeshall, Essex, an Onion bulb having numerous greenish bulbils growing from around the base, so that the original bulb

was surrounded at its base by numerous out-growths. It may possibly have arisen from a second growth being developed after a check imposed by drought.

Cabbage with hairy leaves.—Mr. A. SIMMONDS sent from Mitcham, Surrey, a Cabbage leaf having hairs upon both surfaces, especially upon the veins. The wild form is often hairy, but hairiness appears to be very rare in the cultivated varieties.

Rotting of Narcissus bulbs.—Rev. J. JACOB sent some Narcissus bulbs which had been attacked by the fungus *Fusarium bulbigenum*. This was first described in *Grevillea*, vol. xvi., p. 49, but appears not to have been troublesome since.

Apples diseased.—Mr. ROGERS sent from Hexworthy some Apples with peculiar greenish depression on the surface, showing a well-marked, brown marginal line, which also limited the spots on the inner side, being there about $\frac{1}{8}$ in. below the surface. The trouble had, apparently, developed in the store, and had occurred in a large number of varieties. Mr. CHITTENDEN took them for further examination.

NORTH OF SCOTLAND HORTICULTURAL.

OCTOBER 14.—The inaugural meeting of the recently resuscitated North of Scotland Horticultural and Arboricultural Association was held in the Botanical Class-room, Aberdeen University, on this date. There was a very large attendance, over which Mr. Alexander Robson, of Messrs. W. Smith & Son, Nurserymen, Aberdeen, presided.

The chairman stated that it was now 17 years since meetings of the Association were allowed to lapse. He did not think, however, that those who decided to put the Society in abeyance contemplated that it would be for a period of 17 years. The Association had been resuscitated in a constitutional way by the old committee. No fewer than 165 persons had signified their adhesion to the Association. It was satisfactory that promises of support had been received from several of the professors and lecturers of Aberdeen University, including Dr. Trail, who would give the introductory lecture, his subject being "How to Obtain Improved Races of Cultivated Plants."

Mr. William Reid, interim secretary, submitted the syllabus of lectures for the winter's session. Mr. Mackinnon, Gardener to the Earl of Aberdeen at Haddo House, Aberdeenshire, was appointed president.

NATIONAL SWEET PEA.

The information printed below relates to the awards made to novelties by the Floral Committee of the National Sweet Pea Society in the present year, and recommendations are made by the committee in respect to the arrangements for future trials.

AWARDS.

FIRST-CLASS CERTIFICATE TO—

Trial No. 119 (*Thomas Stevenson, Dobbie's*, sent by Messrs. Dobbie & Co., Edinburgh. The silver medal was awarded, provisionally, to this trial).

Trial No. 111 (*Barbara*, sent by Mr. Robert Holmes, Tuckwood Farm, Norwich; raised by Mr. H. A. Perkin, Reigate).

AWARD OF MERIT TO—

Trial No. 33 (*F. Seymour Davis*, sent by Mr. F. Seymour Davis, Farnham).

Trial No. 43 (*Mauve Queen*, sent by Messrs. Dobbie & Co., Edinburgh).

Trial No. 138 (*Red Star*, sent by Mr. A. Malcolm, Duns, Berwick).

Trial No. 211 (*May Campbell*, sent by Messrs. Dobbie & Co., Edinburgh).

Trial No. 212 (*Mrs. B. Gilbert*, sent by Messrs. Gilbert & Son, Dyke, Bourne).

RECOMMENDATIONS.

The Floral Committee strongly recommends—

(1) That 20 seeds be sent for each individual trial in 1912, 15 plants to be set out in a row 12 feet long.

(2) That raisers be notified if fewer than 15 germinate, and a request made for more seeds.

(3) That failing seeds, seedlings about 3 inches high be accepted to make up the number of plants.

(4) That on the first visit to the Trials in 1912, varieties be selected for voting upon at the subsequent visit; no voting to take place at the first visit.

(5) That a duplicate set of Trials be conducted in 1912, on heavy soil, at least 100 miles north of London; and, in the event of this recommendation being adopted, the Floral Committee pay one visit only to each set, point each stock, and make its awards on the results thus arrived at. Under these conditions a scale of points would be prepared prior to the first visit and all stocks obtaining a certain aggregate of points would be voted upon.

(6) That the raiser's description be furnished in the case of varieties which gain awards, and that such description be included in the proceedings of the Floral Committee.

(The General Committee approves the foregoing recommendations and will endeavour to give effect to them).

CLASSIFICATION OF SWEET PEAS.

The following is an up-to-date selection of varieties. The varieties in each Colour Class are placed in order of merit.

BICOLOR.
Mrs. Cuthbertson
Arthur Unwin
Mrs. Andrew Ireland
Colleen

BLUE.

HORTICULTURAL CLUB.

LECTURE ON RHODODENDRONS.

OCTOBER 10.—This date was a busy one for horticulturists, for it was the opening day of the R.H.S. Fruit Show, whilst the county secretaries of the "International, 1912," assembled at Westminster at 3 p.m., and the members of the Horticultural Club dined together with the county secretaries at 6 p.m.

Following the dinner, Mr. C. P. Raffill, of the Royal Gardens, Kew, delivered an address on Rhododendrons, illustrated by a large number of lantern slides. Mr. Raffill gave a comprehensive account of the Rhododendron, and showed, from a first-hand knowledge, the great diversity of the members of the genus, giving pictures of some of the more notable plants in this country. He said that the number of species known is about 270, and the recent work of plant collectors in China had proved that country to be the headquarters of the genus, which was formerly located chiefly in the Himalayas. The members are widespread, and one of them, *R. lapponicum*, stretches across the northern part of America to Labrador through New England, and by way of Greenland to Europe and Northern Asia. In speaking of the garden Azalea, which is now included under Rhododendron, Mr. Raffill said the distinction was based on there being five stamens instead of 10, but as this distinction is only arbitrary, the two are now merged by systematists. Those known as Indian Azaleas are, curiously, natives of China and Japan, but they were received originally from India. They were grown by Chinese and Japanese gardeners long before they came into the hands of the Continental horticulturists, who have improved them beyond knowledge. The Ghent Azaleas have originated from *R. flavum* crossed with *R. calendulaceum*, *R. viscosum*, and *R. nudiflorum*, afterwards interbreeding the progeny, and then further crossing these with others, including *R. sinense*. The somewhat rare *R. Vaseyi*, said Mr. Raffill, is of this class, with delightful pink, sweet-scented flowers. He recommended its cultivation wherever Rhododendrons are grown. The magnificence of the Rhododendron trees in the south-western counties, and especially in Cornwall and Glamorganshire, was shown by many lantern pictures.

The race of greenhouse Rhododendrons raised from Javan species was referred to, and a caution given not to grow them in too cool a temperature. They require, said Mr. Raffill, a temperature in winter not lower than 50°, whilst in summer the best may be allowed to rise to 90° with advantage. In speaking of the propagation of Rhododendrons, the lecturer referred to layering, and recommended the whole plant to be lifted and placed on its side, as in this way the branches may be readily bent to the ground. Layering may be done at any time of the year, but it is best practised in the spring and summer. Some interesting details were given regarding the properties and economic uses of Rhododendrons. Thus a decoction of the leaves of *R. chrysanthum* is employed in Siberia for the treatment of rheumatism. The leaves of several species are poisonous to cattle; in Sikkim sheep and goats die from browsing on *R. cinnabarinum*. Snuff is made from the dried leaves of *R. campanulatum*, whilst leaves of a number of species are used by the Chinese to adulterate tea, notwithstanding they consider Rhododendrons are generally poisonous.

The next meeting of the Horticultural Club will be on November 7.

CATALOGUES RECEIVED.

WILLIAM DEAL, Brooklands, Kew, Essex—Sweet Peas.
DULAU & CO., LTD., 37, Soho Square, London—Botanical Books.
W. WELLS & CO., LTD., Merstham, Surrey—Chrysanthemums.

FOREIGN.

PAPE & BERGMANN, Quedlinburg—Flower Seeds.
RIVOIRE PERE. ET FILS, 16, Rue d'Algerie, Lyon (France)—New Plants, Vegetables, and Fruits.
FREDRICK ROEMER, Quedlinburg, Germany—Flower Seeds.

Editors and Publisher.—Our Correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the *Publisher*; and that all communications intended for publication, or referring to the Literary department, and all plants to be named, should be directed to the *Editors*. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

ABNORMAL RUDBECKIA: *M. Buysman, Java.* The uppermost bracts of the head of your Rudbeckia have become leafy; they are dentate, and have long petioles. They have no florets above them, so far as can be seen, as the small scarious normal bracts have distributed throughout the rest of the head. The involucre bracts are also somewhat leafy, but this is probably a normal feature. No mention of this abnormality is made by Penzig in his work on teratology.

APPLE DISEASED: *Correspondent.* The Apple Blenheim Pippin which you send us is attacked with brown spot, which affects more often the softer-fleshed Apples. The cause of such spotting is not known for no fungus has been found on the fruits which would be likely to be the cause.—*J. G.* "Black Apples" are caused by *Monilia fructigena*. The trees should be sprayed with Bordeaux Mixture, commencing when the leaves are beginning to expand.

APPLES FOR UPRIGHT CORDONS IN LANCASHIRE: *J. M. H.* The best six varieties of dessert Apples in their order of merit for exhibition in November are Cox's Orange Pippin, Ribston Pippin, Allington Pippin, Rival, Charles Ross, and King of the Pippins. The best six varieties of Pears in the same order of merit are Doyenné du Comice, Pitmaston Duchess, Charles Ernest, Durondeau, Beurré Hardy, and Beurré Alexandre Lucas. The best four varieties of culinary Apples for exhibition are Peasegood's Nonesuch, Emperor Alexander, Gascoyne's Scarlet Seedling, and Bismarck. All the Apples should be worked on the broad-leaved Paradise stock, and the Pears on the Quince stock. You may plant them about 2 feet apart.

CEDAR OF CANADIAN SWAMPS: *Subscriber.* The so-called Cedar of the Canadian swamps is also known as the American Arbor-Vitæ, its botanical name being *Thuja occidentalis* of Linnæus. It is, however, a very different tree from the species usually known as Arbor-Vitæ in gardens. The latter is correctly the Chinese Arbor-Vitæ, or *Thuja orientalis* of Linnæus. It may be mentioned that the genus *Thuja* is divided into four distinct groups. *T. occidentalis* is typical of the first group and *T. orientalis* of the fourth group. The last-named tree is sometimes met with in gardens under the name of *Biota orientalis*, but although *T. occidentalis* has several synonyms, it is only known as *T. occidentalis* in the British Isles. If a tree were ordered from a nurseryman under the common name of Arbor-Vitæ, it is almost certain that the Chinese species would be supplied. Another American tree is sometimes called the Giant Arbor-Vitæ, Red Cedar or Canoe Cedar. This is *Thuja plicata*, sometimes called *T. gigantea*, and is common on the Pacific coast. It is a more vigorous tree than *C. occidentalis*, and the two species cannot very well be confused.

CHESTNUTS: *R. G. N.* See reply to *R. H., Levant*, for storing Walnuts.

CLIMBER FOR PORCH: *W. Webber.* The most suitable plant for the position you mention would be *Crataegus Pyracantha*. This is not, of course, a climber, but it is frequently used to plant against walls. In addition to being evergreen, it bears large numbers of white flowers in May, and a good crop of showy, orange-scarlet fruits in autumn. It will be necessary to wire the walls in order to allow of the plant being trained to cover the required space. By cutting it back in spring it can easily be kept from making too much breast wood.

ELM TREE BARK: *C. C., Dundridge.* The substance on the bark is an imperfect Lichen, which does not seriously injure the trees. It may be removed by spraying the trees with the Bordeaux Mixture.

"FRENCH" GARDENING: *H. L.* Pupils are accepted, on payment of a premium, at the following institutions, where "French" gardening is practised:—Hatchney French Garden, Tisbury, Wiltshire; French Garden Co., Fleet, Hampshire (this firm specialises in Mushrooms); Farnorth French Garden and Nursery, Allithwaite, Grange-over-Sands, Lancashire; French Garden Co., Ltd., Christchurch, Hampshire; and the Thatcham Fruit Farm, Henwick, near Newbury (the pupils at this establishment are mostly women).

GROWING FLOWERS AND FLOWERING PLANTS FOR MARKET: *Hardworker.* You ask if there is a living to be made in the South of England by the growing of flowers and flowering plants for market? Much will depend upon the possession of cultural knowledge of the work in which you wish to embark, your application to the business and the selecting of a suitable place in which to start the enterprise. A light loamy soil resting on a gravelly subsoil well exposed to the south or south-west, and protected from north and east winds is the most suitable for the growing of flowers and other crops out-of-doors. A good supply of water, nearness to a railway station, large town and a central market in which to dispose of your produce at the least possible cost in the way of carriage are necessary conditions. The freight of coal, manure, and similar materials should be borne in mind when choosing your nursery site. The *Book of Market Gardening* and *My Gardener*, which may be obtained from our publishing department at 2s. 9d. and 2s. 10d. respectively, would prove helpful to you. For a list of flowers to grow in the open garden see answer to *W. H. H.* (under the heading of Crops under Glass) in the issue for October 7, p. 265. If you intend growing flowering plants under glass, it would be more than ever necessary to live within easy reach of a town containing good shops where you could send your plants in your own conveyance at a small cost, and you should grow only those plants which are easily disposed of, and which you can turn into money in as short a time as possible. Bulbs of the following kinds would pay, namely, Narcissus (Daffodils) Emperor, Empress, Golden Spur, Sir Watkin, Horsefieldii, J. B. M. Camm, Barri Conspicuous, Madame de Graaff, Bicolor Empress, Victoria; Tulips: single varieties of the Duc van Thol type, Parrot and Darwin Tulips; Hyacinths in variety and Freesia Leitchlinii major. Good bulbs of Narcissi and Hyacinths should be potted singly into 5-inch pots, putting three Tulips into the same size pots, Freesias being placed in 3-inch pots, five bulbs in each pot. All the pots should be well drained, and the potting compost should consist of sandy loam and short manure, free from worms, in the proportion of three parts of loam to one part of manure. The earlier the bulbs are potted up after their arrival in this country the sooner will they come into flower. Tulips may be set out in rows in ordinary cutting boxes filled with the same kind of compost, putting about 24 bulbs in each box. After the flower-spikes have made a few inches of growth shade them with a strip of canvas, placed 12 inches or 15 inches above the plants with a view to promoting stem growth. Hyacinths and Narcissi may be obtained in quantity if treated in like manner. Pot plants of *Spiræa astilboides*, *S. floribunda*, *S. Peach Blossom* (pink flowers), *S. compacta multiflora*, and *S. Washington* growing in 5-inch and 6-inch pots, always command a ready sale in early spring, as also do well-flowered plants of the following species: *Deutzia gracilis*, tuberous-rooted Begonias, and winter-flowering Begonias of the Gloire de Lorraine type; *Cytisus racemosus*, *Cyclamen latifolium*, *Fuchsias*, *Mignonette*, *Rhododendron sinense* (*Azalea mollis*) in 6-inch and 8-inch pots. *R. indicum* in 5-inch pots, *Arum Lilies* (*Richardia africana*) in 6-inch pots, and *Salvia splendens grandiflora*. Cultivate a few popular plants in quantity rather than many species that are

seldom asked for. In preparing the ground for the culture of flowers in the open, it is necessary that land of the description indicated above should have a good dressing of short manure dug or ploughed into it, and that the soil then, if lumpy, be harrowed over, rolled, and re-harrowed before setting out the plants. The soil should be made firm about the roots of each plant in planting. The dwarf growing plants should be placed nearest the "walk-side" of the beds or borders. In planting Chrysanthemums allow a space of 2 feet between the rows, and the same distance from plant to plant in the rows. Afford a space of from 15 inches to 18 inches between rows of the taller-growing, branching Asters, and 12 inches from plant to plant. Stocks and Sweet Sultan may be given a space of 15 inches between the rows and 12 inches in the rows. Yellow Marguerites should be planted in beds consisting of four rows set at 2 feet apart, and at the same distance from plant to plant in the rows, leaving a space of 4 feet between the last row of one bed and the first row of the succeeding bed to provide an alley, and to admit of the flowers being gathered without damaging the plants when the latter have completely covered the ground space of the beds. The white-flowering Marguerites do not require so much space between the plants, being less robust growers. Dahlias should be allowed a space of 4 feet each way.

GRUBS DAMAGING PRIMULAS AND CYCLAMEN: *H. & Son.* The grubs damaging your plants are Weevils. If the plants are turned out of their pots occasionally, and all the larvæ which are visible picked out by means of a pointed stick and destroyed, this may be sufficient. If this treatment is ineffective, shake the roots entirely free from the soil and larvæ, and re-pot the plants in a fresh compost. Another method of killing the grubs is to turn the roots out of the pots, and spray the soil and roots with carbon bisulphide. They may also be trapped with pieces of vegetable, such as Potato or Turnip, buried in the soil. Weevils feed at night time.

HIPPEASTRUMS (AMARYLLIS) TO FLOWER IN APRIL: *C. L. M.* As soon as the growth is complete the bulbs should be gradually dried off. A watering once a week will suffice for about a month to come. After that time, place the plants on their sides and withhold water entirely, at the same time reducing the temperature gradually. When the plants are quite dormant, place them at the warmer end of a greenhouse. About the end of February shake the bulbs out and re-pot them in fresh soil. From that stage keep them in a temperate house, where a minimum temperature of from 50° to 55° Fahr. is maintained. Afford water carefully until the plants are making growth. The flower-spikes should begin to push by the end of March.

INSECTS: *T. D., Lincoln.* The animals sent are a kind of millepede, belonging to the genus *Polydesmus*. Only dried skins came to hand, so the species cannot be stated. They are certainly destructive to all kinds of vegetation, but may be destroyed by mixing vaporite with the soil.—*F., Devon.* The caterpillar is that of the Pale Tussock moth (*Dasychira pudibunda*), and is known as the Hop Dog. It feeds on Hops, Elm, Lime, and other trees.

INSECTS ON ROSES: *R. H. W.* The damage to your Roses has been caused by thrips. These insects have been very abundant this year on many plants. As far as is known, they hibernate in the soil, and it would be well to treat it with some soil fumigant such as Vaporite or Funnite. Thrips are also destroyed by spraying with nicotine wash. It would be well to give your Roses a good syringing with a nicotine preparation now. There are several excellent preparations on the market, such as Voss's Nicotine Wash and Campbell's Nico Soap.

LILY OF THE VALLEY: *D. Chandler.* A market bunch contains twelve flower spikes. These are bunched round a small pad of rough foliage made into a wad about an inch in diameter and 3 inches long. If you intend to send flowers to the market you should buy a market bunch and copy it. In bunching for market the flowers must be graded in at least two qualities.

NAMES OF PLANTS: London Garden. Bous-singaultia baselloides.—*M. E.*: Verbascum Blattaria.—*L. G. P.* Specularia speculum.—*Wm. G. Wadge.* 1, Euonymus radicans tricoloribus; 2, Nepeta Glechoma variegata; 3, Micromeria Douglasii; 4, Sedum sarmentosum variegatum; 5, Lycium chinense; 6, Isoloma hirsuta; 7, Callicarpa purpurea.—*Hard-worker.* Rudbeckia species, probably *R. aurea*. We cannot name with certainty from the single flower.—*G. E.* Amaryllis Belladonna, a West Indian bulbous plant. The bulbs should be planted at the base of a warm wall facing to the south. If the wall is that of a hothouse, so much the better, as the plants will be sure to flower every season owing to the extra warmth in the soil.—*R. P. S.* The shrub which grows in your brother's garden on the Lake of Como is *Olea fragrans*. It is not likely to succeed in Kent in the open ground, but will probably grow against a south wall.—*H. Perkins.* Hibiscus Trionum (annual).—*J. Mason.* Probably Gnaphalium luteo-album Veronica longifolia var.—*M. E.* 1, Thymus serpyllum var. pulchellum; 2 and 3, specimens too scrappy to identify; 4, Saxifraga hypnoides; 5, Thymus serpyllum lanuginosus; 6, Saxifraga trifurcata; 7, Veronica saxatilis; 8, Arenaria balearica; 9, Veronica serpyllifolia; 10, V. epacridea; 11, Sedum rupestre; 12, S. album.—*Senex.* Stapelia maculosa.—*J. W. N., Peterborough.* Amaryllis Belladonna.—*G. C. T.* 1, Cotoneaster frigida; 2, Pyrus pinnatifida.—*Staffs.* 1, Aster Amellus (Italian Starwort); 2, Aster Novæ-Angliæ and A. pulchellus; 3, probably Berberis Darwinii (send when in flower).—*Anxious.* 1, Aster Novi-Belgii Maiden's Blush; 2, A. ericoides; 3, A. N.-B. Robert Parker; 4, A. N.-B. Daphne; 5, A. dumosus.—*Tunncliffe.* 1, Miltonia Clowesii; 2, Tillandsia Lindenii; 3, Cattleya Bowringiana.—*F. T. T.* 1, Oncidium barbatum; 2, Odontoglossum gloriosum; 3, Cattleya intermedia; 4, Lælia pumila; 5, L. harpophylla; 6, Lycaste tricolor.—*C. H.* Zauschneria californica.

ORCHIDS DISEASED: *G. U. R., Linlithgow.* The Orchids are attacked with the fungus Gloeosporium orchidis. It will be best to remove badly-affected leaves, and sponge the plants daily with liver of sulphur in solution—1 oz. in four gallons of water.

PALM ON A LONDON LAWN: *T. J. C.* It is scarcely likely that Phoenix will survive the winter out-of-doors even if you protect it in the manner you propose. You should get a friend to house it for that period, or, failing this, make an arrangement for the purpose with some nurseryman.

PAPER WHITE NARCISSUS: *D. Chandler.* It is not profitable to grow this variety for market in England owing to the importation of French-grown Narcissi, which are usually better flowers than those forced in England.

POLYGONUM BALDSCHUANICUM: *P.* The sprays of this plant sent under a varietal name are well coloured, but the high colouring of the species has been general this year, and flowers on the original plant at Kew are quite rosy in colour. Your specimens of the type are very poor, and not at all typical of this fine climbing plant. As in many other plants, the high colouring depends to a great extent on the kind of soil and situation, whether exposed or shady, and on the character of the season.

PRESERVING WALNUTS: *R. H., Lavant.* A good method of preserving Walnuts is to dig holes in the open ground and sink Seakale pots up to the rims. A piece of slate should be placed at the bottom to prevent worms from getting into the pots. The nuts should be put into the pots, and the lids placed on securely. In these circumstances the nuts will remain for several months in a fresh and firm condition. Another way is to keep the Walnuts in tubs or boxes buried in white sand.

"RARIORUM AFRICANARUM PLANTARUM": *Rag.* This work was published by J. Burmann in 1733-39, and contains 268 pp. and 100 plates. In Messrs. Wesley & Son's catalogue, 1905, it is offered for £1 8s.

REGISTERED FROST IN YORKSHIRE: *Tripoli.* On January 26, 1881, a temperature 9° below zero (41° of frost) was registered in Yorkshire at Sorrel Sykes.

RHODODENDRON SHOOTS: *J. W. T.* The white substance on the leaves is apparently a deposit of lime from the water used in syringing the plants. There is no fungus present.

ROSES ON IRON TRELLIS: *A. F., S. Wales.* The sudden changes in the temperature of iron always have a bad effect on Rose wood in contact with it. The only really effectual method is to cover the iron with some non-conducting material in the way you have tried, but rope, unless dressed, when it gets old is apt to harbour insects. No doubt cane or wood is better, but it cannot always be used. We have had the same problem to deal with in connection with an iron fence about 9 feet high on which Roses are grown. Tying a small piece of asbestos cloth round the iron just at the points where the Rose is tied has been fairly satisfactory, but is rather troublesome. Where the Roses are not required to grow much taller than the height mentioned, it is sometimes possible to get over the difficulty by materially shortening the time during which the Rose is attached to the iron, and where this is practicable it has proved the best way. For this purpose Roses of the type of Dorothy Perkins are used, which make long, sinuous growth from the base every year, and have the old wood removed annually. During the winter a preliminary clearance of this old wood is made, but the young basal growths are allowed to remain running along the ground, and it is not till rather late in the season, say the beginning of April, that the final tying of the young shoots is effected. The method has many disadvantages. It involves leaving the young shoots about the ground in a way that in some positions might look untidy, and tying up so late often leads to unavoidable damage to the young growths, and therefore requires great care, but in our own case the treatment is effectual.

STERNBERGIA: *B. L.* The bulbous plants forming this genus require to be planted in a situation where they will get thoroughly baked in the summer months. The best place is at the foot of a wall facing south, but even in such a place they will not always flower well except after exceptionally warm, dry summers. It is useless to plant them in the open ground as the bulbs do not ripen sufficiently to produce flowers. The soil they require is a heavy loam, and the bulbs should be planted not less than 6 inches deep.

SWEET-SCENTED PELARGONIUMS: *Correspondent.* In regard to your further questions, if you write to Mr. Jas. Hudson, Gunnersbury House Gardens, Acton, W., he will help you in the matter of identification so far as he is able to do so. Some nurserymen catalogue the best-known varieties. Two such firms are Messrs. James Veitch & Sons, of Chelsea, W., and Messrs. Cannell & Sons, Swanley, Kent.

VIOLAS DISEASED: *H. V., Preston.* The fungus attacking your Viola plants is Puccinia violæ. All the infected leaves should be removed, and the plants sprayed occasionally with liver of sulphur in solution.

WOODLICE: *G. H.* This pest is generally most abundant in the warmer houses, more especially in a house containing a hotbed composed partly of leaves. A good plan is to prepare traps by hollowing out pieces of Potato, or Turnip, and placing the pieces, hollow side downwards, in the haunts of the woodlice. On examining the baits each morning, it will generally be found that they contain woodlice, which should be destroyed and the baits replaced. Another way is to poison them by soaking the baits in Paris Green or white arsenic, if desired. A correspondent has used Steiner's "Vermin Paste" with good results. Mix the paste with Barley meal or middlings, putting it on pieces of glass, wood, or tin, and placing the baits in the haunts of the woodlice.

SELF-STERILITY IN PLUMS.

ALTHOUGH the question of self-sterility in fruit trees is a comparatively new one in Britain, in America it dates from 1895, when Waite published the results of his investigations on the subject, under the title of *The Pollination of Pear Flowers*.

Since then, the results of experiments in Europe, and more especially in America, show us, beyond a doubt, that by far the greater majority of Apples, and possibly all varieties of Pears, are self-sterile; and that the same applies, with a few exceptions, to the Japanese Plums and to the native Plums of America. It should, however, be noticed, in the case of Apples, and more especially Pears, that although self-sterile in the scientific sense—i.e., when self-pollinated, or, of course, pollinated from another tree of the same variety, they do not bear seed, yet many varieties bear fruit to a greater or less extent, this fruit being seedless.

Mr. Chittenden has further shown that these fruits, in the case of Pears, are of a different shape from the normal seed-bearing ones.

It is only natural that the problem of self-sterility should first arise in America, where everything, including fruit planting, is done on a large scale, and where

it may happen that there is a large plantation of one single variety, so far removed from any other, that foreign pollen is not transferred by insect agency; a state of affairs which must exist rarely, if ever, in Europe.

Again, self-sterility must not be confused with sterility due to malformation of the sexual organs of a flower or to the mere absence of any pollinating mechanism should insects fail, as is perhaps the case of the Gooseberry; for, whereas, given insects, an isolated plot of any one variety of Gooseberry will crop perfectly well, no number of insects will produce a crop in an isolated orchard of, say, Cox's Orange Pippin, this latter being self-sterile and needing the pollen of some other variety.

Experiments started by myself in 1910 with ordinary European Plums show that the varieties fall into two sharply-defined groups, namely, self-fertile and self-sterile, just as do the Japanese and American Plums.

Although a beginning only has been made in the study of this wide question, the facts which have been brought to light are likely to prove of interest to fruit growers.

The method of procedure adopted in these experiments is very simple. Suitable branchlets of the Plum to be self-pollinated are enclosed, before the buds open, in special paper bags.

These bags, which are very transparent, do not hurt the flowers at all, except where they actually rub against them.

When the tree is in full flower, the bags are removed, and the flowers are pollinated by dusting them over with a brush, or with the finger, previously sterilised in spirit; then the bag is replaced, or a new one put on, and it is not again removed until after the fruit has begun to swell.

The bags used are mostly 7 inches by 13 inches.

In 1910, seven of these bags, on Victoria, gave 68 fruits, and in 1911, 36 bags gave 396 Plums; but this is no real indication of how the fruit set, for nearly every flower set a fruit, and more than half were thinned out by hand.

In the case of the Histon Greengage, five bags gave, in 1910, four fruits all in one bag; in 1911, out of 10 bags, there was not one fruit.

Treated in a similar manner, 28 bags on Early Orleans, 19 on Late Orange, 16 on Sultan, 15 on Late Orleans, 3 on Kirke's Blue, and 11 on a "Sloe" all gave not one single Plum. These then were self-sterile.

On the other hand, 3 bags of Prince Englebert, 12 of Czar, 18 of Pershore, 15 of Yellow Magnum Bonum, and 7 of a Damson set nearly every flower, and, like the Victorias, had to be thinned. These were obviously self-fertile.

Experiments carried on with pot trees in a fruit house made insect-tight with muslin, each flower being carefully self-pollinated by hand, confirmed the results obtained out-of-doors, and in addition, showed that Coe's Golden Drop, Reine Claude d'Althann, Green Gage, Early Green Gage, Blue Imperatrice, Late

Transparent, and Washington were absolutely self-sterile.

There were two fruits on Green Gage, and one on Reine Claude d'Althann, but their position on the trees made it highly probable that they were due to accidental cross-pollination.

Denniston's Superb, Early Transparent, and Reine Claude Violette or Purple Gage set nearly every flower, and had to be thinned.

River's Early Prolific, on the contrary, gave, in 1910, out of eight bags, nine fruits; in 1911, out of 28 bags on two healthy trees, two fruits; and a pot tree which bore some 110 flowers set 12 fruits. This, then, is a variety which, though not absolutely self-sterile, is better cross-pollinated.

One interesting fact observed was that, if, in one of these self-sterile varieties, the flowers are not pollinated at all, they fall off from three to four days after fully opening. If, on the other hand, they are self-pollinated, the fruit may swell until it reaches the size of a culinary Pea, but sooner or later drops off, generally within three weeks. Microscopical sections show a great growth of nucellus tissue. Cherries exhibit this phenomenon even more markedly.

It seems probable that the trouble known as "June Drop" of the Americans, and also the early "stoning" of Greengages and Cherries, which takes place long before a stone begins to form, are to be explained as consequences of self-pollination.

It will be found that the real stoning, or thinning which takes place on a really self-fertile variety like Victoria, or Pershore, is a much more gradual process, and is not by any means confined to the first month.

Further investigations are in progress, and the results will be reported in due course. *W. Backhouse.*

THE ROSARY.

HYBRID TEA ROSE MME. HECTOR LEUILLIOT.

MONS. PERNET DUCHER, of Lyons, has given us a group of yellow Hybrid Tea Roses which, with the exception of one variety, has rapidly become popular, Mme. Ravary, introduced in 1899, is now well known, and scarcely less popular is Le Progrès, which the raiser put into commerce in 1903. Mme. Hector Leuilliot followed in 1906, and a year later Mrs. Aaron Ward was distributed, the latter rapidly becoming known and appreciated. Of this group of Roses, however, the best, and the least known, is perhaps Mme. Hector Leuilliot. Of a golden-yellow colour, tinted with apricot, its flowers are beautifully shaped, and much fuller than any of the other Roses mentioned here. The flowers vary somewhat in colour, especially in a summer such as that of 1911, but Roses from this raiser are particularly liable to vary, the Lyon Rose being a notable instance. Many amateur growers of Roses do not seem to know Mme. Hector Leuilliot, and are much surprised when they see examples in flower. It is one of the most fragrant of Roses, and has large, handsome foliage which, so far as my experience goes, seems to be immune from mildew. It is a free-flowering variety of a vigorous habit of growth, and possesses so many good qualities that it is astonishing to find it so little known. Those who have seen its richly-coloured, fragrant flowers are always delighted, and add this Rose to their collection. *George M. Taylor, Midlothian.*

NEW OR NOTEWORTHY PLANTS.

ARISTOLOCHIA KEWENSIS.

(*A. TRILOBATA* × *A. BRASILIENSIS*.)

(See figs. 133, 134, and Supplementary Illustration.)

A HYBRID *Aristolochia* is the latest addition to the chance hybrids that have originated at Kew. In the Palm House there is a large collection of strong-growing tropical climbers, trained to wires against the lower part of the curvilinear roof, and among them are various species of *Aristolochia*. Two of these grow side by side, with their shoots intermixed, so that a mating of them was not unlikely, as they usually flower at the same time. A capsule eventually ripened on *A. trilobata* which was gathered, and the seeds sown. From these, plants were raised, which, on flowering, bore unmistakable evidences of their hybrid parentage. Mr. Worthington Smith's drawings of the two parents and their offspring show the intermediate character of the hybrid, not only in the perianth, but also in the form of the anthers and stigma, and in the foliage.

A. brasiliensis is, perhaps, the best known of all the tropical species of *Aristolochia*. It was introduced in 1838, by Gardner, who sent seeds from Brazil to the Glasgow Botanic Garden. For large, tropical houses it is a most serviceable climber, as it is easily kept in health, and grows almost as freely as a Grape vine, producing in summer its large, oddly-shaped yellow and brown flowers in great profusion and without fail. The odour of the flowers is disagreeable, but it is scarcely perceptible in a large house.

A. trilobata is also from South America, where the natives are said to use it as a cure for snake bite. It has been in cultivation at Kew for the last 30 years or more, and, although it is not nearly so sturdy a plant as *A. brasiliensis*, it is quite as good-natured under cultivation. Its leaves are more or less three-lobed, dark, glossy-green, with reddish veins, and its flowers, which resemble in form the pitcher of a *Nepenthes*, except for the long, dull-crimson tail, are green, with red veins. Compared with other cultivated tropical *Aristolochias*, it is not attractive.

A. kewensis is as strong a grower as its male parent, and its leaves are nearly as large as in that species, whilst they are firmer in texture, and show traces of red in the veins. The flowers are dull yellow, with red-brown reticulations, the broad, tail-like lip being wholly dull crimson. It is worth a place among tropical climbers, and no doubt will soon be distributed, as it can be multiplied by means of cuttings.

The chance crossing of two species of *Aristolochia* is interesting, as the flowers, whilst they are constructed to prevent self-fertilisation, are supposed, in a wild state, to be visited by a special kind of insect. The method of fertilisation is as follows:—The tube of the corolla is lined with reflexed hairs, which permit small insects to find their way down into the inflated base, but prevent their getting out again. The insects crawl over the stigmas, and if the latter are in a receptive condition, and the insect has previously visited a flower in which the pollen was free, fertilisation is effected; but the anthers do not release the pollen until after the stigmas have been fertilised with pollen brought from another flower, or have passed the condition of receptivity. In any case, the insects are kept prisoners for several days, until the stigmas have withered and the anthers opened, when the hairs which close the trap collapse, and the insects are free to depart laden with pollen. The odour of the flowers in the Palm House at Kew would probably attract ants, which are numerous there, and they might convey the pollen from a flower of *A. brasiliensis* to one of *A. trilobata*. Only one flower appears to have been fertilised in this way. W. W.

FIG. 133.—*ARISTOLOCHIA TRILOBATA*.

(Female-parent of the hybrid *A. kewensis* shown in the Supplementary Illustration.)

FIG. 134.—ARISTOLOCHIA BRASILIENSIS.

(Male-parent of *A. kewensis*.)

LONGFORD CASTLE.

(Concluded from p. 284.)

BROAD, well-filled borders of perennial plants stretch around the kitchen garden wall to the head gardener's cheerful and commodious residence. The outer edges of the borders are planted with various Pinks, Aubrietia, Arabis, &c., which are allowed to encroach on the gravel path, and so make an agreeable broken bordering. The general scheme of these borders consists of bold groups of the various plants, so arranged as to provide a good display throughout the hardy plant season. At the time of my visit the Phloxes, Campanulas, Rudbeckias, Sunflowers of many kinds, Liliums, and Anchusas were providing abundant colour, whilst there were large groups of the best varieties of Michaelmas Daisies showing plenty of flower-buds for a later blossoming. A hammered garden gate of beautiful design leads into the home kitchen garden. The outer walls enclose many other 12 feet high brick walls, and so provide for the cultivation of large quantities of fruit. Everything at Longford is done on a large scale. For instance, Figs, which are greatly esteemed at the castle, are grown in a large house containing two huge trees of the varieties Pingo de Mel and Bourjassotte Grise to furnish ripe fruits in March, whilst late crops are obtained from a dozen trees of Brown Turkey and Brunswick growing against a warm, outside wall.

Ripe Melons have to be provided daily throughout the season, and to ensure a plentiful succession several hothouses are set apart for their cultivation. High quality rather than size is aimed at, and such varieties as Gunton Scarlet, Earl's Favourite, and Longford Seedling are chiefly grown. There are many vineries, and the houses in bearing show remarkable culture. That difficult variety Madresfield Court Muscat was in the highest perfection; large, shapely bunches bore fine berries as black as a Sloe. The much-dreaded splitting of the berries has no terrors for so skilful a cultivator as Mr. Tucker. Next are two houses containing Muscat of Alexandria; here, again, the same pitch of excellence is apparent, every berry of that rich, transparent amber colour which betokens the highest skill of the Grape grower, and always accompanies rich flavour. Many other varieties of Grape are equally well grown. Black Hamburg, Foster's Seedling, Mrs. Pince, Lady Downes, Gros Maroc, and Prince of Wales. The last-named variety as grown here is the handsomest of all the black Grapes. A huge, tapering bunch, with fine shoulders, bearing large, oval berries of first-class flavour, which keeps well until the earliest pot vines ripen their fruit. The necessity for rotation is generally well understood in connection with the kitchen garden crops, but the principles are not often applied to fruit houses, so it was pleasant, as well as instructive, to hear Mr. Tucker remark on his future plans. "These two rods will be taken out this autumn, when I shall plant young canes of Cannon Hall Muscat; three years hence those old rods will go to the fire heap. If you want first-class Grapes you must periodically renew the rods as well as the borders." In the plant houses the same methodical system is practised. Mr. Tucker looks forward, not only from one season to another, but several years ahead. Longford Castle is one of the few remaining establishments where hothouse Pines are still grown, and here the several successional houses contained vigorous plants, chiefly of Queens, in various stages of growth. A long Peach case had the back wall covered with Peach and Nectarine trees, from which the crops had been gathered, whilst along the front there were

many cordon trees of Pear and Plum bearing huge, highly-coloured fruits. The several span-roofed Peach houses contain such sterling varieties as Hales' Early, Violette Hative, and Libra, which was considered by the late Mr. Blackmore to be the finest of all Peaches, and is greatly esteemed here. Many Nectarines are grown under glass, and against the warm outside walls the variety Humboldt still bore handsome fruits. The Peaches which are extensively grown out-of-doors include Prince of Wales, with fine brightly-coloured fruits, Late Devonian, and Gladstone, which late varieties were still in bearing.

Longford Castle has always been famed for its fruit, and Mr. Tucker, who was trained in such famous fruit-growing gardens as those at Elvas-ton Castle, Cardiff Castle and Powderham, when these places were at their zenith, continues the Longford traditions. The exigencies of an unusually large household do not permit of exhibiting as in days of yore, but, although not seen on the show boards, the quality of all the fruit grown is of the highest grade, and our leading exhibitors would find in "Tucker of Longford" a

of the young men. They have a large and airy dining-hall, from which they pass to a fine sitting-room with pleasant outlook and a library. On the upper floor there is a bath-room, to which hot water is supplied in practically unlimited quantities, and there is ample sleeping accommodation for the large staff. The Earl of Radnor fully realizes the meaning of *noblesse oblige*, and houses all his people in a fitting manner.

PLANT HOUSES.

There is a conservatory to be kept gay with flowering plants at all times, and the very many plant houses are full of suitable plants. The first batch of Chrysanthemums, which bore promise of fine blooms, had just been housed. A very large Carnation house of teak wood was being scrubbed, preparatory to its reception of over a thousand Tree Carnations of such kinds as Britannia, Rose-pink Enchantress, and Lady Bountiful. In the next house there were many Malmaison Carnations just opening large flower-buds. The chief varieties grown are Lady Coventry, Princess of Wales, and Calypso. Palms are in frequent request,

FIG. 135.—THE BOTHY AND ROCK-GARDEN AT LONGFORD CASTLE.

very hard nut to crack. Beside the quantity of fruit grown at the castle gardens, which includes a great many Plums, Gages, Cherries, Apples, and Pears, as well as the kinds already mentioned, there is a fine fruit garden at Alderbury, which was planted soon after Mr. Tucker took charge. Here on high ground, secure from destructive spring frosts, is an excellent fruit garden with many high-class Pears and Plums on the walls, and with bush Apple trees at 14 feet apart in the rest of the ground. Cox's Orange Pippin has been removed, as it cankered badly, but the remaining trees are in the best of health, and give evidences of skilled attention. Their clean branches are a sufficient testimony to the value of an alkali winter-wash, which forms part of the routine work in this garden. Space will not permit the mention of one tithe of the varieties which are so successfully grown, but beside the well-known standard varieties Allington Pippin, James Grieve, Wismer's Dessert, Paroquet, with astonishing colour, Chas. Ross, Belle de Boskoop, and Lord Hindlip, which is so good a keeper, are excellently grown.

In an angle of the walls of the frame-yard stands a splendid bothy for the accommodation

and a large span-roofed house is set apart for their cultivation. Codæums, Poinsettias, Hippeastrums, Gardenias, Begonias, of many kinds, are all grown in great numbers, and a fine batch of Clerodendron fallax bears large heads of brilliant flowers. The many heated pits contain various plants which are in demand at their seasons; one pit is devoted to Ferns, another was filled with Richardia Elliotiana, whilst a third contained healthy plants of Calanthe. Heliotrope and Zonal Pelargoniums for winter flowering are extensively grown, as also are many varieties of Bouvardia. Several Orchid houses are full of many healthy plants of such genera as Cypripedium, Dendrobium, Oncidium, Odontoglossum, and Tricopilia, bearing a goodly number of flower-spikes; whilst various batches of seedlings give evidence that these plants receive full attention. At the entrance to the plant ground there is a long, low rockery, built in a tasteful and unpretentious manner, in which Lady Radnor takes an especial interest. The rockery is well furnished with a great variety of plants, the favourite occupants are various Dianthus, Cistus, Campanulas, Anemones, Helianthemums, Valerians, and several species of Allium.

The kitchen gardens, which are very extensive, produce fine crops of vegetables; Asparagus, Seakale, and Artichokes being required in especially large quantities. An uncommon vegetable is the French variety of Potato, Violette, with long purple tubers, which are so excellent for salad purposes. The various quarters contain flourishing crops of successional vegetables sufficient in numbers to cope with the enormous demand which is made on this famous garden. A. C. Bartlett.

HARDY FLOWER BORDER.

VIOLA GRACILIS.

THIS beautiful little Grecian species is undoubtedly one of the finest introductions of recent years. From seed, obtained last year from Greece, I have a batch of plants this season which has given good results. In a year that has not been favourable to any of the *Violaceæ*, owing to excessive drought, *Viola gracilis* has, on a light dry soil, given a rich profusion of its deep violet flowers from May until September, the rich dark green foliage, which covers the ground like a carpet, being completely hidden with blossom. On the same soil Pansies and *Violas* have, this summer, been a complete failure. If this exquisite little *Viola* were only perfumed it would be a serious rival to the Violet, and, as it is, its flowers are quite as beautiful and more lasting when cut. Borne on fairly long, strong stems, its flowers should be of great value for florists' work of all descriptions, and no doubt when it becomes more plentiful *Viola gracilis* will be in great demand for this purpose. It is much admired by everyone who sees it growing, the deep purple flowers with the little white "eye" being particularly beautiful. A derivative named "Purple Robe" has been put into commerce this year, the colour of its flowers being said to be even more intense than those of *V. gracilis*. This, however, is not my experience, and I prefer the species as much the finer of the two. "Purple Robe" is a cross between *V. "Papilio"* and *V. gracilis*, the general habit of the latter parent being dominant. I notice that the seeds of the species are somewhat slow in germinating in comparison with those of other *Violas*, but once started they grow quickly and rapidly make good plants, and my batch, from seed, has reproduced itself with but little variation from the type. As an edging plant for borders it is a valuable introduction, and it is no less valuable as a plant for the rock garden. It is easily propagated by cuttings, the present being a favourable time for putting them in. George M. Taylor, Mid-Lothian.

ASTER ERICOIDES DESIRE.

I CONSIDER this one of the most dainty and elegant of all Michaelmas Daisies, and quite unequalled in its particular class. In the border, in common with all the types of *A. ericoides*, it is a stay-at-home plant, one not destined to rob a square yard or so of ground in its own immediate vicinity in a single year by a great outspreading mat of stoloniferous shoots, hence it is valuable for including in permanently planted borders. It grows 3 feet or so in height, and, with a natural tendency to develop many of its flower-branches laterally, the individual plant requires greater room than do many of the more erect-growing sorts. All the *Ericoides* varieties possess a neatness and an especial charm, being much valued for furnishing cut blooms for personal wear. For this latter use the lateral spikelets furnish well nigh ideal material. To the private gardener who needs a variety of subjects for conservatory decoration, this variety should prove of much value if cultivated in pots, and under glass the white, blush-tinted flower-heads assume a purity which greatly increases the value of a plant, the merits of which may not be readily overrated. E. H. Jenkins.

NOTICES OF BOOKS.

A BOOK ON BULBS.*

MR. WATSON, who furnishes the "forewords" to this volume, complains that many species of beautiful bulbous-rooted plants are neglected, though they are worthy of equal admiration with those so extensively cultivated. But that is what must be expected. Nobody can grow everything; selection consequently rules, and it must be admitted that the popular bulbs of to-day form on the whole a selection difficult to improve upon. The author himself fully recognizes the position; those plants which enjoy the greatest popularity receiving the greatest consideration, though, at the same time, the less popular cannot be said to have less than their due, but they are given as much as can be expected in a book of the kind. The volume, it may at once be remarked, reaches a very high level of excellence, and is one that will remain for some time a standard work on the subjects to which it is devoted. Not only is this applicable to the letterpress, but also to the illustrations, which are of a high order of merit.

The arrangement of the contents is at once simple and effective. Following elucidatory chapters on what bulbs, corms, &c., are, their cultivation in the open air and under glass; their uses for the supply of cut-flowers; their classification, &c., the larger portion of the volume contains in alphabetical sequence all the genera in general cultivation with description, uses, culture, and references to standard works in which figures are to be found. The lists of popular varieties are not always satisfactory; in some cases they are passed over, not improbably on account of the exigencies of space, but in a book of this kind, which will some day possess a historical value, it would have been worth while to have supplied in all cases at least a select list of names of the very best sorts. The book is singularly accurate, mistakes being very few indeed, and it is therefore curious that in one brief paragraph relating to *Hippeastrum Reginae* two errors should occur. One is that the plant first flowered on the birthday of Queen Caroline, the other that it is portrayed on plate 24 of Miller's *Figures of Plants*, plate 24 being *Amaryllis Belladonna*, and plate 23 *H. Reginae*, the two having been obviously transposed in printing. The book, it may be added, is beautifully printed in bold, clear type, and is profusely illustrated. R. P. Brotherston.

AMERICAN WHEAT.†

OF the 200 millions of bushels of Wheat imported annually into this country more than half comes from the vast Wheat fields of the Western Hemisphere. Mr. Rutter has undertaken the task of writing an account of the cultivation, cost of production, distribution, and other economic problems connected with Wheat in Canada, the United States, and the Argentine Republic. The results of his enquiries, which were embodied in a thesis presented for the degree of Master of Commerce in the University of Manchester, are now published in book form.

The influences of the soil, climate and variety or breed of plant upon the yield of the crop are all discussed. As judged by the standard reached in the British Isles, the average yield per acre on the Western Wheat fields is very poor; in the Argentine the average is little more than 10 bushels in the United States and Canada from 15 to 18 bushels per acre, as against 32 bushels in this country. These striking differences are due to a variety of causes, of which the most important are the scarcity of labour in the West and the existence of wide areas of cheap land, which conduce to what would be called here dirty and slovenly farming. Another cause of deficient crop is the growth of spring-sown varieties, which are inherently poor yielders, but productive of grain of high quality from the baker's standpoint. Continuous Wheat-growing on the same land for several years, as well as various climatic influences, also assist in keeping low the returns from the land.

With advancing population the necessity of obtaining higher yields from the soil is beginning to be felt in the States, and the surplus to spare for export from this quarter of the world

will assuredly diminish in the near future. There is, however, room for expansion in the two neighbouring countries, and Europe need have no fear of curtailed supplies from the West for many a day.

The marketing and grading of the Wheat in America as well as the effect of speculation upon the price of the world's chief bread-stuff are carefully described. Mr. Rutter's essay has involved much work in its compilation and affords a good insight into the cultivation, management, and economic relationships of the Wheat crop of the Far West, all of which differ so much from those prevailing in the intensively-cultivated areas of Europe.

THE GALAPAGOS OR TURTLE ISLANDS.

THIS remarkable group of islands on the Equator, in the Pacific Ocean, and about 600 miles distant from Ecuador, is celebrated for having furnished Darwin with abundant materials for discussion, and Sir Joseph Hooker with a collection of dried plants, made by Darwin, which served as a basis for one of his essays on insular floras, and his earlier speculations thereon. The *Voyage of the "Beagle"* and the *Flora of the Galapagos* were given to the world more than 60 years ago, and since then the islands have been visited by a number of expeditions, their natural history more or less thoroughly investigated and the results published. From time to time particulars of the later discoveries have appeared in the *Gardeners' Chronicle*,* together with an examination of the different theories on the origin of the islands and their natural productions. In 1905 the Californian Academy of Sciences organised an expedition to the islands, where a whole year was spent in collecting and observing. Mr. Alban Stewart was the botanist of the expedition, and his report† was issued early in the present year. It is a comprehensive account, embodying the results obtained by previous explorers. Mr. Stewart had the assistance of Dr. B. L. Robinson, author of a *Flora* of the same group, noticed in these columns in 1902. Apart from pictures, it is a complete consolidation, and largely supplements previous contributions to the subject. The *Cactaceæ* constitute the most striking feature in the vegetation, and the *Gardeners' Chronicle* has already published some original figures referred to below. Mr. Stewart paid special attention to these plants, and has done much towards elucidating the species, previously very imperfectly known, and some of them still undefined. Nine pages of description and 15 out of the 19 plates are devoted to this family, of which 10 species are enumerated, three of which are represented by specimens insufficient for determination, six belonging to *Opuntia* and four to *Cereus*. The plant figured in these columns (Ser. 3, vol. xxiv., p. 266, fig. 75) as *Opuntia galapageia* is, according to Stewart, certainly *O. myriacantha*, a cultivated species also figured (Ser. 3, vol. xxvii., p. 177, fig. 56), which Stewart says forms forests 25 to 30 feet in height. The true *O. galapageia* is described as having a relatively short trunk. The figures are almost entirely of habit, or scenic. Stewart finds that 40 per cent. of the species of flowering plants and Ferns enumerated are endemic, which is low as compared with Mexico and other areas on the mainland of America. He himself describes fewer than 20 new ones, and no new genus. Indeed, the generic endemic element is small, and might be neglected in discussing the origin of the flora. Without quite committing himself, the author admits that many biological facts favour the theory of subsidence as against upheaval—a theory first advanced by Dr. Baur. This theory, ridiculed by Agassiz and others, is gradually obtaining somewhat unwilling adherents. Apparently many species are rare, having been collected only once and in one locality. From the enumeration, it would seem that a number of the species collected by Darwin have not been collected since, for example, *Adiantum parvulum*, *Peperomia flagelliformis*, and *P. petiolata*—all endemic species! The Week's Work.

THE FLOWER GARDEN.

By R. P. BROTHERSTON, Gardener to the Earl of Haddington, K.T., Tynninghame, East Lothian.

SPRING BEDDING.—The refilling of the beds with plants to bloom in spring will now claim attention, and it is worth while to consider whether something cannot be attempted which shall be an improvement on the method of employing a large variety of plants. For instance, a dozen different kinds of Tulip often look less well than two or three varieties placed against a harmonious background. Survivals are sometimes seen even now of the terrible old custom of colour rings of Hyacinths all crowded into one bed; but, on the whole, beds are becoming simpler, and the method of permanent planting of bulbs in the grass and under trees is more commonly adopted.

MONTBRETTIA.—For the cultivation of these flowers there does not seem to be any established method. Some growers leave the plants in the ground until they cease to flower; others lift and dry the corms; others, again, transfer them to a position where growth remains active, but shelter from frost is provided for the corms. By far the best results were obtained this season from those which were replanted this time last year. These are still blooming freely, while most of those planted at other periods are past. All varieties are more or less hardy, the hardiest being those which take most after *M. Pottsii*. In all cases deep planting is an advantage, and in winter an extra 3 inches of soil should be placed over the clumps, but it may be removed in the spring.

SCHIZOSTYLIS COCCINEA.—The flower-spikes of this plant are this year much later than usual in making their appearance, and it might be as well to cover them on frosty nights. At this time of year they are chiefly useful for cutting, and, in order to obtain as many blooms as possible, they should be cut as soon as the first flower is expanded. The plant is fairly hardy when planted in poor soil and in a warm, sheltered position, where it flowers well throughout the winter. It should, however, be lifted, divided, and replanted every two years.

SUMMER BEDDING PLANTS.—Rooted cuttings of bedding plants which are not quite hardy should now be transferred to suitable winter quarters. Pelargoniums keep very well in a cold vinery, and only need to have the decaying foliage removed. If the soil is moist, they will not even need water until the spring. Old plants, lifted from the beds, should be denuded of some of the leaves, the long, fibrous roots shortened, and the plants placed in boxes filled with a light compost. If they are in a very cold place, very little root moisture will be needed; in fact, it is possible to preserve them without soil and quite dry in a frost-proof cellar or loft. For Ageratums and Mesembryanthemums a little heat is required, but they must not be overwatered, as this would force growth. In many cases cuttings were put in during the summer to supplement the first supply, of which there was a scarcity. These are not yet rooted, but if they are placed in a cool pit they will strike before spring. Viola cuttings in particular were very scarce. Of these, the old plants should be lifted, the straggling growths shortened, and the plants laid in the soil until March or April, when they may be divided into small pieces, each possessing a few roots.

GENERAL WORK.—The long-expected rain is responsible for the appearance of innumerable weeds in the Carnation beds, and among the finer Narcissi, Anemones, and other plants. These are too small to hand pick, and hoeing loosens without killing them. The only satisfactory way to eradicate them is very lightly to "point" all the bare soil to a depth of about 1½ inches. This, besides killing the weeds, leaves the surface of the soil smooth and neat for the winter. Beds of Spanish Iris must be very carefully examined, as the growths are now active and near the surface. Where the lines are not clear, it would be better to wait a few weeks until they appear.

Carnations should be heavily dusted with soot after showers. This will ward off the attacks of small birds; but where pheasants abound, close netting is the only sure method of preserving the plants. Protective covering for Roses and other tender shrubs should be collected ready for use. Bracken or branches of Beech, with firmly-attached, dried leaves, and boughs of Spruce Fir, are serviceable, and for winding round stems and protecting very small plants there is nothing better than loosely-made ropes of straw.

THE ORCHID HOUSES.

By H. G. ALEXANDER, Orchid Grower to Lt.-Col. Sir G. L. HOLFORD, K.C.V.O., C.I.E., Westonbirt, Gloucestershire.

MAXILLARIA.—This genus contains a large number of species, but many of them, on account of the small size of their flowers, are not worthy of cultivation as decorative plants. The following species are amongst the best and most generally grown:—*M. Sanderiana*, *M. luteo-alba*, *M. splendens*, *M. Turneri*, *M. venusta* and *M. grandiflora*; the last-named species is a very desirable Orchid for blooming during the present season, and the flowers are deliciously fragrant. These plants are all of evergreen habit and, as a rule, free-flowering. A well-ventilated, cool, intermediate atmosphere meets the requirements of these Orchids the year round, and pot culture is the most suitable for all except *M. Sanderiana*. Employ teak-wood baskets, but do not insert any crocks for drainage, as the flower-spikes that usually push horizontally from the base of the pseudo-bulbs are sometimes thrust through the soil in a downward direction. Good fibrous peat, Osmunda fibre, and Sphagnum-moss, in equal proportions, form the most suitable rooting medium. The roots, in most cases, being somewhat large and fleshy, it is well to add plenty of crushed crocks and charcoal to the compost, using the materials in as rough lumps as possible consistent with the size of the pots. Drain the latter well, potting the plants firmly, and always endeavour to repot the plants when new roots can be seen pushing forth from the developing pseudo-bulbs. As long as growth continues, and until the pseudo-bulbs are quite finished and hard, the water supply must be kept well up, and the roots never allowed to dry for any length of time. During the resting season, the less they have the better, so long as the pseudo-bulbs remain plump, but these must not be allowed to shrivel. The worst enemy of *Maxillarias* is red spider, the foliage being very subject to attack, especially if the plants are growing in too high a temperature, or in an atmosphere at all inclining to the dry side. *M. tenuifolia*, one of the oldest and best-known species, has a habit of growth different from that of the species named above, the pseudo-bulbs occurring on erect, wiry rhizomes. The culture should be similar to that already described, except that in the case of this species care is necessary not to allow the pseudo-bulbs to become weakened owing to their being out of reach of the compost.

MASDEVALLIA TOVARENSIS.—Few white-flowering Orchids for winter blooming are more useful for cutting than this *Masdevallia*. It is so free-flowering that it is well worth growing for this purpose alone, besides which the flowers are very attractive on the plants, the white blooms and deep-green leaves contrasting very prettily. During the growing season, and through the summer and early autumn, the plants can hardly be kept too cool; now the flowers are forming they should occupy a house where the night temperature ranges from 50° to 55°. When the flowers are fully expanded, a drier atmosphere is necessary to preserve the delicate beauty of the blossoms. The winter temperature for this species ought not to fall much below 50°, as in a very cold house the leaves are apt to spot badly.

CÆLOGYNE.—The species *C. cristata*, and its varieties *alba* and *Lemoniana*, having now completed their season's growth, the plentiful supply of water hitherto afforded the plants should be reduced. From now onwards until after the flowering stage is over the rooting material, whilst never being allowed to become quite dry, should be kept just moist enough to preserve the pseudo-bulbs in a plump and healthy condition. Henceforward, the plants should be afforded all the light and air possible, and a

cool, intermediate atmosphere. In such a house the flower spikes will be retarded, which has a great advantage when cut flowers are in demand during winter, as a succession of flowers can be kept up for a considerable length of time by removing a few plants at intervals into a warmer house. Any specimens which were remade up last spring should not be allowed to flower, as it usually takes two seasons to re-establish such plants and make them fit for flowering.

PLANTS UNDER GLASS.

By JAMES HUDSON, Gardener to LEOPOLD DE ROTHSCHILD, Esq., Gunnersbury House, Acton, Middlesex.

STOVE FERNS: PROPAGATION.—Many Ferns may be propagated at this season of the year, a case in point being the beautiful *Nephrolepis Marshallii compacta*, a new and distinct variety. This may be readily propagated, both by the stolons and by division when these have already rooted in the pots. We have just broken up several plants of this Fern in order to increase our stock for next season. We divided the plants, and re-set the divisions in quite small pots. The pots were then plunged in fibre refuse in an improvised frame over some hot-water pipes, and covered with the top of a square hand light. I hope by-and-by to repeat the operation, and thus to secure a plentiful supply for decorative uses in less than six months. The claims of this variety, and others of the new forms of *Nephrolepis*, do not so far seem to have been sufficiently recognised. They are extremely attractive plants, and are always much admired when used for decoration, whilst they are by no means tender. It is possible to increase many varieties of *Asplenium* and *Davallia* in a similar manner; the *Aspleniums* from a single frond, and the *Davallias* from the creeping rhizomes which are easily divided.

SEEDLING FERNS.—These will be easily obtainable at this season, and all those should be secured which are likely to be of decorative use. For instance, if the fernery itself is in need of replenishment, the opportunity should be taken of pricking off the seedlings or placing them in small pots.

INCREASE BY MEANS OF FERTILE FRONDS.—Note should be taken of any plants which it is desirable to increase by spores. The methods by which the operation can be performed are many and varied; for example, taking the fertile fronds and pegging them upon sods of peat, laying them upon the soil in pots already containing Ferns, sowing the spores in pots of sandy soil, &c.; or, if it is desired that the Ferns should cover a wall, fronds should be taken from a plant which is known to favour such a position and fixed upon a damp wall. *Adiantum Capillus-veneris* is a Fern of this kind; we have it here thriving well in a forcing pit, and we could get from it a large supply if necessary.

TREE FERNS.—After the trying season we have just experienced, some Tree Ferns will be liable to attacks of thrips. On the appearance of this pest the plants must be at once fumigated, preferably making an application on each of three alternate nights. Meantime, the use of the syringe should be discontinued, or the good effects of the fumigation will be marred. All Ferns should be watched to see that the roots do not suffer for want of water.

DECIDUOUS FERNS.—Some of these are of considerable value. *Davallia bullata*, *Leucostegia immersa*, *Adiantum venustum*, *Lygodium scandens*, and several others are of this nature; but the fact of their taking little space during the resting period should not be allowed to lead to neglect or want of notice, as they require keeping moist and moderately cool. At this season it will be safe to remove the fronds from these Ferns, clearing away any scale insects that may be present.

FERNS THAT NEED EXTRA CARE.—All the *Gleichenias* may be classed under this heading, but if they are well looked after and kept moist and free from insects, they will repay all the care given them. It is advisable to top-dress the soil, thus covering any rhizomes which may have grown above it. The *Gymnogrammes* should also be the subject of special care, and should not on any account be allowed to become too dry.

FRUITS UNDER GLASS.

By E. BECKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Hertfordshire.

STRAWBERRIES.—The plants established in pots for forcing at varying intervals during the ensuing months should by this time have developed good crowns, and where the runners were procured in the first instance from plants unaffected by the drought, they are highly satisfactory. Various means are employed for protecting Strawberry plants during the winter months, but to my mind the best is to stand them closely together in a skeleton or shallow frame, the pots plunged to the rims either in leaves or ashes to protect them from splitting during frosty weather. During periods of rain they may be given the further protection of glass lights. Make quite sure that the plants are placed on a firm basis, such as one formed of cinder ashes.

CHERRIES.—The earliest house of these fruits may now be got into readiness for starting by having the woodwork and glass thoroughly cleansed and attention directed towards the border. The planting or shifting of trees should be done without delay. It should be remembered that excellent fruit is obtained under glass from cordon trees. The soil best suited to Cherries is good loam of a calcareous nature, and if this is lacking, a plentiful supply of mortar rubble should be incorporated, and failing that a liberal addition of coarse road grit. An important item in their culture is the provision of perfect drainage for the roots, and the avoidance of borders of too great a depth. From 2 to 3 feet will in most cases be ample, as during the growth of the fruit any stimulants that are necessary can be afforded. The surface soil of old borders should be removed and a top-dressing added of chopped-loam, lime-rubble, wood-ashes and a sprinkling of a reliable fruit manure. Any necessary pruning should be done beforehand, but if proper attention was paid to stopping the growth before the wood became matured only an occasional shortening will now be needed. This is of great importance, as nothing is more fatal to Cherry trees than a too free use of the knife. Examine the ties, and remove those that have become too tight on the growths. Stout growths should be protected by the addition of a small, neat but effective piece of cloth or shred before effecting the ties to prevent injury to the bark. Admit a free circulation of air day and night.

FIGS.—Permanent trees are specially apt to become too thick in growth, and whilst the tree is dormant it is a good plan to rigorously thin out the old wood as much and as near to the base as possible. To have the tree well balanced with young wood should be the aim of every grower, and nothing is to be gained by overcrowding. Care must be taken that ties are not made too tightly, as the wood swells very rapidly and growths are soon injured. For the majority of the growths, fine tarred string is preferable. Few fruit trees are more susceptible to the attacks of mealy bug than the Fig, therefore every means should be taken to destroy this pest whilst the trees are dormant, but though the pest may be lessened, unless drastic measures are taken, it is almost sure to reappear again when the houses are closed. After the wood has been thoroughly washed, extra care should be taken that the whole of the rubbish and surface soil are removed, and all hiding places painted with methylated spirits.

THE HARDY FRUIT GARDEN.

By W. HEDLEY WARREN, Aston Clinton Gardens, Buckinghamshire.

REMOVING TREES.—The removal of large fruit trees from one position to another is frequently found to be necessary for various reasons which need not be enumerated. If the operation is carried out carefully it usually causes a tree which has been growing too vigorously to enter upon a more fruitful state. In the carrying out of this kind of work, every care should be taken not to damage the roots or branches more than is necessary, lifting the tree with as many roots, and as large a ball of earth as possible. Commence operations by digging out a trench to the depth of the soil or border at not less a distance than 6 feet each way from the stem of the tree. When the trench has been dug out, loosen and remove a portion of the soil which is on the upper side of the general mass of roots, using a garden

fork for that purpose, after which a portion of the soil must be removed from the under side, which is best done by undermining the roots, and in that way loosening and disentangling them from the ball of earth, to the desired distance from the stem of the tree. Great care should be taken not to bruise any of the remaining roots, pruning with a sharp knife close up to a lateral root any that it may be found necessary to remove. When the tree has been thus loosened, the roots and branches should be tied carefully into position to prevent injury during transit, and the entire ball of earth wrapped in mats or sacking, securely tied, to keep the whole mass intact during removal. In this way the tree may be safely removed to the place where it is to be replanted, with every chance of success. The border in which the tree is to be planted should have been previously prepared according to directions given in a former calendar. Let the hole be dug out so large that the roots may be fully extended, and so deep that the upper layer of roots will be covered with soil to a depth of not more than 5 inches. The tree should be placed high enough to allow for the settling of the soil, so that the roots may finally be at their proper level with the rest of the border. Whilst planting operations are going on, care should be taken that the soil is worked well in amongst the roots in their respective layers, so that no hollow places are left. After filling in, the whole should be moderately pressed down by carefully treading over the surface, and the tree well watered in, afterwards applying a good mulching of half-decayed stable manure. The end of October, or early in November, is a most seasonable time of the year for doing this kind of work for almost every class of fruit tree, and unless the weather should prove unusually dry for the time of year, trees so treated will not require more water at the roots until the following spring or summer, when it may become necessary. The upper parts of the trees should, however, be kept moist for a few days after removal by frequent syringings, that is unless the weather be showery. Regarding the pruning of the branches at the time of removal, but little is necessary, beyond the removal of any shoots that may have been damaged. When a tree is not in a sickly or weak condition, it is better not to shorten the branches, and if a tree can be so managed as to do well, whilst retaining its entire head, it is better not to resort to the practice of shortening the branches. Healthy trees treated as described, generally bear a crop of fruit the following summer, whilst over luxuriant trees, by reason of the check they undergo, are brought into a fruitful condition.

THE KITCHEN GARDEN.

By JOHN DUNN, Kitchen Garden Foreman, Royal Gardens, Windsor.

LETTUCE.—Late-planted Lettuce in the open garden should be lifted before there is any risk of injury by frost, and placed in cold pits, such, for instance, as were recently occupied by Beans or similar crops. Lift the plants carefully, retaining a good quantity of soil about the roots, and after they are planted, give them a plentiful supply of clear water. After they have begun to grow, the lights should be removed until frosts occur, when they may be taken off in the day, but should be replaced each night. Lettuces raised from seed in September may now be transplanted in a south border, where they should survive the winter, and come into use early next season. Sparrows are sometimes found to be troublesome to this crop, but frequent light dustings of soot will render the plants unpalatable to the birds, and also preserve them from slugs.

BEET.—The latest sown Beet should be lifted as soon as possible, and great care should be exercised in this operation that the roots are not injured by the breaking or scratching of the skin, or the Beet will suffer in colour when it is cooked. The roots should be stored in a dry, frost-proof shed, with a little dry sand worked in among them, in order to keep them plump.

TOMATOS.—Plants intended to produce ripe fruit early in April will now be ready for potting into 4-inch pots in which they should be grown until the end of November. The pots should first be washed and carefully crocked, then a compost prepared of sandy loam three-parts, leaf-mould one-part. The leaf-mould should be sweet and such as has never been overheated. Pot the

young seedlings moderately firm, placing them within a few inches of the roof-glass in some pit which can be kept closed for a few days until the plants commence to make fresh growth, when air should be admitted to keep them of sturdy habit. Water the plants carefully, and protect them from cold draughts. The atmospheric temperature at night need not exceed more than 50°. Those plants from which supplies are expected during winter should be kept in a temperature of 55°, admitting air as much as practicable. If the plants are allowed to become very dry at the roots, it will be found that many of the fruits will split later when water is applied. Weak manure water may be given to the plants whilst the fruits are green.

PARSLEY.—Plants in pits which are intended for use during rough weather should be picked close to the crowns in order to induce the plants to produce short stocky leaves which will stand the winter. Hoe the soil between the plants and give slight dustings of soot. The plants should be left uncovered as late in the season as possible, only replacing the lights when frost or snow is expected. Overgrown Parsley in the open garden should be divested of all decaying foliage. Keep the ground free from small weeds by the frequent use of a Dutch hoe between the rows.

CABBAGE.—The earliest plantation of Cabbages for spring use will be making good progress, and the ground should be hoed frequently while fine weather lasts in order to destroy all small weeds which make their appearance at this season. Fill up all blanks in the rows by taking plants from the seed-bed, and dust all the plants freely with lime in the early morning late at night, while the slugs are about. If any young plants are left over they should be pricked out 4 inches apart in beds to make fresh plantations in spring.

THE APIARY.

By CHLORIS.

TEMPER AMONG BEES.—There is an idea prevailing that bees are desirous of inflicting pain upon man, whereas they are lovable creatures, and well worth close study. It is by noticing when they resent us interfering with the internal economy of the hive that we can take precautions to avoid our wills clashing with theirs. The best time to manipulate a colony of bees is during the middle of the day, when the great bulk of the bees are foraging, and the worst is just after a heavy thunder shower, when all the nectar has been washed out of the flowers, and the bees are consequently doing nothing. Let the over-anxious endeavour to do anything among the bees during this interval and he will pay dearly for it. Again, at the end of the season some beekeepers are so foolish as to leave frames, after extracting, in the vicinity of the hives; it is dangerous then to approach the hives, and if a road be near passers-by may also suffer. Bees then seem perfectly crazy, and it is useless to go near them until the commotion has subsided, and the dripping frames are either emptied of their sweets, or night has come, and the frames have been removed. This feeding on honey in the open always incites to robbing, whereas syrup-feeding or pea or other meal-feeding does not cause any trouble.

PURCHASING BEES.—The present is not a good time to purchase bees in skeps for transferring to bar frame hives next spring. The combs now are rather soft and very full of honey, if they are not they should be, if the bees are to winter well, and when the hives are overturned for carrying to their new site, the combs are very liable to break away from their bearings. When this happens many bees are often crushed, and possibly the queen among them. If bees are purchased now it should be on condition that they are permitted to remain upon their old site until next April, when the combs will be lighter and tougher, and consequently will bear a jar and overturning better.

WIND BREAKS.—Where an apiary is very exposed the present is an excellent time to plant either forest trees or evergreen shrubs or fruit trees on the north and east sides. The evergreen especially would afford ample protection in a few years. A piece of trellis work may be covered with plants that ramble well and form at the same time a pretty division in the garden.

APPOINTMENTS FOR NOVEMBER.

WEDNESDAY, NOVEMBER 1—
National Chrys. Soc. Exh. at Crystal Palace (3 days).
Bath Chrys. Sh. (2 days). Kent County Chrys. Soc.
Sh. at Blackheath (2 days). Forest Hill Chrys. Sh.
Portsmouth Hort. Soc. Autumn Sh. (3 days).

THURSDAY, NOVEMBER 2—
Torquay Chrys. Sh. Linnean Soc. meet.

FRIDAY, NOVEMBER 3—
Soc. Nationale d'Hort. de France (Paris) Chrys. and
Fruit Exh. (10 days).

SATURDAY, NOVEMBER 4—
Soc. Française d'Hort. de Londres meet. Wood Green
Chrys. Sh.

TUESDAY, NOVEMBER 7—
Roy. Hort. Soc. Coms. meet. (Lecture at 3 p.m. by Mr.
Jas. Hudson, on "The Culture of the Fig in Pots.")
Hort. Club Dinner and Meeting. Birmingham & Mid-
land Counties Chrys. Sh. at Bingley Hall, Birmingham
(3 days). Scottish Hort. Assoc. meet. Southampton
Chrys. and Fruit Sh. (2 days). Oxford Chrys. Sh.

WEDNESDAY, NOVEMBER 8—
Cardiff Chrys. Sh. (2 days). Dorchester Chrys. Sh. (2
days). Liverpool Hort. Soc. Chrys. Sh. at the Corn
Exchange (2 days). Weston-super-Mare Chrys. Soc.
Sh. (2 days). Finchley Chrys. Sh. (2 days).

THURSDAY, NOVEMBER 9—
Exeter Chrys. Sh. (2 days). Putney, Wandsworth and
Dist. Chrys. Sh. at Putney (2 days). Haslemere Dist.
Chrys. Soc. Exh. Forest Gate and Stratford Amateur
Chrys. and Hort. Soc. Sh. (3 days).

FRIDAY, NOVEMBER 10—
Bradford Chrys. Sh. (2 days). Leeds Paxton Chrys. Sh.
(2 days). Huddersfield and Dist. Chrys. Sh. (2 days).
Windsor, Eton and Dist. Chrys. and Hort. Soc. Sh.
Altrincham and Dist. Chrys. Soc. (2 days).

MONDAY, NOVEMBER 13—
United Hort. Benefit Soc. Com. meet.

TUESDAY, NOVEMBER 14—
Ulster Hort. Soc. Sh. (2 days). Saltaire, Shipley and
Dist. Rose Soc. Ann. Meet. Plymouth Chrys. Sh.
(2 days). Chester Paxton Soc. Ann. Fruit and Chrys.
Sh. (2 days). Belfast Chrys. Sh. (2 days).

WEDNESDAY, NOVEMBER 15—
Newcastle & Dist. Chrys. Soc. Exh. (2 days). Buxton
& Dist. Chrys. Sh. Woolton & Dist. Chrys. Soc. Sh.

THURSDAY, NOVEMBER 16—
Scottish Hort. Assoc. Chrys. Sh., Edinburgh (3 days).
Newport (Mon.) Chrys. Sh. Linnean Soc. meet.
Sheffield Chrys. Soc. Sh. at the Corn Exchange
(3 days).

FRIDAY, NOVEMBER 17—Bolton Chrys. Sh. (2 days.)

MONDAY, NOVEMBER 20—
Nat. Chrys. Soc. Executive Com. meet.

TUESDAY, NOVEMBER 21—
Roy. Hort. Soc. Coms. meet. (Lecture at 3 p.m. by
Mr. E. White, on "The International Horticultural
Exhibition, 1912.")

FRIDAY, NOVEMBER 24—
Aberdeen Chrys. Sh. (2 days). Hawick Chrys. Sh.
(2 days).

WEDNESDAY, NOVEMBER 29—
Irish Gard. Assoc. & Benev. Soc. meet.

THURSDAY, NOVEMBER 30—
Roy. Hort. Soc. Colonial Exh. (3 days).

AVERAGE MEAN TEMPERATURE for the ensuing week
deduced from observations during the last Fifty Years
at Greenwich—46.7°.

ACTUAL TEMPERATURES:—

LONDON.—Wednesday, October 25 (6 p.m.): Max. 55°;
Min. 38°.

Gardeners' Chronicle Office, 41, Wellington Street,
Covent Garden, London.—Thursday, October 26
(10 a.m.): Bar. 29.4°; Temp. 51°; Weather—
Dull.

PROVINCES.—Wednesday, October 25: Max 48° Oxford;
Min. 35° N. of Scotland.

SALES FOR THE ENSUING WEEK.

MONDAY—

Greenhouse Plants, Bees, Cow, Hay, &c., at Broom
House, Broomhouse Road, Fulham, S.W., by Protheroe
& Morris, at 1.

MONDAY, TUESDAY, WEDNESDAY, THURSDAY
AND FRIDAY—

Dutch Bulbs at Protheroe & Morris's rooms, at 10.30.

MONDAY, WEDNESDAY AND THURSDAY—

Rose trees, Rhododendrons, Conifer, Bulbs, Lilliums,
&c., at Stevens's Auction Rooms, 33, King Street, Covent
Garden, London, W.C., at 12.30.

WEDNESDAY—

13th Annual Sale of Nursery Stock, at Shortland's
Nursery, Shortlands, by order of Mr. J. Bryant, by
Protheroe & Morris, at 11.

Roses, at 12.30; Palms and Plants at 5; at 67 & 68,
Cheapside, E.C., by Protheroe & Morris.

Palms, Bay Trees, Azaleas, &c., from Ghent, at Stevens's
Auction Rooms.

THURSDAY—

Nursery Stock, by order of the exors. of Mr. B. F.
Slowcock, at Upton Court, Slough, by Protheroe &
Morris, at 12.

FRIDAY—

Nursery Stock at White Hill Nursery, Crowborough,
by order of Mr. H. Welfare, by Protheroe & Morris,
at 12.

Orchids in variety, at 67 & 68, Cheapside, E.C., by
Protheroe & Morris, at 12.45.

International
Exhibition:
Charges
for
Admission.

The high prices, fixed by the
Directors, for admission to
the International Exhibi-
tion of 1912, have been the
subject of a certain amount
of adverse criticism, both in these columns
and those of our contemporaries.

So far as we may judge from the cor-
respondence which has been addressed to
us objection is taken to the original prices
on three grounds: first, that the charges of
admission for the general public are so
prohibitive as to be calculated to prevent
many people from visiting the Exhibition;
second, it is urged that professional gar-
deners should receive considerable conces-
sions in order that large numbers may avail
themselves of the instruction and enjoy-
ment which the great Horticultural Exhibi-
tion will provide for them; third, that Fel-
lows of the Royal Horticultural Society are
entitled to greater consideration than is
vouchsafed to them under the original
scale of charges.

We will deal with these claims in the
order in which we have stated them. With
respect to the general public, the revised
prices of admission, given in the official
communication printed on another page,
make very considerable, albeit conditional,
reductions on those originally proposed.
The prices of admission for the first
five days are to be reduced by one-
half for all who visit the Exhibition
after 5 o'clock. Inasmuch as the Show
is to remain open until 10 o'clock, visi-
tors who take advantage of the lower
rate will have five hours in which to in-
spect the exhibits. We are of opinion
that the concession will go a long way to
satisfy those who have urged a reduction
of prices, though whether it satisfies them
completely will depend on the weight they
attach to the arguments urged by the
Directors in support of their decision to
maintain the original prices for admission
before 5 p.m. on each day. Those respon-
sible for the Exhibition point out that the
space at Chelsea is much less than could
have been utilised; in short, the pre-
valent idea that the site at Chelsea
provides ample room turns out to be erro-
neous. This being the case, it is the boun-
den duty of the Directors to prevent by all
means in their power such overcrowding as
mars, for example, the Temple Shows.
Further, on the first day, no little time will
be taken up by the opening ceremonies:
the work of the large International Jury
must also be performed on that day; and
during such time as is left before 5 o'clock
it should be possible for the foreign
guests and those most interested in the
exhibition, to view it in detail and in some
measure of comfort. But of all the argu-
ments adduced to justify the decision of the
Directors, the most weighty is that they
must bear the heavy financial burden im-
posed by the Exhibition.

The sums of money which they must
pay away before the Show opens are
very large, and it is not only their
right, but their duty, to take measures
to ensure that the 1912 Exhibition shall
be a financial success. They have to
consider not only the general public,
but also their tacit obligations to the guar-

antors to make income and expenditure at
least balance. All things considered, we
think that they are performing this difficult
task with a just sense of equity. It would
doubtless be a popular thing to lower prices
all round; but if this were done, and finan-
cial loss were the result, the interests of
horticulture would be seriously impaired.

Let us turn now to consider the second
ground of complaint, that raised on be-
half of the professional gardeners. The
claims of the professional gardener for
reduced prices are far greater than those
of the general public. The success of
the Show depends ultimately on him. The
exhibits are in no small measure the pro-
ducts of his skill, and his judgment of the
value of the exhibits will have a lasting in-
fluence on the development of horticulture.
Therefore, he, of all men, should be wel-
comed to the Exhibition, and anything
which might tend to hinder him should be
removed. We are glad to say that this
much is fully recognised by the Directors,
who announce that very substantial reduc-
tions in the price of admission will be made
to gardeners. After the first day, on which
no reduction is to be made for gardeners,
the prices for admission are to be reduced
to one-quarter for the four following days;
admission on the second day will be 5s., on
the third day 2s. 6d., and on the fourth and
subsequent days 1s.

Till the day arrives when finance ceases
to vex the mind of man, we do not think
that organisers of exhibitions such as this
International Show could venture on pro-
posing more liberal terms.

Lastly, the concessions which are to be
made to members of the R.H.S. have not as
yet been announced, and all we may say is
that they will be announced at an early
date and simultaneously in the various hor-
ticultural journals.

Intelligent anticipation may, however,
permit the reflection that the claims of
Fellows of the R.H.S. for considerable re-
ductions are less substantiated than those
of professional gardeners. It is true that
the R.H.S. gave a generous donation of
£1,000 towards the expenses of the exhibi-
tion; but it is to be observed that this was
a donation and not an advance payment for
tickets on behalf of the Fellows. If the
donation is urged in support of a claim to
reduction in the price of admission, then
the reduction due to each Fellow amounts
to something less than two shillings for one
day only. We are aware that Fellows may
urge their case on other grounds, and that
those grounds may be valid; but the cost of
the Exhibition has to be met, and we trust
that this hard fact will be taken into con-
sideration by all parties when forming an
opinion of the concessions which have
been, or are to be, granted, and that all
will do their utmost to make the Show a
brilliant success.

ARTS AND HANDICRAFTS.—We are informed
that an Exhibition of Arts and Handicrafts will
be held by *The Englishwoman* at the Maddox
Street Galleries from Wednesday, November 1,
to Tuesday, November 14, 11 a.m. to 6 p.m.
It will be opened on November 1 by The Lady
FRANCES BALFOUR at 3 p.m. There will be a Gar-
deners' Stall, arranged by women gardeners.

THE FIRST HYBRID ARISTOLOCHIA.
ARISTOLOCHIA KEWENSIS (A. BRASILIENSIS \times A. TRILOBATA).

"**THE BOTANICAL MAGAZINE.**"—The issue for October contains illustrations and descriptions of the following plants:—

LISSOCHILUS STYLITES, tab. 8397.—This mauve-coloured species of Orchidaceæ from Southern Nigeria, was described by the late Professor REICHENBACH in 1878. It grows in hot and moist localities, and it is suggested that it might be cultivated in this country by planting it in a large pan of peat and Sphagnum moss, half submerging the pan during the growing season in a tank suitable for *Victoria regia*, with the water at a temperature of about 75° Fahr. The plant requires to be kept in a fairly dry condition for two or three months after the leaves have withered.

APHELANDRA FASCINATOR, tab. 8398.—This brilliant stove plant is described by Dr. STAFF. The species was discovered in Colombia in 1872, and was first described from a plant in Mr. LINDEN'S nursery at Brussels and flowered in 1874. The form now figured was collected in the neighbourhood of Bogota by Mr. D. BOWMAN when travelling on behalf of the Royal Horticultural Society between 1866 and 1868. *A. fascinator* is one of the most useful and prominent members of the Acanthaceæ, being easy to grow in a warm, moist greenhouse, where it flowers abundantly in winter. Propagation is effected by cuttings which are rooted in spring.

SPIRÆA WILSONII, tab. 8399.—Mr. BEAN describes a new species of *Spiræa* collected by WILSON in Central China. *S. Wilsonii* most nearly resembles *S. Henryi*, but *S. Henryi* has more frequently and more coarse toothed leaves, which are slightly lustrous and less pubescent. The corymbs are laxer with pilose pedicels and a hairy calyx tube. *Spiræa Wilsonii*, moreover, flowers a fortnight earlier than *S. Henryi*. The flowers are white.

RHODODENDRON AMBIGUUM, tab. 8400.—Mr. BOTTING HEMSLEY describes this pure yellow-flowering species of *Rhododendron*, introduced from Western China by Messrs. J. VEITCH & SONS. It is described as being near to the Himalayan species, *R. triflorum*. The plant is quite hardy.

BUDDLEIA OFFICINALIS, tab. 8401.—This new Chinese species of *Buddleia* forms the subject of our Supplementary Illustration of the issue for April 1, 1911, p. 201, to which we refer our readers. The flowers are pale mauve with an orange-tinted eye.

GHEENT QUINQUENNIAL, 1913.—The provisional programme of the Exhibition to be held at Ghent in April, 1913, under the auspices of the Société Royale d'Agriculture et de Botanique de Gand, with the patronage of his Majesty the King of the Belgians, is already to hand—a little more than a year before the contemplated event. The schedule, which is a provisional one, provides 27 groups, comprising 780 classes, which provide for every important branch of horticulture. Orchids and new plants will be prominent features. A map is included, which gives a comprehensive plan of the buildings to be erected on the exhibition ground. The Horticultural and Fêtes Palace alone covers a space of 30,000 square metres, and the cost of erection will be 1,750 francs. Evidently no expense will be spared to make this exhibition one of the finest that has ever been held. The last section but one comprises various classes under the heading of "higher education in horticulture," and this is of special interest, as showing the advance of science in connection with such subjects as hybridisation, plant physiology, and plant diseases. Thus, one class will be for "A biological collection showing the adaptation of plants to dry conditions" (724); another "A collection showing the favourable influence of

mutual symbiosis on the germination of Orchids" (732). The study of such subjects should be encouraged in every way, and one of the best means consists in thus giving awards in open competition to those who have given most time and attention to these matters. It is to be hoped that the opportunity for long preparation, which the promoters of the Exhibition have provided by thus early publishing the necessary particulars, will enable a large number of horticulturists to participate in the show, and that an unprecedented success will crown the efforts of those responsible for the arrangements.

MOVEMENT TO ACQUIRE THE CRYSTAL PALACE.—A meeting was held at the Mansion House on the 23rd inst. to consider the question of the acquisition of the Crystal Palace and its grounds for the use of the public. A resolution moved by the LORD MAYOR, declaring that the Crystal Palace and its ground should be acquired for the public, and appointing a committee to make arrangements for an appeal for funds from the Mansion House, and to consider the most practical scheme for the future management and control of the Palace, was carried. A sum of £12,000 was promised, and when the amount has been increased to £20,000, the public appeal will be issued.

THE L.C.C.'S SURPLUS PLANTS.—At a meeting of the Education Committee of the London County Council on the 18th inst. the General Purposes Sub-Committee reported that, for several years past, it had been the custom in the autumn to distribute among the Council's schools about 40,000 plants for cultivation, consisting mainly of surplus bedding plants removed from the flower beds in the Council's parks. A similar number of plants was again available this year. The extra work involved in the selection, pruning, and packing of the plants had in past years been met by the temporary employment of additional staff, working under the supervision of the superintendent of the botany depôt, as the staff of the botany depôt is fully occupied. It was, therefore, decided to recommend the Council to engage an experienced gardener and three youths for three weeks.

PROPOSED GUIDES FOR KEW GARDENS.—The *Times* publishes an interview with Lieut.-Col. PRAIN on this subject. Lieut.-Col. PRAIN said he did not think there was any great necessity for such guides, for at the principal entrances to the gardens notices were posted indicating to visitors what were the sections most interesting and most worthy of a visit. The stranger who had only a limited time at his disposal could see at a glance what were the features of the gardens for the time being. All he had to do was to purchase a key plan, price twopence, and compare the letter and figure on the notice with the map. The Government would not agree to further grants from the Treasury for the purpose of paying guides. The expense would not be justified. Kew Gardens were entirely dependent on the weather for the number of visitors, and while for one or two months of the year there would be plenty for professional guides to do, for the greater period they would be practically idle.

"**THE AMERICAN NATURALIST**" for April, 1911, contains a second series of Dr. B. M. DAVIS'S "Genetical Studies on *Oenothera*." This contribution deals with "Some Hybrids of *O. biennis* and *O. grandiflora* that resemble *O. Lamarckiana*." Until recently it was assumed that *O. Lamarckiana* was a wild species in the ordinary acceptance of the term, and DE VRIES'S *Mutationstheorie*, as Dr. DAVIS remarks, rests mainly on the behaviour of this plant under cultivation. In the *Mutationstheorie* of DE

VRIES the behaviour of *O. Lamarckiana* in giving rise to the so-called mutants is presented as evidence that new species have come into existence without intermediate steps from a form which is assumed to be typical of a species in nature. The question of the status of *O. Lamarckiana* has occupied the attention of Dr. DAVIS and other American botanists ever since the theory was first put forward. Nobody has succeeded in finding typical *O. Lamarckiana* in a wild state, and it is now supposed that it is a hybrid of garden origin. Dr. DAVIS has raised a large number of hybrids between *O. biennis* and *O. grandiflora* in order, if possible, to establish the parentage of *O. Lamarckiana*, and although his numerous experiments have not resulted in a hybrid identical with *Lamarckiana*, some of them are so exceedingly near that they must be classified with it. Dr. DAVIS will continue his experiments, and is sanguine of obtaining the evidence required to establish the origin of this interesting plant.

TOXIC PRINCIPLES AFFECTED BY CULTIVATION.—It is generally recognised that plants, which, in the wild state, contain poisonous substances of a nitrogenous character, tend, under the influence of cultivation, to contain a smaller amount of these toxic principles. COMES, for example, has stated that if a plant, which, in its wild state, was of therapeutic value, be cultivated for several generations on manured and irrigated soil, it becomes in time quite useless, owing to the disappearance of the active principles. A familiar example is afforded by the Almond, the prussic acid-forming glucoside of which, always present in bitter Almonds, has disappeared from the cultivated sweet Almond. Conflicting statements have been made of late years as to the toxicity of different varieties of *Phaseolus Beans*, some of which have been proved to contain prussic acid in the form of a glucoside. Recently Messrs. SCURTI and TOMMASI, of the Rome Agricultural Chemical Experiment Station, have determined the effect of nitrogenous fertilisers on *Phaseolus vulgaris* and *P. multiflorus*, collecting and analysing the seeds in each case. Particular attention was directed to the amount of non-protein nitrogen, which is taken as a measure of the toxic principle. The results conclusively show the presence of a larger proportion of non-protein in the Beans from the unmanured plants. The application of sodium nitrate, for example, reduces the amount of toxic nitrogen in the seeds to about one-third of that present in the seeds of similar plants grown on unmanured soil.

ENGLISH MEADOWS AND UPLAND FARMS.—At WALKER'S Galleries is an exhibition of water-colour drawings by ALICE FOWLER and FRANK FOWLER. The drawings of each artist are hung apart, and as the first-named shows, for the most part, English views of rural and garden interest, and the latter a series of Japanese and Indian sketches, they form, in subject, an agreeable contrast. Perhaps the Indian views by FRANK FOWLER show more of that quality and finish which is specially looked for in architectural drawings, such as his charming series of the wonderful white marble domes of the ever-fascinating "Taj Mahal," which he has depicted in the varying light and effects of "Morning," "Noon-day," "Evening," "Night." But, on the other hand, ALICE FOWLER excels in the freshness of her colour and the free handling of that medium which is so easily "overworked" by the strenuous person; for "water colours," like pastry, need a light hand and heart in the making. And we must confess that English meadows and English skies have a charm of colour and delicacy of tone which cannot be eclipsed or even equalled by any Oriental magnificence in contrasted colour or unusual form. Simple studies of farm incidents delicately accented in

colour and form, such as her "Autumn Ploughing" in the early morning mist, with its restrained tinting and almost monochromatic effect, are worth many times more than the showy sketches set forth by the dabblers and dashers at the majority of the "one-man shows" to which we are accustomed. "Rising the Hill," again, is an interesting study of old-time ploughing. The men and horses are deftly silhouetted against the sky, and the warm, up-turned earth, cleverly accented by dark touches, which resolve themselves into birds as one gazes at this record of a phase of English labour which is fast becoming foreign and unfamiliar to English eyes. It remains to mention "The First Spring Day," in which a dark, Ivy-bound tree, with bare, red branches, stands out conspicuously in contrast to the pale, spring colour of the undulating meadow land, and the pale, warm tinting of the wind-blown clouds above it. The touch of silver-white on the blossoming Sloe trees strikes the true note of springtime. Another mood is touched by a low-toned sketch entitled "Home, Sweet Home." Twilight, a thatched cottage, warm, fire-lighted windows, a garden gate, flanked by tall Evening Primroses, opening their yellow hearts in welcome to the returning labourer, who lifts the garden latch, strike a far-off note of restfulness and peace—not echoed in Bond Street! *Mary L. Breakell.*

SCOTLAND.

COST OF EDINBURGH PARKS AND GARDENS.

THE accounts of the City of Edinburgh for the year ending May 15 last have just been published. The expenditure of the parks and gardens is stated as £14,414 10s. 3d., and the revenue from rents of pasturage of public parks, bowling green, and golf-course dues, &c., as £2,632 17s. 1½d. In addition to the ordinary expenditure there is included under the heading of capital expenditure the sum of £921 15s. 7d. for new works at public parks.

THE WAVERLEY MARKET ROOF GARDEN.

It is proposed by the Parks Committee of Edinburgh Town Council to remove the railings between the garden on the roof of the market and Princes Street. This suggestion has been made for some time, and many will be glad to learn that it is likely to be carried through. A point which is now being considered is regarding what alterations may be necessary to the roof in consequence of the opening up of the garden.

A GARDEN SCHEME FOR THE CALTON HILL, EDINBURGH.

A SOMEWHAT extensive scheme is put forward for the improvement of the historic Calton Hill, Edinburgh, the prominent eminence which is a favourite place of resort for visitors, and is seen so conspicuously when looking towards the east end of Princes Street and Waterloo Place. The proposal is to improve the approaches to the hill and to lay out gardens. The subject has been broached at some of the meetings in connection with the forthcoming municipal election, and has, so far, been well received, although it remains to be fully considered by the council.

BAMBUSA FASTUOSA.

THE illustration at fig. 136 shows a very fine specimen of this Bamboos growing in a small front garden at Reading, and forming, for such a situation, a very striking and beautiful object. Mr. T. W. Henwood informed me that he planted it as a single growth about 12 years ago, after preparing a special station for it by digging out a load of soil and replacing it with new soil, enriched with an equal quantity of cow manure, which was mixed thoroughly with the soil. After planting somewhat firmly, it was liberally watered, and a top-dressing of cow-

FIG. 136.—BAMBUSA FASTUOSA.

manure applied about a week afterwards. A similar dressing was given every season for four or five years, and plenty of water has been supplied during the summer months. The exposure is east and north, protection being only afforded by the house on the west. At present the plant consists of a compact bunch of stout rods, each rod being over an inch in diameter and bearing foliage nearly 30 feet high. As will be seen, it is of more compact habit than most Bamboos, and, by its graceful growth and perfect hardiness, is peculiarly fitted for its position. *C. T. D.*

THE FOURTH INTERNATIONAL CONFERENCE ON GENETICS, PARIS.

(Concluded from p. 287.)

HYBRIDS.

CAMPANULA PYRAVERSI.

MR. F. CAYEUX, Seedsman, 8, Quai de la Mégisserie, Paris, described a new *Campanula*, the result of a cross between *C. versicolor* and *C. pyramidalis*. The hybrid to which he has given the significant name of *C. pyraversi* is fertile. Many of its characters are intermediate between those of the parents; amongst others,

flower colour and diameter, number of flowers in each group on flower-stem, and so on. Other characters are those of one or other parent and persist; for example, the glands on the teeth of the leaves and prolonged period of flowering are paternal characters, yet other characters are new, namely length of petioles and radical leaves.

HYBRID PEAS.

Mr. Arthur Sutton gave an account of crosses between a wild Pea of Palestine, collected by himself, and the culinary Pea, *Pisum sativum*. The object of the experiments was to obtain evidence of specific identity of the wild with

the domestic Pea. Mr. Sutton found the wild Pea in 1904. It grows to a height of about 1 metre, and, though it has green leaf axils, was found, when grown from seed at Reading, to bear unicoloured magenta flowers and olive-green brown-spotted seeds.

Crosses were made between the Palestine Pea and *Pisum sativum* and also between the former and *P. arvense*, which is sometimes considered to be a sub-variety of *P. sativum*.

In the large majority of cases the F_1 plants were sterile, but in four cases, two being crosses with *P. sativum* and two with *P. arvense*, F_2 and F_3 generations were obtained. The F_1 generation showed that colour is dominant, and that the colour was not uniform but "bi-color." As a result of the experiments it cannot be concluded that the Palestine Pea is a precursor of the commercial Pea, for, though certain among the hybrids proved fertile, yet the general characters of the Palestine Pea—coloured flowers, denticulate leaves, woolly hairs in the pods, character of seed—are very different from those of *P. sativum*.

The paper was illustrated by specimens of the seeds of the Palestine Pea and its hybrid progeny.

THE UNIFORMITY OF FIRST GENERATION HYBRIDS.

Mr. Gard, reporting the results of experiments with plants of the genus *Cistus*, drew attention to exceptions to the general rule that the first generation of a hybrid consists of uniform individuals.

In *Cistus* crosses the first generation consists of individuals which differ with respect to foliar and other characters. Further reciprocal crosses between *Cistus* are in some cases identical and in others not.

Professor Swingle also showed different types of plants obtained in the F_1 of *Citrus* crosses.

HYBRID "TOBACCO" PLANTS.

Mr. M. G. Bellair, Head Gardener at the National Palaces, recorded results obtained by crossing species of *Nicotiana*.

N. sylvestris pollinated by *T. tabacum* yields an F_1 exhibiting in most respects the characters of the latter species. The F_2 generation yields a number of types of which some are sterile, others feebly fertile. In F_3 plants resembling the two parents are obtained. Those derived from *Nicotiana sylvestris* and *N. tabacum* do not behave like the pure species. When crossed with one another they produce a large series of forms: giants, dwarfs, white, rose, red-coloured, and striped flowers.

THE ORIGIN OF CULTIVATED OATS.

Mr. L. Trabut reaches the conclusion that the Oats in cultivation are derived from several natural species. General opinion holds that the Oats of cultivation (*Avena sativa*) are derived from *A. fatua*.

A study of the Oats of the Mediterranean region has led Mr. Trabut to conclude that they are derived from *A. sterilis*. Other cultivated Oats are to be regarded as descended from *A. barbata*.

The general conclusion reached is that Oats of temperate and mountainous regions are descended from *A. fatua*; those of southern Oats are to be regarded as descended from *A. barbata*.

DOUBLE FLOWERS.

Miss E. K. Saunders, Newnham College, Cambridge, gave a résumé of her work on the genetics of double flowers. In Stocks, the doubles form neither pollen nor ovules, and are derived from seed produced by pollinating singles with pollen derived from single plants. Two types of singles exist: true singles and what may be called "double singles." These two forms, though indistinguishable, behave entirely different with respect to reproduction. The true singles yield only single-flowered progeny; the double-singles give rise to both doubles and singles, and generally to more of the former than the latter.

From the behaviour of double-singles when crossed with singles, it is concluded that the character "single" is determined by the presence of two factors, the double character appears in the absence of one or other of these factors. The pollen of the double-singles (singles which, when crossed with singles, yield singles and doubles) is incapable of carrying one or the

other of the two factors which produce singleness. The whole investigation is of the greatest scientific interest, and shows how by patient experiment the most difficult cases may be found to conform with Mendelian law.

Incidentally it may be mentioned that Miss Saunders confirms to some extent the opinion which has been put forward often, that old seed gives a higher proportion of doubles than is given by fresh seed. This she attributes to the greater vitality of doubles. The suggestion made by Chaté that seed situated at the lower part of the capsule gives a high proportion of doubles is not confirmed. If the former view turns out to be correct, it should not be impossible to rogue out the singles by artificial means, and so to secure seed giving doubles only.

"LEFT-HANDED AND RIGHT-HANDED" CEREALS.

Mr. R. H. Compton, Botanical Laboratory, Cambridge, has investigated the inheritance of "left-handedness" and "right-handedness" in the leaves of various cereals. As is well known, the leaf of Barley, Oat, Maize, &c., is, when young, so rolled that one edge covers the other. The rolling may be in one direction or the other, and hence the one may be termed right and the other left-handed. Breeding tests indicate that the character is not hereditary, the proportion of left-handed to right-handed leaves remaining constant, no matter whether the parent was left- or right-handed with respect to its leaves.

A similar conclusion was reached with respect to the spiral twist which characterises mature leaves of Barley and Oat.

THE PRODUCTION OF WHEAT OF HIGH BREAD-MAKING VALUE.

Dr. Charles E. Saunders, Cerealist to the Government Experimental Farms, Ottawa, gave an account of experiments conducted in Canada with the object of obtaining varieties of Wheat having both the qualities of earliness and high bread-making value.

The variety popular in Canada, Red Fife, gives good results, but is somewhat late in certain regions of Canada. Not one of the imported early Wheats has proved satisfactory, and hence it has been necessary to have recourse to hybridisation, and to determine by baking tests the value of the grain produced from the hybrids and their descendants.

Mr. Saunders dissents from the view that "strength" in Wheat is a simple Mendelian character. He holds that it depends on a number of factors, and that the behaviour of the quality "strength" with respect to heredity is as yet far from determined.

PARTHENOGENESIS.

Mrs. R. Haig Thomas contributed a paper on *Nicotiana* hybrids, in which inheritance of flower colours was described. In *Nicotiana glauca* and *N. affinis* segregation of colour occurred in F_1 ; the reds selfed produced in F_2 reds, violets, and whites; the violets selfed gave violets and whites. In the course of her experiments Mrs. Haig Thomas has discovered that parthenogenesis occurs in several species and varieties of *Nicotiana*. She has also demonstrated a like production of fertile seed without pollination in *Oenothera biennis*.

GAMETIC COUPLING AND REPULSION.

Results of great importance from the theoretical standpoint were announced by Mr. Bateson and Professor Punnett. As is well known, in the simplest case of a cross between plants differing in respect of two factors, the hybrid gives rise to gametes of four kinds, which are produced in equal numbers. In such a case the gametic series may be written thus:

$$1 AB : 1 Ab : 1 aB : 1 ab$$

In some cases, however, it has been found that certain kinds of gametes are produced in greater numbers than the others, and experiment has shown that the gametic series in such cases may be of any one of the following forms:—

$$3 AB : 1 Ab : 1 aB : 1 ab$$

$$7 AB : 1 Ab : 1 aB : 7 ab$$

$$15 AB : 1 Ab : 1 aB : 15 ab$$

and so on, the general expression being

$$(n-1) AB : 1 Ab : 1 aB : (n-1) ab.$$

These cases, in which the end terms of the series of gametes are greater than the middle terms have been spoken of as "partial coupling," the name implying the idea that the factors A and B are associated, or coupled, together in gametogenesis, so that they tend to pass both to the same germ cell. At the same time, other cases are known in which, to judge from the character of the offspring, the same two factors appear to be repelled from one another. The results obtained hitherto suggest that the repulsion is complete, and such that both factors never pass into one and the same gamete. Not long ago it was discovered that the occurrence of coupling or repulsion depends on the way in which the hybrid is built up, so that if a parent AB were crossed with a parent ab coupling occurs, but if the cross were made the other way—Ab × aB—the factors appear to be repelled from another.

This year, Punnett's experiments with Sweet Peas, in which the characters concerned were sterility and a curious malformation of the flower (Cretin Pea) have shown that repulsion is not complete, but that the gametic series is $1 AB : 3 Ab : 3 aB : 1 ab$. Such a series of gametes would give a very small number (1 in 64) of offspring of the type ab. It is evident that the greater the discrepancy between the values of the middle and end terms of the gametic series, the smaller will be the number of recessives in F_2 , and it can scarcely be doubted that the supposed cases of complete repulsion really represent the formation of a gametic series of the form

$$1 AB : (n-1) Ab : (n-1) aB : 1 ab$$

where n has one of the higher values, 8, 16, 32, &c.

Thus we get an explanation of the occasional appearance of a single recessive plant in families exhibiting repulsion, a phenomenon which has hitherto been quite obscure.

It appears then that, in general, a di-hybrid may produce gametes in any one of a series of forms, ranging from

$$(n-1) : 1 : 1 : (n-1)$$

on the one side, through

$$1 : 1 : 1 : 1$$

up to

$$1 : (n-1) : (n-1) : 1$$

Bateson and Punnett point out that the conception embodied in the terms "partial coupling" and "repulsion" is no longer justified, the phenomenon being more accurately described as a "reduplication of terms" in a series of gametes.

EXPERIMENTS AT BURBAGE.

Mr. Hurst gave an account of the extensive experiments which are being carried out at his experimental station at Burbage, Leicester.

These experiments are planned on a large scale and embrace many plants of commercial importance.

The object of experiments with Peas is to obtain pure lines (of homozygous forms) so that, as it is hoped, rogues will be eliminated from the strains finally chosen for distribution. Other plants in course of being investigated genetically by Mr. Hurst include Sweet Peas, Orchids, Roses, Rhododendrons, fruit and forest trees.

A number of papers dealing with other than the horticultural aspect of genetics was also presented to the conference.

Obituary.

MRS. TURTON.—Readers of the *Gardeners' Chronicle* will sympathise with Mr. Thomas Turton, gardener at Sherborne Castle, Dorset, in the loss he has sustained in the death of his wife. Mrs. Turton died on the 20th inst., and was interred at Sherborne on the 23rd. She leaves a family, the members of which are mostly grown up. I have known Mr. Turton since 1872, and he is greatly respected. H. J. C.

ROYAL INTERNATIONAL HORTICULTURAL EXHIBITION, 1912.

(See also article on page 306.)

WE are informed in an official communication that, in consideration of numerous requests from representatives of the horticultural world, the Directors of the Royal International Horticultural Exhibition have decided to provide special facilities for professional gardeners, and also to reduce the charges for admission of the general public.

The prices originally fixed for the eight days of the Exhibition are as follow:—

1st day	£2	2	0
2nd "	1	1	0
3rd "	10	0	0
4th "	5	0	0
5th "	2	6	0
All subsequent days	1	0	0

The following tariff has now been arranged:—

1st day, until 5 p.m., as before	£2	2	0	after 5 p.m.	£1	1	0
2nd "	1	1	0	"	10	0	0
3rd "	10	0	"	"	5	0	0
4th "	5	0	"	"	2	6	0
5th " throughout the day	2	6	0	"	2	6	0
Throughout the day on all subsequent days	1	0	0	"	1	0	0

The special rates for professional gardeners are:—

2nd day	s. d.	5	0
3rd "	2	6	0
4th and all subsequent days	1	0	0	throughout the day	1	0

which involve, as will be seen, a very great concession.

The Directors have retained the original prices for admission during the greater part of each day, chiefly on account of the limited space at their disposal. The actual size of the ground is 21 acres; but at least seven acres are occupied by trees, shrubs, &c., which leaves only 14 acres for tents, exhibits, offices, &c., &c. Applications for space have, naturally, been very numerous, and ground has to be allotted for paths, promenades, and so forth. It must also be remembered that, apart from the visitors themselves, there will be a large number—say, 3,000—of officials and servants, including jury-men, exhibitors, attendants, &c.

It is gratifying to be able to announce that in the floricultural section of the Exhibition, British growers have made a very ready response to the invitations addressed to them. Foreign floriculturists from most parts of the world are also applying for exhibition space, so that the international character of the show will be well maintained.

Among the most recent donors of special prizes are Messrs. Clay & Sons, who are offering for competition in the Rose class, a silver gilt Rose bowl, valued at 80 guineas.

Turning to the interesting subject of horticultural sundries, this section is likely to exhibit a completeness never before witnessed in this country. The exhibits will be given prominent positions in the grounds, both under cover and in the open. In every case, the awards will be made by special jurymen; thus, in the classes for sundries, only men who have a thorough knowledge of these matters will officiate.

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

THE RECENT FRUIT SHOW.—I was very pleased to see that someone had raised the question of judging at the recent Fruit Show. Being an exhibitor at this particular show, one does not like to be the first to complain, but the points raised by A. (see p. 293) did not affect me in the least. I noticed his point, in the class for "Any other cooking variety," that the Blenheim Pippin was awarded 2nd and 3rd prizes respectively. A fact of this kind should not pass the eye of any keen judge, and I consider it detrimental to other exhibitors who, probably, had as good dishes of this particular Apple as the exhibitor who gained an award, but lost their chance by having exhibited according to the rules of the Society. There is one yet more important point which needs urgent attention, namely, that the judges intermingle with the exhibitors during the time of staging the exhibits. This was freely done at this particular show. Some will probably

say, the best is the best. I quite agree, but should two exhibits run each other very close, as did some of the exhibits there, the judge would naturally lean towards a friend's exhibit. I have judged at several shows, and have always on the arrival at the show been conducted to the secretary's tent, there to await the report of the staging stewards that the exhibits were ready for judging, and I think that the R.H.S. will do well in future to see that this practice is followed at the Society's fruit show. *Fairplay.*

FRUIT MANUAL.—*Yorkshire Gardener*, p. 272, voices the wish of many fruit-growers, namely, that an up-to-date fruit manual should be compiled. The necessity for an authoritative work was exemplified at the recent R.H.S. Fruit Show. In the "single-dish" classes for Pears, among several dishes of the variety Thompson exhibited, was one apparently somewhat out of character, the name of which the judges in their wisdom crossed out. Among the experts who were asked to give their opinion were the two well-known veterans, namely, Mr. Charles Ross and Mr. H. J. Clayton, the latter formerly of Grimston Park, Yorkshire. *Willmot H. Yates.*

NARCISSUS FLY (MERODON EQUESTRIS).—Until the Rev. W. Wilks gave his experience some time since (I believe in the *Gardeners' Chronicle*) of the Narcissus grub being found in bulbs of Lilies, I am not aware that any authentic information existed of the pest in question attacking other than Amaryllidaceous plants. There is a note on the subject in the present *Journal of the Royal Horticultural Society*, p. 123. I have repeatedly found the larvæ of Merodon in Dutch cultivated bulbs of Galtonia candicans, the earliest instance, so far as memory serves me, being about 22 years ago. At no time have I attempted to breed out the flies, for the grub being well known to me I took the same precaution then as now of putting all affected bulbs into the fire. There is, therefore, every reason for cultivators of bulbous plants of all descriptions to be on the watch for this pest. In the case of the Daffodil, discolouration of the outer tissues of the bulb is a not infrequent indication of the presence of the grub, though it may be as frequently due to the presence of the bulb mite, *Rhizoglyphus*. *E. H. Jenkins, Hampton Hill.*

CATTLE POISONED BY LABURNUM.—Some ten days ago I cut down two Laburnum trees, and they fell into my neighbour's field. I did not have them gathered up immediately, and during the night cattle ate of the tops, which contained foliage and seed pods. Three days later the farmer found his cattle unable to stand. There are a good many Oak trees in the field, and we both thought that the cause of the trouble was Acorns. One cow in calf died; a postmortem examination was made, and to our surprise, no Acorns were found. The inside of the beast was quite black. The farmer, not satisfied, sent for the veterinary surgeon, and he said that the beast had been poisoned. The second beast now is dead, a bull, and two more yearlings (bullocks) are down. The veterinary surgeon does not give any hopes of their recovery. The veterinary tells me that the trouble is caused by the unusual season. Had there been any grass for the cattle they would not have eaten so liberally of the Laburnum, and, secondly, had there been grass it would have passed through them. Vegetation, having no nature in it, caused the stoppage, and then the Laburnum seed caused death. *Gardener.*

SEEDLING APPLES.—Referring to Mr. Bunyard's interesting article (see p. 293), I have two new Apples, fruiting for the first time this year, raised from seeds of Fearn's Pippin seven years ago and grafted on to the Crab stock. The seedling trees, from which the grafts were taken, were exactly as Mr. Bunyard describes, and I feared they had reverted to the Crab; but, when grafted, they both grew satisfactorily. Neither is quite the same as the female parent, but one largely partakes of that parent, both in colour of blossom and in fruit. The other differs greatly both in blossom and in fruit. I am, by pruning, getting the "free" stocks to grow in the way usually desired. There grew a third sort from the same sowing of pips, but it has not fruited yet. The foliage shows it to be distinct from the other two and from the parent. *S. Jackson, Clinton House, Kingsland, Shrewsbury.*

RIPENING OF WOOD IN APPLES AND PEARS.

With reference to Mr. Bailey's letter on the above subject, your Report on Fruit Crops for Kent last July (p. 67) shows:—*Apples*: Average, 5; over, 2; under, 2. *Pears*: Average, 1; under, 8. This looks as if "bumper crops" were not general. It is clear, however, that the quality of Apples is not affected by the weather of the previous summer. *Alfred O. Walker, Ulcombe Place, near Maidstone.*

RHUS TOXICODENDRON (see p. 272).—On reading Mr. Divers' letter I cannot help thinking that two different things must be doing duty under the one name. Years ago I used to have a plant bearing the name *Ampelopsis japonica*, which was very similar to the one known as *R. Toxicodendron*. Its chief characteristics were that it was difficult to propagate, and that it coloured beautifully in the autumn. The best plant of it I ever saw was in the angle of a rather high wall at Ravensdale Park between Newry and Dundalk, and it was the glory of the garden every autumn. I used to get a few plants occasionally from Tunbridge Wells, but they were always grafted and probably always upon *Rhus Toxicodendron*, because I once saw in a garden to which I had sent it both growing from a common root. *R. Toxicodendron* never colours here in the autumn to more than a brownish-yellow, and because Mr. Divers refers to the change of colour and the immunity of his workers from eczema, it is probable that he has *Ampelopsis japonica* and not the *Rhus* at all. *T. Smith, Newry.*

THE CELERY DISEASE (CERCOSPORA APII)

has now become very prevalent in this part of the country. So bad in fact that it is hardly safe to grow Celery without periodical spraying. I am afraid if matters go on as they have done for the past two or three years growers will have to make up their minds and spray this crop just as they do Potatoes. How this disease has become so prevalent here I cannot say. I have heard the theory advanced that the infection may have come through seed saved from infected plants. I have never had this disease in my own plants until the present year, but I know others who are troubled with it every year, and they were not able to produce good Celery until they started spraying. I sprayed half the Celery here several weeks ago, and am glad to say it is nearly clean now, though at the time it was badly affected. It would be interesting to hear from growers in England if the disease is spreading, and what steps are being taken to combat it. *D. Calthorpe, The Gardens, Ballyheigue Castle, Ballyheigue, Co. Kerry.*

EXPERIMENTS IN THE POLLINATION AND SETTING OF FRUIT.

The notes on pp. 254 and 255 on this subject are of very deep interest. My experience is that ordinary varieties are not really good agents to supply the pollen; it is not potent enough to produce good crops. The species produce much better and more fertile pollen for fructification than the varieties. The Common English Crab, or the Siberian Crab, planted amongst a batch of Apples, works wonders. During 1904-1908, in the nurseries of Messrs. Keynes, Williams & Co., an attempt was made to make these nurseries more interesting and ornamental by the plantation of mixed borders. The assortment of trees and shrubs at the disposal of the planter was very limited, and intermixed therewith were many varieties of Crabs, including the varieties John Downie, Siberian, and others. Adjoining these ornamental borders were fruit trees of all sizes and varieties, ranging from one to ten years old. At a glance, the observer could see, in a kind of cycle from the Crab, the effect of fruit production from the pollination of these Crabs. At this period I was in communication with a horticultural teacher in the Government School of Gardening, at Buda Pesth. I told him of my suspicion that the species, if employed for pollination, was the right thing. The idea was put into practice, and has proved successful in Hungary. Further, I suggested a classification, placing Codlins, Pippins, Pearmain, Nonpareils, Russets, Reinettes, Pomeroy, Costards, and Crabs in sections. In the Buda Pesth School of Gardening better results were obtained from the pollination within a given class than by using the pollen of a Pearmain on a Pippin,

or a Codlin on a Russet; but where Crab pollen was used, excellent results ensued. I have tried Crab pollen to set Cox's Orange Pippin, by planting a tree of the variety of John Downie amidst a dozen trees. I have carried branches of Crab Apple blossom, and set them up in jars of water, and I have also used a pencil brush to carry pollen to impregnate the flowers, and found every fruit to set. In my lectures on fruit I am strongly recommending the planting of a Crab of some kind, John Downie, Dartmouth, Siberian, or some other variety; they are useful and ornamental. A few weeks ago I visited the gardens of Croxdale Hall, Co. Durham. Many varieties of Crab are to be found in the shrubberies, with the result that Apple trees of all sorts bear very heavy crops. Many readers of the *Gardeners' Chronicle* can doubtless remember an ancient manor house or old farmstead with its orchard, where invariably a Crab (Siberian) was to be found. Whether it was so planted there for its beauty or its fertility in assisting other Apple crops one cannot say. There the Crabs are, and though the old orchard produces fruits of inferior quality, it rarely misses a crop. I venture to say, if Mr. C. Martin, manager of the Toddington Orchard Co., in Gloucestershire, were to plant one John Downie Crab to every 25 trees of Cox's Orange Pippin, intermixed, the results would astonish him. The planting season is now upon us. It is a good time to procure a few Crabs. Mr. Hooper does not tell us if Lane's Prince Albert was used in any experiments of pollination. I shall be pleased to give my experiences on the pollination of other fruits, but I am afraid I am encroaching on your space at the present time. I should like to say that I am in communication with the Under-Secretary for the Department of Agriculture and Stock, Brisbane, Queensland, on this and other allied subjects. Any useful information I receive I shall be pleased to impart. *John Smith, County Council Lecturer and Instructor in Horticulture.*

SOCIETIES.

ROYAL HORTICULTURAL.

OCTOBER 24.—The attendance at the fortnightly meeting of the Committees on Tuesday last was greater than is usual at this time of the year, notwithstanding a heavy downpour of rain. Hardy trees and shrubs largely predominated, and in consequence of the continued mild weather, cut flowers from the open ground were of high quality. The splendid collection of hybrid Nerines from Mr. Elwes found many admirers, and fully deserved the awards which they received.

The FLORAL COMMITTEE recommended 13 Awards of Merit, four of these being for Nerines. The same Committee awarded 14 medals for groups.

The ORCHID COMMITTEE recommended two First-class Certificates and one Award of Merit, while the FRUIT AND VEGETABLE COMMITTEE recommended an Award of Merit to a variety of Plum, being a sport from Coe's Golden Drop.

Floral Committee.

Present: W. Marshall, Esq., and Henry B. May, Esq., (Chairmen); and Messrs. A. Kingsmill, W. J. Bean, John Green, G. Reuthe, John Dickson, Wm. J. James, Charles T. Druery, C. R. Fielder, J. F. McLeod, C. Blick, W. Howe, J. Jennings, Herbert J. Cutbush, Chas. Dixon, Arthur Turner, Charles E. Pearson, J. T. Bennett-Poë, W. P. Thomson, B. C. Notcutt, E. A. Bowles, George Paul, R. C. Reginald Nevill, F. Page Roberts, E. H. Jenkins and James Hudson.

Messrs. H. B. MAY & SONS, Upper Edmonton, staged a large collection of Ferns, which consisted entirely of 120 species and varieties of Adiantum. On the opposite table Messrs. MAY arranged well-flowered pot plants of Begonia Gloire de Lorraine in several varieties, and similar specimens of Begonia Aglaia. (Silver-gilt Flora Medal.)

Messrs. J. VEITCH & SONS, Chelsea, filled one end of the Hall with a magnificent collection of hardy trees and shrubs. At the back there were tall standards of Scarlet Oak (*Quercus coccinea*), with brilliantly-coloured leaves, whilst in the foreground smaller plants of such useful shrubs as

Berberis Thunbergii, *Kadsura japonica*, and *Smilax caduca* also supplied vivid colouring. Such variegated shrubs as *Eurya latifolia variegata*, *Osmanthus Aquifolium ilicifolius argenteo-variegatus* (a choice shrub with an unfortunate string of names), *Rhamnus-alaternus variegata*, and several forms of Ivy, Holly, and Cupressus, contrasted finely with the many dark-green subjects. A few plants of *Symphoricarpos occidentalis* bore heavy crops of large, white fruits, and the common Myrtle was also fruiting. Messrs. VEITCH's exhibit of greenhouse plants made a bright show. Bouvardias in variety, and a batch of Nerine Fothergillii major, with compact spikes of flowers, showed good cultivation. In the middle of this collection there was a large batch of that valuable winter-flowering Begonia "Mrs. Heal" in full flower. A bamboo stand decorated with red and white Lapagerias and surrounded with fruiting Oranges attracted a deal of attention. (Silver-gilt Flora Medal.)

Mr. L. R. RUSSELL, Richmond, contributed a splendid collection of Bamboos, which occupied the whole of the wall space. This huge exhibit illustrated the interesting variety of Bamboos now in commerce. At the back of the group there were tall and stately culms of *Phyllostachys Henonis*, and the even taller *P. fastuosa*. Graceful semi-pendulous growths of the half-hardy *Arundinaria Falconeri* and *Arundinaria nitida* occupied prominent positions. The dwarf *Bambusa disticha*, on which the Japanese practise their dwarfing art, was present, as also was *Arundinaria Fortunei variegata*, in which the white streaks were clear and distinct. *Bambusa marmorea variegata* has less green in its leaves, but the variegation is not so clear. *Bambusa tessellata* is a desirable low-growing species with large, glossy leaves. Mr. RUSSELL also filled half of one of the tables with a collection of berried shrubs and several flowering plants of *Ceanothus Gloire de Versailles*. The berried subjects included good examples of *Crataegus Pyracantha*, *Aucubas*, *Skimmias*, *Pernettyas*, *Hollies* with yellow berries, and cut sprays of *Vitis heterophylla humulifolia*, bearing numbers of blue and purple berries. (Silver-gilt Flora Medal.)

Messrs. W. CUTBUSH & SON, Highgate, arranged a large collection of hardy climbing plants at the right of the entrance to the hall. This group of well-grown plants had a good background of tall Bamboos, and was bordered with profusely-berried plants of *Skimmia japonica*. Most of the specimens in this exhibit, which consisted largely of *Vitis* species, were recent introductions from China. On the other side of the entrance Messrs. CUTBUSH set up a large selection of good varieties of Michaelmas Daisies, with small batches of Nerine Fothergillii major, and border Chrysanthemums in the foreground. Messrs. CUTBUSH also exhibited a selection of Carnation blooms. (Silver-gilt Banksian Medal.)

Messrs. J. CHEAL & SONS, Crawley, exhibited sprays of autumn foliage in great variety. Of the many kinds shown, *Crataegus Carrierei* (with green leaves and large fruits), *Quercus palustris*, the deciduous Cypress (*Taxodium distichum*), and *Aralia spinosa* (bearing fruits) were the most effective. (Silver Flora Medal.)

Messrs. PAUL & SON, Cheshunt, also arranged a numerically large exhibit. The sprays of *Parrotia persica* did not, owing to the bad light, do justice to this valuable tree. The middle of the group was occupied with a number of branches of Rose species bearing hips of various colours. A vase of Rose Rayon d'Or, with deep-yellow colour and an agreeable perfume, illustrated the mildness of the season. (Bronze Flora Medal.)

Mr. JAMES BOX, Lindfield, Haywards Heath, filled a corner of the Hall with a very tasteful arrangement of hardy flowering plants, which had been grown entirely out-of-doors. The blooms of the Chrysanthemums were surprisingly fresh. A small collection of Delphiniums, with a few flowers of Papaver orientale, and larger quantities of herbaceous Phlox and Pentstemons, would have been creditable even if shown during the month of August. (Silver Flora Medal.)

Messrs. WARE & Co., Feltham, Middlesex, exhibited border Chrysanthemums, Dahlias, and Michaelmas Daisies. The Chrysanthemums included such good white varieties as Caledonia and Tapis de Neige. Amongst the coloured varieties, Normandie and Patricia were noteworthy. (Silver Flora Medal.)

Messrs. BAKERS, Wolverhampton, exhibited a collection of Peony-flowered Dahlias, attractively

arranged with autumn foliage and yellow sprays of the culinary Asparagus. (Silver Flora Medal.)

Messrs. CARTER PAGE & Co., London Wall, also exhibited Dahlias. This firm's contribution included good Cactus and single varieties. (Silver Banksian Medal.)

Mr. J. B. RIDING, Chingford, exhibited a selection of his well-known Dahlias, chiefly of the popular collarette type.

H. J. ELWES, Esq., Colesborne, Cheltenham (gr. Mr. W. Walters), contributed a large selection of his famous Nerines. Of the large number shown, only six had been previously exhibited, and but few of the seedlings bore distinctive names. This interesting group admirably illustrated the great improvement which has been effected in this valuable, late autumn-flowering greenhouse plant. Many of the plants shown had large spikes, with fine individual flowers, in which the petals were distinctly broader than in the commoner forms, and many of the colours were bright and distinct. The hybrid "Miss Carrington," which received an Award of Merit in 1903, was included, and its large trusses of fine pink blooms were greatly admired. Four of the hybrids shown received Awards of Merit. Two small plants of *Stapelia gigantea*, with strange-looking flowers, 14 inches across, astonished many of the visitors, who were also interested in the yellow-flowered *Urceolina pendula*. Mr. ELWES also exhibited the rare *Aristea* (*Witsenia*) *corymbosa*, a small Cape Iridaceous, which has a stem like a Yucca, but bearing small tufts of Iris-like foliage and blue flowers. (Silver Flora Medal.)

Messrs. R. VEITCH & SON, Exeter, also exhibited Nerines, and included the large-flowered *N. Bowdenii*, *N. devonia*, and *N. Fothergillii* × *crispum*, which bears fine scarlet flowers. Besides these choice Nerines, there were large sprays of *Buddleia Colvilei*, which is now flowering for the second time.

Messrs. W. WELLS & Co., Merstham, arranged a tasteful group of Chrysanthemums. There were some enormous blooms of "White Queen" displayed with branches of Scarlet Oak. Amongst the single varieties we especially noted "Altrincham Yellow" (with good, rich colour), the large-petalled Snowflake, and "Joan Edwards" (with blooms of a good mauve shade). (Silver Banksian Medal.)

Messrs. STUART LOW & Co., Bush Hill Park, Middlesex, arranged a striking collection of Carnation blooms, chiefly set up in separate colours. Besides many of the older varieties, this exhibit included, in *Gloriosa*, *Washington*, and *Baroness de Bienen*, three new pink varieties. (Silver Banksian Medal.)

Messrs. BARR & SONS, Covent Garden, staged a small collection of Michaelmas Daisies, with a few seasonable Alpines, and two pots of the tiny-flowered *Narcissus serotinus*, which has a delicate perfume.

Mr. G. REUTHE, Fox Hill Nursery, Keston, arranged Alpine plants and a few vases of Michaelmas Daisies.

Messrs. ALLWOOD BROS., Haywards Heath, showed their recent varieties of Carnation, including the French *La Rayonnante* (a glorified *Fortunata*).

ERNEST MOCATTA, Esq., Woburn Place, Addlestone (gr. Mr. T. Stevenson), exhibited a large number of exceedingly well-grown Celosias, in relatively small pots.

Messrs. DOBBIE & Co., Edinburgh, staged an attractive selection of varieties of Cosmos bearing large flowers.

Miss V. G. JEFFREY, "Rozal," Gymbal Road, Lee, was awarded a Silver Flora Medal for a valuable collection of botanical studies in colours.

Miss PUGH, Streatham Common, exhibited a set of water-colour paintings of various garden scenes, chiefly from the Royal and London County Council parks.

AWARDS OF MERIT.

Nerine "Mrs. Balfour."—This is a large flower tipped and edged with pink, with lighter centre. One of the best Nerines we have seen.

N. "Hon. Miss Gibbs," a very large spike, bearing broad-petalled plum-coloured flowers.

N. "Mrs. Meade Wolds."—An orange-scarlet flower with very broad petals.

N. "Snowflake."—A white-flowered hybrid, having a good, compact truss. All were shown by H. J. ELWES, Esq., Colesborne, Cheltenham (gr. Mr. W. Walters).

Chrysanthemum "Bronze Goacher."—(See report of N.C.S. exhibition on p. 264.)

C. "Dorothy Dann."—A single-flowered variety; terra-cotta shaded with orange. Roth were shown by Messrs. W. WELLS & Co., Mersham.

Berberis verruculosa.—An evergreen species from China, with a dense habit and small, shining leaves, glaucous beneath. The small yellow flowers are borne in pairs, and are followed by violet-purple fruits.

Lonicera nitida.—An evergreen Honeysuckle, possessing habit of growth and foliage suggestive of the small-leaved Myrtles, and which bears fragrant, creamy-white flowers. Also shown by Messrs. J. VEITCH & SONS, Chelsea.

Aster "Amethyst" (Novi-Belgii).—This has blue flowers, fully 2 inches across.

A. "Profusion" (ericoides).—A very decorative variety, bearing an abundance of small, white flowers. Both were shown by the Hon. VICARY GIBBS, Aldenham House, Elstree.

Dahlia "Delice."—A decorative flower of good size, rose-pink in colour, and borne well above the foliage. Earlier in the season the colour is deeper than in the specimens shown. Exhibited by Messrs. CARTER PAGE & Co., London Wall.

Veronica "Silver Queen."—A bushy Veronica, with less green in its leaves than usual. Shown by Messrs. W. CUTBUSH & SON, Highgate.

Olerodendron Fargesii.—An evergreen species from China, closely related to *C. trichotomum*. The cordate leaves are terminated with whitish flowers at midsummer, which give place at this season to bright-green, closely-set berries. Shown by the DIRECTOR OF THE ROYAL GARDENS, Kew.

Orchid Committee.

Present: J. Gurney Fowler, Esq. (in the Chair); and Messrs. Jas. O'Brien (hon. sec.), Harry J. Veitch, Sir Jeremiah Colman, Bart., Stuart Low, J. S. Moss, R. G. Thwaites, F. J. Hanbury, A. A. McBean, C. H. Curtis, T. Armstrong, W. Cobb, J. Charlesworth, J. Cypher, W. P. Bound, W. H. Hatcher, H. G. Alexander, A. Dye, W. H. White, Gurney Wilson, and W. Bolton.

MESSRS. JAS. CYPHER & SONS, Cheltenham, were awarded a Silver Flora Medal for a group which included good examples of *Cattleya Mantinii*, *C. Portia*, *C. Mrs. J. W. Whiteley*, a very fine form of *C. F. W. Wigan*, a selection of autumn-flowering *C. labiata*, *C. Fabia*, and others; a good selection of *Cypripediums*, including some new hybrids, *Vanda cœrulea*, *Lælio-Cattleya luminosa*, and other *Lælio-Cattleyas*, the rare *Masdevallia angulata*, and *Bulbophyllum grandiflorum*.

MESSRS. HASSALL & Co., Southgate, were awarded a Silver Flora Medal for a group composed principally of a remarkable selection of forms of *Cattleya labiata*, including a white variety, with violet blotch on the lip, and another which is a new form, so far as colour is concerned, the prevailing tint being light violet, and the petals white, tinged with blue. A good example of the rare *Angræcum* (*Listrostachys*) *infundibulare*, with a large, white front to its long, funnel-shaped lip, *Eria stellata*, and others were also shown.

MESSRS. ARMSTRONG & BROWN, Tunbridge Wells, secured a Silver Flora Medal for a group in which fine forms of *Cattleya labiata* and its hybrid *C. Fabia* were attractive features. A selection of the pretty *C. Armstrongia* formed the centre, and a good selection of *Cypripediums*, *Phalænopsis Rimestadiana*, *Dendrobium Cœlogyne*, *Bulbophyllum Godseffianum*, *B. grandiflorum*, *Cirrhopetalum appendiculatum*, and other uncommon species were also included.

MESSRS. SANDER & SONS, St. Albans, were awarded a Silver Flora Medal for a very pretty and interesting group, the setting of which was of *Cattleya Fabia*, including the white variety and the brilliantly-coloured variety *ignescens*, together with other hybrids. Among the *Cypripediums*, *C. Franconia* (*Callosum Sanderæ* × *Callo-Rothschildianum*) was a very fine, bold flower of good quality and distinct. Rare species included *Bulbophyllum Medusæ* with two fine spikes, a pretty tuft of *Saccolabium acutifolium* with many heads of bloom, *Catasetum macrocarpum*, *Cynoches Egertonianum viride*, *Acineta chrysantha*, and *Spathoglottis Fortunei*.

MESSRS. CHARLESWORTH & Co., Haywards Heath, received a Silver Flora Medal for a group of rare Orchids, in which the autumn-flowering form of *Epidendrum vitellinum* gave bright, orange-scarlet colour, many of the spikes being branched. *Cattleya Fabia alba* was a very fine white-petalled form, *Lælio-Cattleya Haroldiana*, *L.-C. luminosa*, *L.-C. Golden Oriole* and some new hybrid *Lælio-Cattleyas* were very brightly coloured, and *Miltonia Bleuana nobilior*, the very handsome *Odontoglossum Aireworth*, the rare, clear-yellow *Oncidium varicosum* concolor, and other rare plants were also noted.

MESSRS. STUART LOW & Co., Bush Hill Park, secured a Silver Flora Medal for a fine group, at the back of which was an elegant display of *Oncidium varicosum* and *O. oblongatum*. *Cattleya labiata*, *C. Loddigesii*, and *C. Warscewiczii* were effective, and *Dendrobium Phalænopsis Schröderianum*, *Oncidium spilopterum*, *O. Lanceanum*, a selection of good *Cypripediums*, *Cynoches maculatum*, and *Masdevallia macrura* were also included. A pretty hybrid in the group was *Lælio-Cattleya Herscentia* (*L. Boothiana* × *C. aurea*), a rose-coloured flower.

MESSRS. J. & A. A. McBEAN, Cooksbridge, were awarded a Silver Banksian Medal for a pretty group, the best plant in which was their grand form of *Lælio-Cattleya St. Gothard*, which secured a First-class Certificate (see Awards). In the centre were good plants of *Vanda cœrulea* with *Dendrobium Phalænopsis* and pretty forms of *Cattleya Warscewiczii*, *C. Dowiana aurea*, &c. A richly-coloured form of *Odontioda Charlesworthii*, raised by Messrs. McBEAN, was also exhibited.

Monsieur CHAS. MARON, Brunoy, France, was awarded a Bronze Banksian Medal for a small group made up of two grand specimens of his dark-coloured *Cattleya Fabia Vigeriana*, and a very clear, white-petalled *C. Fabia alba*, together with a selection of *Brasso-Cattleyas*.

Lieut.-Col. Sir GEO. L. HOLFORD, K.C.V.O. (gr. Mr. H. G. Alexander), showed his fine *Lælio-Cattleya luminosa aurea*, which received a First-class Certificate (see Awards), and the new *Cypripedium Oberon* (*Euryades* × *Fairrieanum*), an improvement on the dark-coloured *C. Baron Schröder*, and of darker colour.

FRANCIS WELLESLEY, Esq., Westfield, Woking (gr. Mr. Hopkins), showed *Cattleya labiata* Lady Leese, a charming pure-white form, with violet blotch on the lip; *Lælio-Cattleya Mrs. Phayre* (*L.-C. Norba* × *C. aurea*), with delicately-tinted, yellowish flowers, with rose-pink lip; and *L.-C. Mrs. Phayre inversa*, the lip of which resembled a light form of *C. aurea*.

EDWARD ROBERTS, Esq., Park Lodge, Eltham (gr. Mr. W. Carr), sent *Cypripedium Gipsy*, said to be a cross between *C. Ianthæ superbum* and *C. niveum*, a fine flower, with the colours of *C. Harrisianum superbum*.

W. P. BURKINSHAW, Esq., West Hill, Hessle, Hull (gr. Mr. Barker), showed fine specimens of *Cypripedium Gaston Bultel* and *C. Lord Ossulston*, each with several flowers.

C. J. PHILLIPS, Esq., The Glebe, Sevenoaks, showed *Oncidium Forbesii* "Glebe" variety, one of the largest yet exhibited.

Sir TREVOR LAWRENCE, Bart., K.C.V.O. (gr. Mr. W. H. White), showed a grand specimen of *Octomeria Baueri*, with a great number of bunches of cream-yellow flowers.

FRANK LLOYD, Esq., Coombe House, Croydon (gr. Mr. E. Mills), showed a pretty hybrid between *Lælia Jongheana* and *Sophranitis grandiflora*.

Monsieur le Comte de HEMPTINNE, St. Denis, Westrem, Belgium, showed *Lælio-Cattleya Steppestiana* (*C. Luddemanniana* × *C. aurea*), a pretty flower, with yellow sepals and petals, and ruby-red lip, with gold veins.

Mr. E. V. Low, Vale Bridge, Haywards Heath, showed the fine white *Brasso-Cattleya Queen Alexandra*, and a grand specimen of *Cattleya labiata*.

AWARDS.

FIRST-CLASS CERTIFICATES.

Lælio-Cattleya luminosa aurea (*L. tenebrosa* "Walton Grange" variety × *C. Dowiana aurea*), from Lieut.-Col. Sir GEORGE L. HOLFORD, K.C.V.O., Westonbirt (gr. Mr. H. G. Alexander). In this very remarkable and handsome hybrid the features of the beautiful *Lælia tenebrosa* "Walton Grange" variety are well

marked, the very large flowers having clear, greenish-primrose sepals and petals, broad and well displayed. The large lip is of an intense reddish-claret colour. It is very distinct.

Lælio-Cattleya St. Gothard "McBean's" variety (*L.-C. Gottoiana* × *C. Hardyana*), from Messrs. McBEAN, Cooksbridge. One of the showiest of *Lælio-Cattleyas*, and remarkable in that it adheres in the broad form of the lip and general characters to *C. Warscewiczii*, obtained through *C. Hardyana*, but the flower is broader. The original form obtained a First-class Certificate when shown by Mr. H. S. Goodson, October 13, 1908. "McBean's" variety is better even than that fine form. The broad, flat sepals and petals are bright rosy-lilac, the broad, rounded, crimped lip ruby-crimson, with a light disc.

AWARD OF MERIT.

Vanda Kimballiana alba, from Messrs. MANSELL & HATCHER, Rawdon, Leeds. The first white form of the favourite species yet seen. The flowers are exactly similar in form to the coloured type, but white, with a yellow base to the lip.

Fruit and Vegetable Committee.

Present: A. H. Pearson, Esq. (in the Chair); and Messrs. J. Cheal, C. G. A. Nix, E. Beckett, A. Dean, W. E. Humphreys, J. Vert, J. Davis, A. R. Allan, P. C. M. Veitch, P. D. Tuckett, G. Wythes, J. Harrison, W. Poupart, and J. Jaques.

Numerous seedling or local Apples were sent for the inspection of the Committee. One of these, a pretty medium-sized dessert variety, shown by Mr. ARTHUR GOSLING, Chichester, was interesting, but, being rather past its season, the exhibitor was asked to send fruits again a little earlier next year.

A variety of Tomato shown by Mr. F. H. CHAPMAN, Rye, was sent to Wisley for trial.

MESSRS. AMBROSE PALMER & Co., Grosvenor Square, sent a collection of 30 dishes of very good Apples and Pears. Of cooking Apples the finest were Bramley's Seedling, Lady Henniker, Newton Wonder, Lane's Prince Albert, Warner's King, Bismarck, and Peasgood's Nonesuch. Dessert varieties were seen in Cox's Orange Blenheim and Allington Pippins, and James Grieve. Good Pears were Conference, Beurré Diel, Duchesse d'Angoulême, Le Lectier, and Nouveau Poiteau. (Silver Banksian Medal.)

Mr. W. B. McDONALD, Public Library, Shepherd's Bush, who sent bunches of ripe Black Humber Grapes from a vine growing on an open wall at the previous meeting, was, after the vine had been seen and reported upon, awarded a Bronze Knightian Medal.

From the Society's Gardens, Wisley, came a remarkable collection of 60 stocks of Carrots, about half-a-dozen roots of each variety being staged. For such a season as the past has been, the roots were clean and good, and the collection reflected the highest credit. The types most prominent were the Little Gem, or Early French Forcing, the rather longer and stout Early Gem; the Early Nantes, a pretty, small Carrot some 5 to 6 inches long; Long Red, or Perfection Coreless, a coreless variety of sausage shape, and greatly liked on the Continent, but one which does not do well here on cold soils. The names of Dainty, Paris Market, Chatenay and Matchless were attached to some of these stocks. Then came the short Model type, a very handsome summer Carrot. There were several lots of the Old Long Surrey, a very deep-rooting variety, also of the Altrincham or Magnum Bonum, with purplish tops to the roots. The very fine maincrop Carrots, Scarlet Perfection, St. Valery, Matchless (perhaps best known as the Red Intermediate), James' Intermediate and Blanc des Vosges, with broad, white Parsnip-like roots.

Mr. W. E. SANDS, Hillsborough, Ireland, staged 36 varieties of Irish-grown Potatoes. None was above good table size, but all were very clean and free from disease. Of Irish varieties were the Colleen White Round, Erin's Best, Erin's Queen, Leinster Wonder, Irish Hero (a strong grower and heavy cropper), King George V. (a pretty, white, round tuber), and British Queen No. 2, a good selection apparently from the Old British

Queen. Of coloured Irish varieties were the purple Skerries, and the red Irish Queen. Then of Scotch or English varieties Midlothian Early, Factor, Langholme Model (a pretty white kidney), Epicure, President, Windsor Castle, Eclipse, Duchess of Cornwall, The Diamond, Sharpe's Victor, and others were all excellent. (Silver Knightian Medal.)

AWARD OF MERIT.

Plum Coe's Violet.—An Award of Merit was given to this sport from Coe's Golden Drop Plum. The fruits are prettily tinted with violet, and they possess exceedingly rich flavour. Those exhibited were grown in a cool orchard house and sent by Lord HOWARD DE WALDEN, Audley End, Saffron Walden (gr. Mr. J. Vert).

NORTH OF ENGLAND HORTICULTURAL.

OCTOBER 18.—This young society had to remove to a larger hall on this date so that the numerous exhibits could be properly staged and accommodated. The Town Hall is the largest in the city, and it was filled with one of the finest collections of fruits and flowers ever seen in Leeds. Great interest was centred in two exhibits, namely, a dish of Ribston Pippin Apples from the original tree raised from seed in 1709, exhibited by Major DENT, of Ribston Hall, who is the chairman of the Council. The other exhibit was a collection of Apples from the gardens of the cottagers in the little hamlet of Hook. These latter were sent for the FRUIT AND VEGETABLE COMMITTEE to adjudicate upon, and they awarded a small Silver-gilt Medal.

AWARDS.

PLANT AND FLORAL COMMITTEE.

Large Gold Medal to Messrs. DICKSON & ROBINSON, Manchester, for a large collection of Asters and Chrysanthemums.

Large Silver-gilt Medals to Messrs. HARKNESS & SON, Bedale, for hardy flowers; Messrs. G. GIBSON & Co., Bedale, for hardy flowers; and Messrs. J. & W. BROWN, Peterborough, for Roses.

Large Silver Medals to Messrs. E. J. BATCHELOR & SON, Harrogate for Chrysanthemums; Mr. W. LAWRENSON, Yarm-on-Tees, for Carnations; and Messrs. W. CUTBUSH & SONS, Highgate, London, for a collection of hardy flowers.

Small Silver Medal to Messrs. KERR & SONS, Liverpool, for Cyclamen and Begonias.

Large Bronze Medal to Messrs. YOUNG & Co., Cheltenham, for Carnations.

Small Bronze Medals to Mr. ALVA J. HALL, Harrogate, for hardy Veronicas; Messrs. G. LONGSTER & SONS, Malton, for hardy flowers; and Messrs. S. BROADHEAD & SONS, Huddersfield, for Alpines.

FRUIT AND VEGETABLE COMMITTEE.

Large Gold Medals to the KING'S ACRE NURSERIES, Hereford, for a stand of very fine Apples and Pears; Messrs. T. RIVERS & SON, Sawbridgeworth, for 31 pot-grown Apples; J. BRENNAND, Esq., Baldersby Park, Thirsk (gr. Mr. J. Hathaway), for an exhibit of 51 Apples (excellent).

Large Silver-gilt Medals to W. H. ST. QUINTON, Esq., Scampston Hall, Rillington (gr. Mr. F. C. Puddle), for Apples and Pears; and to the HOOK VILLAGERS, for 154 dishes of Apples and Pears.

Large Silver Medals to R. J. FOSTER, Esq., Stockeld Park, Wetherby (gr. Mr. J. Turton), for Apples, Pears and Melons; Messrs. J. BACKHOUSE & SON, York, for Apples; Major DENT, Ribston Hall, Wetherby (gr. Mr. J. McLelland), for 20 dishes of Apples and Pears; and Messrs. DOBBIE & Co., Edinburgh, for 27 baskets of Potatoes.

Large Bronze Medal to Hon. Mrs. G. W. WINN, Walton Hall, Wakefield (gr. Mr. W. Allison), for an exhibit of Apples.

ORCHID COMMITTEE.

Silver-gilt Medals to Messrs. CHARLESWORTH & Co., Haywards Heath; J. H. CRAVEN, Esq., Keighley (gr. Mr. F. W. Corney); and Mr. ED. V. LOW, Vale Bridge, Haywards Heath.

Silver Medal to Messrs. MANSELL & HATCHER, Rawdon.

Bronze Medals to Messrs. A. J. KEELING & SONS, Bradford; J. WATSON, Esq., Morley (gr. Mr. C. Cross); and the LIVERPOOL ORCHID Co.

SUNDRIES.

Silver Medal to Messrs. W. WOOD & SON, London.

FIRST-CLASS DIPLOMAS.

J. H. CRAVEN, Esq., Keighley (gr. Mr. F. W. Corney), for *Cypripedium San-actæus* "Craven's" variety; Messrs. WM. CUTBUSH & SON, London, for *Cimicifuga Simplex*; Messrs. DOBBIE & Co., Edinburgh, for *Collarette Dahlias* "Diadem" and "The Czar"; Mr. ED. V. LOW, Haywards Heath, for *Cattleya labiata* var. W. R. Lee and C. l. var. leucochila; Messrs. CHARLESWORTH & Co., Haywards Heath, for *Cattleya labiata* var. Lord Rothschild's delicata; and Messrs. DICKSON & ROBINSON, Manchester, for Onion "Premier."

SECOND-CLASS DIPLOMAS.

Mr. WM. LAWRENSON, Yarm-on-Tees, for new Apple "Wm. Nicholson;" Messrs. DOBBIE & Co., Edinburgh, for *Collarette Dahlias* "Princess Louise," "Windsor" and "Balmoral;" Messrs. HASSELL & Co., London, for *Cattleya labiata* "exquisita;" and Messrs. CHARLESWORTH & Co., Haywards Heath, for *Cattleya labiata* "Empress Frederick."

NATIONAL CHRYSANTHEMUM.

OCTOBER 23.—At a meeting of the Floral Committee of the National Chrysanthemum Society, held on Monday last, awards were made to the following novelties:—

FIRST-CLASS CERTIFICATES.

Gertrude Peers (Japanese).—A well-formed flower, of rich ruby-crimson, with gold reverse. Shown by Messrs. W. WELLS & Co.

Walter Parsons (Japanese).—A striking shade of chestnut, suffused with gold. Shown by Mr. W. THOUPE.

Coronation (Japanese).—A well-built flower, of deep rose shade, with silvery reverse. Shown by Messrs. J. STREDWICK & SONS.

Wonder (Japanese).—A pleasing colour of old rose, shaded with terra-cotta, and having a buff reverse. Shown by Mr. M. SILSBURY.

Mrs. W. Garnier (single).—Bright bronze, tipped gold, with yellow zone. This is a sport from *Bronze Pagram*, upon which it is a distinct improvement. Shown by Messrs. CRAGG, HARRISON, & CRAGG.

Yvetta Richardson (early single).—This flower is a shade of crushed strawberry, with reddish-rose markings. Shown by Mr. H. J. JONES.

CARDS OF COMMENDATION.

Mrs. W. Hookey (Japanese).—Straw yellow, shaded with rose. Shown by Messrs. W. WELLS & Co.

Madame A. Nonin (market decorative).—A pleasing shade of silvery pink. Shown by Mr. G. PERRY, Hayes.

Miss Venetia Hartmann (Japanese).—Lemon yellow. Shown by Mr. W. JINKS.

Surprise (early single).—Bright-reddish terra-cotta. Shown by Mr. H. J. JONES.

Thoupe's Terra-cotta (early decorative).—Golden bronze. Shown by Mr. W. THOUPE.

Several blooms of *Cránford Yellow* and *Golden Glory* were exhibited, and the two varieties were declared to be synonymous.

A vote of thanks was accorded Messrs. Lowe & Shawyer, Uxbridge, and Messrs. Cragg, Harrison & Cragg, Heston, for the kind manner in which the members of the Floral Committee and friends were received at their nurseries recently.

BULB-GROWERS' SOCIETY OF HAARLEM, HOLLAND.

The following awards were made at the September meeting of the Floral Committee of the Society of Haarlem Bulb-growers:—

FIRST-CLASS CERTIFICATE.

Pæony-flowered Dahlia President Fallières.—A new seedling variety, with bright, orange-scarlet flowers.

AWARDS OF MERIT.

Canna P. Fougerat, with large, bright-scarlet flowers.

C. Médérie Charot, light-scarlet, shaded with orange.

C. Nabert Neiss.—A very floriferous variety with large, bright-orange flowers.

C. Frau Spitta, with large, bright, carmine-rosy flowers.

C. Hohenzollern.—A large-flowering variety with light-yellow flowers.

Pæony-flowered Dahlia Souvenir de Maasdijk.—A new seedling variety with large yellow flowers shaded with rose.

Dahlia (collarette) Diadem.—Colour carmine-rose, the collar being white, feathered with rose.

* * * The Editors will be glad to receive, for consideration, large photographs of horticultural subjects, suitable for reproduction in this Journal.

APPLES DISEASED: T. W. The Apples are affected with the Apple scab fungus. This disease can be eradicated if all diseased branches of the tree are removed at once, and next season the trees are sprayed with the Bordeaux mixture whilst the leaves are quite young.

BEGONIA: H. M. M. We must ask you to send better specimens of the *Codiaeums*, hardy shrub, and *Begonias*, it being impossible to make a satisfactory examination from such shrivelled leaves.—H. H., Dorset. The roots are badly affected with Eelworm, as may be seen by the numerous excrescences. There is no cure; you had better obtain stock from a fresh source another season, and select your potting compost also from a different source.

CORDON APPLE TREES DISEASED: Vanda. The Apple trees are attacked by a fungus which has caused root-rot. It will be well to bare the collar and main roots as much as practicable, and dredge them with a mixture of one part of sulphur mixed with two parts of quicklime, covering this mixture with fresh soil mixed with lime and sulphur in the same proportions as already named.

CYCLAMEN: W. H. M. The grubs which are destroying the Cyclamen corms are the larvæ of a Weevil. It may be sufficient if the plants are occasionally turned out of their pots, and all the larvæ which are visible picked out by the use of a pointed stick and destroyed. If this treatment is ineffective, shake the roots entirely free from the soil and larvæ, and repot the Cyclamens in a fresh compost. Another plan is to turn the roots out of the pots, and spray the roots and soil with carbon bisulphide or "Vaporite."

FIGS: S. W. There is no disease present in your Figs. Prick up the ground, and in the spring apply a mulch of short manure.

FUNGUS: B. Barker. Both fungi are the Fly mushroom *Amanita muscaria*. This species is poisonous.

GRAPES: London. There does not appear to be anything the matter with the Grapes, except that they are affected with the insect known as Mealy Bug. The Grapes themselves are perfectly sweet; if decay is found amongst them it is merely due to the berries being over ripe.

HEDGE FOR SCREEN: E. H. C. We do not recommend the mixing of several kinds of plant in a hedge, but, on the contrary, advise you to plant common Beech or Hornbeam. Either plant is capable of making a good hedge, and

has the additional merit—Beech especially—of holding its leaves during the greater part of the winter, thereby forming additional protection. Thorn is not of much use if a hedge over 4 feet in height is required. Your best plan is to procure plants of the common Beech or Hornbeam, about 3 feet or 4 feet in height, and to plant them about 1 foot or 18 inches apart, according to the bushiness of the plants.

MELON LEAVES: *T. S.* The plants are badly attacked by the fungus disease, *Cercospora melonis*. Remove all badly infected leaves, and spray the plants throughout the house with a rose-red solution of permanganate of potash at intervals of three days.

NAMES OF FRUITS: *P. A.* 1, Hawthornden; 2, Welford Park Nonesuch; 3 and 4, Cox's Orange Pippin; 5, Blenheim Pippin; 6, Pitmaston Golden Pippin; 7, Rosemary Russet.—*B. & W.* The fruits are so badly grown and deformed that we cannot name them with certainty.—*J. B.* Red Apple, Herefordshire Beefing, Green fruit, Duke of Devonshire. The Plum was smashed.—*T. Pitt.* 1 and 4, Beurré Diel; 2 and 3, Send again later; 5, Blenheim Pippin; 6, Ribston Pippin.—*J. W.* 1, Summer Strawberry; 2, The Queen; 3, Yorkshire Beauty; 4, not recognised; 5, Cellini; 6, Colonel Vaughan.—*G. W.* Without doubt Warner's King; 2, King of the Pippins; 3, Withington Fillbasket; 4, Lane's Prince Albert; 5, Yorkshire Beauty; 6, Doyenné Boussoch.—*Pomo.* 1, Vicar of Winkfield; 2, Beurré Diel; 3, Waltham Abbey Seedling; 4, Castle Major; 5, French Crab; 6, Dumelow's Seedling.—*R. J. O. C.* 1, Lord Derby; 2, Ribston Pippin; 3, Ribston Pearmain; 4, send again later.—*T. E.* 1, Small's Admirable; 2, Royal Russet; 3, Court-pendu-plat; 4, Court of Wick; 5, Detling Seedling; 6, Allen's Everlasting; 7, Blenheim Pippin.—*R. J. F.* 1, Queen Caroline; 2, Scarlet Golden Pippin; 3, Round Winter Nonesuch; 4, possibly a local variety; 5, Winter Hawthornden.—*W. S.* 1, New Hawthornden; 2, Cox's Orange Pippin; 3, Potts's Seedling; 4, Bedfordshire Foundling; 5, Blenheim Pippin; 6, Stamford Pippin.—*Fletcher Bros.* 1, Mère de Ménage; 2, Ribston Pippin; 3, Reinette de Canada.—*O. A. C.* 1, Cellini; 2, Beauty of Kent; 3, Small's Admirable; 4, Lady Henniker; 5, Lane's Prince Albert; 6, Warner's King.—*M. B.* 1, Sandringham; 2, Mère de Ménage; 3, Bank Apple; 4, Warner's King; 5, London Pippin; 6, Lane's Prince Albert.—*G. W. H.* 1, Bismarck; 2, Small's Admirable; 3, American Mother; 4, Lord Lennox; 5, Stirling Castle; 6, Gravenstein; 7, Reinette de Hollande; 8, Melon; 9, Minchull Crab; 10, not recognised; 11, Warner's King; 12, Duchess of Oldenburg.—*J. MacD.* 1, Prince Albert; 2, not recognised; 3, Alfriston; 4, Ribston Pippin; 5, French Crab; 6, Grange's Pearmain.—*F. Duns.* A, Belle de Pontoise; B, Golden Harvey; C, Reinette Van Mous; D, Pitmaston Pineapple; E, Maltster; F, White Nonpareil.—*J. Coomber.* 1, Cox's Pomona; 2, Lewis's Incomparable.—*No note for identification.* One Pear was included amongst Apples, asking if it is a cooking variety; the fruit is Hacon's Incomparable, and is not recognised as a good stewing Pear; 1, Mabbott's Pearmain; 2, Claygate Pearmain; 3, Waltham Abbey Seedling; 4, Glory of England; not syn. with Gascoyne's Scarlet.—*T. W.* 1, White Nonpareil; 2, French Crab; 3, Kedleston Pippin; 4, Mank's Codlin; 5, King of the Pippins; 6, not recognised.—*J. M.* Undoubtedly Marie Louise.—*A Reader.* Hughes's Golden Pippin.—*H. Tuckett.* We do not think the Apple is in commerce, but it is a splendidly-flavoured variety; we advise you to get some young stocks grafted from the original tree.—*P. White.* Nonpareil.—*H. M.* 1, Annie Elizabeth; 2, Hanwell Souring; 3, Minchull Crab; 4, Forge Apple.—*C. F.* 1 and 4, Summer Pippin; 2, Frogmore Golden Pippin; 3, French Crab; 5, Fearn's Pippin.—*No Letter* (fruits packed in a pickling spice box): 1, Stirling Castle; 2, Beauty of Kent; 3, Blenheim Pippin; 4, Bramley's Seedling; 5, Allington Pippin.—*Constant Reader.* 1, Harvey's Wiltshire Defiance; 2, Queen Caroline; 3, Dean's Codlin; 4, Blenheim Pippin; 5, Winter Strawberry; 6, Claygate Pearmain.—*C. W.* Cornish Aromatic.—*E. Dalton.* 1, Warner's King; 2, Belle Dubois; 3, Broad Eye Pippin;

4, Queen Caroline; 5, King of the Pippins; 6, not recognised; 7, Marie Guisse; 8 and 9, these are inferior specimens and cannot be named.—*J. MacD.* 1, Cellini; 2, Annie Elizabeth; 3, Tower of Glamis; 4, Malster; 5, Grange's Pearmain; 6, Lane's Prince Albert.—*E. W. Seel.* 1, Scarlet Golden Pippin; 2, Allen's Everlasting; 3, Van Mons; 4, Hawthornden; 5, Tom Putt.—*E. H. C.* 1, Summer Stibbert; 2, Winter Strawberry; 3, we have compared the fruit with the variety Lord Derby, and the only difference we can detect is that the fruit sent is a little sweeter.—*A. B.* 1, Manks Codlin; 2, Fearn's Pippin; 3, Dean's Codlin; 4, Radford Beauty; 5, Mannington Pearmain; 6, King of the Pippins.—*B. H. L.* 1, King of the Pippins; 2, White Nonpareil; 3, Mabbott's Pearmain; 4, Adams's Pearmain; 5, Hormead's Pearmain; 6, Dumelow's Seedling (Wellington); 7, Ashmead's Kernel.—*W. Bowles.* The specimen arrived in a much-bruised condition; send earlier next season.—*H. W.* Pears decayed; 3, Blenheim Pippin; 4, Round Winter Nonesuch; 5, King of the Pippins; 6, Lady Sudely.—*T. J. F.* 1, King of the Pippins; 2, Minchull Crab; 3, Lord Derby; 4, Melon Apple; 5, White Nonpareil; 6, Grégoire Bordillon; 7, Winter Quarrenden; 8, Fearn's Pippin; 9, Napoleon; 10, Easter Beurré; 11, Marie Benoist; 12, Gansel's Bergamot; 13, Brownlee's Russet; 14, Josephine de Malines; 15, Northern Spy; 17, Blenheim Pippin.—*Cestrian.* 1, Braddick's Nonpareil; 2, Spitzenberg; 3, Barcelona Pearmain; 4, Royal Russet; 5, Cockle's Pippin; 6, Tower of Glamis; 7, Belledge Pippin; 8, Ross Nonpareil.—*H. R. B.* 1, Newton Wonder; 2, Beauty of Kent; 3, Brabant Bellefleur; 4, Reinette Franche; 5, Golden Noble; 6, Mickleham Pearmain; 7, Ashmead's Kernel.—*J. J.* 1, a very fine fruit of Dumelow's Seedling (Wellington); 2, Kentish Pippin; 3, Langton Nonesuch.—*G. H. S.* 1, The Queen; 2, King of the Pippins; 3, Waltham Abbey Seedling; 4, Dumelow's Seedling; 5, Bramley's Seedling; 6, not recognised.—*H. E. C.* Pear Vicar of Winkfield; Apple Biggs's Nonesuch.—*G. E.* 1 and 2, King of the Pippins; 3, Norfolk Beefing; 4, Bramley's Seedling; 5, not recognised, most likely a local variety; 6, Tower of Glamis.

NAMES OF PLANTS: *R. W. N.* The *Salvia* is *S. pseudo-coccinea*, the hairy-stalked, scarlet Sage. The white-flowered climber is *Araujia sericifera*, known also as *Physianthus albens* and *Araujia albens*. The flowers are capable of ensnaring moths and other insects. A correspondent stated in our issue for October 31, 1896, p. 523, that he found seven moths entrapped, including two large privet hawk moths (*Sphinx ligustri*) and five pot-herb moths (*Hadena oleracea*), and other insects.—*T.* *1, *Cratægus orientalis sanguinea*; *1, with opposite leaves is either the cut-leaved Persian Lilac or a Jasmine (too shrivelled and broken to identify); 3, *Fraxinus excelsior heterophylla* (*these two specimens were numbered one).—*Florence.* Varieties of *Pernettya mucronata*.—*R. B. R., Cheshire.* The plant sent with the Balsam is *Cuscuta reflexa*, a species of Dodder, a parasite belonging to the Convolvulaceæ. *C. reflexa* is not a British species.—*G. E. G.* We cannot name the variety of Zonal Pelargonium, or Geranium as you call it, from a shoot and leaves only. You had better wait until the plant is in flower, and then send a specimen to some nurseryman who makes a speciality of Pelargoniums for bedding purposes. If you find that the plant does not bloom satisfactorily, it would be well to cultivate it in as poor a soil as possible.—*A. J. Collins.* 1, *Salvia azurea grandiflora*; 2, *Ceratostigma plumbaginoides*; 3, *Erigeron mucronatus*; 4, *Caryopteris Mastacantha*; 5, *Cistus ladaniferus*.—*K. L.* *Alternanthera versicolor* and *Salvia splendens*.—*C. E. C.* 1, *Pittosporum tenuifolium*; 2, *Boussingaultia baselloides*; 3, *Myrica Gale*; 4, *Begonia* species, send when in flower.—*W. Brooks.* *Vitis heterophylla*.—*W. R. C.* 1, *Arbutus Unedo* (the Strawberry Tree); 2, *Escallonia* species, probably *E. macrantha*, but the specimen is insufficient to identify with certainty.—*Dennis Rose.* 5, *Aster Novi-Belgii* *Ariadne*; 6, *A. N.-B. Purity*; 8, *A. Novæ Angliæ rubra*; 10, *A. ericoides*. The others

were quite withered.—*B. W.* 1 and 2, seedling forms of *Cupressus Lawsoniana*; 3, *Thuya gigantea*.—*A. Campbell.* 1, *Magnolia tripetala*; 2, *Tilia platyphyllos* (*T. grandifolia*).—*T. O.* 1, *Odontoglossum nævium*; 2, *O. Lindleyanum*; 3, *Oncidium oblongatum*; 4, *Dendrobium moniliforme*.—*Constant Reader.* *Viburnum Opulus* (Guelder Rose).—*W. H. C.* *Sedum carneum variegatum*; 2, *Helxine Soleirolii*.—*Talfor.* *Eucomis regia*.—*S. McG.* *Lomaria Boryana* and *Athyrium filix-foemina* *Fieldiæ*.—*Chewton.* *Vitis heterophylla*.—*F. W. S.* *Urceolina pendula*.—*E. S., Norfolk.* 1, *Cydonia japonica*; 2, *Olearea Haastii*; 3, *Cistus ladaniferus*; 4, *Andromeda japonica*; 5, *Veronica Andersonii*, garden form; 6, *Cassia chrysophylla*; 7, *Leycesteria formosa*.

POINSETTIA AND BEGONIA: *F. R.* We do not find anything the matter with the Poinsettia (*Euphorbia pulcherrima*), but the Begonias appear to have suffered a check from some cause, as the ends of the shoots are starved and ill-nourished.

POTATO: *J. W. D.* The tubers are affected with ordinary scab. The affection is only "skin deep," and the tubers are just as valuable for consumption as those with clean skins. Indeed, it is frequently found that scab Potatoes are more "floury" when boiled than ordinary tubers, and for this reason are preferred by many people. In order to prevent scab another season, you might immerse the seed tubers for two hours in a solution of one pint of commercial formalin (formaldehyde, 40 per cent.) in 36 gallons of water. Add Acid manures to the soil before planting the tubers, withholding organic manures. Sprinkle flowers of sulphur around the sets.

ROYAL HORTICULTURAL SOCIETY'S EXAMINATION: *G. G., Devon.* For information respecting the examinations of the Royal Horticultural Society apply to the Secretary, Royal Horticultural Society, Vincent Square, Westminster. Respecting the advertisers who offer to conduct classes by correspondence in connection with these examinations, we are not in a position to recommend one or the other, as obviously this could only be done after an examination of the tutors themselves.

STOCKS FOR FRUIT TREES: *Brown.* The term "free" stock is applied to stocks raised from seeds obtained from Apples without regard to variety, such, for instance, as may be obtained from cider mills. The wild or natural stock is raised from seeds obtained from the wild crab, whilst the Paradise or dwarf stock is a surface rooting stock on which Apples are grafted for cultivation as Cordons, Espalier, or even Pyramid trees. The same terms apply to stocks used for Pear trees, except that the restricting stock is the Quince and not the Paradise. Nectarines and Peaches are budded or grafted on seedling stocks of the Almond, Peach, and certain varieties of Plum. Almond and Plum stocks are more frequently used, being less tender than Peach stocks.

VINES: *J. P. O. D.* The best plan to adopt is obvious, namely, remove the border, and make a fresh one on the lines recommended in these columns on September 30 last. You must settle for yourself whether it is necessary to plant new canes, for this question can only be determined by examination of the plants now in the house. If you plant afresh, it will be well to select early ripening varieties, such as Black Hamburgh, Royal Muscadine, Madresfield Court, and Foster's Seedling. The roots may be allowed to grow outside as well as inside. If the glass of the roof is shaded by trees, such trees should be removed, it being important to expose the vines fully to the sunshine.

WEEDS ON LAWN: *E. L.* Hand weeding is the best method of getting rid of the Bind-weed and other weeds you mention, but, failing this, you may make frequent small applications of nitrogenous manures, such, for instance, as Sulphate of Ammonia. This will encourage the growth of the true grasses, which may eventually succeed in smothering the weeds.

ASHBOURNE.

(See figs. 137, 138, 139, 140, and Supplementary Illustration.)

ASHBOURNE, well known to readers of the *Gardeners' Chronicle* as the residence of Mr. R. H. Beamish, an enthusiastic amateur horticulturist, is situated close to the sea, on the red sandstone hill at Glounthaune, and overlooks the fiord which runs up from Queenstown to Cork.

Soon after the gates are entered the plant lover realises that he is in a place of more than usual interest, for rare and uncommon plants occur on every side, and Palms, Bamboos, Cordylines, and other tender subjects provide an exotic vegetation. On the occasion of my visit this summer, *Lonicera Heckrottii* stood out, twining charmingly around the butt of an old tree, where its metallic rose-coloured flowers and glaucous leaves were in beautiful harmony with the bark which supported it. Near by was a plant of *Embothrium coccineum* in magnificent flower, and placed to considerable advantage against a background formed of the dark foliage of Pine trees. Just below this plant were large masses of Ghent Azaleas, the subdued hues of the flowers, which characterise the race, providing a refined colour scheme.

In a morass were planted stream-loving plants including splendid specimens of *Ourisia coccinea* and *O. macrophylla* in

abundance, as well as the rarer *O. Cockayniana*.

Rodgersia pinnata, resembling a *Gunnera*, and many of the damp-loving Irises were also plentiful, and growing in association with minute *Rhododendrons* was a hybrid *Meconopsis*, raised by Mr. Beamish from *M. integrifolia* and *M. grandis*.

Passing through a valley in which a streamlet flows one emerges close to a magnificent clump of *Senecio Fosteri*, a glorious plant, with silvery white tomentum on the under surface of the leaf, and a glaucous-grey upper surface. It develops *Cineraria*-like flowers of a deep yellow tone. Just below it, on a little island in

an end or even to its climax. The flowers are white, and, together with the foliage, are borne a considerable distance from the crown of the plant. The water here is bordered by masses of *Iris lævigata* and numerous other plants, including a clump of *Arundo Donax* with stems 20 feet tall.

Close at hand is a fine arbour covered with two forms of *Wistaria multijuga*, which were in full bloom and growing as luxuriantly as in their native country. Passing through a natural arboretum, the eye is attracted by such rare trees as *Laureola aromatica*, *Fagus fusca*, and *F. Cliffortioides*, which has very small, glossy, green leaves, and is notable for its graceful habit and Fernlike branches.

FIG. 137.—*CYPRIPEDIUM SPECTABILE* AT ASHBOURNE, CO. CORK.

the stream, is growing the Bulgarian *Primula deorum*, and few grow it with such success as Mr. Beamish. Facing this situation are planted hundreds of uncommon plants, the most notable being *Tricuspidaria hexapetala*, better known as *Crinodendron Hookeri*, associated with *Eremurus Elwesii* and *E. robusta*.

A little to the left, an artistic arrangement of *Nymphæas* meets the eye, the colours of the varieties being blended most harmoniously. *N. Marliacea albida*, *N. gloriosa*, *N. Ellisiana*, *N. Froebellii*, *N. tuberosa Richardsonii*, and *N. gracilis alba* were growing in fine form. There was also a curious species from Lapland in flower. The plant dies down long before the *Nymphæa* season has come to

Broussonetia papyrifera, with its burr-like flowers, was sheltered by majestic Bamboos. This *Broussonetia* possesses the peculiar character of having no two leaves alike. The Tortoise-shell Bamboo, *Phyllostachys heterocycla*, was sending up fine young growths. Mr. Beamish has a healthy collection of these plants, which include *Arundinaria Hindsii*, *A. H. graminea*, *A. palmata*, *A. p. nana*, *A. pygmaea*, *A. Falconeri*, *Phyllostachys viridis*, *P. aurea*, *P. fastuosa*, and *P. nigra*.

Eucommia ulmoides, a plant which furnishes rubber, was making rapid growth, being evidently suited to its southern home. *Aralia Sieboldii* assumes the character of a very large shrub in these gardens, and *Leptospermum bullatum* was a

sheet of flower and seeds at the time of my visit. Close by it is planted a very rare variety—*L. Chapmanii*, which was flowering for the first time this summer. This flower, instead of being white, has a deep rose-coloured centre edged with light rose, forming a beautiful contrast. A specimen of *Rhaphithamnus cyanocarpus*, a plant rarely seen in the open in these islands, was 10 feet wide and 8 feet high, and bore little flowers of French-grey colour which are succeeded by blue berries. The plant has a distinct, Holly-like appearance, and grows best in a dry, peaty soil. Amid all these rare and choice plants a beautiful tropical group luxuriates (see Supplementary Illustration), *Chamærops Fortunei* and *C. humilis* were in magnificent health, quite different from that of the majority of these plants growing out-of-doors in Great Britain. They are surrounded by *Cordyline Banksii* and its variety *erythrorachis*, a most delightful plant, the red venation of the leaves giving it a distinctly bright appearance, especially when the leaves are surmounted by whorls of scented flowers.

The rock garden at Ashbourne (see Supplementary Illustration) is one of the finest examples of modern Alpine gardening in the British Isles, and certainly the best in Ireland. On our way to the rockery we passed a specimen of *Decaisnea Fargesii*, an interesting bush discovered in China by the Abbé Fargès, and introduced to Europe by Mr. Maurice de Vilmorin. Its peculiarity lies in the fruit which is produced from somewhat insignificant, dull-yellow flowers. The fruits are formed in clusters of from two to five, and are cylindrical in shape, somewhat resembling huge azure-blue caterpillars hanging from the branches. Such uncommon shrubs as *Plagianthus betulinus*, *Pterocarya adiantifolia*, *Prumnopitys elegans*, *Escallonia organensis* (a beautiful Brazilian form), *Teucrium parviflorum*, *Pittosporum patulum*, *Olearia Solandri*, *O. insignis*, *Osteomeles anthyllidifolia*, and many others were noticed. Specimens of *Ilex Pernyi*, *I. insignis*, and *I. fragilis*, growing in company with large specimens of *Buddleia Colvillei* and *Pittosporum Mayi pictum*, 20 feet in height, attracted my attention.

Acer oblongum and *A. carpinifolia* were also noticeable, and just by the entrance to the rock garden is a splendid clump of *Viburnum plicatum*, the flowers covering the shrubs as with a sheet of snow.

Many gems of the Alpine flora are met with in the rock garden proper. There is a batch of *Cyananthus incanus*, a plant of rare beauty. Further on the rock garden opens out vistas of many rugged hills and deep vales, and in the distance a stream dashes in torrents from the heights above, and rushes on its rugged way down one of the most delightful valleys that was ever designed by a landscape artist.

Plants of *Cypripedium spectabile* and *C. macrantha* grow in colonies, as though they were in their own native home (see fig. 137). *Onosma albo-roseum* grows in clumps from 12 inches to 18 inches across, the plants being exceptionally vigorous and healthy. *Haplocarpha scaposa*, which Mr. Beamish introduced from the Cape, has the appearance of growing quite well in its new habitat.

Saxifraga lingulata Albertii (fig. 138) evidently a variety of, or very nearly related to *S. lantoscana*, abounds in such a way as to crowd its flowers into a dense mass concealing the foliage. There is little doubt that this plant is one of the best of the encrusted-leaved *Saxifragas*, and certainly the most floriferous. Other *Saxifragas* include the true *S. islandica*, growing in a cleft in a vertical position, such as is generally occupied by *S. longifolia*. *S. Griesbachii* nestles in the chinks close at hand, with *S. Ferdinandi* *Coburgii* and other *Saxifragas* too numerous to mention. Close by, I noticed the rare *Oxalis adenophylla* with its curious, crinkled leaves and rose-coloured flowers.

Colonies of *Lithospermum rosmarinifolia*, *L. prostratum*, *L. graminifolium*, and *L. intermedium* were exceedingly fine. The ground was carpeted by *L. prostratum* interspersed with *Arenaria montana*, hanging over the surface of

Moltkæa petræa, a near relative of *Lithospermum*, was also in full flower; this plant has a glaucous appearance, like the Lavender, and its beautiful flowers remind one of a *Lithospermum*. *Rosa sericea* was situated in such a position that the sun shone through its large red spines, producing a beautiful effect.

Genista dalmatica, one of the smallest of the Gorses, furnishes the top of one of the miniature mountains. *Teucrium fruticans* specially appeals to those who love glaucous foliage, and in this garden it assumes the size of a large bush; the flowers are of a sky-blue colour. *Corylopsis parviflora*, *Olea europæa*, and *Davidia involucrata* are other notable plants included in this uncommon garden.

Passing out of the rock-garden, I noticed a fine bush of *Daphne oleoides* in full flower.

On the top of a hill, *Pinus insignis*, *P. Montezumæ*, *P. flexilis*, *P. oocarpa*, *P. patula*, *P.*

FIG. 138.—*SAXIFRAGA LINGULATA ALBERTII* AT ASHBOURNE.

the rock. *Æthionema kotschyana* (see fig. 139) is one of the most beautiful and rare plants that Mr. Beamish possesses. When in flower it is a veritable blaze of carmine-pink.

Another rarity observed, although not in flower, was *Anemone Fanninii*, with its giant leaves, much resembling those of *Saxifraga palmata*. That delightful species, *Viola bosnaica*, studded some of the slopes of the rock-garden. Of the numerous *Campanulas* planted in the rock-garden, I will mention only *C. muralis*, which was a sheet of flower stretching up the slopes of the western bank. One of the smallest of the shrubs that furnish the hilltops and the steeper banks is *Bryanthus erectus*. This plant is a hybrid between *B. empetrifomis* and *Rhodthamnus chamæcistus*. It is a difficult subject to cultivate, but Mr. Beamish has succeeded with it.

Tœcote, *P. Khasya*, *P. Merkusii*, *P. Hartwegii*, *P. palustris*, *P. Ayacahuite*, *P. Armandii*, *Picea omorica*, *P. pungens pendula Kosteri*, *P. violacea Waltzii*, *Sciadopitys verticillata*, *Taxodium mucronatum*, and *Torreya myristica* are all growing in splendid vigour. One of the most beautiful Conifers in the collection is *Picea violacea Waltzii*, with its glaucous-white foliage.

Along a small upland valley is, perhaps, one of the most surprising features of the garden. Here, situated in a little sun-trap, are numerous tropical plants, among them *Musa japonica* or *Basjoo*, which has hitherto survived the Irish winters unharmed, *Aloës*, and various succulents, surrounded by such rare trees as *Cæsalpinia japonica*, *Genista fragans*, *Perovskia atriplicifolia*, *Guevina avelana*, and *Dendromicum rigidum*, 12 feet high.

There are also numerous plants introduced by Mr. Wilson from China, and others from New Zealand, brought home by Captain Dorien Smith. Near at hand was a plant of *Agave filifera filamentosa*, with a fine spike of flowers. Descending the hill, one catches a beautiful view of the rock-garden below. A long path stretches from the dwelling house to the rock-garden, bounded on either side by *Cordylines* and arching Yews, and this is the only formal arrangement in the whole of Mr. Beamish's garden.

On a sheltered wall of the residence, which is entirely covered with creepers, *Smodingium argutum* and *Fremontia californica* were observed in glorious flower, and *Solanum crispum* towering to the full height of the wall. A plant of *Vitis Henryi* in a northern corner is 30 feet high, and as much in width. There are also specimens of *Vitis Thomsonii*, *Actinidia Kolomikta*, *Clematis Prattii*, *Ercilla spicata*, *Cassia corymbosa*, *Manettia bicolor*, *Habrothamnus fasciculatus*, and last, but not least, a fine *Mandevilla suaveolens*, which, at the time of my visit, was covered with flower-buds.

The paramount impression made upon the visitor is that this is no ordinary garden. A natural wildness prevails everywhere, yet perfect harmony in colours has been achieved. The gardener is Mr. Williamson, whom Mr. Beamish rightly regards as a man who places the health and general success of his plants above everything else. *W. H. Paine.*

THE ROSARY.

CULTURAL HINTS FOR NOVEMBER.

AFTER the recent rains Roses may be lifted and transplanted with ease, and seldom has the wood been more thoroughly ripened. Complete the planting this month of hedge briars intended for grafting as standards, also the cuttings for raising a supply of dwarf stocks. There is considerable difference of opinion amongst even the most experienced Rose growers respecting the benefits or otherwise of protecting Roses. Personally, I am not in favour of much protection being afforded, and certainly not to the extent to which it was practised formerly; nor do I like the plan of mulching with manures or litter, which substances retain a great deal of moisture; for I am convinced that this, combined with frost, is doubly harmful. My aim is to keep the plants, and especially their bases, as dry as possible during frosty weather. But the tenderness of certain varieties must be borne in mind, also the district, and whether the situation of the garden is low, and consequently more subject to the influence of frost, before arriving at a decision. Sprays of Heath, Spruce, Birch, or similar plants may be got in readiness for sticking into the ground upon the exposed side of the plants to break frost-laden winds, which seem to do more harm than a frost of greater intensity in calm weather. The ordinary loose litter does not protect the plants from dangerous frosty winds, because it is blown away into sheltered corners where it is not needed, leaving the Roses fully exposed. Branches stuck in the ground are more permanent, by no means untidy, and can be fixed or removed in a few minutes. They both answer the purpose of breaking the wind and prevent the accumulation of excessive moisture.

Always make a practice of drawing some soil around the base of dwarf Roses, both as a means of keeping this important part of the plant dry, and also as a capital and almost invaluable way of warding off frost, for, provided the bottom eyes are kept sound, the plants will come through very severe winters safely. Proceed with the planting of Roses as soon as the ground will allow, but do not tread upon newly-trenched soil when it is wet. Spread out the roots and add a little soil, then tread the ground, which is better than waiting until all the soil has been added before making it firm.

ROSES UNDER GLASS.

The most forward pot plants may be pruned and started into growth in a temperature of 55° to 60°, and their management will be easier if a small house is given up to them entirely. Do not prune such climbers as *Marechal Niel*, *William Allen Richardson*, and *Pierre Cochet* except to remove any small, twiggy growths that were overlooked or have formed since the summer pruning. All long growths should be retained so far as they are sound, and this applies to those trained on walls or the roof of the house. Ordinary, free-growing varieties should not be

the house too close for a while; the plants will be better for all the air and light available so long as the requisite temperature can be maintained without danger from draughts.

GRAFTING UNDER GLASS.

Grafting indoors should now be commenced, and if stocks were potted as advised they will be in an excellent condition for the purpose. Good seedling briars are preferable to rooted cuttings as stocks, because they have very little pith and may be grafted direct upon the roots, thus avoiding sucker-formation later. Manures and leaf

FIG. 139.—*ÆTHIONEMA KOTSCHYANA* AND OTHER PLANTS ON THE ROCKERY AT ASHBOURNE.

pruned quite so hard as in the case of similar plants when growing in the open, nor will they be carrying quite so much wood; but keep the centre of the plants clear from twiggy wood. In our establishment we require a quantity of fairly good blooms rather than a few of extra quality. If the latter are wanted the pruning must be severe and the number of blossoms curtailed. Be sure that the wood of the plants is quite clean before forcing. If the old leaves are cut off and the wood well syringed with a rather strong insecticide, several pests may be destroyed that would otherwise increase rapidly. Do not keep

soil should be avoided, as they encourage fungi to grow in the close propagating case. Fresh yellow loam and a little coarse sand are all that is necessary. Tiles or slates are better than wood to stand the pots upon, with a layer of sand or washed ashes to keep them firm and maintain a uniform moisture. Let a few of the stocks be introduced to warmth about a fortnight before they are grafted, it being better to have the stock a little in advance of the graft. Future batches may be introduced as the propagating case is emptied. Any ordinary propagating case having a regular bottom heat will answer the

purpose. I would rather not have a pipe inside the case, because it would dry one part more than another. Pipes enclosed beneath it are the best, for the heat may be regulated much better from below the bottom of the frame. Squares of glass laid over the case and resting against a piece of wood so as to form a lean-to are more suitable than fixed glass, which is not at all necessary when the case is protected by the house. One may easily get to any of the contents of the frame by moving one or more squares of glass. Ventilation may also be provided to any desired extent by leaving more or

possible, only allowing room for the graft to be fixed. If the graft is smaller than the stock it is cut in the form of a wedge, and slipped into a corresponding cut in the stock. The other method is that known as side or whip grafting, which consists of making a slanting cut at the base of the graft, and an upward cut of corresponding size and length upon the stock, so that the barks of both fit closely together. Tie the scion and stock firmly, and be sure that they fit as true as can be managed; a little practice will soon secure this at the first cut. Grafting wax or mastic is unnecessary when the case is kept

with due regard to the light and temperature. In about six weeks time the more forward plants may be removed from the case, and stood in the same house until partially hardened. They may be slightly syringed overhead at that stage. Any plants that are backward may be kept close in the case. It is unlikely that all the plants of one batch will develop uniformly, and the varieties will also behave differently. If possible, select grafts from matured wood of the previous season's growth from plants under glass or in pots. *Practice.*

SOME ADVANTAGES OF AUTUMN CULTIVATION.

It will be admitted that the past season has been one of the most trying which has been experienced for some years. Want of water has been the chief trouble, though there have been many instances where the ill-effects have been very much reduced by a thorough system of cultivation. Such a system must have its beginnings in the autumn, and its chief effects are improved water capacity and texture or tilth, increased availability of plant food, and a large measure of freedom from insect and fungous pests during the following season.

WATER CAPACITY.—In regard to water capacity, even in our temperate climate the chief cause of reduction of yield by a crop is want of water at some period during its growing season. After such a summer as the last the ground became very hard and solid, so that the autumn rains are unable to soak into the soil. Some may think that after the rain we have had of late, this is unlikely, but only quite recently I found many dry places within a few inches of the surface. This is probably in part due to air, which, having collected in the soil during the dry weather, prevents rain from penetrating. Stirring will allow this air to pass out and then rain, instead of running off the surface into the nearest drain, will be able to enter the soil. Another effect of stirring is to make the pore space larger, so that the soil will soak up more water. There are not many experimental results which can be applied to soils of varying type, but with an average light garden loam it can be said that soil stirred in autumn will provide one-eighth to one-sixth more water to the crop during the following summer.

TEXTURE AND TILTH.—We are considering texture in the sense of workability, not with immediate reference to the physical structure of the soil. After the past dry season the soil particles are closely packed, and tend to form hard lumps. If these lumps are further consolidated by being trodden on, it will be very difficult to get a tilth in the early spring. Some agency must, therefore, be found to break down these lumps, and the most successful will be frost, after the ground has been laid up rough. The freezing of water causes it to expand. This expansion forces the particles apart, and when the thaw comes the whole lump falls to pieces, giving a friable seed bed.

AVAILABILITY OF PLANT-FOOD.—Practically all the constituents of the soil are unavailable to the plant until they have been exposed to weathering or decomposing agents, such as frost, running water, oxygen, carbon dioxide, &c. It will be seen, therefore, that stirring the soil by exposing it to these agencies tends to add to the available plant-food. Still more is this the case when organic manures are dug in at the same time, as, by their decomposition, they give the solvent agent, carbon dioxide, and provide food for the organisms which absorb nitrogen from the air and render it available to the plant. Bacteria also take part in many other processes by which the inorganic foods are converted into soluble forms.

FREEDOM FROM PESTS.—In countries where there are no frosty winters insects and fungous diseases abound. With us these are far more likely to be killed if the soil is laid up so that frost can penetrate to all parts. Birds also can do good work when the soil is open. *T. W. Tayleur.*

FIG. 140.—LINUM LOWII ON THE ROCKERY AT ASHBOURNE.

less space between the squares. Every precaution should be taken not to allow moisture to condense in the case. Perhaps the best way to avoid this is to wipe the glass daily or turn it over, when the damp on its surface will disappear. Always have the soil moist enough to do without water for some time after the graft is fixed, as overhead waterings cause decay from the moisture getting between the scion and the stock. There are several forms of grafting, and I will describe the two most generally practised. The stock is cut off as close to the roof glass as

quite close. Should water be needed, let it be afforded very carefully in the pot without wetting the graft, as it is most injurious to wet the latter before the union is complete. Keep the frame perfectly dark at first, and not warmer than 65° to 70°. As callus forms and growth pushes out from the graft, gradually expose the plants to the light, but do not allow strong light to reach them until leaves have formed, and only allow a very little then. Fresh air may be given by leaving the squares of glass a little way apart, but exposure should be very gradual and given

FLORISTS' FLOWERS.

HOW TO CULTIVATE SWEET PEAS TO FLOWER IN MAY.

THE present is a good time to sow Sweet Peas for raising plants to flower under glass in April and May. The seeds should be sown in shallow boxes or pots, and when the seedlings are about 2 inches high they should be potted singly into 3-inch pots, using a fairly heavy loam with a little silver sand added to keep the soil open. After potting place them in cold frames, where they may remain till early in February, giving them ventilation on every suitable occasion. Never coddle Sweet Peas, for it means ruin to them. Early in February, the plants should be transferred to their permanent quarters either in prepared trenches, through the centre of a cool-house or in pots, as the case may be. I prefer planting them out in trenches, as they are less liable to suffer through becoming dry, and this method also allows the plants more root room. The centre of a Tomato house suits them very well, and if the house is only about 12 feet wide, a single row is sufficient, and the space so utilised is often wasted. If the house is large, two or three double rows may be planted, leaving just sufficient room to get between the plants for gathering. American Carnations and Sweet Peas do very well together, as they both require plenty of light and air, but very little fire heat. In preparing the trenches for inside culture, take care not to overfeed the plants with manure, as this would cause too sappy a growth. From the time of planting all the air possible should be admitted to the plants, otherwise they will become drawn and weak, and bud-dropping will result. Plants cultivated in trenches should be allowed one foot space from each other, and for 12-inch pots three plants are sufficient for each pot. In cultivating for exhibition, each plant should be restricted to two or three shoots only. Strong flowers, such as Elsie Herbert, Maud Holmes, and others, will carry three, but weaker varieties, such as Earl Spencer and Dazzler, are better on two stems, and all lateral growths should be removed as soon as they appear; if the flowers are wanted for table work or market purposes, this is not necessary. The best method of training plants grown in trenches is to place tall stakes in pairs at intervals of about 12 or 15 feet, one each side of the row, and the tops of the stakes reaching well into the centre ridge of the house. Then strain thin galvanized wire (commencing about a foot from the ground) from one stake to the other as far as required, and add other wires as the plants grow (about every 2 or 3 feet). The growth can then be trained from one wire to the other by simply fixing a piece of raffia in the required direction and tying the growth to it. Then an occasional tie to the wire keeps the whole thing firm and steady.

Water must be given sparingly in the early stages, but when the plants are growing fast, a plentiful supply is necessary. An occasional application of weak manure and soot water is a great help during the growing period, and as the flower-buds appear a dressing of Macreth's special Sweet Pea manure will greatly help the length of stem and the colouring of the bloom, especially such colours as Dazzler, Maud Holmes, Geo. Herbert, and Helen Lewis. Plants grown in pots will require more feeding than those in trenches. Some varieties are more adapted for culture under glass than others, and the following are to be recommended:—Freda, white-waved; Jack Tar, blue; Edrom Beauty, orange-pink-waved; Stirling Stent, bright orange; George Herbert, carmine; Maud Holmes, crimson; Aurora Spencer, rose-striped; Elsie Herbert, picotee-edged; Mrs. Charles W. Breadmore, buff, picotee-edged; Mrs. Andrew Ireland, bicour; Mrs. Hugh Dickson, cream-pink; Dazzler, a flame-coloured flower; Countess Spencer, pink; Clara Curtis, cream; Paradise,

ivory; Iris, pale shrimp; Tennant Spencer, mauve; and Masterpiece, lavender. If carefully grown, Sweet Peas can be had in bloom by the middle of April, and will well repay the trouble taken with them, or they can be more easily cultivated for flowering at the time of the International Horticultural Exhibition, which will be held next May. *George Herbert, Colden Common, Winchester.*

MARKET GROWING AND LOW PRICES.

THE extraordinary depreciation in the value of market garden produce which has been so noticeable in recent years and this season seems to be more marked than ever, is a matter of very serious moment to those who try to grow for profit, and to the small grower especially. For years past the latter has led a struggling existence, and if prices continue to fall as they have been doing recently one cannot see how the man with moderate capital, and with nothing to fall back upon to tide him over bad seasons, is to continue in the business. The small man who has a retail trade and can supply customers direct will always, of course, be able to hold out better than his fellow who from choice or necessity grows only for the wholesale market. But competition in the retail business is likely to become more severe as time goes on, simply because many who did not care about it before will be driven to retail trade by the low and unprofitable prices obtained for their stuff in the wholesale market.

In order to illustrate the unhappy position of the small market grower at the present time—the big grower, of course, is equally affected, but producing on a larger scale he has a better hold on the salesman, and with a bigger turn-over can afford to take smaller profits—let us look at the price of Tomatos to-day as compared with what it was some 20 years ago. This year in the middle of July best English Tomatos were selling in the London market at 2s. 6d. to 3s. per dozen pounds; 20 years ago the grower would have thought himself badly treated if at that time of the year he could not have made exactly double those prices. At that time of day Tomatos seldom dropped to 4d. per lb. wholesale until August, and at that figure some of us used to ask ourselves whether there was very much profit in the business. We always considered that when the price went to 3d., as it sometimes did at the latter end of August—though seldom for more than a week or two—we were losing money, and we did everything to keep the crops back for the small rise that generally occurred a little later. Sometimes, especially if the weather happened to be wet and dull, Tomatos would command July prices in September, and we can remember the time when we have finished off a late crop in October at 6d. and 7d. a lb. For our early crop, which came in at the latter end of May and beginning of June, we used to get 1s. 3d. and 1s. 6d. a lb., and we always reckoned on a 1s. up to the middle of June. By the latter end of that month we thought 8d. and 9d. quite low enough. Nowadays that price is reached at the beginning of June and sometimes earlier.

The fall in the price of Tomatos and other produce is, of course, due to two things—increased competition at home and increased supplies from abroad. The price is lower than usual this year owing, no doubt, to the fine weather, which has brought on the outdoor crop more abundantly and earlier than usual. In some years, of course, the outdoor Tomato is a practical or complete failure. It seems impossible to suppose that prices for Tomatos can fall much lower—that is to say, that they can be worse next year than this, for they certainly will go lower in the ordinary course of events up to the end of August or beginning of September, especially if the outdoor crop proves to be heavy and is not cut off in its prime by bad weather. But when “seconds,” which years back used to fetch 3d. per lb. in August, are sold in the middle of July at 1d., one feels afraid

to suggest what may ultimately happen. Prices, perhaps, are not quite so bad as they appear—to-day we have more prolific and quicker-growing varieties than we had 20 years ago, so that we can get a better yield per plant, and market at least a portion of the crop before prices fall to their lowest.

But unless the small grower takes special pains to grow only the best varieties and most prolific strains—this usually means a good deal of trouble in selecting and saving one's own seed—and practices the highest methods of cultivation at present known, he has a very small chance of making both ends meet. We used to consider that we did well if, in a house containing, say, 800 plants, we managed to get a yield of 3 lbs. to 4 lbs. per plant, and such a house might be worth £50 to us in the season if all went well, and neither the wireworm nor the disease blighted our hopes. To-day, even with a greater crop, we must be content with very much less money, and a little bad luck will effectually wipe out all our profits. The little man who can sell a ton or two of Tomatos retail during the season is generally able to take twice as much money as his neighbour who sends to market and grows a similar amount. Yet the latter has just the same amount of labour, and labour, as those who have tried the crop know only too well, is a pretty serious matter in the case of the Tomato. For many years the Tomato has been regarded as a staple crop, but if it is not ever again going to pay better than it does at the present time, the little man will be obliged to look upon it merely as a means of employing his spare time and labour from other, and more profitable, summer crops.

Meanwhile it can hardly be said that the consumer is deriving the full benefit of the drop in the price of Tomatos and other market produce. There has, it is true, been a reduction in some cases by the retail shopkeeper, but this reduction is not in proportion to the fall in wholesale prices. One can only suppose, therefore, that the retailer is taking something more than his legitimate profit, because, if he were not, one would be able to buy Tomatos and other things at about half the prices that were asked 20 years ago. That, as every consumer knows, is not the case. Take Potatoes as a case in point. These have been exceptionally cheap this year—the average price for English, best quality, on July 12 was 2s. 6d. per bushel of 56 lbs., and at the same time they were being sold in the shops at 2d. per lb. Second English were quoted in the market as low as 2s. the bushel, but nowhere could one find them being retailed at a lower price than that already mentioned. To sell at 9s. (allowing the odd 4d. for loss in weighing out) that which costs only 2s. or 2s. 6d. (plus another 6d. perhaps for carriage) is surely rather more than a legitimate profit. Twenty years ago the wholesale price of best English Potatoes in the middle of July would be about 4s. a bushel, but the consumer could buy them then almost as cheaply as he can to-day.

One supposes that, in accordance with the usual laws of demand and supply, more Potatoes and other stuff would be sold in the shops if the consumer could get them at a lower rate, but if the retailer by keeping up his prices can get as good a profit on a certain quantity as he could on double the amount sold at a reduced price, it is natural, of course, that he should prefer the former alternative. The grower is therefore doubly hit—his sales are limited by the comparatively high price still charged by the retailer, so that he cannot say to himself by way of comfort at the reduction in wholesale prices, “Well, if prices are lower than they were, I can make up for it to some extent by selling a greater quantity at a time.” On the contrary, he is often obliged to reduce the already low market price to clear his stock, and that in the end makes matters worse than ever because it tends to the lowering of prices in the future. Altogether, the outlook for the market grower just now appears to be anything but bright, and this is particularly so in the case of the little man. *F. B.*

The Week's Work.

THE ORCHID HOUSES.

By H. G. ALEXANDER, Orchid Grower to Lt.-Col. Sir G. L. HOLFORD, K.C.V.O., C.I.E., Westonbirt, Gloucestershire.

DENDROBIUM.—Most species, hybrids and varieties of *Dendrobiums* have now finished their season's growth, and are gradually reaching the point at which they become almost inactive. Both the evergreen and deciduous plants gain great benefit from a good rest when they have been prepared for it by making a strong, healthy growth during the previous season. Hard, well-developed growths do not shrivel during the winter, even when kept dry, whereas soft, badly-developed growths shrivel badly, and in the latter case the rest may prove injurious rather than otherwise, and even prevent the plants from flowering satisfactorily. As soon as growth is completed, which may be determined by the end leaf of each pseudo-bulb being fully developed, the plants should be gradually afforded a cooler temperature, and, at the same time, the amount of moisture, both at the roots and in the atmosphere, must be decreased. Nevertheless, there should not be absolute dryness of the rooting material for any length of time even during the resting period. The good old species *D. nobile*, and its numerous hybrids, are always classed in the deciduous section—and the treatment they require is indeed the same—but they tend to retain their leaves through the resting period. These deciduous plants, while resting, should occupy a house where a cool, intermediate temperature is maintained, and there is plenty of ventilation and sunlight.

EVERGREEN DENDROBIUMS.—Plants of the *D. thyrsiflorum* group, such as *D. densiflorum* and *D. chrysotoxum*, have completed their growth. These require, with respect to resting, treatment like that advised for the deciduous species. Give them sufficient water only to keep their pseudo-bulbs, foliage, and roots in a sound and healthy condition. The species *D. Dalhousianum*, *D. moschatum*, and *D. fimbriatum* are quite another type of the evergreen section, for whilst they also require a prolonged season of rest, they must not be housed in such cool winter quarters. In a well-ventilated house where the temperature does not fall below 55° they rest well. These conditions, together with the comparatively dry state of the roots, cause the long pendulous spikes of gorgeous flowers to develop freely.

DENDROBIUM PHALÆNOPSIS SCHRÖDERIANUM.—Plants of this species are now in flower, and no other kind is so attractive during the present season. When well grown, the blossoms are produced with the greatest freedom, and in the case of recently-imported plants the dry-looking stems contribute their share to the display, in addition to the spikes produced from the tops of the new growths. Until such time as the flower-spikes are removed, a moderate amount of moisture at the roots is needed, but afterwards, when at rest, much less water will be required. These *Dendrobiums* should occupy a warm house all the year round.

D. FORMOSUM.—This beautiful species is the best of the evergreen nigro-hirsute section in which the leaves are retained on the stems of more than one season's growth. The stems, all furnished with black hairs, produce fine heads of attractive white flowers at this season, and these, when displayed together with *D. Phalænopsis Schröderianum*, form a very effective group. The treatment of *D. formosum* is, both during the growing and resting seasons, similar to that of *D. Phalænopsis*.

D. CHRYSANTHUM.—The long, pendulous wreaths of flowers produced by this species when grown in a natural manner are very beautiful. Unfortunately the blossoms seldom last for more than a fortnight. Although it is a deciduous species, it requires a rather different mode of treatment from that usually given to this section. The plants are not by any means constant in the time of flowering, but, as a rule, they are seen in bloom during late autumn and early winter, and as soon as the blossoms are passed the eyes at the base of the stems push again, and growth recom-

mences. Any plants in need of fresh rooting material should receive attention when their young shoots have attained 2 inches or 3 inches in height, and just when they are about to produce roots. Basket culture is best for this species, and, since they are vigorous plants, fairly large baskets may be employed. A well-drained compost of *Osmunda* fibre and *Sphagnum*-moss in as rough a condition as possible, mixing with this plenty of broken crocks and charcoal to ensure aeration, is suitable. *D. chrysanthum* grows best when suspended from the roof rafters of a well-ventilated house where an intermediate temperature is maintained, and as the plants are often active during the winter months, special care must be exercised not to over water the roots.

THE KITCHEN GARDEN.

By JOHN DUNN, Kitchen Garden Foreman, Royal Gardens, Windsor.

CAULIFLOWERS.—Seedlings raised a month ago should now be ready for potting in sandy loam into 4-inch pots. Cauliflowers should be potted firmly, and they need a good watering directly they are placed in the cold pit. When the plants commence to make fresh growth, the lights should be removed, and only placed in position again when protection from frost or heavy rain is necessary.

CELERY.—The earthing-up of this crop should not be overlooked, and the recent dry weather renders it necessary to pay particular attention to watering the beds freely before the final earthing-up takes place. Celery delights in moisture, and the beds should be thoroughly soaked with clear water with as little delay as possible. Do not place the soil too high about the plants, nor allow any to get in amongst the leaves which should be tied carefully together before the operation is commenced.

LEeks.—Give liberal supplies of water to late-planted Leeks and stir the soil between the rows in order to keep them growing as late in the season as possible. This vegetable pays for liberal treatment, and any plantations which have not attained the required size will benefit by a good watering of weak liquid manure from the farmyard.

FRENCH BEANS.—A good sowing of French Beans may be made now to yield a supply at about the end of December. Choice vegetables will be scarce in many places during the coming winter, but the consequent difficulties may be partly avoided by sowing an extra quantity of Beans at the present time. Seven-inch pots are best for winter use, and the soil may consist of three parts sandy loam, and one part decomposed horse-droppings, which should be broken up finely and mixed with the loam. The pots should be filled to within 2 inches of the rim and the soil made moderately firm. Seven seeds may be sown in each pot and covered with 1 inch of fine soil. The plants may require thinning, and it will be necessary to place some small twigs round the plants to keep them in an upright position. The temperature of the house should be 65° in mild weather, and 5° less if the weather is extra cold. Keep the plants near the glass, and make a frequent use of the syringe to keep red spider in check. Beans in pits from which supplies are now obtainable should be watered once weekly with weak manure water, and plenty of air should be given to the pits. While mild weather lasts, only a slight fire-heat will be necessary to keep the plants from damping, and a little air may be left on at night, with the same object in view.

GREEN HERBS.—Make immediate preparations for obtaining a supply of green herbs throughout the winter. Mint and Tarragon are easily forced if they are placed on a mild hotbed, over which has been laid a few inches of finely-sifted soil. The roots may be lifted carefully and placed close together on the bed in order to grow as much as possible in a limited space. Cover the roots with fine soil which should be watered in amongst them with clear water, applied at a temperature of 70°. In a few days growth will commence, when a light covering of fine leaf-mould may be spread over the plants; but care must be taken that the bed does not become too hot, or the roots will be damaged.

TRENCHING.—Advantage should be taken of dry days to convey manure to the different plots which are in need of trenching, so that this im-

portant work may be commenced as soon as possible. Ground intended for crops of Onions, Peas, and members of the Cabbage tribe should be trenched and manured heavily as early as possible; but that for Carrots, Parsnips, and Beet should be trenched without any green manure being applied, selecting for such crops plots which were manured last season. For all crops, deep cultivation will be found to repay the grower for the extra trouble and expense incurred.

POTATOS.—Tubers placed in temporary stores a month ago should be overhauled as soon as possible, in order to remove all unripe Potatos which may have been picked up and stored at the time of lifting. Whilst this work proceeds, sufficient tubers for next planting season should be selected and placed in a cool, airy shed, where protection from frost can be given, and care should be taken that no tubers formed late in the season are selected for this purpose.

THE FLOWER GARDEN.

By R. P. BROTHERSTON, Gardener to the Earl of HADDINGTON, K.T., Tynninghame, East Lothian.

SPRING BEDDING.—The preparing and planting of beds and borders for spring bedding entail a considerable amount of work. The soil needs to be in a very fertile condition, and should require no manure to be dugged into it now. In the case of light soils a thorough digging will not be necessary; it will suffice to merely loosen the ground with the fork, so as to facilitate the work of planting. When the ground is ready, it will not be a long process to insert the bulbs, as they may be planted very rapidly, making the soil firm when each bed is finished, and finally levelling the surface smooth. Manure may either be applied on the surface previous to making the soil firm, or it may be placed on in the spring. Wallflowers need to be planted rather deeper than they have been growing during the summer months, but other subjects, such as *Myosotis*, *Silene*, and *Arabis* should be placed at the same depth as before. In beds planted for effect I do not like the bulbs to be arranged at all formally. In the case of Tulips, for instance, it is a mistake to plant them wider apart than 6 inches or 7 inches, and they need not all, or even the larger number of them, be planted in rows, it being much better to group three, four, or five together, although the outer row must of necessity very closely conform to the edge of the bed. As a rule, flowers of self colours are to be preferred to varieties that are feathered, but exceptions may be made in the cases of *Keizerskroon* and *Duchess of Parma*, as these are very bold and striking sorts. *Rose Gris de lin* is a very pretty variety, and this also may be employed. Nevertheless, such varieties as *Chrysolora* or *Ophir d'Or* (yellow), *Wouvermann* (purple), *Colour Cardinal* (crimson), *Prince of Austria* or *Thomas Moore* (orange), and *Proserpine* (rose) are, on the whole, more satisfactory. I do not hold with planting a series of beds or even a single one with early Tulips only, but would include for an early display *Winter Aconites*, *Scilla præcox*, *Crocus biflorus*, and, for a succession, *Darwin* or *Cottage Tulips*. A very gay effect is produced by employing *Daffodils*, red *Fritillarias* (Crown Imperials), and *Muscari botryoides* together. For this combination I prefer *Sir Watkin* or any deep-yellow *Daffodil*, or a bicolor, or even a *Leedsii*, such as *Katherine Spurrell*, or, where it is possible, *White Queen*. It is surprising that, although there are many good yellow *Hyacinths*, these are seldom employed, yet is there any quite so sweet as *Ida*? Although I do not plant fancy *Polyanthuses* now, at one time four of our borders were planted with them. They made a grand display, and had a prolonged season of flowering, but they were so exhaustive of the soil that they were eventually banished from the garden. Those who cultivate them should introduce a layer, 2 inches deep, of spent manure from a Mushroom bed just below the surface of the ground, whilst a slight sprinkling of superphosphate is also beneficial. The plants should be planted thickly enough to touch each other to produce the best effect. A very effective display may be made in spring time by planting special borders with broad masses of *Alpine Auriculas*, *Primroses*, and several early-flowering members of the *Primrose* tribe. Where *Erythroniums* are employed, the improved varieties of *E. Dens-canis* are very fine. Other subjects that may be utilised for spring

bedding are *Leucoium vernum*, *Muscari*, *Iris Krelagei*, *I. reticulata*, and other *Irises*; *Tulipa Greigii*, *T. Kolpakowskiana*, *T. Duc van Thol*, *Aubrietias* in variety, *Fritillaria*, *Bulbocodium vernum*, *Anemone blanda*, *A. Robinsoniana*, double-flowered *A. nemorosa*, double *Ranunculus Ficaria*, *Galanthus Elwesii*, *G. plicatus*, *Orobis vernus* and its variety, *Chionodoxa* in species, *Crocus* in variety, *Hepaticas* of all kinds, *Scilla præcox*, *S. bifolia*, *S. taurica alba*, *S. italica*, *Jonquils*, *Myosotis*, *Adonis vernalis*, *Doronicum austriacum*, double *Saxifraga granulata*, double *Cardamine pratensis*, double *Daisies*, *Saxifraga sancta*, *S. Rhei*, *S. oppositifolia*, and *S. Burseriana*. As a rule, it is best to plant these in liberal groups of each kind, so that the same plant or variety need not be repeated. *Narcissi* are sometimes introduced with these, but as *Daffodils* are usually extensively planted elsewhere in the pleasure grounds, they are better excluded from the beds, unless in the case of *Jonquilla*, *Campanelle Jonquil*, *Narcissus cyclamineus minor*, *N. c. minimum*, and *N. Capax plenus*. *Saxifraga Cymbalaria* does well in strong soil, and propagates itself from self-sown seeds. A selection of annuals sown amongst the bulbous plants in May will maintain the interest of the border throughout the summer months.

THE HARDY FRUIT GARDEN.

By W. HEDLEY WARREN, Aston Clinton Gardens, Buckinghamshire.

WALL FRUIT TREES.—During favourable weather, planting should be pushed on with all possible despatch. Directly the leaves are all off the trees, winter pruning should be commenced, and as much of it as possible done before the bad weather sets in. It is much better in every respect that pruning should be done now, than to be left until the spring, although, in cases where summer pruning was properly attended to, there will not be much to be done in winter. When pruning this class of fruit tree, attention should be paid to the mode of bearing of the different kinds; some sorts bear almost exclusively on the young wood of the past year, as the Grape vine, Fig, Peach, and Nectarine; whilst others bear on spurs attached to the old wood, as seen in Apricots, Pears, Plums, Apples, and Cherries. But, again, there are exceptions, some kinds bearing on both sorts of wood. In pruning Peach and Nectarine trees, it is necessary to have a regular distribution of well-ripened young wood, well provided with blossom, over every part of the trees. All the most naked shoots of the previous year should be cut away to a properly-placed young shoot. These may be shortened, if necessary, according to their strength and position.

BUSH FRUITS.—The present month is the best season in which to make plantations of bush fruit, and to fill up any gaps. To plant the young trees in the same place, and among the roots of the old bushes is a bad practice. First of all, remove the old roots, whether decayed or not, and also a sufficient quantity of the soil to allow of the fresh roots being spread out; scatter the old soil over the surrounding ground, and plant the young trees in a sufficient quantity of fresh soil. Trees large enough to be swayed by the wind should be staked securely immediately after being planted; three stakes forming a triangle are better than one stake placed close to the tree. By the former method the bush is steadied, and that injurious hole which, by the swaying of the tree, makes the stake worse than useless, is prevented from being formed. When the state of the weather is such as to prevent planting being continued, pruning can be done with advantage. Early pruners often get the best crops, besides having the pleasure of knowing that their trees have received seasonable attention, instead of having to hurry through the work in the spring. The soil between the bushes cannot be forked over too soon after the fall of the leaf. A thin mulching of seaweed over the surface of the soil makes an excellent dressing for the trees.

GENERAL REMARKS.—Proceed with the planting of fruit trees of all kinds, and never forget the importance, first, of providing good drainage, and, second, of making the holes wide enough to allow the free extension of the roots horizontally. It is always advisable to select such kinds and varieties as are known to succeed in the locality. If more

attention were paid to this matter we should not hear so much of failing crops. In the season just passed, some varieties of Apples, Pears, and Plums bore good crops of fruit in this neighbourhood, whilst others, similarly situated, had little or no fruit. I would advise young gardeners especially, when they go into a fresh locality, to consult other growers in that neighbourhood before planting largely.

PLANTS UNDER GLASS.

By JAMES HUDSON, Gardener to LEOPOLD DE ROTHSCHILD, Esq., Gunnersbury House, Acton, Middlesex.

ACALYPHA.—This fine foliage plant may be given similar treatment to that recommended previously for *Codiaeums*; but, on the whole, I should prefer to select the lateral shoots rather than the main leaders. It will be found advantageous to have this kind of propagation done in advance. *Acalypha hispida* may still be doing useful service, but it will probably be found that suckers or small shoots are pushing forth at the base of the stem, and these will make good cuttings.

CYANOPHYLLUM.—This plant, together with any others with large, overhanging foliage, should be cut down if at all "leggy." Cuttings can then be taken in due course from the old stools, and early in the year good, young plants can be thus secured. The essential feature of a good plant is that it should be well clothed to the pot.

PANDANUS VEITCHII.—This species and *P. Baptistii* are often known to throw out at the end of the season small, grassy growths from the base. These are ideal growths out of which to form sturdy, dwarf plants; the true character can thus be ensured while the plants are still in small pots. With care, these small cuttings can often be removed with a root or two at the base. It is a good thing in the case of either species, if the plant is grown too large, to remove the main crown, unless the plant is dispensed with altogether. Large plants do not look so well as smaller specimens.

SANCHEZIA NOBILIS VARIEGATA.—I have often wondered why it is that this highly ornamental plant is not cultivated more extensively. Given generous treatment it is extremely handsome, in appearance not unlike a *Codiaeum*, and when in flower it makes a very suitable subject for decorative purposes. It is a rapid grower.

TYING AND TRAINING.—This applies more particularly to shrubby greenhouse plants, which may have been a little neglected during the summer. Labour expended on this work at the present time will be well repaid, if only by the increased amount of room which will thus be obtained. Greenhouse *Rhododendrons* (*Azaleas*) will be all the better for tying, if they are intended to be used as decorative plants. A good shape to adopt is that of the pyramid, as plants of this type provide the maximum of effect in the minimum of space. Cape Heaths hardly need any training if proper attention is bestowed to stopping the shoots, though in some instances a few sticks and a little tying are beneficial. Heaths should not be formally trained, and a little practice will soon show how they should be treated; if sticks are used, they should be either made of teak or painted green. For effecting the ties, green string or twist should be employed.

FRUITS UNDER GLASS.

By E. BECKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Hertfordshire.

SUCCESSION VINERIES.—The work of pruning and cleaning later vines if carried out as soon as convenient will be beneficial to the plants, as it will allow of an earlier and longer rest. If a suitable Grape house or fruit room is available for storing the Grapes, these will last in equally good condition, cut and placed in water, provided they are examined frequently and bad berries removed from time to time. The same directions apply to pruning as were recommended for the earliest vines, and, as in that case, the rods and houses should be thoroughly cleansed. If the vines have been attacked by mealy bug, they should be thoroughly washed, and afterwards painted with the following mixture:—one pint of gas tar, two wine-glassfuls of paraffin, a 60-sized pot of flowers of sulphur, and three pints of clay. Boil these materials, adding sufficient

water for thinning. I gave this recipe in a previous Calendar, but repeat it for those who may not have seen it on the former occasion. After removing the old and loose soil from the surface of the border, and if the border is found to be dry, apply a good watering, then afford a top-dressing of new compost, composed of, first, a good sprinkling of bone dust and artificial manure, and next a layer of turves that have been stacked for 12 months, placing the turves closely together with the grass side downwards.

YOUNG VINES.—Any young vines that are planted in narrow, partially-constructed borders should be encouraged to ripen their growths by admitting a free circulation of air and keeping just a little warmth in the water-pipes. Those that were planted last spring as young, growing plants raised from eyes the same season, will have made fine long growths, but I would recommend that they be pruned back to the base. Dormant canes planted just as they were breaking into growth, and what are known as cut-backs, that is, canes two seasons old, should be shortened to the first wire of the trellis, that is, to within about 4 feet of the base, whilst those that were planted of only one season's growth should be treated as advised above. Supposing that a good growth is made and numerous roots are formed, next season's growth will be greatly improved by the addition of a top-dressing and further extension of the border. The soil and any refuse should be removed from the surface, in exactly the same manner as recommended for the whole borders, removing at the same time the face of the partially-built border made last season. A layer of whole turves, placed on the drainage grass side downwards, is placed to the distance to which it is proposed to extend the border, and a wall gradually and firmly built up with a good compost well worked in between the intervening space, making the soil thoroughly firm as the work proceeds, until the desired height is reached. To prevent any mishap by the border falling in, a support should be given by placing one or two stout boards along the front and some struts to hold them in position. If it is intended to raise a further supply of young vines from eyes of any particular varieties of well-known stocks, the growths as pruned should be carefully labelled and preserved by tying them in bundles and heeling them in until they are required for use. Any young vines in pots should be plunged either in leaves or ashes to the rims of the pots, to protect them from frost, and the canes trained round two canes or neat stakes.

THE NOLINEÆ.—Following his profusely-illustrated writings on *Yucca* and *Agave*, Dr. W. TRELEASE has published a monograph of the allied group *Nolineæ* in the *Proceedings of the American Philosophical Society*, vol. 1., pp. 405-442, plates 1-17. This small group of the *Liliaceæ* is confined to the dry region of North America, from Guatemala to Colorado and Carolina, with the greatest concentration of species in the dry uplands of Mexico. TRELEASE recognises four genera, naming *Nolina*, *Beaucarnea*, *Dasyliirion*, and *Calibanus*; but in consequence of divergent views of generic limits, many of the species, more especially those in cultivation, have a long and perplexing synonymy. Several have been referred to three out of four of the genera. TRELEASE derives his generic characters from the inflorescence, attachment of the flowers, the ovary, and the seed vessel. The name *Calibanus* will be unfamiliar to horticulturists. It has been given to the plant figured in the *Botanical Magazine* (t. 5099) under the name of *Dasyliirion Hartwegianum*, and perhaps more generally known as *Dasyliirion Hookeri*; a name published a little earlier in the same year. Recent explorations have largely augmented the number of known species of the *Nolineæ*, and TRELEASE enumerates 27 of *Nolina*, one of *Calibanus*, seven of *Beaucarnea*, and 17 of *Dasyliirion*. Members of this singular group are comparatively rare in cultivation, but there are some fine specimens in the Succulent House at Kew, notably of *Dasyliirion acrotrichum*, which has about a dozen names. The figures illustrating habit are very interesting. *Beaucarnea gracilis* is arboreal, with an enormous swollen trunk. *Nolina longifolia*, syn. *Dasyliirion longifolium* and *Beaucarnea longifolia*, has a trunk 6 feet to 10 feet high, concealed by the very long, closely-hanging leaves. W. B. H.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, as well as specimens of plants for naming, should be addressed to the EDITORS, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

APPOINTMENTS FOR THE ENSUING WEEK.

SATURDAY, NOVEMBER 4—
Soc. Française d'Hort. de Londres meet. Wood Green Chrys. Sh.

TUESDAY, NOVEMBER 7—
Roy. Hort. Soc. Coms. meet. (Lecture at 3 p.m. by Mr. Jas. Hudson, on "The Culture of the Fig in Pots.") Hort. Club Dinner and Meeting. Birmingham & Midland Counties Chrys. Sh. at Bingley Hall, Birmingham (3 days). Scottish Hort. Assoc. meet. Southampton Chrys. and Fruit Sh. (2 days). Oxford Chrys. Sh.

WEDNESDAY, NOVEMBER 8—
Cardiff Chrys. Sh. (2 days). Dorchester Chrys. Sh. (2 days). Liverpool Hort. Soc. Chrys. Sh. at the Corn Exchange (2 days). Weston-super-Mare Chrys. Soc. Sh. (2 days). Finchley Chrys. Sh. (2 days).

THURSDAY, NOVEMBER 9—
Exeter Chrys. Sh. (2 days). Putney, Wandsworth and Dist. Chrys. Sh. at Putney (2 days). Haslemere Dist. Chrys. Soc. Exh. Forest Gate and Stratford Amateur Chrys. and Hort. Soc. Sh. (3 days). B.G.A. London Branch meet. (Lecture, by Mr. W. H. Aggett, on "The Policy of the B.G.A.")

FRIDAY, NOVEMBER 10—
Bradford Chrys. Sh. (2 days). Leeds Paxton Chrys. Sh. (2 days). Huddersfield and Dist. Chrys. Sh. (2 days). Windsor, Eton and Dist. Chrys. and Hort. Soc. Sh. Altrincham and Dist. Chrys. Soc. (2 days)

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last Fifty Years at Greenwich—45°.

ACTUAL TEMPERATURES:—

LONDON.—Wednesday, November 1 (6 P.M.): Max. 54°; Min. 41°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—Thursday, November 2 (10 A.M.): Bar. 29.8°; Temp. 53°; Weather—Dull.

PROVINCES.—Wednesday, November 1: Max. 51° Ireland S.W.; Min. 46° Lincoln.

SALES FOR THE ENSUING WEEK.

MONDAY, TUESDAY, WEDNESDAY, THURSDAY AND FRIDAY—
Bulbs at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 10.30.

MONDAY, TUESDAY AND WEDNESDAY—
Nursery Stock, at Ottershaw Nurseries, Chertsey, by order of the Exors. of Mr. G. Fletcher, deceased, by Protheroe & Morris, at 12.

MONDAY, WEDNESDAY AND THURSDAY—
Bulbs, Rose Trees, Shrubs, Liliums, Gladioli, &c., at Stevens's Auction Rooms, 38, King Street, Covent Garden, London, W.C., at 12.30.

WEDNESDAY—
1,935 cases of Japanese Liliums, received direct; also miscellaneous Bulbs, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 1.

Palms and Plants, Azaleas, Bays, &c., at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 5.

THURSDAY—
Nursery Stock, at Lindfield Nurseries, Lindfield, Sussex, by order of Mr. J. Box, by Protheroe & Morris, at 11.30.

FRIDAY—
Orchids, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 12.45.

The Board of Agriculture. Mr. Runciman, till recently President of the Board of Education, succeeds Lord Carrington as head of the Board of Agriculture. It is common knowledge that the two Boards do not see eye to eye with respect to the development of agricultural education, and it is to be hoped that the new President of the Board of Agriculture, coming as he does from the rival Board, may be able to assert the claims of his new charge against those of the Board of Education. The present position of affairs bodes no good for agriculture nor for horticulture. Till the for-

mation of the Development Fund, only a trivial sum of money was available for the purpose of agricultural instruction. The Board of Agriculture did what little it was possible for it to do with the funds at its disposal. Suddenly the conditions are altered. A large annual grant is available from the Development Fund for the purposes of agricultural teaching and research. The Board of Education seizes the opportunity thus provided, claims to undertake the lower stages of agricultural teaching, and succeeds, apparently, in annexing by far the larger part of the funds available for agricultural development. To its less-powerful sister-department is left a relatively small sum for higher education and research. This is called, in official language, a concordat. Annexation would appear to be a more accurate designation. In strict logic and at first sight there would appear to be something to be said for such an arrangement; but a less pedantic outlook and more leisured consideration will show that the division of labour between the departments and the ascription of the larger proportion of the money to the Board of Education are bound to prove disastrous to agriculture. For, in the first place, the Board of Education has little or no experience of agricultural education. It is out of touch with the farming community. It has not the staff necessary for elaborating schemes of agricultural instruction nor for carrying them out.

In the second place, agricultural education is not a general, but a technical, problem. It is not to be got by glorified nature-study series of courses. It is not to be imparted to young children in farm-schools. The bases of agricultural training must be laid on the farm. Education in agriculture must follow, and not take place side by side with general education. By all means let the urban and out-of-date methods of education still sanctioned by the Board be replaced by methods more suitable to rural—and, indeed, also to urban—districts. Were the Board of Education to do this, were it to reform, for instance, the curricula of teachers in training with reference to the needs of rural schools, it would deserve and receive the thanks of the community. But let it recognise that training in agriculture lies no more within its province than training in medicine or in law. Education in these professions is left to members of those professions, and, so far as we know, the Board of Education has no part nor lot in it. Why, then, should training in agriculture—which must come after the elementary-school stage is past, and after youths have spent some time in actual farming—be entrusted to the Board of Education?

We hear much in these days of continuity of education, co-ordination, educational ladders, and so forth, and yet agriculture is to be made the subject of an experiment in which education is to be a joint affair between two departments, the lower rungs of the ladder are to be supplied by the one department and the higher rungs by the other. It does not

need extraordinary foresight to predict the result. When the ladder gives way, as give way it will, the departments will be heard accusing one another of being the cause of the catastrophe, and poor Agriculture will be left to pick itself up as best it may. As the final result, there will be another concordat, and the more powerful Board of Education will assume full control of all agricultural education, and we shall thenceforth lag further behind the other nations in the paramount matter of agricultural education.

The problem is at best a most intricate one. It is a problem which, if it is to be solved successfully, must engage the sympathetic co-operation of the farming community. That co-operation the Board of Education cannot hope to obtain. Hence their schemes will fail; though in the meantime they will have cost the community not only the loss of large sums from the Development Grant, but also that of equally large sums from local sources.

The right course is to proceed on the Irish model, and to entrust the whole of agricultural education to the Board of Agriculture, which, during the lean years of insufficient financial support, has at least had ample opportunity of studying the problem from the point of view of the requirements of British agriculture. By this course the lower grades of agricultural education would be indissolubly linked with, and not divorced from, the higher grades, and teachers and investigators, from the University to the country area, would be united in a common and fine aim—to assist to the full extent of their powers the cause of agriculture. If any such aspirations have actuated Mr. Runciman in exchanging the presidency of the Board of Education for that of the Board of Agriculture, it will be good news for friends of agricultural education. Mr. Runciman may, moreover, be assured that, did he take steps in this direction, his action would receive such widespread and energetic support as would go far to ensure his success in providing a scheme which, at all events, would not, like the infertile hybrid scheme now in course of ingeneration, be foredoomed to failure.

ROYAL HORTICULTURAL SOCIETY.—The next meeting of the Committees of this Society will take place on Tuesday, the 7th inst. In the afternoon Mr. JAMES HUDSON will deliver a lecture on "The Cultivation of the Fig in Pots."

HORTICULTURAL CLUB.—The next house dinner of the Club will take place on Tuesday, the 7th inst., at the Hotel Windsor, Victoria Street, S.W., when Mr. REGINALD A. MALBY will lecture on "A Miniature Alpine Garden." The lecture will be illustrated by lantern slides. Members may introduce guests to this meeting (ladies or gentlemen). The following new members have been elected to the club since May last:—Messrs. G. H. C. BARD, EDWIN BECKETT, N. F. BARNES, A. C. BARTLETT, CHRISTOPHER BOURNE, F. J. CHITTENDEN, HEINRICH R. DARLINGTON, CLARENCE ELLIOTT, WILLIAM HALES, T. GEOFFREY W. HENSLOW, M.A., JOHN JENNINGS, W. H. LEES, A. MCKELLAR, A. W. METCALFE, WHITPAINE NUTTING, HENRY W. W. NUTTING, GEORGE REYNOLDS, and HORACE J. WRIGHT.

VIEWS IN THE GARDEN OF ASHBOURNE, CO. CORK, THE RESIDENCE OF R. H. BEAMISH, ESQ.

ABOVE : THE ROCK GARDEN.

BELOW : CHAMAEROPS FORTUNEI AND C. HUMILIS SURROUNDED BY CORDYLINE

THE KING TO OPEN THE ROYAL INTERNATIONAL HORTICULTURAL EXHIBITION.—Our readers will learn with satisfaction that His Majesty KING GEORGE V. has communicated to the Directors of the Royal International Horticultural Exhibition, through Lieut.-Col. Sir GEORGE HOLFORD, K.C.V.O., C.I.E., his intention to open this exhibition on May 22, at 12 noon. There is already evidence that this show will attract horticultural novelties from all parts of the world, while it will present to visitors a unique display of present-day floriculture.

NATIONAL SWEET PEA SOCIETY.—We are asked to state that this society will hold its annual meeting at the Hotel Windsor, Victoria Street, Westminster, on Friday, December 8, at 2 o'clock. Notice of new rules or alteration of rules should be communicated to the hon. sec., Mr. C. H. CURTIS, Adelaide Road, Brentford, on or before Friday, November 17. The annual meeting will be followed by a dinner at 6 o'clock, and this in turn will be followed by a Sweet Pea Conference, to commence at 7 o'clock, at which the following subjects will be dealt with:—Sweet Pea Diseases, by Mr. FRED. J. CHITTENDEN, F.L.S., Director of the Wisley Laboratory; Packing Sweet Peas for Market, by Mr. THOS. PAGE, of Hampton; and Packing Sweet Peas for Exhibition, by Mr. THOS. STEVENSON, of Addlestone.

A CONCESSION TO TREE GROWERS.—As the result of negotiations between the Royal English Arboricultural Society and the Estate Duty Office, the latter has agreed that the expense of replanting timber sold and felled will be allowed as a necessary outgoing to the maintenance of a timber estate.

NOVA SCOTIAN APPLES.—The shipments of Apples to this country from Nova Scotia during the present season is stated to have amounted to no fewer than 300,000 barrels.

DUTCH HORTICULTURAL SCHOOLS.—In the course of an article on the rapid increase in Ireland of winter schools for farmers, the *Standard* draws attention to the Dutch horticultural schools which are doing such admirable work for market gardeners. The schools are subsidised by the State, and give instruction not only in gardening practice, but also in languages and commercial subjects. One of the most successful of the Dutch horticultural schools is that at Naaldwijk, near The Hague, in the heart of one of the largest market-gardening districts of Holland. The special point of interest in connection with the garden attached to this school lies in the fact that it is owned by a co-operative gardeners' association.

COMMON WEEDS.—Leaflet No 251 published by the Board of Agriculture, is the first of a series which is to deal with common weeds. The plants described in the present leaflet are the Corn Marigolds, Docks and Sorrels, Goosefoot, Stinging Nettles, Yellow Kettle, Poppies, and Corn Cockle. The illustrations are excellent, and the brief descriptions accurate and striking. Young gardeners and others who wish to have means of identifying the weeds commonly met with should write to 4, Whitehall Place, for copies of the leaflet, which may be had from the Secretary, free of charge and post free.

MEDICAL RHUBARB.—Dr. C. C. HOSSENS, in a pamphlet published in *Archiv der Pharmacie* (ccxlix.) and reviewed in *Nature* (October 26, 1911), discusses the source of Chinese medical Rhubarb. The strongest evidence is put forward in a letter by Mr. E. H. WILSON that Rheum officinale furnishes the Rhubarb supplied from Tachien-lu, but that the best quality is derived from a variety of *R. palmatum*.

AUTUMN WEATHER.—According to the *Standard* of October 23, the weather in Warwickshire has been so mild that crops of Strawberries and Raspberries have been gathered recently in the gardens of St. Mary's Priory, Princethorpe, and in the Coventry district Sweet Peas have produced a second crop of blossom. The same newspaper reports that Raspberries grown in the open were exhibited at Newbury on October 26. But perhaps the most striking evidence of the openness of the weather is the growth which has been made by grass. Not only are lawns which were bare or brown now covered with their usual green, but newly-sown grass has germinated with extraordinary rapidity, and has well repaid the labour of those who were compelled by the devastating drought to resow the worst patches on their lawns.

"SLIME FLUX" OF ELMS.—A correspondent in *Nature* (October 19, 1911) draws attention to the condition of certain Elms at Ettrington, near Stratford-on-Avon, which are said to have been "killed by wasps," the idea being that the wasps, attracted by the sweet sap, attacked the trees in such swarms as to drain them of sap. W. J. B., in commenting on the letter, points out that a similar phenomenon may be seen at Kew at the present time. In this case the trunk of a fine specimen of *Ulmus parvifolia* has served for some months past to attract hundreds of wasps and bluebottles. The insects, however, are not to be regarded as causing the outflow of sap; they merely feed on it. The exudation is caused by a wound parasite—probably a yeast—which gains access to the cambium and sets up fermentations, which result in the production of sugary substances. These substances exuding in the slime serve to attract the insects. This disease is not uncommon in Britain, and, unfortunately, is usually attended with results fatal to the tree.

APPLES AND PEARS FOR AWARDS.—The Chairman of the Fruit Committee of the Royal Horticultural Society wishes to call the attention of those sending Apples and Pears for awards to the fact that at least six fruits of each variety are required by the rules, and that all specimens should be in good usable condition, either for cooking or dessert, at the time of sending. Each variety should be accompanied by full particulars as to the position in which it is grown (wall culture or otherwise), and also the form of tree, and, if possible, its origin, with full notes as to cropping, keeping, and age of tree, otherwise the examples cannot be dealt with. For instance, it is useless to send Apples in October and November which will not be at their best till March.

CIDER APPLES.—It is common belief that Apples from young trees are inferior to those from old trees for the purpose of making cider. Scientific confirmation of this belief has been lacking hitherto, and, therefore, some recent experiments of Monsieur DRUELLE are of interest. He has made a comparative study of Apples from young trees, 10 to 15 years old, with those from old trees, 55 to 60 years old, grown in the same orchard, and finds that, though the fruit from the young trees is generally heavier, it actually contains less water than the Apples from old trees. The former are richer in sugar, but contain less tannin and acids. It is possible that cider made from the fruit of the old trees will have better keeping qualities, but the results do not justify, as yet, ascribing a greater commercial value to the Apples from the old trees. It is a fact of considerable interest that the analytical differences in the two cases are so marked.

ROYAL INTERNATIONAL HORTICULTURAL EXHIBITION.

PRICES OF ADMISSION FOR R.H.S. FELLOWS.

As stated in our leading article last week, the directors of the International Exhibition have further considered the position of Fellows of the Royal Horticultural Society in regard to the prices of admission, and we are now in a position to print the following official communication on the subject:—

The directors of the International Exhibition Association have agreed:—

(1) To give to all Fellows of the R.H.S. certain special privileges over the general public in regard to the purchase of tickets for the Exhibition; and

(2) To allow all such tickets purchased by Fellows of the Society to be transferable.

ADMISSION ARRANGEMENTS.

GENERAL PUBLIC.

The directors of the International Exhibition Association have decided on the following prices of admission:—

	Before 5 p.m.	5 to 10 p.m.	All day.
May 22	£ s. d. 2 2 0	£ s. d. 1 1 0	May 27 ... £ s. d. 2 6
" 23	1 1 0	10 0	" 28 ... 1 0
" 24	10 0	5 0	" 29 ... 1 0
" 25	5 0	2 6	" 30 ... 1 0

FELLOWS OF THE R.H.S.

The special privileges accorded to Fellows of the R.H.S. are as follow:—

FELLOWS OF THE R.H.S. PAYING AN ANNUAL SUBSCRIPTION OF FOUR GUINEAS.

May 22	May 23	May 24, 25, 27	May 28, 29, 30
Two tickets at half price	& { Two tickets at half price } at either hour,	{ Four tickets for any, but only one, of these days; with two additional tickets for the 5s. day—all at half price. }	No reduction.

FELLOWS OF THE R.H.S. PAYING AN ANNUAL SUBSCRIPTION OF TWO GUINEAS.

May 22	May 23	May 24, 25, 27	May 28, 29, 30
One ticket at half price	& { One ticket at half price } at either hour,	{ Two tickets for any, but only one, of these days; with one additional ticket for the 5s. day—all at half price. }	No reduction.

FELLOWS OF THE R.H.S. PAYING AN ANNUAL SUBSCRIPTION OF ONE GUINEA.

May 22	May 23, 24, 25, 27	May 28, 29, 30
One ticket at 30s.; or 10s. 6d. after 5 p.m.	& { One ticket at half price for any, but only one, of these four days. }	No reduction.

Honorary and corresponding members enjoy the same privileges as two-guinea Fellows.

Associates: May 22, 23, 28, 29, 30, no reduction. One ticket on May 25 or 27 at half-price.

One-guinea affiliated societies: May 22, 23, 28, 29, 30, no reduction. Ten tickets on May 25 and 16 tickets on May 27, all at half-price. Two-guinea affiliated societies double privileges.

All privileged tickets on the above scale must be purchased on or before May 12, and can only be obtained direct from the office of the Royal Horticultural Society, Vincent Square, Westminster, S.W.

All the above tickets will be transferable, but will each be available for one admission only. Fellows can, therefore, circulate among their friends such of the tickets as they do not personally require. Cheque or postal order payable to the Royal Horticultural Society must accompany every application for tickets, and tickets, when once purchased, cannot be exchanged for others of a different date. *R. Hooper Pearson, Hon. Press Secretary.*

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

NOMENCLATURE OF "CAPE" PELARGONIUMS.

—The Council of the Royal Horticultural Society has been asked to endeavour to obtain an agreement on the nomenclature of what are commonly known as Cape Pelargoniums. The only practical way known to the Council is to invite all growers of these plants to at once send cuttings (rooted or otherwise, with the name known to the sender attached) by post to the Superintendent, R.H.S. Gardens, Wisley, Ripley, Surrey. They will be potted up, and next year be compared with each other, and with herbarium specimens and printed records. No Zonals, or Show, or French Pelargoniums should be sent; only those known as "Cape." W. Wilks, Secretary R.H.S.

INTERNATIONAL EXHIBITION OF 1912: CHARGES FOR ADMISSION.—As pointed out in the Editorial article on this subject, p. 306, the first consideration for the Directors is to make income and expenditure at least balance, and they doubtless, as business men, have only weighed the question of charges in relation to the potential attendance. If they can attract a crowd of two-guinea visitors, the results will be more satisfactory than a crush of one-guinea visitors. It may be assumed, too, that the Directors have not overlooked the fact that the exhibition of 1866 was a great financial success, though the charges for admission were somewhat less than half those now proposed, for the four days the exhibition was open, namely, 21s., 10s., 2s. 6d., and 1s. W. Botting Hemsley.

GARDENERS AND THE INSURANCE BILL.

Gardeners as a body have the lowest average death rate—with the exception of the clergy—in the United Kingdom. There are more than 5,000 country seats listed in the *Horticultural Directory*, and with an average of five gardeners in each place, this would mean 25,000 gardeners employed in private gardens alone. Besides these there are those engaged in public parks, botanic gardens, as well as landscape gardeners, nurserymen and florists, and market gardeners. To all such the United Horticultural Benefit and Provident Society unquestionably affords the best means of insurance under the Bill. The society is solvent, fully registered, and well managed. As paragraph I., sub-sec. II., clause 18 of the Bill has been omitted, any fear of exclusion on account of insufficient numbers has been removed. The society is approved, conforming to all the requirements and provisions of the Bill, yet if the pooling of one-half of the surplus profits, on the working of the Government scheme, could be avoided by enrolling sufficient new members the whole of the balance, which is sure to be considerable in such a healthy society, could then be utilised in any of the various ways the Bill permits for the benefit of its own members exclusively. The secretary is Mr. W. Collins, 9, Martindale Road, Balham, S.W., from whom information can be obtained. Mark Webster, Kelsey Park Gardens, Beckenham.

SEEDLING APPLES.—Mr. E. A. Bunyard (see p. 293) speaks of the variety "Charles Ross." I had the pleasure of seeing the mother tree in fruit for two seasons, the fruits of which were certainly larger than one of its parents (Cox's Orange Pippin), but very much smaller than the fruit from a young and vigorous tree. I think I am correct in stating that four "pips" were sown from a fruit on Cox's Orange Pippin which resulted from a cross with Peasgood's Nonesuch, and Mr. Ross obtained three first-class and distinct fruits, the three being "Charles Ross," "Rival," and "The Houblon." The fourth was worthless, and was used as a stock. I believe that the Apple Charles Eyre, illustrated in your issue for October 14, was the one Mr. Ross said that he sowed on his 80th birthday. An amusing incident occurred while I was his neighbour at Welford Park. Mr. Ross's son, a schoolmaster, showed against him in the class for flavour, and excelled with his own Apple. This was accomplished from a small garden, and staged at the R.H.S. show by the veteran himself! E. Young, Bentley Priory Gardens, Stanmore, Middlesex.

EDUCATION FOR GARDENERS.—With reference to the letter of Mr. John Smith with regard to higher education for young gardeners (see p. 262), I think this scheme would be a very good one. There will be no doubt several difficulties to overcome, especially with regard to the interchange of work. I think that one year is quite long enough for a young journeyman to stay in a place if he is in search of knowledge, but the exact time is a matter of opinion. W. G. Newman, *The Gardens, Fullbrooks, Worcester Park, Surrey.*

INSTRUCTION IN FRENCH GARDENING.—In your reply to H. L. on French gardening (see p. 297), you only mention one school where women are taught the French gardening methods. May I point out that both Studley College and Swanley College have installed this "système maraichère" under competent teachers, and the Burhill French Garden also trains women students in this branch of horticulture? I enclose a copy of our prospectus, giving a view of part of our French garden. M. Peers, *Horticultural College, Studley Castle, Warwickshire.*

BRITISH-RAISED SOYA BEAN.—I have pleasure in sending herewith specimen plant of Soya Bean (*Glycine hispida*), which I have raised this year in my garden from seed which I brought from the East in April last. Sown in the open ground on May 25, it was up in three days, began to branch at three weeks, flowered at ten weeks, and was gathered exactly at the end of the 16th week after sowing. The variety chosen was Sakura, a cream-coloured bean, rich both in oil and flour, which I also introduced into Ceylon last year. I put the plants to the severest tests possible. They were sown on poor, gravelly soil, under Cherry and Pear trees, and also against a wall having a N.E. aspect. Three plants selected for crossing with White Czar Runner Beans were placed in the open, but they behaved no better than the others, and certainly did not yield so heavily as those raised on poor, herbaceous border soil. The ground had been previously prepared by nitrogenous manuring—which is absolutely essential for successful raising of Soya Bean—but a further experimental treatment, when the plant began to flower, with nitrate, promptly killed every one to which it was applied. I find that the Bean stands drought and ground frost much better than the English Runner Bean, and am of opinion that it would be a certain success on sandy soils if sown in this country in early May. They would do well between Potatoes or as a main crop, and should be sown somewhat thickly. The yield is from 15 cwt. to 1 ton per acre. There are several varieties, the qualities of which are chiefly distinguished by their different colouring. Most of those of other than a rich cream colour are valuable as fodder food, but have no value as oil-producers. I may say that my endeavours have been directed towards acclimatising the latter, and, if possible, to transfer by crossing the oil contents of the Soya to our common English Runner Bean. My first cross looks very promising, but, of course, nothing definite can be said of it at present. Should these efforts succeed, it might be possible in a few years to give the farmer a legume which, whilst enriching an exhausted soil, will enable him to offer the seed-crushing trade an article which is in great and ever-increasing demand, and which at present has to be brought to the mills from the Far East. W. Wicherley, 22, Limes Grove, Lewisham, S.E. [The seeds in the pods appeared to be thoroughly ripe and perfectly sound.—Eds.]

DOUBLE FLOWERS IN STOCKS.—In the account which appeared in last week's issue of the *Gardeners' Chronicle* of papers read at the fourth International Conference on Genetics at Paris, some details are given of the results which I have obtained in Stocks with regard to the inheritance of double flowers. The writer concludes his summary by saying that, if the view which I have been led to form, namely, that old seed often gives a higher proportion of doubles than fresh seed, should prove to be correct, "it should not be impossible to rogue out the singles by artificial means, and so to secure seed giving doubles only." As I feel that this last remark may possibly give rise to some misconception, I should be glad if you would allow me space to state the facts more explicitly. The slightly greater vitality of the

seeds destined to give rise to doubles only becomes marked when the quality of the seeds is so bad, or the length of time during which they have been kept is so long, that only a very small percentage survive. Only when the bulk of the seed has died is one able to obtain plants which are exclusively, or almost exclusively, double. But, apart from the difficulty of hitting off the conditions which will ensure the right amount of mortality among the seeds, the smallness of the yield after this has been done (perhaps three or four plants out of every 100 seeds sown) renders this method of procedure for obtaining a culture of doubles out of the question. So far as I know, the only case in which it is possible to be sure of raising a large number of plants which will be all double is a certain strain of sulphur-whites. In this strain the seeds, when well ripened, can be sorted according to colour into two lots; the more yellowish ones will all give rise to cream doubles, those which are browner to whites, which will be nearly all single. In seed of good quality this sorting can be carried out with considerable accuracy. It will, of course, be necessary to sow some of the brown seeds in order to obtain seed-bearers, and the harvest of each generation, since the strain is ever-sporting, will need to be sorted afresh. E. R. Saunders, Cambridge.

SCOTLAND.

DUNDEE HORTICULTURAL ASSOCIATION.

THIS association has just issued its annual report and syllabus of meetings for the ensuing session. The report shows that the association has 84 members. The scheme of lectures is well arranged, and two prizes are to be given for the best plans submitted for the laying out of gardens and grounds. One prize is for gardeners under 30 and the other for those above that age.

ROYAL SCOTTISH ARBORICULTURAL SOCIETY TO VISIT BALMORAL.

THE permission given by the King for the members of the Royal Scottish Arboricultural Society to visit Balmoral on the occasion of their annual excursion in June next is highly appreciated by the members, and it is likely that a large number will take part in the excursion. Forestry has been systematically carried on at Balmoral for many years. In connection with the foreign excursion the Society makes each year, the suggestion that financial assistance should be given to young, practical foresters to enable them to join such excursion is received with considerable favour by the many young foresters now taking a thorough training in Scotland.

HEATING OF THE WAVERLEY MARKET HOUSE, EDINBURGH.

It has been announced already in these columns that Messrs. Mackenzie and Moncur have been entrusted with the heating of this building. We now learn that the system adopted is the Plenum. A Babcock and Wilcox tubular boiler, placed in a sunken chamber outside the market house, will be used to generate the steam for heating the air, and oil fuel, automatically fed, will be employed instead of coal, in order to prevent smoke. The heating chamber, to which the steam will be conveyed from the boiler by piping, will be placed just inside the market house. This will contain a series of 75 coils of 1½ inch iron piping, in flat grid-iron-shaped sections, placed parallel to each other, and over this piping the air (which will be admitted through an opening in the roof at the end of the chamber) will be forced into the hall by means of a fan, driven by a 40 h.p. electric motor. The total length of piping in the coils will be 8,000 ft., and the fan will be capable of discharging 5,000,000 cubic feet of heated air into the building per hour. After passing over the hot pipes, the air will be conveyed into the hall at the level of the roof girders by means of a large duct, and from this smaller ducts will be carried along the roof of the building, so that the hot air will be distributed equally all over its area. The vitiated air will be expelled by means of the doors and other openings above the floor level. In hot weather the fan may be employed to force fresh air into the building, for ventilating purposes. The cost of the scheme will exceed £2,000. Correspondent.

SOCIETIES.

ROYAL HORTICULTURAL.

Scientific Committee.

OCTOBER 24.—*Present*: Mr. E. A. Bowles, M.A., F.L.S. (in the Chair); Dr. A. B. Rendle, F.R.S., Messrs. H. J. Elwes, F.R.S., A. Worsley, W. Hales, J. T. Bennett-Poë, M.A., V.M.H., J. Douglas, V.M.H., R. A. Rolfe, A.L.S., J. O'Brien, V.M.H., G. Wilson, C. H. Hooper, W. Fawcett, B.Sc., J. O'Dell, W. C. Worsdell, G. Gordon, R. Hooper Pearson, and F. J. Chittenden (hon. sec.).

Nerine pudica alba.—Mr. WORSLEY showed a white-flowered form of what he regarded as *Nerine pudica*, a seedling raised by him some time ago. He also showed ripe fruits of the variegated form of *Vitis heterophylla*.

Various plants.—Mr. H. J. ELWES drew attention to a flower of *Pæonia lutea* from a plant (sent out by Messrs. Vilmorin) flowering for the second time this year, but now, unlike the first flowering, holding its flowers well above the foliage. Mr. BOWLES remarked that he had a form which normally flowered in this way, also from Messrs. Vilmorin. Mr. ELWES also showed a plant of *Statice fruticans* (= *arborea*), a Canary Island species, raised from seed, and flowering well within a year of seed-sowing; *Aristea corymbosa*, a woody Iridaceous plant from South Africa; and *Stapelia primulina*.

Primula sinensis stellata.—A remarkable instance of foliose development of the calyx in *Primula sinensis stellata* was shown by Mr. ODELL, in which the calyx segments were many times as long as the petals, and were of distinct leafy form.

Vegetable Marrow fasciated.—A well-marked example of this common malformation was sent by Mr. W. A. Voss, particularly remarkable on account of the flowers being produced in pairs along the stem, each pair consisting of either two staminate or two pistillate flowers, and the fruits also growing in pairs.

Malformation in Vitis sicyoides.—Mr. W. PATTERSON sent an interesting specimen of a malformed *Vitis sicyoides* from St. Vincent. The malformation is mentioned in Grisebach's *Flora of the British West India Islands*, where it is said to be common, but this is the first specimen met with by Mr. PATTERSON. It was growing "just where the conditions prevailing might be expected to exert influence to encourage an inflorescence to grow into such a form, namely, moisture and very little light." The specimen sent, which was over 15 inches in length and consisted of long, slender branches bearing numerous short, whorled branchlets, was "part of one axillary growth found growing on the ground under dense shade." Mr. PATTERSON drew attention to dark streaks of fungus spores on the ultimate branches, and suggested that the malformation might be of pathological origin. The fungus present is a member of the *Ustilaginæ*, and no doubt the cause of the malformation. The form which it gives rise to has been described as a type of a new genus, *Spondylantha aphylla*, by Presl. [see *Rel. Haenk.*, ii., 35, t. 53 (1834)].

Cattleya sororia, Rchb. f.—Mr. R. A. ROLFE exhibited a flower which had been raised in the collection of W. Evans, Esq., of Leicester, from *C. Harrisoniana* crossed with the pollen of *C. bicolor*, and remarked that it was identical with the natural hybrid, *C. sororia*, Rchb. f., and thus confirmed its supposed parentage, which was originally in doubt. He also exhibited for comparison paintings from the *Dictionnaire des Orchidées* of the two parents, remarking incidentally that the one figured as *C. Harrisoniana* was wrongly labelled *C. Loddigesii*, and that, in fact, the names of the two species had been transposed, as was sometimes the case in gardens.

Lælio-Cattleya amanda, Rchb. f. and *L.-C. Verelii*, Rolfe.—Mr. ROLFE also exhibited flowers of these two natural hybrids, remarking that they were originally confused under the former name. The first, however, was from *Lælia Boothiana* and *Cattleya intermedia*, the latter from *C. Boothiana* and *C. Forbesii*, as was evident from the strong red veining on the disc of the lip. All three species were known to grow together in the neighbourhood of Rio de Janeiro. The two hybrids were in flower at Kew, that of *L.-c. amanda* being from a batch raised by himself by crossing *L. Boothiana* and *C. intermedia*,

with a view to proving the parentage. Paintings of some of the plants in question were also shown.

Pollination in Orchards.—Mr. C. H. HOOPER gave an outline of his observations on pollination in orchards, which confirmed those of others that cross-pollination was necessary in the majority of cases in order that fruit should be produced. The results obtained have already been published in the *Gardeners' Chronicle* (see p. 254). Mr. WORSLEY pointed out that a certain temperature was necessary for the shedding of pollen in many instances, and if this were not attained, infertility might result. Mr. CHITTENDEN said that certain of the varieties Mr. HOOPER had found not to set fruit without the aid of foreign pollen, he had found would do so, and suggested that in order to settle the cases, in which only negative evidence was available, it was necessary to repeat the experiment several times, for there was great difficulty in eliminating many other factors which contributed to unfruitfulness.

Bitter-pit in Apples.—Among the numerous diseased plants sent for examination were several specimens of Apples attacked by "bitter-pit." This disease is particularly prevalent, even among hard-fleshed Apples, this season. It is characterised by numerous brown spots in the flesh at varying depths below the surface, and having, as a rule, no connection with surface injury in any way. No fungi or bacteria have been found connected with it, and it appears to be a disease of physiological origin rather than due to any parasite. The dead, brown cells contain starch, whereas in the rest of the flesh the starch has been converted into sugar. It would, therefore, appear that the death of the cells probably took place before the ripening process had proceeded so far as the conversion of starch into sugar, and may possibly be due to an accumulation of a poisonous substance in the cells through interference with the water supply.

KENT COUNTY CHRYSANTHEMUM.

OCTOBER 24.—The 24th annual show of this society was held at Blackheath on this date. The weather was wet during the whole of the time the show was open. There was a great falling off in the entries this year, owing, no doubt, to the early date of the show and the death of the president of the society, H. F. Tiarks, Esq., who was in the habit of exhibiting largely. The quality of the Japanese blooms was very good, but nothing exceptional in size; those of the incurved varieties were very rough and poor, although as a rule they are of excellent size and quality at this show. The fruit classes were fairly well contested, but vegetables were poorly represented. A magnificent group of miscellaneous plants was shown by Messrs. JAMES VEITCH & SONS, Chelsea; all the plants used were perfectly grown, and included *Nepenthes*, *Orchids*, *Codiaeums*, *Alocasias*, *Cocos*, *Ericas*, and *Nerines*. A Gold Medal was awarded.

HERTFORD HORTICULTURAL.

OCTOBER 25, 26.—This society held its 20th annual exhibition in the Corn Exchange, Hertford, on these dates. The show was a great success. The groups of miscellaneous plants were oblong in shape and arranged in the centre of the hall, whilst near by were eight decorated dinner tables, which produced a charming effect. The side tabling was reserved for cut Chrysanthemums and fruit. The principal class was for 24 Japanese Chrysanthemums, and the 1st prize was won by P. BOSANQUET, Esq., Ponfield, Hertford (gr. Mr. J. Turk); 2nd, Mrs. BROWNING, Hertford (gr. Mr. Haynes), with highly-coloured specimens. There were five competitors in this class. Blooms of Henry Perkins, G. J. Bruzzard, Mrs. R. Hooper Pearson, and George Lawrence were conspicuous in the exhibits. Good winter-flowering Begonias and Zonal Pelargoniums were shown. Fruit was grand, and keen competition existed in all the classes. The largest class was for 24 dishes of Apples, distinct, 16 of culinary and 8 dessert sorts. The 1st prize, which included a silver cup, was won by Mr. GERRISH, of Pendley Manor Gardens, Tring; 2nd, W. S. CAIN, Esq. (gr. Mr. F. Pateman); both were splendid exhibits, the fruit being of large size and well-coloured. Exhibits of Pears and Apples in the smaller classes were all good. A magnificent collection shown by Mr. PATEMAN was

awarded the 1st prize in the class for six dishes of dessert Pears. Mr. FULFORD, Warl Priory, was placed 2nd.

VEGETABLES are always shown well at Hertford and in large numbers. Messrs. Sutton & Sons, J. Carter & Co., and McMullen, Hertford, offered prizes for collections. In one of these sections only one point divided the 1st from the 2nd and the 2nd from the 3rd exhibit.

BRIGHTON AND SUSSEX CHRYSANTHEMUM.

OCTOBER 31, NOVEMBER 1.—The 29th annual exhibition of this society was held in the Dome and Corn Exchange on the above dates. The entries were fairly numerous, and the standard of excellence well maintained.

In the classes for plants (open) S. C. WITTING, Esq., Hollingbury Copse, Patcham (gr. Mr. Geo. Chandler), secured the premier award for a group of Chrysanthemums arranged with Ferns or other foliage in a circle 8 feet 6 inches in diameter. For a group of similar size, composed exclusively of Chrysanthemums, E. M. MARX, Esq. (gr. Mr. A. J. Jones), was awarded the 1st prize. In the class for 12 bush plants, Pompons only, PHILIP H. BAYER, Esq., Withdean, secured the handsome silver cup and the society's silver medal. Mr. G. LAMBERT (amateur), Chichester, was awarded the 2nd prize. For six bush plants (single-flowered varieties excluded), Mr. LAMBERT won the 1st prize, followed by S. COPESTAKE, Esq. (gr. Mr. Sayers), with PHILIP H. BAYER, Esq., 3rd.

In the cut-bloom section, the class for 36 Japanese blooms was won by Mrs. STEWART MACKENZIE, Lydhurst, Haywards Heath (gr. Mr. W. Evans), and the 1st prize comprised a handsome silver bowl and the society's silver medal. This collection contained grand blooms of Hon. Mrs. Lopes, Bessie Godfrey, Splendour, Eclipse, Mrs. C. H. Totty, Sir Frank Crisp, Mr. A. T. Miller, Mme. G. Rivol and Master David. Col. G. P. HENTY, Avisford, Arundel, was awarded the 2nd prize.

For 25 Japanese blooms, as cut from the plants, in not fewer than 18 varieties, the premier award and the society's silver medal were secured by Mr. C. Fox, Tunbridge Wells, who exhibited lovely blooms of Beatrice May, Lady E. Letchworth, Walter Jinks, G. Mileham '08, Evangeline and Reginald Vallis. The 2nd prize was awarded to Messrs. JAS. STREDWICK & SONS, St. Leonards-on-Sea; 3rd, Rev. F. SCLATER, Newick Park, Lewes (gr. Mr. J. H. Hickson). For 12 Japanese blooms, distinct, ALFRED F. BLADES, Esq., Reigate (gr. Mr. Frank Cordell), was successful, showing Miss A. Nicoll, Mrs. G. Mileham, Rose Ellis and Lady E. Letchworth; F. A. WHITE, Esq., Oakleigh, East Grinstead, was 2nd.

The best exhibit of six incurveds, one variety, was shown by Col. C. P. HENTY, the variety being *Emblème Poitevine*, whilst Capt. H. ACTON BLAKE was successful for six Japanese blooms, showing the variety Mrs. A. T. Miller.

In the class for 12 Japanese blooms, in not fewer than nine varieties (amateur division), Mr. C. Fox led easily with choice blooms of Beatrice May, Reginald Vallis, G. Mileham, Rose Pockett and President Viger.

For three bunches of White Grapes (open), E. E. D'AVIGOR GOLDSMID, Esq., was placed 1st (gr. Mr. Charles Earl), whilst for Black Grapes, in three bunches, Mrs. MASHTER, The Grange, Hurstpierpoint, won the 1st prize.

NON-COMPETITIVE EXHIBITS.

The honorary exhibits added largely to the success of the exhibition. We mention some of the more important.

Messrs. BALCHIN & SONS exhibited ornamental flowering and foliage plants and Chrysanthemums (Gold Medal), C. G. A. NIX, Esq., Tilgate Forest, Crawley, showed a magnificent collection of fruit (Gold Medal); Messrs. TOOGOOD & SONS, Southampton, exhibited a table of fruit and vegetables (Gold Medal); Mr. FRANK WOOLLARD, Brighton, showed cut flowers of Chrysanthemums and Roses (Silver-gilt Medal); Mr. G. W. PIPER, Uckfield, had some good Rose blooms (Silver-gilt Medal); Messrs. ALLWOOD BROS., Haywards Heath, showed Perpetual-flowering Carnations (Silver Medal); and Messrs. WELLS & Co., Merstham, staged Chrysanthemums and Carnations (Silver Medal).

National Chrysanthemum Society.

NOVEMBER 1, 2, 3.

CHRYSANthemum shows are usually associated with dull weather, but, on the opening day of the National Chrysanthemum Society's great autumn exhibition at the Crystal Palace, Sydenham, the climatic conditions could scarcely have been more favourable, for the sun shone brilliantly. Of recent years we have noticed a great improvement in these exhibitions and a return to some of the former magnificence seen at the old Westminster Aquarium. It is true that in some particulars, such as in the plant classes, nothing is now seen approaching those of the old times, nor are the specimen blooms larger or of better substance, but there are compensations in other directions. For instance, the type of bloom known as the decorative or market Chrysanthemum is now of great importance, and it gives a garden value to the Chrysanthemum which the larger exhibition blooms fail to provide. Then, again, the colours are greatly improved, whilst the season has been prolonged considerably by the introduction of early and correspondingly late-flowering varieties. It was pleasing to see in such an adverse season, which, as Sir Albert Rolit observed at the luncheon, has led us to confuse the dates—because early varieties are late and late varieties early—such a good show. Although the competitive classes were not so keenly contested as usual, this was compensated by the many excellent trade exhibits, some of them constituting a show in themselves and being arranged with consummate skill. It was a season for old varieties, and such favourites as Duchess of Sutherland, Mrs. A. T. Miller, Frances Jolliffe and Reginald Vallis were never shown finer. As already stated, there were very few plants exhibited and, although substantial prizes were offered in two classes, there was only one competitor who showed in the class open to amateurs for a floral display of Chrysanthemums arranged with suitable foliage in a space of 200 superficial feet. The exhibitor was J. C. ENS, Esq., Wood Hall, Dulwich (gr. Mr. R. B. Leech), and he was awarded the 1st prize.

OPEN CLASSES.

BLOOMS SHOWN ON BOARDS.

INCURVED VARIETIES.—The most important class in this section was for 36 blooms of distinct varieties. There were three exhibits, of good average quality, the 1st prize being awarded to PANTIA RALLI, Esq., Ashted Park, Epsom (gr. Mr. G. J. Hunt). The yellow and white varieties were the more prominent blooms in all three exhibits. Mr. RALLI showed Edwin Thorp (an especially fine bloom of this excellent white variety), Godfrey's Eclipse (yellow, also an excellent flower), W. Biddle, Lady Isabel, Emblème Poitevine (one of the largest blooms shown), Miss E. Holding (rosy-pink), Buttercup, Colonel Kekewich, Clara Wells, Mrs. F. Judson, Miss Nellie Southam (a splendid flower of this fine rosy-lilac variety), Duchess of Fife (a large well-formed bloom, white), Romance, H. W. Thorp, C. H. Curtis, Mrs. Robert Hall, Globe d'Or, Mrs. C. Brooks, Mrs. G. Denyer, and John Wainwright as his best specimens. One of the Holmes' Memorial Challenge Cups, of which two were offered, and the Dean Memorial Medal were awarded to this exhibit.

The 2nd prize was awarded to A. TATE, Esq., Downside, Leatherhead, with blooms not much inferior to those of the 1st prize collection, the best examples being Clara Wells, Mrs. J. P. Bryce, Pantia Ralli, Edwin Thorp, H. W. Thorp, Godfrey's Eclipse, and Mrs. J. Wynne. 3rd, Miss LANGWORTHY, Gays House, Holyport (gr. Mr. T. J. Broom).

In the class for 12 varieties, distinct, there were two exhibits, shown by A. TATE, Esq., and Miss LANGWORTHY, who were awarded the 1st and 2nd prizes respectively. Mr. TATE had much superior flowers, Duchess of Fife, Emblème Poitevine, Clara Wells, and Mrs. J. Wynne, being a selection of the best blooms.

There was a class for six blooms of one variety; three exhibitors competed, and all staged yellow varieties. The 1st prize was awarded to Mr.

TATE for large blooms of Buttercup; 2nd, A. T. MILLER, Esq., Emlyn House, Leatherhead (gr. Mr. G. Mileham), with the same variety; 3rd, Miss LANGWORTHY, with Clara Wells.

JAPANESE VARIETIES.—One of the Holmes Memorial cups was offered, with £7 in money, as the 1st prize in the class for 48 Japanese blooms, distinct. There were only two entries, but both collections were of excellent quality, and provided a choice display of the finest Japanese varieties in cultivation. The 1st prize was awarded to Mrs. W. CLARK, Frensham Place, Farnham (gr. Mr. C. Moore), who beat Mr. TATE by a few points only. Mrs. CLARK had large, fresh blooms of J. Lock (a large bloom, yellow flushed with red), Margaret Smith, Mrs. C. H. Totty, Master James, President Viger, Mrs. Chas. Beckett (rich yellow), White Queen, W. R. Holmes (a splendid flower), Master David, W. Jinks, J. W. Molyneux (a rich crimson shade), Mary Farnworth, Mrs. A. T. Miller, Duchess of Sutherland, Mme. Paola Radaelli, G. Mileham, Pockett's Crimson, Miss A. Nicholls (white), and Reginald Vallis. Mr. TATE showed a bloom of King George V. not yet in commerce. Other prominent varieties shown by this exhibitor were Mme. G. Rivol, Miss Annie Nicoll, Mrs. R. C. Kelly, Hon. Mrs. Lopes, Mrs. A. T. Miller (one of the largest), Duchess of Sutherland, Walter Jinks, and Master James.

The President, Sir Albert Rolit, offered a cup for the best exhibit of 24 blooms, distinct, and this brought a good contest between six exhibitors. The cup was won by Capt. C. WIENER, Ewell Castle, Ewell (gr. Mr. H. Lloyd), whose magnificent blooms included such fine varieties as Reginald Vallis, Frances Jolliffe, Master David, Annie Nicholls, J. Lock (a grand flower), Mrs. F. C. Stoop, Melchet Beauty (a suffusion of red on yellow), Mrs. A. T. Miller (a giant amongst white sorts), Mrs. Geo. Mileham (the rose-pink colour is very pleasing), Henry Poulton (deep chestnut-red), Bryant's Beauty, Rose Ellis (a pretty blush variety), and Edith Smith (cream). 2nd, Rev. COOPER-MARSDIN, Borstal-dene, Bickley (gr. Mr. W. Rigby), with large flowers, but not so fresh as those in the premier stand. He showed Master James, Leslie Morrison, Frances Jolliffe, George J. Bruzard, Mrs. Chas. Penford, Mrs. Geo. Mileham, and J. Lock exceedingly well. 3rd, A. JAMES, Esq., Colton House, Rugby. 4th, A. TATE, Esq.

In the class for 12 blooms, distinct, a special 1st prize was offered by the Ichthemic Guano Company. The blooms were arranged on a table space 5 feet by 3 feet, and the use of other plants was allowed for effect. This proved a very pretty class, five excellent displays being forthcoming. The 1st prize was made in favour of the largest blooms, shown by Mr. TATE, who employed Codiaëums (Crotons) and a rather dense ground of greenery. The blooms of Mrs. A. T. Miller, Kara Dow, Walter Jinks, Miss Annie Nicoll, Hon. Mrs. Lopes, and Countess of Granard were in the best exhibition style. 2nd, Mr. A. SMITH, The Convent Gardens, Roehampton, whose display was too formal, but the flowers were of good quality. 3rd, Rev. A. C. COOPER-MARSDIN.

BLOOMS SHOWN IN VASES.

The "Great Vase Class," which was for 12 vases, each containing three blooms of one variety, was disappointingly small, as the two exhibits that were staged created but a longing for more. The large, massive blooms, of splendid quality, shown in trios, with the natural foliage, were most imposing, especially those shown by A. JAMES, Esq., Coton House, Rugby (gr. Mr. A. Chandler). His crimson sorts were grand, especially George Hemmings and Master David. G. J. Bruzard and Master James were also shown well. The white Evangeline, yellow Algernon Davis, Reginald Vallis, Mrs. H. Thornton, James Lock, and Frances Jolliffe were all good. 2nd, Mr. TATE, who had splendid flowers of Mrs. A. T. Miller, Duchess of Sutherland, Hon. Mrs. Lopes, Miss Annie Nicoll, Walter Jinks, and Beatrice May.

One vase of a white variety.—The variety Mrs. A. T. Miller was favoured by all the competitors, who numbered four. The 1st prize was

awarded to Mr. TATE, and the 2nd to Mr. H. J. HEDGE, Kirkdale Nurseries, Sydenham.

One vase of a yellow variety.—The better of two exhibits was a vase of Hon. Mrs. Lopes, shown by Mrs. W. CLARK, Frensham Place, Farnham (gr. Mr. C. Moore). The other vase was Bessie Godfrey, shown by Mr. HEDGES.

One vase of any other variety.—James Lock, yellow, with suffusion of crimson, shown by A. T. MILLER, Esq., was adjudged the better vase of two, the other being Mrs. George Mileham, shown by Mr. HEDGES.

INCURVED BLOOMS.—There were only two exhibits in the class for 12 vases of Incurved Chrysanthemums, these being staged on the same table as the great vase class. Mr. PANTIA RALLI won the 1st prize, his blooms being very choice specimens, and including Edwin Thorp, Buttercup, Mrs. F. Judson, C. H. Curtis, W. H. Thorp, Godfrey's Eclipse, Romance, Duchess of Fife, and Miss Nellie Southam. 2nd, Mr. A. TATE, who showed J. Wynne, Buttercup, Mrs. G. Denyer, Pantia Ralli, and others.

MARKET VARIETIES.—Medals were offered in a class for 12 bunches of disbudded inflorescences as grown for market, 12 blooms of one variety only in each vase. An outstanding exhibit staged by Messrs. CRAGG, HARRISON & CRAGG, Heston, was awarded the 1st prize. It was a magnificent display, the varieties being Bronze McNeill, Emblème Poitevine, Mary Thorp (pink), Money-maker (white), H. W. Thorp (white), Crimson King, Heston Bronze, E. Cox (white incurved), Phoebe (pink), D. Ingamells (yellow), Mrs. Roots (white), and Freda Bedford (bronzy-chestnut); 2nd, Mr. F. BRAZIER, Nurseryman, Caterham.

ANEMONE-FLOWERED VARIETIES.—There was only one exhibit in the class for 12 large-flowered Anemone varieties, the exhibitor being Miss LANGWORTHY, the 2nd prize being awarded.

This exhibitor was also the only grower who showed in the class for six vases of Pompon varieties, and the 1st prize was deservedly awarded, the blooms being of splendid quality, especially Katie Mannings, Mdle. E. Dordan and Sunset.

The best vase of Pompon or Anemone Pompons was arranged by Mr. L. LAWRENCE, Shoreham Cottage Gardens, near Sevenoaks.

Single Chrysanthemums.—A prize of three guineas was given by Messrs. Cragg, Harrison & Cragg for the best display of single flowers, in not fewer than three distinct varieties, arranged in eight vases, twelve blooms to a vase. Mr. F. G. BEALING, Nurseryman, Basset, Southampton, was the only exhibitor, and he was disqualified, as some of the vases contained fewer than 12 blooms.

A former President, C. E. Shea, Esq., offered prizes for a table of single Chrysanthemums arranged for effect, with appropriate foliage, and again Mr. BEALING was the only exhibitor, and he was awarded the 1st prize.

A very pretty ground exhibit was staged by Lady TATE, Park Hill, Streatham (gr. Mr. W. Howe), in a class for a display of single and Pompon varieties, and it was awarded the 1st prize.

AMATEURS' CLASSES.

There were four sections for amateurs, two each of Sections A and B, which was rather confusing. In the first Section A, for cut blooms, there was a class for 12 Japanese blooms, distinct, and five competed. All the collections were meritorious, the 1st prize being awarded to Rev. COOPER-MARSDIN (gr. Mr. W. Rigby). He showed G. J. Bruzard, Edith Smith, Reginald Vallis, Hon. Mrs. Lopes, Mary Farnworth, Mrs. A. M. Falkner, Mrs. Geo. Mileham, Mrs. W. Knox, President Viger, Bessie Godfrey, J. Lock, and Gladys Blackburn. 2nd, D. LINK, Esq., Beckenham (gr. Mr. W. Trowell).

In a similar class in Section B the 1st prize was awarded to Mr. T. SHARPE, Railway Terrace, Stone, Greenhithe, with excellent blooms of Miss A. Nicoll, Mrs. G. Mileham, Bessie Godfrey, Master David (very rich in colour), Mme. G. Rivol, Mrs. A. T. Miller, and Walter Jinks. 2nd, Mr. B. E. DAVIES, White Lodge, Bidden-

There were also two classes for 12 incurved blooms, one in each respective division, but there was no entry in Section A. In the other case there were two exhibitors, the 1st prize being awarded to Mr. J. KING, East View, Hendon, and the 2nd to Mr. SHARPE. The premier blooms were of good size and form, the best being Buttercup, H. W. Thorpe, and W. Biddle.

Other prize-winners in the amateurs' classes were:—Messrs. J. VANSTONE, Tulse Hill; R. GLADWELL, South Norwood; C. H. MARTIN, Hendon; A. DYER, Norwood; J. LUSCOMBE, Norwood; B. E. DAVIES, Biddenden; and G. MOORMAN, Hampton Court.

DECORATIVE CLASSES.

There were no fewer than 29 decorated tables, there being two classes for these. In the class restricted to yellow and bronze varieties, the 1st prize was awarded to Mrs. A. ROBINSON, Park Hill, Carshalton, with a pretty, but rather prim, arrangement, in which the varieties Source d'Or and Lizzie Adcock figured prominently. In the class for any colours other than bronze and yellow, the prize-winner was Mr. T. W. STEVENS, Donnington Gardens, Sydenham, medium-sized blooms of a chestnut-red variety being mingled with pink and white sorts, and relieved with autumn-coloured foliage in sprays.

The best vase of five blooms of a Japanese variety, in a class open to amateurs, was shown by Capt. C. D. CLARK, Shortlands (gr. Mr. W. Passey), the variety being the popular Mrs. A. T. Miller, very excellently shown.

The best vase of decorative varieties shown by an amateur was arranged by Mr. A. Dyer, gardener to E. H. WOOD, Esq., Church Road, Upper Norwood.

The best basket of autumn berries and foliage was shown by Mrs. BREWSTER, 12, St. Peters, Canterbury. The best basket of Chrysanthemums by Mrs. G. DAVIES, Upper Norwood, and the best vase of Single Chrysanthemums by Mr. M. E. MILLS, Croydon.

AFFILIATED SOCIETIES CLASS.

Although only three of the numerous societies affiliated with the N.C.S. entered in the special class provided for them, the contestants proved worthy rivals, and each showed excellently. The 1st prize was won by the DULWICH SOCIETY, with a splendid exhibit, but it was regrettable that none of the varieties was named. The 2nd prize was won by the SEVENOAKS and WEST KENT SOCIETY, and the 3rd prize by the SYDENHAM and DISTRICT SOCIETY.

FRUIT CLASSES.

Grapes.—There were three classes for Grapes. For three bunches of white Grapes there were four entries, the 1st prize being won by W. C. BAYER, Esq., Tewkesbury Lodge, Forest Hill (gr. Mr. E. C. Wickens), who showed three excellent bunches of Muscat of Alexandria; 2nd, Lord HILLINGDON, Sevenoaks (gr. Mr. J. Shelton), with the same variety.

The best bunches of Gros Colman were shown by Mr. E. C. WICKENS, Forest Hill.

The best three bunches of black Grapes, other than the variety Gros Colman, were shown by Lady TATE (gr. Mr. Howe), who exhibited Black Alicante; 2nd, Sir WALPOLE GREENWELL, Bart., Marden Park, Caterham (gr. Mr. W. Lintott), with the same variety.

Six dishes of dessert Apples, distinct.—There were five exhibits, the 1st prize being won by Rev. O. TURNER, Woburn Park, Weybridge (gr. Mr. A. Basile), with Cornish Aromatic, Cox's Orange Pippin, Rival, American Mother, King of the Pippins, and Chas. Ross. 2nd, Sir WALPOLE GREENING, Bart.

Six dishes of culinary Apples, distinct.—This proved a splendid class, some magnificent fruits being staged. The premier exhibit was staged by Rev. TURNER, who showed Bismarck, Emperor Alexander, Lady Henniker, Newton Wonder, Mère de Ménage (magnificent fruits of this highly-coloured variety), and Bramley's Seedling.

Six dishes of dessert Pears, distinct.—The best of three exhibits in this class was shown by Rev. TURNER, who showed Durondeau, Beurré Diel, Duchesse d'Angoulême, Beurré Bachelier, Roosevelt, and Charles Ernest, all the fruits being of splendid quality in every respect. 2nd, Sir WALPOLE GREENWELL, Bart.

AWARDS.

FIRST-CLASS CERTIFICATES.

Mrs. Percy E. Wiseman (Incurved).—A primrose-yellow variety shown by Mr. P. E. WISEMAN, Earl's Cottage, Woodham Water.

Heston Bronze.—A market variety, of light bronze colour.

Celia (single).—A yellow variety. Both these were shown by Messrs. CRAGG, HARRISON & CRAGG.

Mrs. John Peed (single).—A bright yellow flower. Shown by Messrs. J. PEED & SONS, Norwood.

Caterham Bronze (single).—A fine bronze variety, with a yellow zone bordering the greenish disc. Shown by Mr. F. BRAZIER, Caterham.

R. P. Burge (single).—A white variety. Shown by Mr. PHILIP LADDS, Swanley.

Mrs. Andrew Walker (Japanese).—The blooms of this variety are of moderate size, and the florets of a rich shade of chestnut-red. The variety is a sport from Freda Bedford.

Miss Margaret Walker (single).—A variety of golden-bronze shade; a very bold flower, measuring 6 inches across. Both these were shown by Messrs. W. WELLS & Co., LTD.

Charles Dickens (single).—A variety of rich yellow colour; a seedling from Mensa. Shown by Mr. NORMAN DAVIS, Framfield.

NON-COMPETITIVE EXHIBITS.

Mr. NORMAN DAVIS, Framfield, Sussex, set up one of the finest displays of Chrysanthemums ever seen at an exhibition. It had a commanding position, being immediately opposite the organ, and backed by hanging curtains of cardinal velvet. The front formed a semi-circle, and the ends receded, finishing in two half-circular groups. It was resplendent with stove foliage plants of gorgeous colours, and Palms, Bamboos, and Ferns were utilised in large numbers. Three bold epergnes of Chrysanthemums dominated the background, and towards the front were shorter stands, filled with large exhibition blooms and dwarfier vases in the foreground. Varieties of special notice were Lady Talbot, December Gold, Beatrice May, White Queen, Mrs. G. C. Kelly, Miss Gladys Herbert (new, mauve pink, a fine, deep flower), Miss Beatrice Hoar (deep crimson, new), and Mrs. A. Herbert (cream). Besides the single variety, Charles Dickens, which received a Certificate, there was a companion seedling from Mensa, named Chas. Kingsley, which the raiser considers the better of the two; the colour is a clear buttercup yellow. This exhibit received the gold medal offered by Messrs. Clay & Son for the best miscellaneous exhibit, and also the Society's large Gold Medal.

Messrs. H. J. JONES, LTD., Ryecroft Nurseries, Lewisham, also made an imposing display with Chrysanthemums of all types, in which large Japanese blooms predominated. This display was relieved with autumn-tinted foliage, with greenery at the base. The principal features were tall upright epergnes, rather too stiff to produce the best effect, and not nearly so pleasing as the large vases which this exhibitor employed in former years. But baskets in the foreground were delightful, and here also the group was enhanced by some of the vases referred to. Notable varieties included Mrs. R. H. B. Marsham, Mary Farnworth, Mrs. A. T. Miller, Mrs. Percy E. Wiseman (incurved, new), Mrs. Trevor Williams (sulphur florets tinted with pink), Margaret Smith, and Miss Nellie Brockman. (Large Gold Medal.)

Messrs. W. WELLS & Co., Merstham, Surrey, were also the exhibitors of a group of Chrysanthemums of imposing appearance, the grouping being admirably executed. The front was undulating, the boldest flowers being arranged in epergnes at the back against a tall, green background of drapery. Bright foliage served to make a veritable colour scheme, and prominence was given to two large specimens of Phoenix Roebelinii. Very pretty also were two baskets of Chrysanthemums, one at either end of the group, one arranged with Cranford Yellow and red Oak leaves, the other with Wells' White and similar foliage. Amongst the choice blooms were Mrs. Gilbert Drabble, a magnificent white variety; Mrs. R. A. Witty, new, chestnut bronze; Mrs. G. C. Kelly, rose-red; Mrs. F. C. Stoop, White Queen, Mrs. R. Hookey, and David Ingamells. (Large Gold Medal.)

Mr. W. J. GODFREY, Nurseryman, Exmouth, filled a table with varieties of Chrysanthemums, single varieties being numerous. (Large Silver Medal.)

Messrs. CRAGG, HARRISON & CRAGG, Heston, Middlesex, had varieties suitable for market in exquisite blooms. The beautiful white single Mensa, J. B. Lowe (crimson), E. Pagram (rose-pink, single), F. King (pink), Roupell Beauty (red), and White Pagram are a selection. (Large Silver Medal.)

Large Japanese blooms were staged by Mr. H. W. THORP, Durrington, Worthing, for which a Silver-gilt Medal was awarded. Walter Parsons is a new variety of reddish terra-cotta colour.

A Large Silver Medal was awarded to Mr. F. BRAZIER, Caterham, for a large display of single and decorative Chrysanthemums.

Messrs. H. CANNELL & SONS, Swanley, Kent, exhibited Chrysanthemums, Zonal-leaved Pelargoniums and a collection of Apples and Pears in 157 dishes. The Chrysanthemums included many pretty single varieties, such as A. Botham, Miss Till, Caledonia, Metta, Florrie King, and Florence Coles. Rayonnante, a pink Japanese variety, has exceptionally narrow florets. The fruit was of excellent quality and evoked the praise of the President, Sir Albert Rollit, in a speech at the luncheon. (Large Gold Medal.)

Messrs. JOHN PEED & SON, West Norwood, arranged a bold, circular group of Chrysanthemums in the main transept. It was greatly admired by visitors, and contained many choice specimen blooms of popular varieties. (Gold Medal.)

Messrs. BUTLER BROS., Bexley Heath, Kent, showed a group of delightful little plants of Chrysanthemums in 4½-inch pots, and not more than 12 to 18 inches high. The varieties were Butler's Caprice du Printemps, Kathleen Thompson (bronze), Tapis d'Or, Mrs. Roots (white), Felton's Favourite (white), Dazzler (red), La Pactole (bronze), Yellow Caprice du Printemps, October Yellow, October Bronze, Mrs. Greening (pink), and Mrs. Coates (single pink variety). Silver-gilt Medal.

Messrs. J. CHEAL & SONS, Lowfield Nurseries, Crawley, received a large Silver Medal for an exhibit of Apples and Pears. A similar award was made to Mr. W. A. VOSS, Fairlight Glen, Rayleigh, Essex, for baskets of Apples and Pears.

Messrs. D. RUSSELL & SONS, Essex Nurseries, Brentwood, staged ornamental shrubs and a collection of Apples. The shrubs were arranged in a very attractive manner, and made a showy group. (Gold Medal.)

Messrs. HOBBIES, LTD., Dereham, Norfolk, showed Dahlias of the Collarett type, and varieties of Roses. (Small Gold Medal.)

Messrs. WILTON & GODARD, Durrington, near Worthing, made a pretty group with large Japanese Chrysanthemums. A new variety, named Dorothy Wilton, has old gold florets, passing to rosy-bronze. Other new varieties are Zoë Wilton (creamy-buff), and Dorothy Godard (showing a silvery reverse). (Large Silver Medal.)

Messrs. H. B. MAY & SONS, The Nurseries, Upper Edmonton, exhibited a large assortment of Ferns, also varieties of Begonias of the Gloire de Lorraine type. (Small Gold Medal.)

Mr. W. H. PAGE, Tangley Nurseries, Hampton, showed the fine scarlet Zonal Pelargonium His Majesty; also Fiscal Reformer (salmon-rose), and Winter Cheer (cerise). (Small Silver Medal.)

A Gold Medal was awarded to Mr. PHILIP LADDS, Swanley, for an exhibit of market Chrysanthemums, and a similar medal was awarded to Messrs. STUART LOW & Co., Enfield, for collections of Carnations and Apples.

MANCHESTER AND NORTH OF ENGLAND ORCHID.

OCTOBER 12.—Committee present: Rev. J. Crombleholme (in the Chair); and Messrs. R. Ashworth, J. Bamber, C. Parker, H. Thorp, Z. A. Ward, J. Cypher, J. C. Cowan, J. Evans, W. Holmes, A. J. Keeling, D. McLeod, and H. Arthur, secretary.

AWARDS.

FIRST-CLASS CERTIFICATES.

Odontoglossum grande aureum Charlesworth's variety, from R. LE DOUX, Esq.—A very distinct variety, with pure white lip.

Cypripedium Thogun, from W. R. LEE, Esq. (gr. Mr. Woodhouse).—One of the finest *Cypripediums* yet seen, a large, well-marked flower, of almost round form.

AWARDS OF MERIT.

Cattleya labiata alba "Mme. Le Doux," *C. × Empress Frederick*, var. *Marlfieldense*, *C. exquisitum*, all three were shown by R. LE DOUX, Esq. *Cattleya suavior* (*C. intermedia alba* × *C. Prince Edward*), from W. J. HARGREAVES, Esq., Burnley. *Cattleya highburyensis* var. "Mary McCartney," from J. MCCARTNEY, Esq. *Cattleya Adula*, Ward's var., and *Cypripedium Zethus*, both shown by Z. A. WARD, Esq. *Dendrobium Phalanopsis Schröderianum* var. "Miranda," from W. R. LEE, Esq., a beautiful, well-marked form, the colours running in lines. *Cypripedium Lord Ossulston* var. *cherubicum*, from the Rev. J. CROMBLEHOLME, a brilliantly-coloured variety, distinct from the original. *Lalio-Cattleya Lily* (*C. labiata* × *L. C. Dominiana*), *Oncidium Forbesii splendens*, *Cypripedium westgatense* (*C. insigne Sandera* × *C. Laura Kimball*), all three from Messrs. A. J. KEELING & SONS. *Cattleya Ena Morton's* var. (*C. bicolor* × *C. Massiana*), shown by the LIVERPOOL ORCHID CO. *Cattleya Thurgoodiana* "Wivelsfield" var., from Mr. ED. V. LOW.

HEREFORD FRUIT AND CHRYSANTHEMUM.

OCTOBER 25, 26.—As in previous seasons, the annual show of this society was held in the Shire Hall, Hereford, on the above dates. Apples, as is invariably the case, were staged in large numbers, and these fruits were of excellent quality. Collections of miscellaneous fruits, also exhibits of Pears, Grapes, and vegetables, together with agricultural roots and grain, were other leading features of the show. Many trade exhibits assisted considerably in making the show a success.

APPLES.—In the class for a collection of 50 dishes of distinct varieties, including culinary and dessert sorts, only two exhibits were staged. Messrs. PEWTRESS BROS., Tillington, won the 1st prize easily with choice fruits. The following were amongst their best varieties: Flander's Pippin, New Hawthornden, Tillington Court, Tyler's Kernel, Newton Wonder, King of the Pippins, Belle de Pontoise, Blue Pearmain, Byford Wonder, and Baxter's Pearmain. 2nd, P. H. FOLEY, Esq., Stoke Edith (gr. Mr. Roberts).

There were also two exhibits in the class for a collection of 30 dishes of distinct varieties, Mr. C. W. POWELL, of Warham Court Farm, being placed 1st with good fruits of Bismarck, Lord Derby, Annie Elizabeth, Newton Wonder, Lady Henniker, Golden Noble, Gascoyne's Scarlet Seedling, King Edward VII., Beauty of Kent, and others. J. RILEY, Esq., Putley Court (gr. Mr. Taylor), was 2nd.

There were five entries in the class for a collection of 12 dishes of culinary varieties, and the 1st prize was won by the SELLACK FRUIT FARM Co., Ross (gr. Mr. O. Thomas), with splendid examples, including Bramley's Seedling, New Hawthornden, Newton Wonder, Gascoyne's Seedling, Bismarck, and Lane's Prince Albert. F. BODDINGTON, Esq., Burghill, was awarded the 2nd prize for almost equally good fruit; 3rd, Mrs. WOODHOUSE, Burghill.

The class for eight dishes of dessert Apples brought seven exhibitors, whose collections were collectively very imposing. Messrs. GETTING & NEWTON, Glewston Court, Ross (gr. Mr. Kelly), was placed 1st. This firm staged Rival, American Mother, Cox's Orange Pippin, and Wealthy in superb condition. The Rev. G. H. DAVENPORT, Foxley (gr. Mr. G. R. Currie), was 2nd.

There were three entries in the class for a collection of eight dishes of culinary and four of dessert Apples. Mr. BOTT, Brunton, secured the 1st prize, with choice fruits including the varieties Charles Ross, Cox's Orange Pippin, King of the Pippins, Blenheim Pippin, Wealthy, Lady Henniker, Peasgood's Nonesuch, Bramley's Seedling, Golden Noble, Lord Derby, Belle de Pontoise, and Annie Elizabeth; 2nd, Mr. G. R. CURRIE; 3rd, Mr. C. B. LEE WARNER.

The class for a collection of varieties recently introduced proved specially interesting. Mr. C. W. POWELL, who won the 1st prize, showed, amongst others, Rival, Charles Ross, Lord Hindlip, James

Grieve, Coronation, and King Edward VII. Mr. R. M. WHITING, Credenhill, followed closely, having fine fruits of Encore and Hector Macdonald.

Mr. C. W. POWELL was also 1st in the class for eight culinary varieties suitable for market purposes. Mr. C. THOMAS excelled in the class for 12 culinary and 6 dessert varieties suitable for market purposes, and Mr. KELLY was 1st for eight dishes of dessert market sorts.

There were 19 single-dish classes for Apples, in which were seen some of the best fruits in the show. In the class for Blenheim Pippin, 31 dishes were staged. There were several classes for cider Apples.

Champion classes.—The best dish of culinary Apples in the show was staged by Mr. BODDINGTON, the variety being Stirling Castle. Mr. C. THOMAS showed the best dessert variety in Cox's Orange Pippin.

PEARS.—Mr. G. R. CURRIE exhibited the best collection of 12 dishes, having Doyenné du Comice, Pitmaston Duchess, Beurré Diel, Beurré Bosc, Emile d'Heyst, Marie Louise, Easter Beurré, Durondeau, Glou Morceau, Thompson's, Conference, and Winter Nelis; 2nd, A. W. FOSTER, Esq., Brockhampton Court (gr. Mr. G. H. Parrott).

There were three creditable collections in the class for eight dishes, the best being shown by Sir JOHN COTTERELL (gr. Mr. C. Liddle), who staged good dishes of Beurré Diel, Nouvelle Fulvie, Doyenné du Comice, Durondeau, Beurré

THE LATE GEORGE HENRY GOLDSMITH.

Bosc, Easter Beurré, Conference, and Pitmaston Duchess; 2nd, General CLIVE, Peryston Court (gr. Mr. W. D. Thomeley).

In the single-dish classes, Mrs. WOODHOUSE was 1st for Marie Louise, Sir JOHN COTTERELL 1st for Doyenné du Comice, Mrs. BLASHILL 1st for Pitmaston Duchess, and the Rev. G. H. DAVENPORT 1st for any other variety.

Mr. LIDDLE secured the prize offered for the champion dish, with splendid fruits of Doyenné du Comice.

Messrs. PEWTRESS BROS. were the only exhibitors in the class for a decorative group of fruits in a space of 50 square feet, and deservedly received the 1st prize.

There were three exhibits in the class for a collection of six dishes of fruits. Mr. C. LIDDLE led with Muscat of Alexandria and Lady Downe's Grapes, Emerald Gem Melon, Coe's Golden Drop Plums, Doyenné du Comice Pears, and Cox's Orange Pippin Apples. Col. HENRY, of Haffield (gr. Mr. J. Sykes), was placed 2nd with almost equally fine fruits.

GRAPES.—Capt. P. A. CLIVE, Whitfield (gr. Mr. Stevens), who was the only exhibitor in the class for Gros Colman, was awarded the 1st prize. For any other black Grape, Mr. DUNN was 1st amongst three exhibitors, staging Black Alicante in capital condition. Mr. SYKES followed with Gros Maroc. For three bunches of white Grapes, there were five good exhibits; Mr. ROBERTS led with Muscat of Alexandria, being closely followed by Mr. G. R. CURRIE, who staged the same variety; 3rd, Mrs. WOODHOUSE.

CHRYSANTHEMUMS.—There were six classes for Chrysanthemums, and the blooms were required

to be exhibited in vases. The flowers made the halls very attractive, and were arranged through the centre of the fruit tables. The leading prize-winners in these classes were C. F. HALFORD, Esq., F. W. G. WILLIAMS, Esq., A. G. BURNLEY, Esq., Capt. CLIVE, and Dr. C. S. MORRISON.

F. W. GRESWOLDE WILLIAMS, Esq. (gr. Mr. H. Tribe), showed the best group of miscellaneous plants; Mr. C. LIDDLE was a close 2nd.

Five exhibitors arranged dinner-table decorations with Chrysanthemum blooms. Miss BOLT, Brenton, was placed 1st.

VEGETABLES.—The chief prize-winners in the vegetable classes were Mr. A. G. BURNLEY, Capt. P. A. CLIVE, Mr. W. H. DAVIES, Mr. T. YOUNG, Mr. W. STANSBURY, Archdeacon WINNINGTON INGRAM, and Lady FLORENCE KING-KING.

NON-COMPETITIVE EXHIBITS.—The KING'S ACRE NURSERY Co. staged a splendid collection of Apples and Pears, consisting of upwards of 130 baskets and dishes, as well as a large stand of floral devices and Chrysanthemums. Mr. WILSON, Commercial Street, Hereford, arranged a large and imposing stand of cut flowers, bouquets, and wreaths. Messrs. YOUNG & Co., Hatherley, Cheltenham, made a fine display with varieties of Carnations.

Obituary.

G. H. GOLDSMITH.—We regret to announce the death, on the 21st ult., of Mr. George Henry Goldsmith, of 6, Springwell Road, Tonbridge. Mr. Goldsmith, who was 69 years of age, had been in indifferent health for the past five or six years, and was taken worse nine weeks ago at the residence of his daughter, Mrs. E. A. P. DEE, Southborough, Tunbridge Wells. Mr. Goldsmith commenced his gardening career at "High Trees," Redhill, and in course of time became head gardener at Hollenden Park, Hildenborough, near Tonbridge, where he remained for 17 years. After terminating his engagement at Hildenborough, deceased was appointed gardener to Sir E. G. Loder, Bart., at Leonardslee, Hordsham, Sussex. During his 15 years service at Leonardslee he removed many valuable plants from Flore, Northampton, to Leonardslee. Mr. Goldsmith relinquished gardening some 14 years ago, and engaged in the greengrocery business at Tonbridge. In his earlier days he was a keen cricketer, both as a player and umpire. He leaves a widow, three sons, and three daughters. The funeral took place on Wednesday, the 25th ult., at Tonbridge cemetery.

M. LOUIS GRANDEAU.—Agricultural science has suffered a severe loss in the death of M. Louis Grandeau, the distinguished French chemist. M. Grandeau, who was 78 years of age, held numerous important posts, and was not only a student of agricultural chemistry, but also a journalist of high repute. In this latter capacity no less than in that of professor, he rendered signal service to the cause of French agriculture.

TRADE NOTICES.

ROBERT GREEN (1911), LTD.

This company has been registered with a capital of £3,000, in £1 shares. Business: That carried on at 28, Crawford Street, London, as Crawford Street Flower Depot, Ltd., florists, nurserymen, &c. Private company. Office: 8, Old Jewry, E.C.

WM. WOOD & SON (MARESFIELD), LTD.

The above-named company has been registered with a capital of £6,500, in £1 shares. Business: That of horticulturists, florists and seedsmen, carried on at the Woodlands Nursery, Maresfield, Sussex, as Wm. Wood & Son. Agreement with F. S. Champion, A. Turner, Mrs. D. M. Wood, R. N. Wood, Miss N. M. Wood, Mrs. B. Wood, Mrs. E. M. Salomon, C. F. Wood, and Miss W. B. Wood. Private company. Office: Woodlands Nursery, Maresfield, Sussex.

BARRON, JOHNSON & CO., LTD.

This company has been registered with a capital of £1,500 in £1 shares. Business: That of wholesale and retail fruit growers and merchants, &c., carried on by S. Barron and J. N. Johnson, at Jackson Street, at High Street, and Belvoir Road, and at Forest Road, Coalville, Leicestershire, as Barron, Johnson & Co. Private company.

SCHEDULE RECEIVED.

Ancient Society of York Florists.—The annual Chrysanthemum show of this society will be held at York, on Wednesday, Thursday, and Friday, November 15, 16 17. Secretary, Mr. H. Dale, 9, St. Leonard's, York.

* * * The Editors will be glad to receive, for consideration, large photographs of horticultural subjects, suitable for reproduction in this Journal.

BIENNIALS, LAUREL, RHODODENDRON, AND ORANGE: *J. P. O'D.* (1) The present is a good time to plant Wallflowers, Double Daisies, Myosotis, and Canterbury Bells. (2) Assuming that your Laurels have made satisfactory growth after being cut hard back, they should be transplanted as soon as possible. (3) You do not state the kind of Rhododendron (*Azalea*) you refer to, or how long they have been planted. We suspect them to be *Rhododendron sinense*, generally known as *Azalea mollis*, and that the plants were exposed to the drying influence of the air before they were planted. In these circumstances the plants would flower fairly well, but would not possess sufficient strength to make satisfactory growth. From your description of the soil it should be suitable for these plants. (4) The fact of your Orange tree, which has healthy leaves, dropping its fruits soon after they are set, points to cultural errors; probably the atmosphere of the house is too dry, or the plants are grown in too much heat.

BULBS IN MOSS FIBRE: *F. H. van V., Transvaal.* As plenty of cocoanut fibre is obtainable, you can make a suitable mixture for growing bulbs in bowls by adding to it a mixture of fine and moderately coarse charcoal. Bulbs will grow successfully in this medium. When the bulbs are showing their buds a little weak liquid manure may be given, or artificial manures may be lightly sprinkled on the surface of the fibre. We do not, however, advise any manure being used in the earlier stages of the bulbs' growth, and even in the later stages it is not absolutely necessary. Good bulbs will flower quite well in the fibre and charcoal mixture without any other addition. The proportion of charcoal to fibre should be at the rate of four quarts of charcoal to one bushel of fibre. You will do no harm by mixing crushed shell or even old mortar rubble, which can generally be obtained from local builders or house-breakers, using it at the rate of 4 quarts to the bushel. The mixture should be made quite damp, but not so wet as to be at all sticky, or, indeed, to allow of any water being squeezed out. The bulbs do not require a great deal of moisture for the first few weeks after planting, only just sufficient to encourage the roots to start into growth. After the first few weeks, however, more water should be given gradually, although at no time should the mixture be allowed to become soppy. After planting, either of the following plans may be adopted: (a) The bowls or vases may be plunged out-of-doors on a bed of cocoanut fibre or ashes, and covered entirely with cocoanut fibre, leaving them thus until the bulbs have made good fibrous roots (Roman Hyacinths four or five weeks, large-flowered Hyacinths, Tulips, Daffodils, &c., eight to 12 weeks. (b) Or the bowls may be plunged in a cold frame, airy cellar, or out-house instead of out-of-doors; with this treatment, however, it will be necessary to occasionally water the bulbs. (c) A third plan is to place the bowls after potting in a dark or moderately dark, airy place, which is cool but not too cold; they should not be placed in a close cupboard; treated thus they will also require a little water occasionally. In the case of bowls plunged out-of-doors there will be no need to give any attention in the way of watering, as they will receive an abundance of moisture from the autumn rains. Where, however, the bulbs are not exposed to the rain, the bowls should be examined once or twice each week, care being taken that the fibre mixture is kept uniformly moist, but for the first week or two after planting only sufficient water should be given to keep the fibre damp enough to encourage root action. As soon as the bulbs are well rooted, however, water should be given more freely,

the fibre mixture being then kept quite moist. Great care must be taken that the mixture is never allowed at any time to become dry, even for a day. If obtainable, rain water should always be used. When the bulbs have made some top growth the bowls should be placed in a sunny window where they will get the morning sun, or put into a cool greenhouse close to the glass, it being necessary that they should be given sufficient light and air to prevent the foliage becoming drawn. No bottom heat should be given, a temperature of 55° to 60° by day, and 50° to 55° by night is sufficient to obtain good blooms; the bulbs resent too warm a temperature. The spent Hops you mention may be employed as manure for other crops.

CHRYSANTHEMUMS DISEASED: *A. Q. and E. S. & Sons.* The Chrysanthemums are attacked by *Cylindrosporium Chrysanthemi*. Spray the plants with permanganate of potash of a pale rose colour.

CUCUMBER LEAVES: *Anxious.* The symptoms suggest eelworm at the roots, which causes knots or warts on the fibres. No cure is known. Do not plant Cucumbers, Tomatos, or Melons in the same house until it has been thoroughly cleansed, removing every particle of the old soil. If it is suspected that eelworm is present in the new soil sterilise it by baking.

DRACÆNA: *W. H. P.* There is no disease present on the leaves of *D. Sandere*. The condition complained of is brought about by a too moist and insufficiently ventilated atmosphere with deficient warmth.

FRUIT PLANTING: *Fruits.* 1, As you propose to plant Apples, Pears, Plums and Cherries on three or four acres, you will not need a great number of varieties of each kind. They cannot all be "the very best," and the most desirable varieties to grow in one district may not be the best in another place. It is important to ascertain which varieties flourish in your district. Apples that grow well in most soils are (culinary) Early Victoria, Lord Grosvenor, Queen, Ecklinville Seedling, Lane's Prince Albert, Bramley's Seedling, and Newton Wonder; and (dessert) Mr. Gladstone, Beauty of Bath, Worcester Pearmain, James Grieve, and Cox's Orange Pippin. If you intend to grow fruit for market it is best not to have too many varieties. Those named are given for a succession. 2, As you intend to make your soil by taking out gravel and putting in better material, you might grow the culinary sorts as half-standards on the crab stock, and the dessert varieties as bush-shaped trees (not pyramids) on the English paradise stock. Tall standards would outshadow the dwarf trees too much. 3, All the cooking varieties named do well as standards or half-standards, and all the dessert varieties as either dwarf or half-standards. 4, Two-year-old bush or half-standard trees are to be preferred to older ones. They would not be "fruiting trees"; but it is a great mistake to let trees fruit until the third season after planting, and even then they should not be allowed to bear except on the lower parts of the branches. If you order trees trained in bush-shape, they will probably be three years old. 5, November is the best month for planting, if the soil is in a good condition. If you cannot plant before Christmas, any time up to the end of March will do. 6, As you have no great depth of natural top soil, 12 feet would be a sufficient distance between the trees each way. Or you might place the half-standards 15 feet apart in the rows, and the bush trees at a distance of 10 feet, allowing 15 feet between the rows. Then you could plant Gooseberries or Currants between the trees in the rows 5 feet from each other or from a tree, and they may be allowed to remain till the trees overshadow them. There would then be two small fruit bushes between each two half-standard trees and one between each pair of bush-shaped trees, while between the two rows there would be two rows of Gooseberries or Currants. The bushes would come into profit long before the trees. 7, The best and cheapest plan of protecting trees from rabbits or hares is to place a circlet of 1 inch mesh wire netting around each stem. Experience has proved that netting 18 inches wide is sufficient, and this may be cut into 18 inch lengths, the cut ends being

twisted into each other in three places from top to bottom. But this question of rabbits indicates that you will do well to have all your trees on stems, because you cannot adopt the plan of netting them just recommended if you have bush-tree branches close to the ground. The stems of the dwarf trees need not be more than 3 feet high. If shorter, the lower branches may in time hang down low enough for the rabbits to reach them. If you have such trees, it will be necessary to have tall netting, tied to stakes all round the orchard, which will cost much more than the the circlets round the stems. So far, the remarks apply to Apples only. The following variety of Pears may be planted for a succession: Clapp's Favourite, Louise Bonne of Jersey, Beurré Superfin, Doyenné du Comice, Thompson's, Winter Nelis, and Josephine de Malines. A good succession of cooking Plums will be found in Rivers's Early Prolific, Czar, Belle de Louvain, Victoria, Pond's Seedling, and Monarch. Among the best of dessert Plums are Greengage, Denniston's Superb Gage, and Coe's Golden Drop.

GRAPES: *A. E.* There was no evidence of shanking in the berries sent us, but many of them had failed to ripen. This is probably due to the vines having been planted in borders which were not prepared properly at the commencement. If the drainage is imperfect, then the border would be colder during the whole season than would be the case if it were made according to the usual practice.

NAMES OF FRUITS: *Waller.* 1, Margil; 2, Scarlet Golden Pippin; 4, 5, 6 and 7, Cellini; 3, 8 and 9, Old Nonpareil; 10, Catshead.—*O. A. C.* 1, Dumelow's Seedling; 2, Warner's King; 3, Fearn's Pippin; 4, Kerry Pippin; 5, Cox's Orange Pippin; 6, Blenheim Pippin.—*G. O. S.* Cornish Gilliflower.—*G. A. S. L.* Very carelessly packed. Many of the numbers were detached. We only undertake to name six at one time. 1, Winter Hawthornden; 2, New Hawthornden; 3, Blenheim Pippin; 4, Ashmead's Kernel; 5, Ribston Pippin; 6, King of the Pippins. The remaining fruits will be named in the next issue.—*Edward Tate.* 1, Hanwell Souring; 2, Golden Noble; 3, Grange's Pearmain.—*Upton.* 1, Spice Apple; 2, Cockle Pippin; 3, Beauty of Kent; 4, Old Nonesuch; 5, Scarlet Nonpareil.—*J. D. S.* 1, Court of Wick; 2, Nancy Jackson; 3, Minchull Crab; 4, Mère de Ménage; 5, Lord Derby; 6, Tom Putt.—*T. Murray.* Grapes smashed.—*T. Earl.* 1, Brabant Bellefleur; 2, Bramley's Seedling; 3, Annie Elizabeth.—*H. A. B.* Hornead Pearmain.—*A. Roe.* Hawthornden.—*W. H. C.* British Queen.—*C. W. T.* 1, Welford Park Nonesuch; 2, King of the Pippins; 3, English Codlin. The Grapes should have been packed separately.—*West End.* 1, Newton Wonder; 2, Hubbard's Pearmain; 3, King of the Pippins; 4 and 5, Dumelow's Seedling; 6, Colonel Vaughan.—*R. M.* 1, Beurré Capiaumont; 2, Autumn Bergamot; 3, not recognised.—*E. T.* 1, Tower of Glamis; 2, Alfriston; 3, New Hawthornden; 4, Yorkshire Beauty, syn. Red Hawthornden; 5, Dean's Codlin; 6, Prince Albert.—*Wool.* 1, Welford Park Nonesuch; 2, Belle de Boskoop; 3, Annie Elizabeth; 4, Alfriston; 5, Baumann's Reinette; 6, Durondeau; 7, Blenheim Pippin.—*A. J. Wilson.* 1, Cox's Pomona; 2, Gooseberry Apple; 3, Warner's King; 4, Beauty of Kent; 5, Mannington's Pearmain; 6, so very small, we do not recognise it.—*A. Goatcher.* 1, a very good flavour, we do not recognise the fruit; 2, Scarlet Nonpareil; 3, Minchull Crab; 4, Sam Young; 5, Reinette Van Mons.—*Ernestii.* 1, Gooseberry Pippin; 2, Brabant Bellefleur; 3, Beurré Clairgeau.

NAMES OF PLANTS: *A. J., Forest Gate.* *Quercus* *Ilex* (Evergreen Oak).—*F. Street.* 1, *Vitis heterophylla*; 2, *Rosa carolina*; 3, *Juniperus rigida*.—*R. M.* 4, *Ruscus racemosus*.—*G. A. S.* *Chlorophytum elatum variegatum*, long, narrow leaf; *Maranta Makoyana*, with coloured foliage; *Begonia manicata*; *Colocasia antiquorum*, largest leaf. The specimens were without numbers or other means of identification.—*H. G. K.* 1, *Eupatorium Weinmannianum*; 2, *Nerine undulata*.—*W. H. C.* *Bryophyllum calycinum*, the ovate leaf; and *Schinus molle* (Pepper tree).—*R. T.* 1, *Gymnogramme tartarea*; 2, *Pteris hastata*; 3, *Lastrea decurrens*; 4, *Lomaria alpina*; 5, *Polypodium*

pectinatum.—*H. R.* 1. *Oncidium bicallosum*; 2, *Octomeria diaphana*; 3, *Pleurothallis Scapha*; 4, *Bulbophyllum Careyannum*.—*A. S.* *Ruscus racemosus*.—*Hugh L. Ronburgh.* *Loiseleuria rotundifolia*; 2, *Hypericum* (? *H. urale*).—*H. B. H.* 1, *Rhus Cotinus* (Venetian Sumach); 2, *Hippophae rhamnoides* (Sea Buckthorn); 3, *Abies (Picea) pectinata* (Silver Fir); 4, *Crataegus Pyracantha* (Evergreen Firethorn).—*J. L. Shrewsbury.* *Pyrus Aria* var.—*G. H. P.* *Populus alba* (Abele or White Poplar).—*R. A. B.* *Berberis vulgaris*.

PEARS DECAYING: *L. C.* There is no disease present. Certain trees nearly always produce fruits which decay rapidly.

PLANTS FOR AN HERBACEOUS BORDER FACING NORTH: *Gardener.* As your border is in the immediate vicinity of Elm trees, which are very exhaustive of the soil and as it faces north, it would be well to grow such plants as require but little watering and manure, both of which will induce the roots of the Elm trees to penetrate the soil of the border. Taking them in alphabetical order varieties of the following genera should do well:—*Acanthus*, *Achillea*, *Aconitum*, *Alyssum*, *Anchusa*, *Anemone japonica*, *Anthericum*, *Arabis*, *Asters* (perennial), *Asilbe*, *Bocconia*, *Campanula*, *Chrysanthemum* (*C. maximum*), *Coreopsis* (*C. cordifolia*), *Delphinium*, *Dicentra*, *Digitalis*, *Echinops*, *Erigeron*, *Eulalia*, *Funkia*, *Galega*, *Geum*, *Gypsophila*, *Helenium*, *Helianthus*, *Hepatica*, *Heuchera*, *Hollyhocks*, *Hypericum*, *Iberis*, *Inula*, *Iris*, *Kniphofia*, *Lathyrus*, *Lily of the Valley* (*Convallaria*), *Lobelia* (*L. cardinalis*), *Lupinus*, *Montbretia*, *Monarda*, *Oenothera*, *Pæonia*, *Papaver*, *Pentstemon*, *Phlox* (*P. decussata*), *Physalis*, *Polyanthus*, *Polygonum*, *Potentilla*, *Primula*, *Pyrethrum*, *Rodgersia*, *Rudbeckia*, *Scabiosa*, *Saxifraga*, *Sedum*, *Senecio*, *Solidago*, *Spiræa*, *Statice*, *Tamarix*, *Telekia*, *Thalictrum*, *Tropæolum* (*T. speciosum*), *Verbascum*, *Veronica*, and *Viola*. There are, in addition, annuals and biennials, such as *Wallflowers*, *Primroses*, *Myosotis*, and *Sweet Williams*, also *Carnations*. Bulbous or tuberous-rooted plants offer a further choice, and include *Cyclamen hederaefolium*, *Colchicum*, *Lilium auratum*, *Gladioli*, *Early*, *Cottage*, and *Darwin Tulips*, and *Narcissi*. Many of those enumerated are lime-loving plants; a light mulch will be beneficial, and this should be pricked into the border lightly. If the Elm roots become too troublesome, it will be advisable to dig a deep trench and sever them. Afterwards, for a few years, they will not cause much trouble. The Elm is often a surface-rooting tree.

POTATOS DISEASED: *C. G. A.* The disease attacking your Potatos is known as Winter Rot, induced generally by storing the tubers before they are dry.

PREPARING MEADOWLAND FOR APPLES: *A Constant Reader.* The variety of Apples recommended to *Fruits* will be suitable. With respect to preparing meadowland for planting, this should have been done months ago, say, directly after hay-making. Then the land should have been steam-cultivated or ploughed, worked about to kill the grass, and afterwards given a final ploughing. If you deal with it now for planting this season, you must turn the turf in; a subsoil plough should follow in the track of the ordinary plough. But the grass will come up in the seams between the furrows, and sods will be dug up and littered about in the planting. The land could be bastard-trenched, the turf being placed grass downwards just below the top spit; but the operation is costly. By far the best plan will be to plough the land with an ordinary plough a skim coulter being used to get the grass turned in well, leaving it alone afterwards till the spring, when it can be worked about to kill any live grass. Then it can be well manured and ploughed for Potatos, which would probably be a remunerative crop on fresh land. A second early variety, such as *British Queen*, should be planted, so that the produce will come off the land in August. Then you can have the field steam-cultivated up and down and across, the depth being increased to 18 inches, or more, if possible, in the crossing operation. There would be time afterwards for harrowing the land several times to kill

any weeds, and it should then be in an excellent condition for fruit, without further manuring.

RECORD PEARS: *Danum.* Your fruit of Uvedale's St. Germain weighing 2 lbs. 4 ounces is not a record. In our "Record" book is an entry of a fruit of this variety weighing 3 lbs. 8 ounces, grown by Mr. T. Arnold, Brookside, Headington, Oxford, particulars of which may be found in *Gardeners' Chronicle*, December 2, 1893. Another fruit of Uvedale's St. Germain, weighing 3 lbs. 5 ounces, was described in a note on "Horticulture in Australia," published in *Gardeners' Chronicle*, November 16, 1861, p. 1006, and was one of six fruits of Uvedale's St. Germain variety, of the aggregate weight of 15 lbs. 11 ounces. They were grown by Mr. John Walker, Wattle Hill, Pitt Water, Tasmania.

ROSE FOR NAMING: *B. H. M.* We cannot undertake to name varieties of Roses, or any florists' flowers. It would be best for you to send specimens to a Rose nursery, but be sure to send a better specimen than was sent to us.

ROSES FOR EXHIBITION: *R. L., Aberdare.* The best twelve tea-scented Roses for exhibition purposes are:—White Maman Cochet, Mme. Jules Gravereaux, Mrs. Edward Mawley, Maman Cochet, Souvenir de Pierre Notting, Medea, Muriel Grahame, Molly Sharman Crawford, Comtesse de Nadaillac, The Bride, Mme. Constant Soupert, and Catherine Mermet. The best twelve H.T. Roses for exhibition are: Bessie Brown, Mildred Grant, Dean Hole, Caroline Testout, J. B. Clark, Florence Pemberton, Mrs. W. J. Grant, Lady Ashtown, Mme. Theodore Roosevelt, Wm. Shean, Kaiserin Augusta Victoria and Lyons Rose.

SUBURBAN GARDEN: *Small Plot.* Dig the plot to be grassed 9 or 10 inches deep, breaking the ground fine and picking out all weeds and roots in the process of digging. Afterwards fork into it a good dressing of short manure. Make the surface fairly level, and then plant the circumscribed space with varieties of Daffodils (*Narcissus*), Tulips, Crocuses, Snowdrops, Scillas, and Chionodoxas. Make the holes with a setting stick, about 6 inches apart and the same depth, large enough at the base to admit of the bulbs of Daffodils and Tulips resting on the bottom of each hole, the other bulbs mentioned, being so much smaller, will easily reach the base of the individual holes. When the planting is completed, close in the soil over the bulbs, tread it over, and rake the surface level. This done, sow a good mixture of lawn grass seed evenly over the prepared space as soon as the ground is ready, covering the seed with sifted garden soil to the depth of about half-an-inch, and roll it, to compress seed and soil, as well as to produce an even, firm surface. If the seeds do not come up satisfactorily, a fresh sowing can be made towards the end of February next. The borders marked C and A on your sketch plan should be dug to the depth of 15 inches, the bottom being broken up with a digging fork, and all weeds and roots removed in the process of digging. Afterwards fork a good barrowful of short manure into each border, and then plant, in holes 10 to 12 inches deep and 6 inches apart, the bulbs indicated above and in the manner already described. Thus planted, the expense and labour incurred in taking up and replanting the bulbs annually are obviated, and the bulbs so planted will, we know, by the experience of millions of bulbs thus planted, flower quite as early and well as those which have been planted only a few inches below the surface of the soil. A sprinkling of short manure can be forked, not too deeply, into the borders before putting the summer bedding plants therein, without in any way interfering with the bulbs underneath. In borders C. C., we should advise you to put one plant of each of the following hardy perennials: *Aster* (Michaelmas Daisy) *ericoides*, *A. Esme*, *A. horizontalis*, *A. Royalty*, *A. Amellus*, *Achillea Ptarmica* (double-flowered variety), *Coreopsis grandiflora*, *Phlox Beauty of Warwick*, *P. Etna*, *P. sylphide*, and *P. Ostark*; *Lychnis chalcedonica*, *Galega officinalis*, *Delphiniums* in variety, *Pæonia sinensis*, *Dactylis glomerata* elegantissima, and *Scabiosa caucasica*. The

above-mentioned plants attain to a height of 2 to 2½ feet, and should, therefore, be planted along the back of the borders. The following plants, being much dwarfer, should be planted irregularly along the middle and near the edge of the border, namely, *Aster* *Gorgeous* and *A. nanus*, *Aquilegia cœrulea*, *A. chrysantha*, and *A. californica*, *Megasea cordifolia*, *Trollius* "Fire Globe" and *T. napellifolius*, irregular clumps of *Aubrietia grandiflora*, *A. detoidea* *Bouganvillei*, *A. Purple Robe*, *Arabis albida*, *A. plena*, *A. lucida* *variegata*, *Hepatica angulosa*, *H. triloba*, *H. alba*, *H. rubra plena*, *Pink Mrs. Sinkins*, *Saxifraga umbrosa* (London Pride), *Anemone fulgens* and *A. apennina*, with an edging of *Gentiana acaulis*. These will provide a fine floral display. We suspect your *Nasturtiums* were sown too late, and, perhaps, in the shade of some building; otherwise they should have flowered profusely during the long, tropical-like summer. *Ligustrum ovalifolium* or the Golden Privet would be better than either Ivy or *Ampelopsis Veitchii* to cover your low fences.

SWEET PEAS FOR EXHIBITION: *B. L.* The best 12 varieties of Sweet Peas for exhibition are: *Etta Dyke* (white), *Clara Curtis* (cream), *Edrom Beauty* (orange-pink), *Sunproof Crimson*, *Nubian* (maroon), *Mrs. Routzahn* (cream-pink), *Elfrida Pearson* (blush), *Asta Ohn* (lavender), *Mrs. Cuthbertson* (bicolor), *Thomas Stevenson* (orange-scarlet), *Elsie Herbert* (white picotee edged) and *Queen of Norway* (mauve).

TREATMENT OF NELUMBIUMS IN WINTER: *Subscriber in Norway.* During the winter, the resting period of these plants, it is advisable to keep the root stocks of *N. speciosum* roseum in a temperature of 55° to 60° Fahr. (8° to 12° Réaumur). Possibly 8° to 10° R. was not the lowest temperature the plants experienced during a severe frost, which would account for their loss. The root-stocks must on no account be allowed to become dry. The tubs should be removed into a house where the temperature does not fall below 55° Fahr. or 11° R., and there should be sufficient water in them to cover the mud in which the *Nelumbiums* are placed to a depth of about 2 inches or 5 centimetres. In the spring, before the plants start into growth, take the root-stocks out of the mud, and carefully re-arrange them in fresh soil and water. If treated as described there should be no difficulty in keeping them healthy through the winter.

VIOLET LEAVES: *C. C.* The plants are injured by a fungus, (*Cercospora violæ*). Remove the diseased leaves, and afford the plants plenty of ventilation. Spraying with liver of sulphur at a strength of 1 ounce in four gallons of water will help to arrest the disease.

WINTER TREATMENT OF VERBENA MISS WILLMOTT: *J. W.* The treatment you have afforded the plants has been unsuitable. Cuttings should not be taken from the open border and subjected to a temperature of 60° to 65° Fahr. in a close frame provided with bottom heat. On the other hand, the "closed, cold frame" was possibly too cold. September, again, is rather too late for inserting the cuttings unless it be the earlier part of the month. They would strike better in sandy soil during August in a cold frame that is kept close during the greater part of the day, but the first thing every morning the lights should be removed for about one hour, then afterwards lightly damping down and closing the frame. Old plants are not satisfactory when lifted. The better plan is to keep a few specimens in pots all through the summer; these will often survive the winter when others fail. This *Verbena* may be kept through the winter if treated in a similar manner to bedding *Calceolarias* in cold frames. It would be a good plan to adopt this treatment another season.

SOME ENGLISH GARDENS.

THE taste for natural or "wild" gardens is increasing so rapidly in Britain that it becomes more and more difficult every day to keep abreast of each new development.

For many years—ever since 1885, in fact—I have made a practice of travelling over France, Italy, Germany, Austria, and England in order to visit the best gardens; and I think I may lay claim to a fair knowledge of most of the Alpine and natural gardens of Europe. Yet the question constantly occurs to my mind, "What constitutes a garden; of what should it consist?"

I think that the desire is inborn in all men to plant a piece of ground, and to rest there, surrounded by that peace which flowers bring. The perfect garden is not to be found at Versailles; it is not in the parterres of the Italian renaissance; its secret lies more in the natural grouping of flowers, so that the growth of plants appears to be free and unrestrained. The author of *Præterita* saw the highest beauty in Alpine landscapes, in wild gardens, in flowers hanging freely from natural

rocks; and I believe that the greatest joy, the purest happiness, are to be found in making for oneself gardens such as these.

It is in this, then, that I find the answer to my question as to the nature of a perfect garden; in the planting of trees and shrubs, herbaceous and water plants, rocks and alpine flowers, in wild profusion.

In May last, I made a tour through England and Ireland, visiting gardens which were new to me. My impressions of some have been published already in these pages (see *Gardeners' Chronicle*, 1910). Of certain of the others, I propose to write now.

Eighteen years ago I had the pleasure of visiting Gravetye Manor, with the late Mr. G. F. Wilson and Mr. Burbidge, of Dublin. I re-visited it during the present year, and was much pleased at the progress made in the gardens, particularly in natural scenery. I was sorry to see that the meadow of *Gentiana acaulis*, which I saw in 1893, had vanished: Mr. Robinson seems to have discontinued the cultivation of this plant among the grass. However, he showed us a splendid border of it in the kitchen garden, facing a bed of well-flowered *Pulsatillas*. The *Gentians* are of the type *Gentianella*, the old "acaulis." According to Paxton, this has been raised in English gardens ever since the sixteenth century. It differs in habit from the three *Gentianas acaulis* of the Alps (*G. Clusii*, *G. angustifolia*, and *G. Kochiana*) but seems to be most nearly allied to *G. angustifolia*. The only border of *Gentianella* which I consider surpasses that of Gravetye, is one that I saw at Wisley, two years ago. Here, I counted on one plant over sixty flowers!

The ancient garden surrounding the old manor is a most delightful place. The walls are covered with rock plants, such as *Erinus alpinus*, *E. hirsutus*, *Corydalis lutea*, *Arenaria balearica*, *Arabis*, *Drabas*, and *Aubrietias*, and all kinds of dwarf plants adorn the edges of the paths. A brilliant collection of *Magnolias* was in its glory at the time of my visit, and I was filled with admiration at the number of beautiful shrubs, trees, and flowers of all kinds, which were grouped in a highly artistic manner beyond the house garden. I was particularly struck, however, by the scenery—the most exquisite that I ever remember to have seen in a garden of this kind. Imagine a fine landscape of Scotch Pines, the brilliant sunshine illuminating the red bark and dark-green foliage; and, in contrast, lying at the base of the trees, groups of golden yellow bushes of *Gorse* and *Broom*. To the right of the picture a natural slope of wild *Heather* rises from the foreground; while to the left the eye is attracted by clumps of *Erica mediterranea*, *E. arborea*, *E. lusitanica*, and *E. australis*, in full flower; the whole a marvellous piece of Mediterranean scenery, let, like a vignette, into a frame of green *Sussex* uplands!

Mr. Robinson gave us some valuable hints on the *E. australis*, which, he stated, he obtained several years ago, but could now never get true to name,

the *E. mediterranea* being always sent instead. The *E. australis* is the pearl and gem of heaths—nothing can be more charming and picturesque. Here, at *Floraire*, I am unable to grow heaths on account of the chalk in the soil; the only two exceptions being *E. carnea*, and the beautiful Corsican variety *E. stricta*. I was, therefore, all the more delighted at the feast of colour presented by the group I have described above, and particularly by *E. australis*. This I found again two days later in the garden of Sir Frederick Mirrielees, near Dorking; but these two places, and Newry, are the only ones where I have seen it.

There is at Redhill a very curious little garden, of the old English type. It is essentially a spring garden. It is described in one of Miss Jekyll's books, where, indeed, I first saw it illustrated. Mr. Arthur Trower, the owner has also published an extremely interesting and original book on the subject of his garden*. It is a marvellous scheme of colour and form, comprising the happiest possible combination of all the spring flowers. Daffodils, Tulips, *Muscari*, Primroses, and *Polyanthus* are all in profusion, filling the air with their mingled scents. Ancient walls, and small groups of picturesque ruins, covered with Ivy and climbing plants, add greatly to the general charm, the whole making a picture of wonderful beauty and grandeur.

In the springtime, visitors come from far and wide to see the garden; and it speaks well for their appreciation and self-control that not a flower is plucked, nor a single plant disturbed.

Not far from Gravetye there is a fine Elizabethan residence, possessing one of the most beautiful natural parks that I have seen. It lies in a valley, surrounded by wooded and rocky hills. In the month of May it is a keen pleasure to roam through these fields, which extend for four miles, and are a mass of *Scilla nutans*—the favourite "Bluebells"—the colour irresistibly suggesting that of the Mediterranean Sea. The park is the property of a flower-loving friend of mine; and he showed me, with pardonable pride, a specimen of the very rare, filmy *Fern Hymenophyllum tunbridgense*, growing wild in a corner of the rocks. I had never seen this *Fern* before; but certainly the conditions were ideal, the climate being mild and equable, and the soil, thanks to the care and attention of the owner, all that could be desired. I saw also the finest specimen of *Cupressus macrocarpa* grown in England; and the best plant of the rare *Adenocarpus anagrus* which I remember to have seen. This latter is a magnificent *Broom*, a native of the Canary Islands, and should be planted in every garden in the south of England. In the rock-garden proper, I found a collection of *Androsaces*, terrestrial Orchids, and *Saxifrages*, and also large clumps of *Linnæa borealis*, flowering quite freely—not a common sight in this climate.

* *Our Homestead and Its Old-World Garden*, by Arthur Trower.

The little old garden, which belonged to the late Miss Ewart, near Dorking, is well known to every garden-lover. The gardener there is a very clever man, and takes a great interest in the plants, of which he is quite as fond as Miss Ewart was herself. He has made his small territory almost a miniature "Botanic Garden." The form is very original, having been fashioned after the taste of its rather eccentric owner; but this makes it all the more interesting.

Not far from Dorking lies the residence of Sir Frederick Mirrieles, to which I have already referred in connection with *Erica australis*. The estate lies in the best possible position for the creation of a garden, covering a large area facing south-west, in the heart of the rich Surrey hills. I arrived there one evening, accompanied by Sir Frederick; and I was particularly struck by the exquisite view from the terrace of the house. The sun was setting, and the last warm rays were falling on the varied landscape, deepening and intensifying all the colours, and blending them subtly and harmoniously. Birds preparing for the night sang their last song of praise and joy; myriads of flowers gave forth an intoxicating scent; the very curious dwelling, beautified by climbing plants, and guarded by tall Scotch Firs, the red light streaming down upon their stately stems, and through the dark green of their foliage, all gave an impression of peace and beauty which will long remain with me.

There is here a fine and artistic rock-garden, built by Mr. Potter. It is extremely natural, and in the best possible taste. The stones of which it is composed are local, and were brought from the woods close by, thus perfectly preserving the harmony of the landscape. I was fortunate in finding there the most beautiful specimen of *Lithospermum prostratum* I have ever seen, covering a space of over 10 square feet. The ground is somewhat poor, peaty sand chiefly; very suitable for Alpine plants, if for no others. There were some good patches of true *Saxifraga lingulata*, *Morisia hypogæa*, *Linnaea borealis*, and species of *Androsace*. The plants are arranged in much the same way as at Friar Park, and this rock-garden bids fair to become one of the finest in England.

When I first heard of the "Six Hills Nursery" of Mr. Clarence Elliott, I imagined it lying at the base of half-a-dozen high mountains. Readers will therefore judge of my surprise and amusement when I saw the six little molehills which give the nursery its name—tiny hummocks, of unknown use, but said by antiquarians to be of Danish origin. However, this slight disappointment did not in any way affect my pleasure in visiting the man who had the intrepidity to go all the way to the Antipodes to fetch *Oxalis enneaphylla*. (By the way, I hope he did not destroy the species, but left sufficient of the plant to survive his visit.) My reason for going to Stevenage was to learn the culture of this plant, which has not hitherto done very well with me; and I found that Mr. Elliott is in the habit of treating it under very varied conditions. Sometimes he treats it as a wall plant, and grows it between two rocks; sometimes he raises it in a frame; and sometimes he calls it a perennial, and plants it in the kitchen garden! As it seems to grow equally well in all these widely-different positions, I am afraid I am not much the wiser. I was particularly interested in the means adopted there of increasing the rarest Alpine plants and by the good results which Mr. Elliott obtains with the more delicate of them. Henry Corrévon, *Floraire, near Geneva*.

(To be concluded.)

FIG. 142.—*SENECIO HERITIERI* IN MESSRS. SUTTON AND SONS' COLLECTION.

NEW OR NOTEWORTHY PLANTS.

SENECIO HERITIERI.

IN the first volume of the *Botanical Magazine*, published in 1793, there is a figure of *Cineraria lanata* "lately introduced from Africa." It is really *Senecio Heritieri*, of De Candolle, a native of Teneriffe, where it grows at an elevation of 6,000 feet. So far as I know, this plant had long been lost to cultivation until quite recently, when Messrs. Sutton & Sons re-introduced it from Teneriffe and exhibited it at the Temple Show in 1910. Figure 142 was prepared from a specimen supplied by Messrs. Sutton. It will be seen that this plant is quite distinct from what is now generally grown as *S. Heritieri*, which is probably a hybrid, and is characterized by a tall, shrubby habit, zigzag stems, and large, loose panicles of flower-heads, generally terminal, whereas the true *S. Heritieri* rarely exceeds a foot in height, has straight stems, and solitary flower-heads, as shown in the figure. There are other differences, such as in the lobing of the leaves and the form and arrangement of the ray florets. Messrs. Sutton have crossed this plant with garden *Cinerarias*, the result being a race of dwarf, elegant habit with large flowers of various colours. For these I suggest the name of Alpine *Cinerarias*, to distinguish them from the large-flowered and stellata races. To my taste, the pure, unadulterated *S. Heritieri* is particularly pleasing, and it is to be hoped that it will not be allowed to slip out of cultivation again. There is the possibility of its proving hardy in this country, an elevation of 6,000 feet on the Teneriffe mountain being in the snow region.

The spurious *S. Heritieri* now requires to be renamed. I am inclined to believe that it is a hybrid between *S. populifolius* and *S. Heritieri*, but how it originated is "wropped in mystery." We know that the true *S. Heritieri* was cultivated in the Jardin des Plantes in 1815. We also know that in the early half of last century gardeners crossed various species of what were then known as *Cinerarias*. My first acquaintance with this hybrid was in 1889, when Mr. Moore, of Glasnevin sent it to Kew as *Cineraria aurita*, and it has been grown here ever since as a winter-flowering plant for the conservatory, its good nature under ordinary treatment and its decorative qualities being unsurpassed by those of any other garden *Cineraria*. There are two good hybrids from it, one raised at Glasnevin and named *S. Moorei*, the other at Kew and named *Lady Thistleton-Dyer*. Seeing that this plant is most probably of garden origin, an appropriate name for it is *S. hortensis*.

To summarise matters, we have (1) *Senecio Heritieri*, from Teneriffe, represented in fig. 142; (2) *S. hortensis*, hitherto known as *Cineraria aurita* or *S. Heritieri*, a tall perennial with zigzag stems and large paniculate heads of flowers. W. W.

ORCHID NOTES AND GLEANINGS.

CYPRIPEDIUM PURPURATUM "TRACY'S" VARIETY.

THIS remarkable variety which is now flowering in Mr. Tracy's nursery, Twickenham, gives an example of the distinct characters which are occasionally to be found in species, the bulk of which are true to the common type. *C. purpuratum* is always distinct and pretty, but no material variation in it was recorded until the variety referred to was shown by the late Mr. H. A. Tracy at the meeting of the Royal Horticultural Society on September 26, 1905, when it was given an Award of Merit by the Orchid Committee. The foliage, as well as the flowers, are very distinct, the leaves being for the greater part silvery-white with a veining and blotching

of deep green. The flowers are larger than those of the type, the fine white dorsal sepal being tinged with rose at the base, and marked with purple lines; the petals are broad and flat tinged with rose, and the lip coloured rose-purple. A good selection of hybrid *Cypripediums* are also in bloom in this nursery, including some handsome forms of *C. Euryades*, *C. Leeannum*, and other hybrids of *C. insigne*.

EPIDENDRUM VITELLINUM AUTUMNALE.

THIS is one of the showiest cool-house Orchids of the season, its strong, frequently branched spikes of orange-scarlet flowers giving a fine dis-

IVY-LEAVED PELARGONIUMS IN JERSEY.

THE beautiful Ivy-leaved Pelargonium withstands a considerable amount of cold, but does not survive our English winters. In Jersey, however, the plant grows in the open the whole of the year round, and in fig. 143 is reproduced a photograph, kindly sent by Mr. Isaac Malzard, showing plants of the variety *Souvenir de Charles Turner* growing on a wall in his garden at L'Abri, Beaumont. Mr. Malzard informs us that the wall is 13 feet high, and a space of 40 feet is completely covered with the plants, of which there are five. They were raised from cut-

FIG. 143.—IVY-LEAVED PELARGONIUM SOUVENIR DE CHAS. TURNER IN A JERSEY GARDEN.

play throughout October and November. Plants are now in flower in the Orchid nursery of Messrs. Charlesworth & Co., Haywards Heath. The original form, discovered by Dr. Coulter on the high ranges near Xalapa in Mexico, had comparatively small flowers, and the summer-flowering variety, *Majus*, for which Messrs. Rollisson, of Tooting, received a First-class Certificate at the Royal Horticultural Society's meeting on June 15, 1869, has been the one most commonly seen in gardens. The autumn-flowering variety, however, is by far the finest, and produces its flowers at a time when they are the more desirable. It is also the freest in growth.

tings inserted two years ago last spring, and the extraordinary growth they have made may be seen from the illustration. The blossoms were produced this summer in such profusion as to completely cover the plants. The garden being near to the seaside doubtless accounts, to some extent, for the wonderful growth and flowering, as the sea air is very beneficial to all members of the Pelargonium family. Ivy-leaved Pelargoniums grow equally well in the south of France, including districts of the Riviera, where specimens 10 feet high are common, whilst in Ventnor, Isle of Wight, they may frequently be seen covering the fronts of houses to the eaves.

NURSERY NOTES.

MESSRS. JAMES VEITCH & SONS, LTD.,
CHELSEA.

NOTWITHSTANDING the establishment at Feltham, Messrs. Veitch still cultivate certain classes of plants at Chelsea. On the occasion of a recent visit to the latter nursery, the *Nepenthes* were in splendid condition, the pitchers being large, finely developed, and beautifully marked. Most of the plants are grown in baskets suspended over a large tank; indeed, with the exception of the path and a narrow front staging, the area of this tank is equal to that of the house. Among the most noteworthy *Nepenthes* was the hybrid Sir W. T. Thiselton-Dyer (*N. mixta* × *N. Dicksoniana*), a plant remarkable for its very large pitchers, which are richly blotched with brownish-red on a green ground, the rim being extensively developed, deeply ribbed, and of a pronounced bronzy hue when mature. It was raised at Chelsea, and when exhibited at the R.H.S., on August 14, 1900, it gained a First-class Certificate. *N. mixta*, itself a hybrid from *N. Northiana* and *N. Curtisii*, has also a very striking pitcher of a pale green blotched with red and marked towards the mouth with deep crimson. There is a distinct form known as *N. mixta sanguinea*, whose pitchers are more of a reddish-brown tint. Others deserving of mention are *N. Burkei*, *N. Chelsonii excellens*, *N. Mastersiana*, *N. Morganiana*, *N. Rafflesiana*, *N. Tiveyi*, and *N. ventricosa*, remarkable for its curiously-contracted pitchers.

A large house of *Camellias* serves to indicate the demand that still exists for these beautiful greenhouse-flowering shrubs. It is true that the large specimens of former days are not to be seen, but in their place there are healthy young bushes from 2 to 3 feet in height well furnished with flower-buds. Indian *Rhododendrons* seem to thrive excellently at Chelsea, where many plants are grown as standards with stems 3 feet high.

At whatever season a visit is paid to Chelsea, one is sure to meet with some of the javanico-jasminiflorum hybrids of *Rhododendron* in bloom. At the time of my visit the following varieties were among the more noticeable: *Apollo* (orange-scarlet), *Creon* (clear yellow), *Diadem* (orange-scarlet with a carmine suffusion), *Hercules* (fawn yellow, tinged pink), *Jasminiflorum carminatum* (rich carmine), *Maiden's Blush* (white, suffused with pink), *Ne Plus Ultra* (crimson-scarlet), and *The Queen* (creamy-white). Of the small-growing hybrids from *R. multicolor*, the pure-white *Mrs. Heal* and the deep-red *Ruby* were conspicuous.

A whole house is devoted to the culture of *Begonias* possessing ornamental foliage. The extreme variability in the markings of the leaves and the beautiful colours represented in them should commend these *Begonias* to all those who practise indoor gardening, especially as they are of easy propagation and culture and quickly attain an effective size. Those hybrids from *B. Bowringiana*—*His Majesty*, *Mrs. H. G. Moon* and *The Queen*—are conspicuous for their rich colours.

Among those popular greenhouse plants, the indoor *Heaths*, beside *Erica gracilis* and its white variety, which are so universally seen at this season, two other brightly-coloured varieties were very attractive. One, *Erica verticillata*, is a somewhat upright-growing species. The flowers are borne in whorls on the upper parts of the principal shoots, are about half-an-inch long, and of semi-transparent bright crimson tint. The other, *E. cerinthoides*, forms a free bushy specimen, the shoots being furnished with deep green hairy leaves. In this species the flowers are borne a dozen or so together in a terminal head. They are tubular in shape, about an inch long,

crimson-scarlet in colour, and somewhat sticky on the exterior.

Ferns, Palms, *Codiaeums*, *Cordylines* and other popular foliage plants are represented by plants of all sizes. A noteworthy feature is the influence that this tropical summer has had on the *Codiaeums*, as the leaves have acquired a brilliancy of colouring unusual even with them.

Other subjects well worthy of note include single and double forms of *Hibiscus rosa-sinensis*, *Cannas* in variety; *Crowea saligna*, quite a mass of charming pink blossom; *Gloriosas*; *Allamandas*; *Æschynanthus Lobbianus*, one of the most useful members of the genus; *Amasonia punicea*; *Mussaenda frondosa*; and *Myrtle Jeannie Reitenbach*, remarkable for its small leaves, neat, compact habit, and above all for its great profusion of bloom, for the fact that quite small plants flower freely. *W. T.*

TREES AND SHRUBS.

THE BAMBOO GARDEN.

HARDY Bamboos are at their best during October and the three or four following months. During this time they are then full of vigour, with handsome, deep-green foliage, which contrasts favourably with that of various evergreens in the vicinity. Were this condition to last, there would be every excuse for placing Bamboos in the most prominent parts of the garden; but, unfortunately, from the beginning of March to the middle of July they are, as a rule, unsightly, by reason of the dead and dying foliage, a condition which is hastened by the cold winds of spring. Therefore, it is advisable to keep Bamboos away from trees and shrubs which are at their best in springtime, and the most suitable position for them is one which is shut away, to some extent, from the rest of the garden. An ideal place is a sheltered valley, with a stream running through it, for shelter from cold winds is of vital importance to the well-being of most Bamboos, whilst they are water-loving subjects, and provision must be made for an adequate water supply, in the event of an extended period of drought being experienced. Providing that rich soil is available, it matters little whether it is heavy or light, for excellent specimens may be seen growing in both kinds. Rich, light soil is advantageous for the kinds that sucker freely, for, in such ground, they spread quickly and form very picturesque groups.

Great assistance may be given to Bamboos during late spring by cutting away many of the older branches, taking care to remove them right to the base, and not leaving a few inches of stump. This gives plenty of room for the development of young culms, and, as young leaves appear, the plants become presentable at an earlier date than would be the case if the old branches were left undisturbed. The application of a surface dressing of manure in May is attended with good results, for, in addition to supplying the surface roots with food, it helps to keep the ground beneath moist and cool.

No better time can be found for the transplanting of Bamboos than May, for at that time young shoots are being formed, and the roots are at their most active stage, consequently, injuries are soon made good. Plants removed in the dead of winter, on the other hand, take a long while to re-establish themselves, and transplanting at that period is sometimes attended by fatal results. Propagation is usually affected by division of the clumps in May, but whenever seeds can be obtained they should be sown, for seedling plants may be expected to have a useful life of 30 or 40 years before them, whilst plants obtained by division may flower and die at any time.

Fewer hardy roots of Bamboo are available than was the case ten years ago, for, in the period which has elapsed since the early days of

the present century, several kinds have flowered, and some appear to have been lost altogether, for, although flowers are borne with the greatest freedom, seeds in a few instances only have been developed in quantity. Of some sorts, good stocks of seedling plants exist, but it is probable that other kinds may have to be reintroduced from Japan or China.

At the present time some of the more noteworthy species are *Phyllostachys fastuosa*, a handsome plant from Japan, with strong, upright branches, ascending to a height of 18 or 20 feet, clothed with large, dark green leaves; *P. viridiglaucescens*, one of the oldest and hardiest kinds, with graceful, semi-pendant branches, and small, light green foliage; *P. flexuosa*, another Japanese species, of peculiarly graceful outline; *P. aurea*, of stiffer habit than the last-named; and *P. Quiloi*. *P. nigra* and its various varieties are very attractive Bamboos, but, unfortunately, they flowered a few years ago, and few seedlings appear to have been obtained.

Amongst the *Arundinarias*, *A. nitida*, a species from Central China, is one of the daintiest of all Bamboos. Its small, bright green leaves are borne on graceful, arching branches, 8 feet or more long. *A. anceps* is another free-growing, attractive plant, peculiarly adapted for loose ground, where it can have plenty of room to sucker freely and spread over a considerable area. *A. Simonii* grows to a height of 16 or 18 feet, and forms striking-looking clumps. It flowered a few years ago, but, fortunately, a good crop of seeds was procured, from which nice young plants have been obtained. *A. Hindsii* var. *graminea* is another tall-growing Bamboo, of handsome appearance. *A. Kumasasa*, better known as *Bambusa palmata*, is easily distinguished by means of its large leaves, which are frequently 8 or 9 inches long, and upwards of 2 inches wide. It grows very rapidly, and requires a great deal of space for its proper development. It may, however, be kept within bounds by removing the suckers occasionally.

Apart from the taller-growing sorts, there are several smaller-growing kinds which are well worth attention. Of these, *A. auricoma*, *A. Fortunei*, *A. humilis*, *A. pumila*, and *A. pygmaea* all deserve attention.

In Cornwall and other places with a similar climate some of the more tender species, such as *Arundinaria falcata* and *A. Falconeri*, may be grown. Formerly, very imposing clumps of these species were to be seen, but they flowered a few years ago, and the majority of the plants seen now-a-days are small. *D.*

PLANT NOTE.

TORENIA ATROPURPUREA (RIDL.)

THIS species (figured in *Bot. Mag.*, 8388, and referred to in *Gard. Chron.*, September 2, p. 171) differs from *T. asiatica* in that it is a creeping plant, while *T. asiatica* is a short-lived, erect herb, and practically annual.

On seeing the light-blue colour of the flowers in the *Botanical Magazine*, some will wonder why it was called *atropurpurea*. The original form here is, however, of a very deep black-purple. I found once in the Ulu Batang Padang Valley, in Perak, a form in which the corolla was half cream colour and half black-purple, a most beautiful and striking plant, the line between the two colours being quite distinct. I could get no seeds of this, and failed to get it down alive.

The plant figured may be a variety from Sumatra, or it may have gone off its normal colour. It is certain that in many plants which I have sent to England the colouring of the flowers or leaves has not come up to the brilliancy, and especially the depth, of colour that they have normally here. This is, I think, due to the lack of our brilliant sunlight in England. *H. N. Ridley, Singapore.*

THE ROSARY.

ROSE HEINRICH MÜNCH.

HEINRICH MÜNCH is the name of a new Rose recently obtained by the firm Münch & Haufe, of Leuben, near Dresden. The colour is stated to be a clear pink of the shade found in the centre of Capt. Christy, the flower is fairly full, and the petals of the open blossoms are reflexed in the manner of La France. The outer part of the petals is tinged with yellow. The Rose was raised from seed borne by Frau Karl Druschki, the pollen parent being (according to the *Rosen Zeitung*) either Caroline Testout or Mrs. W. J. Grant, and the Rose is stated to resemble the seed parent in habit. It is added that the flowers are borne singly on long, stiff stems, and that the Rose will be found useful for garden decoration for cutting or for forcing. It has been well spoken of in Germany, and its merits as a Rose for forcing are particularly emphasised.

Mons. P. du Plouy, a writer well known to readers of the *Journal des Roses*, states that the plant is as vigorous as Reine des Neiges (Frau Karl Druschki), has few thorns, and is covered with pleasing green foliage. The buds are rounded more often than pointed, and are carried on long, straight stems; they come singly, and open slowly but readily. The flowers are large, full, and of the most beautiful silvery Rose imaginable; they last a long time in the half open stage, and will easily stand travelling without flying. One of their great qualities is that the petals, while reflexed towards the outside of the flower, seem at the same time to cover in the heart in a way that somewhat reminds one of La France, though the colour is softer, clearer, and more pleasing to the eye.

Ever since the introduction of Frau Karl Druschki, 11 years ago, hybridists have been at work trying to obtain a coloured form of that fine Rose, but down to the present the pink Druschkis and red Druschkis that have been presented to Rosarians have failed to equal their supposed parent in its qualities of purity of colour and form. Should Heinrich Münch be found to possess these qualities when grown in this country, it may be assured of a welcome by Rosarians. Judging only from the form of the flower as shown in fig. 144, it would seem more likely that Caroline Testout was the pollen parent than Mrs. W. J. Grant, but this hardly affords an explanation of how the yellow colouring may have been acquired, and as nothing is said as to fragrance, it may be the Rose takes after its seed parent in this respect. Be that as it may, we shall look forward to the coming of Heinrich Münch with interest, and shall hope to give it a fair trial later on. *White Rose.*

THE ORLEANS ROSE.

I VENTURE to predict a great future for this Polyanthus variety, it has so many points in its favour. In the first place, it has a vigorous constitution, and it flowers abundantly and continuously. Then the colour may be said to be unique, being described by some as "geranium-red," although all those I have seen were of a rose-pink. Its most remarkable feature is yet to be mentioned, namely, the longevity of the blossoms. Those on a plant which I have in a pot expanded on April 22 last; a fortnight later the plant was placed in the open ground, but even then the blossoms did not fall, and some of those which came out in April remained for several weeks. I advise all Rose growers to add this useful variety to their collections. *E. Molyneux.*

ROSE MME. HECTOR LEUILLIOT (H.T.).

MR. G. M. TAYLOR's interesting note on Mme. Hector Leuilliot, induces me to give my own experience of this Rose in the near neighbourhood of London, and to express the hope that he may perhaps give us some further information as to the treatment he has found to be

so satisfactory. Mme. Hector Leuilliot is undoubtedly a most beautiful flower, fragrant, and grand in colour; the latter early in the season sometimes almost approaching the Lyons Rose, though more usually of a fine deep orange, and at other times a golden yellow with buff or pinkish shading. It is also a fine strong grower, hardy, and with good leathery foliage, nearly, if not quite, immune from disfiguring disease, but with this I must part company from Mr. Taylor, for I have found it a very shy bloomer. The flowers are lovely when we get them, but we find too few of them.

I tried this Rose first as a dwarf, but, finding its long growths rather unmanageable, and hoping to improve its flowering, I put it in a standard, in which form I now grow it. As a

bedding Rose. La France is another variety which usually gives me, with proper treatment, a fair supply of tolerable flowers, at least if the weather be propitious, while my neighbours on the Harrow clays tell me that it is worn out and its constitution gone. Can Mr. G. M. Taylor assist us with Mme. Hector Leuilliot? What is the secret of its barrenness? Is it the soil or the treatment, or must we long for the dewy nights and long summer days of Scotland as the essential factor to ensure success? The Rose is so beautiful that the answer to the question is of importance to Rosarians, both north and south of the Tweed. *White Rose.*

REFERRING to Mr. G. M. Taylor's interesting article (see p. 299) on this Rose, I note that he

FIG. 144.—ROSE HEINRICH MÜNCH: COLOUR PINK.

standard it has made a fine head, and I think it gives me rather more flowers than I had before from the dwarf, but they are still all too few, and perhaps there are, after all, better ways of treating it. Sometimes treatment is at fault, at others it is climate, and we are helpless. I know well there are Roses which will flower freely and well in some gardens, which in others are of little value. The Earl of Warwick is an instance in point. In my garden it gives me no flowers of any value till the autumn, and then they are often of but poor quality, while some of my friends, not many miles away on the Essex clays, find that this Rose gives good flowers through the whole season. Some have even found it sufficiently free to make a good

mentions that Mme. Hector Leuilliot is perhaps the best variety of the group of yellow varieties introduced by Mons. Pernet Ducher. I should be glad to know from Mr. Taylor, on what points he formed that opinion. I consider Mme. Ravary the best all-round yellow Rose introduced by Mons. Pernet Ducher. Moreover, Mme. Hector Leuilliot is a semi-climber in growth, and, in most situations, a very shy bloomer. Billard et Barré is a much superior variety to Mme. Hector Leuilliot, being a more profuse bloomer, and its colour a brighter yellow. I should be glad to hear other opinions on the subject, as most growers are interested in yellow Roses of all shades and of various habits. *Chester Parker, Norwich.*

The Week's Work.

THE FLOWER GARDEN.

By R. P. BROTHERSTON, Gardener to the Earl of Haddington, K.T., Tynninghame, East Lothian.

ROSE CUTTINGS.—Many kinds of Roses may be propagated from cuttings, although all are not amenable to this method of increase, I believe that *Rosa hemisphaerica* has never been propagated from cuttings. Although the nurserymen find it the better plan to bud their plants on strong stocks, gardeners and amateurs will find plants raised from cuttings quite satisfactory. I have raised several hundreds of a new variety of Rose during the past season in a propagating pit, but this is not necessary at this time of the year, a somewhat shady border being more suitable. Select well-ripened young shoots with, if possible, a heel of the old wood attached, a stout shoot about 15 inches in length being preferable to a weaker one that is not so long. It is necessary to place at least 9 inches of the cutting below the soil, in order that the part where the roots form will keep sufficiently moist. My practice is to insert the cuttings in rows in trenches, making the soil very firm about them. The comparatively new hybrids of *R. Wichuraiana* are especially easy of increase by this means, and, in this case, comparatively small shoots may be employed. This type of rose is so valuable for covering wire trellises, fences, &c., that those who have plenty of shoots available should insert a considerable number of cuttings, and no time should be lost in doing the work. I especially recommend that Dorothy Perkins and others of that type be largely increased by this means.

CHRYSANTHEMUMS.—Out-door Chrysanthemums have been valuable in the garden this autumn, and in dry, sheltered positions the plants will continue to flower for some weeks to come. In the majority of cases, however, the flowers will be over by now, and the plants should be lifted for stock purposes without delay. Boxes used for raising cuttings are most suitable for storing the old roots, and, if the latter are raised with a fair proportion of soil attached to them, it will not be necessary to use much extra soil. As a preventive against slugs and frost a covering of leaf-mould to the depth of 2 inches should be placed over the plants, or cocoanut fibre may be used for the purpose. If most of this material is allowed to remain until growth has commenced afresh in spring, after transferring the boxes to a warm house, the shoots will become drawn as they grow, and form a superior type of cutting. At this stage I remove all the bottom growths that are to be had, most of them with roots, and dibble them into soil in cold frames. By the following April these will have developed into fine, hardy plants.

THE RESERVE GARDEN.—It is advisable for several reasons, to set apart a portion of ground for the cultivation of flowering plants other than those that are required for decorative purposes. These reserve plants will furnish a supply of cut blooms, and be available for replacing any that have died in the beds or borders. They also provide an excellent means of increasing the stock, and generally prove very valuable. The best place for this reserve quarter is a good position in the kitchen garden or near to it. The ground should be well cultivated, and afterwards made very firm, to favour the production of a mass of roots, which will enable the plants to be shifted, if need be, successfully. I would recommend that a few each of the better varieties of late Phloxes, a selection of Michaelmas Daisies, Eupatoriums, Solidagos, *Campanula persicifolia* and its varieties, *Veronica sessiliflora*, *Helenium*, *Lavender*, *Montrétia*, *Polygonum oxyphyllum*, *Helianthus multiflorus* in variety, *Scabiosa caucasica*, *Galatella incana* and *Erigeron speciosus* superbus be planted in this manner. In spring and early summer these should be supplemented with annual and other short-lived plants. In every case any manure that is applied should be placed near to the surface, and not buried deeply.

THE ORCHID HOUSES.

By H. G. ALEXANDER, Orchid Grower to Lt.-Col. Sir G. L. HOLFORD, K.C.V.O., C.I.E., Westonbirt, Gloucestershire.

PREPARING FOR WINTER.—During the dull days of winter all the light possible is needed by the plants, whether in the coolest or warmest divisions, hence no time should be lost before cleansing the houses and putting everything in order. The glass and woodwork of the houses should be thoroughly washed, both inside and out. It is a great advantage if each house, as it is taken in hand, can be cleared of its occupants, to permit of the ventilators and doors being opened widely for a few hours after the work is done to sweeten the atmosphere before rehousing the plants. All stagings should be thoroughly scrubbed, inside walls washed down, and the moisture-holding material in the house turned or renewed as the case demands. In summer, the algal and other green matter does not accumulate so rapidly as in winter, nor are its effects so bad, because fresh air can be more freely admitted at that season. Cleanliness forms an important feature in the successful culture of all plants, but none more so than Orchids. By keeping everything clean about the plants, and giving reasonable and proper ventilation, the plants will grow cleaner and be free from insect pests. Rubbish of any kind should not be allowed to accumulate in Orchid-houses, especially about the hot-water pipes, as this offers hiding places for wood-lice, cockroaches, ants and other insect pests. *Tradescantia*, *Pilea muscosa*, *Begonias* of the Rex section and similar plants are often introduced in Orchid-houses for decorative purposes, being grown on the stages or the ground. The growing of these plants in this manner is not to be recommended, as they harbour slugs, snails, and other insect pests. Another disadvantage is that the luxuriant growth these plants usually make under warm, moist conditions is a hindrance to the free circulation of air about the house. Suitable night temperatures will now be from 60° to 65° for the warmest divisions, 55° to 60° for the *Cattleya* or intermediate-house, 54° to 58° for the cool intermediate-house, and 50° to 54° for the cool-house. During the daytime a rise of from 5° to 10° should be permitted, according to the condition of the weather. Much less moisture is now required, especially in the cooler divisions, where evaporation is slow. A careful watch should be kept on the outside conditions, for as the wind changes, so will the temperatures of the houses be affected. When east or north-east winds prevail, a considerable amount of artificial heat will be necessary, and this, again, necessitates increased damping of all bare surfaces beneath the plants. Guided by the state of the weather, air should be admitted daily to the different structures proportionate in quantity to the nature of the occupants, but fog and frosty air must always be excluded.

FRUITS UNDER GLASS.

By E. BECKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Hertfordshire.

FORCING.—In many gardens the forcing of various subjects in the fruit-houses will have been commenced by this date, and it will need unremitting care and attention on the part of the grower to secure the best results. In all cases forcing must be gentle at first, and, during the early stages, fire heat should only be employed at night-time, when the weather is exceptionally cold, and even then, very carefully. During the daytime, when the weather is bright and warm, free ventilation must be given, and about mid-day the paths damped, but avoiding a saturated atmosphere, and especially towards evening. Much depends upon the structure of the house as to the amount of water necessary to provide a proper amount of humidity. Where open iron gratings are employed, much less moisture will be needed than in houses with pathways of flagstones, and where oftentimes a channel underneath contains the hot-water pipes. Early houses of Figs and Vines in pots that are plunged in fermenting materials will derive a certain amount of humidity from the plunging materials. Should the weather be very cold, sufficient heat should only be used in early Peach-houses to prevent the temperature falling below 45°, but pot Vines and Figs may be allowed 5° higher. Spray the

plants daily when the weather is bright, and tie the canes of Vines in a horizontal position.

POT FIGS.—The method of growing Figs in pots has much to recommend it, and it is surprising what a large quantity of fruit of excellent quality can be obtained in this way, provided proper attention is given to the stopping and regulating of the shoots. As the roots are in a very restricted space, stimulants may be afforded frequently and liberally. The pots are best plunged in a mild hotbed composed of equal parts of long, strawy litter and tree leaves. For early work select trees with thoroughly mature wood, such as those that were forced earliest last year. An excess of water at the roots must be avoided, as much water will not be needed until growth becomes active. It will be necessary at this date to protect from frost Fig trees still in the open.

THE ORCHARD HOUSE.—Trees in pots intended for furnishing the Orchard-house that are still in the open must now be plunged to the rims of the pots in leaves or ashes, to prevent injury to the receptacles from frost. Guard against American blight attacking Apple trees, and paint infested spots with methyated spirit.

TOMATOS.—A sowing of Tomatos may be made now to furnish plants for fruiting next spring. I find the most convenient method is to sow in 6-inch pots that have been well washed and suitably drained, covering the drainage material with fibrous loam. Use a compost of finely-sifted loam, leaf-mould and sand, and sow the seeds thinly and evenly, placing the pots in a house having an intermediate temperature. Cover the pots with a pane of glass, removing this each morning for a short time. As soon as the seedlings appear place the pots on a shelf fully exposed to the light, and, when they are large enough to handle, transfer them singly into small 60 pots. Damp their surroundings occasionally with the syringe, and when the plants are in need of a support, tie them to thin sticks. Endeavour always to promote a dwarf, sturdy habit.

THE HARDY FRUIT GARDEN.

By W. HEDLEY WARREN, Aston Clinton Gardens, Buckinghamshire.

THE ORCHARD.—An orchard should always be situated where there is a free circulation of air, in a southern exposure or one that has a little incline to the south-east or south-west. Where the situation is low, or confined, the trees become infested with moss or lichen, either of which, if allowed to remain on the trees, is very injurious. A screen of forest trees on the north or east side, at such a distance from the fruit trees that the latter are not shaded by them, is of very great advantage by protecting the trees from cold winds and spring frosts. A rich, strong, loamy soil, not too retentive of moisture, to the depth of about 3 feet, is most suitable for orchard trees. The drainage should be perfect, for though the top soil be all that is required, if the sub-soil is wet and cold, the trees will not succeed, but will soon become diseased. Therefore, if the substratum of soil is not naturally porous, it must be made so: the extra expense incurred will soon be repaid by the fertility and prosperity of the trees, which will continue to bear long after others that are planted in a cold, or undrained soil. Whatever system of drainage is selected, it should be arranged to carry any excess of moisture entirely away from the site of the orchard. Whether manure is needed or not when the ground is being prepared for the planting of the trees, will depend on the quality of the soil. In planting orchard trees never place the roots deeper than is absolutely necessary for supporting the tree. The distance apart should be regulated according to the variety and other conditions described in the Calendar for September 23. As the distances given are sufficient for the trees when they are in bearing, it is a very good plan, particularly in cold districts, to plant other quick-fruited trees in the spaces between them, removing them when the space is required by the permanent trees. After the trees are planted, they should be mulched, watered, and secured to stakes, using haybands as ties. No other crops should be cultivated in ground in which the roots of the trees extend. During summer weeds should be kept under by hoeing the surface frequently. With regard to the pruning of orchard trees, it is scarcely possible to lay down any hard-or-fast

rule that will apply to all kinds, but it is indispensably necessary to keep all the branches sufficiently far apart to prevent them rubbing against each other. Many varieties and kinds grow naturally in a form peculiar to themselves, and this should be followed as closely as possible in training, always keeping the bearing shoots well apart. The forming of the head of the tree must be commenced the first season after planting, by retaining a sufficient number of young growths, regulating these on all sides to preserve a well-balanced specimen, and rubbing off all others. If the main leader should at any time be accidentally broken, a lateral shoot should be trained into position as a substitute. This attention to forming the head must be followed up for three or four years from the time of planting, after which it is seldom necessary to shorten the end of a leading branch. After the trees have reached the bearing stage, they must be pruned regularly every year, keeping the branches well apart, and avoiding much growth in the centre, which would prevent the sun and air from reaching every part of the tree. Specimens that are attended to regularly every year will bear more abundantly and produce finer fruit than those that are pruned only once or twice in eight or ten years, as is too frequently the case.

PLANTS UNDER GLASS.

By JAMES HUDSON, Gardener to LEOPOLD DE ROTHSCHILD, Esq., Gunnersbury House, Acton, Middlesex.

PALMS.—The hot summer has suited all kinds of Palms, favouring the development of a hard, enduring growth, which is so desirable, especially in the case of those used for decorative purposes indoors. It will be advisable to examine the stock, with a view to checking insect pests. Some, and especially those that require a stove temperature, are very susceptible to attacks of red spider; species of *Thrinax*, *Euterpes*, *Cocos*, and *Hyophorbes* are all liable to infection of this troublesome pest. Many kinds of scale insect are injurious to Palms, especially to *Kentias*, species of *Phoenix*, and *Latanias*. This insect often attacks the leaves at the base of the petiole, and in such cases care must be taken not to use insecticides too freely. It is better to use a brush for painting the infested parts with the specific, but it is no use attempting to detach the scales at the same time; rather let them be killed by the insecticide and removed later. Whatever preparation is employed for the purpose, it should never be used at a greater strength than that advised by the makers. Also take care that the mixture is shaken, so that the ingredients may be well mixed before it is employed. When a quantity of the mixture has been poured into a suitable receptacle, weaken it with water warmed to a temperature of about 110°. If the plants are examined in about a week or so after the insecticide has been employed, it will be found, in nearly every instance, that the insects are dead, and may be removed easily by means of a sponge soaked in a weaker solution than was used first. The scale clings tenaciously to the plants, and some growers try to remove them by means of a pointed stick, but this is a wrong practice. If the stock of Palms is a large one, it is a good plan to syringe the plants over all with a fairly strong preparation of soot-water, to which has been added a little size, which will cause it to cling evenly over the surface. This method is adopted by trade growers, and although the plants are rendered unsightly for a short period, the object for which it is applied is ultimately attained. Afterwards a careful sponging with a little soft soap in warm water will restore a cleanly appearance. Soot, if used with discretion, will impart a green colour to the leaves, acting as a manure. The receptacles, whether pots or tubs, should be made clean and tidy. If worms are present in the soil, water the plants with lime water, when the worms will generally appear at the surface on rapping the pots.

TEMPERATURES.—The usual temperature maintained in the stove—55° to 60° as a minimum—will be suitable for Palms of the more tender kinds in the winter season, with the exception of a few, such as *Stevensonia grandifolia* (*Phœnicophorium Sechellarum*) and *Verschaffeltia splendida*. *Kentias*, which are amongst the most useful of all Palms, do well in a temperature not lower than 50° or 55°. Almost all the members of the family require a very moist atmosphere and plenty of water at the roots. Some, such as

Coryphas and *Latanias*, will grow well in an ordinary greenhouse, whilst *Thamnocalamus excelsus* is not harmed if the temperature reaches the freezing point under glass.

PLANTS IN PITS AND FRAMES.—Both *Cinerarias* and herbaceous *Calceolarias* should be quite safe for another month or six weeks in a cold frame; though efficient covering should be in readiness to protect them during times of frost. Dry mats should be used, as wet ones are not nearly so good a protection. If the glass should become frozen, care must be taken not to admit any fresh air to the plants until the frost disappears. *Primula sinensis* will thrive well in a slightly-heated frame or pit; better, indeed, than in a large, airy house. The same treatment may be recommended for *Cyclamen latifolium*, though this plant should have a little more moisture than the *Cyclamen*. If space is limited, the large-flowering *Show* and *Regal Pelargoniums* may be placed in pits, and afforded slight warmth in frosty weather. In most gardens there are not nearly enough pits, notwithstanding that many plants thrive better in such places than in cool houses; and, further, it seems a waste of valuable space to store large numbers of small plants in the houses. After the earliest plants of *Chrysanthemums* are past, there will be more room in most gardens; advantage may be taken of this to give increased space where unavoidable overcrowding has occurred. The tendency is, in most gardens, to grow rather too many *Chrysanthemums* for November flowering.

THE KITCHEN GARDEN.

By JOHN DUNN, Kitchen Garden Foreman, Royal Gardens, Windsor.

RHUBARB.—Provided the roots have been lifted and exposed to the weather for a few days, the forcing of Rhubarb may be commenced at once. If a small supply only is required, the roots may be placed under the staging of a well-heated glass house, but away from the direct influence of the hot-water pipes. The Mushroom house or a warm cellar are also suitable. At Windsor, we force large quantities of Rhubarb during winter and spring, and mostly in ordinary, flat pits, where a little fire heat can be applied when necessary. A mild, lasting bottom-heat is provided by beds of tree leaves, trodden tightly together. A layer, six inches deep, of fine soil is placed over the bed, and the roots are laid as closely together as possible, the spaces between them being filled with fine, rich soil as the work proceeds. Dawes's Champion is our favourite variety for forcing, and the roots are planted for the purpose three years previously. The clumps are quite large enough, and respond to forcing better than roots which may have been in the ground for twice as long a period. If the soil is moist at the time it is placed around the roots, very little water will be necessary until growth commences, but any roots that are exposed to hot, dry air will require damping frequently.

SEAKALE.—If strong, one-year-old crowns have been prepared in sufficient numbers to furnish roots for forcing all through the winter and spring without a break, forcing may be commenced at once. But if the supply of roots is limited, forcing had better be delayed for a week or two, as it is better to start late than have the crop run short in the spring. In small establishments an occasional dish may easily be produced by placing a number of roots rather thickly in large pots and filling in the spaces between them with fine, rich soil, which should be pressed tightly amongst the roots with the fingers. The pots may afterwards be stood in the forcing pit, or they may be placed in a Mushroom house, or any dark place, where there is sufficient heat to start the crowns into growth. But in order to thoroughly blanch the shoots; other larger pots should be inverted over those in which the crowns are planted, and all light excluded by stopping up the crevices with damp moss. If the soil is used in a moist condition, no water will be necessary until growth commences, when clear water, warmed to 70°, may be applied as necessary. If the pots are plunged in a mild bottom heat, so much the better. If large supplies are required, the best plan is to plant the crowns closely together in a gentle hotbed, composed of leaves. A sunken pit with wooden

shutters is best for this purpose; and it will be an advantage if fire-heat is available during times of frost. At Windsor we force all our Seakale in this way; each division of the pit holds about 1,500 crowns, which furnishes about one week's supply. In preparing the beds for this crop, it is necessary to turn the fermenting material several times to sweeten it. If the bed should become too hot, the result will be fatal to the roots. When the beds are prepared they will carry two or three crops of Seakale in succession without the introduction of fresh heating material. All that is necessary is to examine the soil when each batch of roots is planted, and if it is found to be too dry a good watering should be given to each row of roots after they have been placed in position, and the soil made tight about the roots as planting proceeds. The depth of the soil should be at least nine inches. When lifting the roots for forcing, cuttings should be secured to furnish next season's crop. They should be inserted in a horizontal position in some sheltered part of the garden, and covered with four inches of soil, over which a covering of ashes should be placed if sharp frost sets in. Select the cuttings as nearly the same size as possible, and endeavour to grow the crowns as large as possible.

THE FRENCH GARDEN.

By PAUL AQUATIA.

SPRING CROPS.—It is essential that seedlings of Lettuce and Cauliflower should now be well-established in their winter quarters, either in frames or under cloches. Some growers examine the batches of plants in order to replace any that are missing, and this should be done without delay, as these late-planted Lettuces are always backward in their growth, and being smaller than the others are often thrown away when planting is done in the early spring. The present season is remarkable for the scarcity of slugs, which are very destructive to seedling Lettuces; but very little damage may be expected if they do not appear for another fortnight. It is, however, necessary to examine the cloches and the frames in the early morning, and any slugs that are seen should be destroyed. The general appearance of all seedlings is better than it has been for some years past; they are healthy and even in growth; therefore, as soon as the growth is a little further advanced, ventilation may be afforded to Cos and Passion Lettuces, but it would be best to wait until the end of November before opening the glass where the "Little Gott" are growing. Air must be given day and night to Cauliflowers, except in frosty weather, in order to promote a healthy and sturdy growth throughout the winter, and to prevent a precocious development of the inflorescences. Seeds of Cabbage Lettuce "All the Year Round" or "Georges" and Cos Lettuce "Paris White" should be inserted in a frame or under cloches to supply plants for setting out late in March. There is a tendency for a better demand for this produce than formerly. Where a small greenhouse is available, the seeds may be sown very thinly in boxes, and the seedlings should remain undisturbed until late in February, when they should be pricked out. The programme for next season must be made out according to the quantity of material at the grower's disposal. This year's market for early produce has proved that prices for Lettuces are more remunerative in April than earlier. The quotation for Carrots fell rapidly early in June, but Turnips always commanded a good price. Vegetable Marrows, as a forced vegetable, proved an excellent crop in May and June, and easy of cultivation with a little hot manure, and the shelter of cloches.

WINTER CROPS.—Chicory "Witloof" will soon be ready for forcing. Many methods are adopted, according to the means available. One of the most economical is to dig a trench 4 feet wide and 10 inches deep. The roots, after having been cleaned, especially near to the crown, are placed in the trench in rows 3 inches apart. They are covered with a layer of 3 or 4 inches of fine sifted soil. Frames and lights are then set over them, and these are covered with mats. When possible, the path between the frames is filled with manure, which favours a quicker growth and prevents drought.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, as well as specimens of plants for naming, should be addressed to the EDITORS, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY, NOVEMBER 13—
United Hort. Benefit Soc. Com. meet.

TUESDAY, NOVEMBER 14—
Ulster Hort. Soc. Sh. (2 days). Saltaire, Shipley and Dist. Rose Soc. Ann. Meet. Plymouth Chrys. Sh. (2 days). Chester Paxton Soc. Ann. Fruit and Chrys. Sh. (2 days). Belfast Chrys. Sh. (2 days).

WEDNESDAY, NOVEMBER 15—
Newcastle & Dist. Chrys. Soc. Exh. (2 days). Buxton & Dist. Chrys. Sh. Woolton & Dist. Chrys. Soc. Sh.

THURSDAY, NOVEMBER 16—
Scottish Hort. Assoc. Chrys. Sh., Edinburgh (3 days). Newport (Mon.) Chrys. Sh. Linnean Soc. meet. Sheffield Chrys. Soc. Sh. at the Corn Exchange (3 days).

FRIDAY, NOVEMBER 17—Bolton Chrys. Sh. (2 days).

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last Fifty Years at Greenwich—43°.

ACTUAL TEMPERATURES:—

LONDON.—Wednesday, November 8 (6 P.M.): Max. 50°; Min. 46°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—Thursday, November 9 (10 A.M.): Bar. 29.4°; Temp. 46°; Weather—Dull.

PROVINCES.—Wednesday, November 8: Max 46° Colchester; Min. 37° Lincoln.

SALES FOR THE ENSUING WEEK.

MONDAY AND TUESDAY—
Nursery Stock, at the Nursery, St. Stephen's, St. Albans, by Protheroe & Morris, at 12.

MONDAY, TUESDAY, WEDNESDAY, THURSDAY AND FRIDAY—
Bulbs, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 10.30.

MONDAY, WEDNESDAY AND THURSDAY—
Bulbs, Perennials, Conifers, and other Decorative Plants; also Roses, at Stevens's Auction Rooms, 38, King Street, Covent Garden, London, at 12.30.

WEDNESDAY—
Palms, Araucarias, Azaleas, &c., from Belgium, at 4; English and Dutch Roses, Fruit Trees, &c., at 5, at Stevens's Auction Rooms, 38, King Street, Covent Garden, London.

Roses and Herbaceous Plants at 12.30; Palms and Plants at 5; at 67 & 68, Cheapside, E.C., by Protheroe & Morris.

FRIDAY—
The "Ridgeways" Collection of Orchids, Orchids from Uganda, &c., at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 12.45.

We learn with regret of the death of M. Edouard André, Editor of the *Revue Horticole*, who had served on the staff of that excellent periodical for more than 50 years.

M. André's services to horticulture were conspicuous; not only was he widely known for his ability in the art of garden design, but he also laid the world of horticulture under deep obligation by his introduction of many serviceable plants which he collected in the course of his journeys in tropical countries. We are indebted to our above-mentioned contemporary for many of the details in the following account of the life of this distinguished man.

M. Edouard François André was born at Bourges in 1840, and was the son of a horticulturist of that town. In his early youth he chose the profession of horticulture, and had the inestimable advantage of an early technical training

both in his father's establishment and at Angers, under M. Leroy. In 1859 he went to Paris, and spent a year of study in the Museum of Natural History. In 1860 André became head gardener to the Ville de Paris, a post which he held for eight years. Here his aptitude for landscape gardening found large scope, and he has left an enduring monument of his skill in many of the great parks, particularly in the Parc des Buttes, Chaumont.

Of the charm of this park we ourselves can speak with some knowledge. Imagine a waste of land, the refuge of all the undesirables of the region of Paris beyond Montmartre: this waste made still further desolate by the fact that it had been quarried and then abandoned. See now a beautifully-wooded park, its former disadvantages converted by the skill of M. André into one of the most delightful and "natural" of gardens. See further, at play there, the hundreds of children of

THE LATE M. EDOUARD ANDRÉ.

the workers of that none-too-lovely part of Paris, and he would be churlish indeed who did not acknowledge to a warming of the heart when he remembers that this transformation was wrought by the then young head gardener M. André.

With this wide experience gained at Paris, M. André entered the competition organised by the town of Liverpool for the laying-out of Lord Sefton's estate of 370 acres as a public park. André was placed first in the competition, received the prize of 300 guineas, and was entrusted with the execution of his plans. This work lasted for five years, and the park was opened in 1867 by Prince Arthur.

With the éclat which this undertaking brought M. André, it is natural that he should have received numerous invitations to exercise his skill in landscape gardening in this country. Beside laying-out various private gardens, M. André was responsible for the design of Woodhouse Moor Park at Leeds. Evidences of his

varied skill are to be found in all parts of Europe, in Holland, Denmark, Russia, Austria, Bulgaria and Italy.

One of the most interesting of his works was the transformation of the citadel of Luxemburg (in the Grand Duchy) into a public garden—a labour which took 20 years (1872-1892) to execute.

Nor were M. André's activities as garden-architect limited to Europe. In 1890 the Government of Uruguay invited him to visit that country in order to remodel a part of the ancient town of Monte Video, and to draw the plans of a new city more adapted to modern requirements.

The gardens of Monte Carlo again—those dreams of fairyland—are an expression of his genius. It is no wonder that André's great work, *l'Art des Jardins*, should have become a classic immediately on its appearance in 1879.

Like all great men, M. André was a great worker. From 1870-1880, as Editor of *l'Illustration Horticole*, he described large numbers of new plants, showing a distinct preference for the Bromeliads.

André's first visit to S. America took place in 1875, when he was deputed by the Minister of Public Instruction to report on the vegetation of that region. The journey lasted upwards of two years, and M. André collected about 3,400 species of plants, the description of which was delegated to various botanists, Mr. Baker of Kew undertaking the *Amaryllidaceæ*.

M. André himself described the *Bromeliaceæ*, of which he had collected 129 species. Of this number, 91 were described as new species, and two new genera, *Sodiroa* and *Tecaphyllum*.

Again, on a subsequent journey in 1890, in Uruguay he collected many plants which were new to horticulture. Of the plants introduced by M. André and described for the most part in the *Revue Horticole*, the most interesting is perhaps *Anthurium Andreanum*, Linden. This scarlet-spathed and popular Aroid was discovered by André in New Granada, growing on a trunk of *Ficus elliptica*. The first attempt to introduce the plant to Europe proved abortive, and it was not till 1878 that André succeeded in this task.

The greatest distinction which fell to M. André was his appointment to the Professorship of Garden Architecture at l'Ecole Nationale d'Horticulture of Versailles when, in 1892, the chair—the first of its kind—was established on his behalf.

M. André was a corresponding member of the Royal Horticultural Society of London, Officer of the Legion d'honneur, and he held many distinguished orders. He was interred on October 28, at La Croix (Indre-et-Loire).

In summing up the work of this distinguished man, we cannot find a fitter expression than that employed by the *Revue Horticole*: André gave to landscape art a new impulse, and by precept and example formed a new school. He devoted his life to the advancement of horticulture. He brought great honour to the name of Frenchman throughout the civilised countries of the earth.

MECONOPSIS INTEGRIFOLIA,
PHOTOGRAPHED IN ITS CHINESE HABITAT BY MR. GEORGE FORREST.

SUPPLEMENTARY ILLUSTRATION.—*Meconopsis integrifolia* was first discovered in the province of Kan-Su, China, and was introduced to this country about 1904 by Mr. E. H. WILSON whilst plant collecting for Messrs. JAMES VEITCH & SONS, Chelsea, and was first figured in our issue for October 1, 1904. Since that time quantities of seed have, from time to time, been received from Western China by various firms, but, despite this, the plant is not commonly met with in cultivation. Mr. FORREST informs us that the plant grows abundantly in the province of Yunnan, at certain altitudes and in certain situations, on most of the mountain ranges north and west of lat. 27° N., long. 101° E.; he adds that, once seen growing wild in Alpine meadows, where whole hillsides are starred with its sulphur-coloured, nodding blooms, it is remembered for ever. Its altitudinal range is not great, approximately from 11,000 to 13,000 feet, and the finer specimens are generally found where the pasture is least luxuriant. On parts of the Lichiang Range, lat. $27^{\circ} 30'$ N., it is common, but there it does not flower until June, and only then in situations where the winter snows have entirely disappeared and the soil is partially warmed by the sun. Much farther north and west of the above range, on the great Mekong-Salwin divide, it thrives exceedingly in a more rigorous atmosphere. Mr. FORREST found it there late in May. He met with superb specimens in perfect flower, growing in the first melted hollows of deep snowdrifts in a very cold atmosphere, and on ground which at the time was practically bog. Judging from this, it seems almost certain that the plant is a lover of moisture and a light, stony soil. It is a free-flowerer, normal plants generally bearing from four to seven blooms; Mr. FORREST found one specimen carrying 11 flowers. There appears to be two forms, one which may be called the more southern, having the corolla widely-expanded when in full bloom; the other, or more northern, having the petals incurved, somewhat after the habit of a *Trollius*. Our illustration is reproduced from a photograph of a plant growing on the Lichiang Range, and is probably the first published showing the plant in its native habitat.

PROPOSED ORCHID SHOW AND CONFERENCE.

—At the meeting of the Orchid Committee of the Royal Horticultural Society on Tuesday last, the Chairman, Mr. J. GURNEY FOWLER, stated that several Orchidists had expressed opinions to the effect that an autumn Orchid show and conference were desirable, and he wished to have the opinion of the Committee in order that he might bring the matter before the Council. The members of the Committee unanimously agreed that the project ought to be carried out, and the majority voted for the first meeting to take place in November, 1912.

ROYAL METEOROLOGICAL SOCIETY.—A meeting of this Society will be held at the Institution of Civil Engineers, Great George Street, Westminster, S.W., on Wednesday, November 15, when the following papers will be read: 1, "The Abnormal Summer of 1911," by Mr. CHARLES HARDING; 2, "Notes on Solar Halos," by Mr. WALTER LARDEN, M.A.

THE PRESERVATION OF TREES AT CHISWICK.

—The Lombardy Poplars which stand opposite to the L. and S.W. Railway Station at Chiswick are not to be sacrificed during the widening of the road at that point. The *Standard*, which reports this decision of the Chiswick Council, states that it has been arrived at in deference to strongly-expressed local public opinion. It is to be hoped that the successful intervention of the public in this case may encourage similar efforts elsewhere.

NATIONAL CHRYSANTHEMUM SOCIETY.—A conference will be held by the National Chrysanthemum Society at Carr's Restaurant, Strand, on Monday, December 4, at 7 p.m. The chair will be taken by the President, Sir ALBERT ROLLIT. Papers will be read by Mr. F. W. LADDS on "The Culture of Disbudded and Spray Blooms," and by Mr. P. A. CRAGG on "Soil Preparation, and the use of some Chemical Foods." The annual dinner of the Society will take place in the Royal Venetian Chamber, Holborn Restaurant, on Wednesday, November 29, at 6.15 p.m. for 6.45 p.m. Tickets may be obtained from the Secretary, Mr. RICHARD A. WITTY, 72, Savernake Road, Gospel Oak, London.

BRITISH LINEN BANK HORTICULTURAL SOCIETY.

—Owing to the success of the flower show held in July last, at the British Linen Bank, London, a society composed of members of the staff has now been formed under the above title. At the first general meeting held on the 26th ult., a committee of management was elected, and the necessary arrangements were made for the framing of rules and other details. We trust that this will be but the beginning of a practice that may eventually become popular in all the large banks.

MR. AND MRS. ALEXANDER DEAN, of Kingston-on-Thames, who were married in the Parish Church of Millbrook, Southampton, on November 4, 1854, passed the 57th anniversary of their wedding on the 4th inst. Both are in excellent health and lead active lives. Mrs. DEAN completes her 81st year next March, and Mr. DEAN his 80th year. The latter, who has been one of the horticultural instructors under the Surrey Technical and Education Committee for 20 years, is still able to give lectures in various parts of the county during the winter months, and in summer engages in the judging of cottage gardens and allotments and rural flower shows. His first contribution to the *Gardeners' Chronicle* was published some 45 years since, and he has been a frequent contributor from then to the present day.

MR. THOMAS STEVENSON.—At the Paris Chrysanthemum Show, which opened on the 3rd inst., this well-known gardener at Woburn Park, the residence of E. MOCATTA, Esq., obtained a series of successes. He entered in five classes, staging in each case some grand blooms, which were the admiration of the numerous visitors. The exhibits were all grouped together, and occupied a most prominent place in the show, and the taste displayed in their arrangement was of a high order of merit. The jury awarded the exhibitor a work of art, three large gold medals, and a large silver-gilt medal. Mr. STEVENSON exhibited as an ordinary member of the National Horticultural Society of France.

ENGLISH EXHIBITORS ABROAD.—At the recent Paris Show, Messrs. STUART, Low & Co. staged Carnations in vases, for which they received a well-deserved award. In the Orchid Room our representative noticed a collection of *Cypripedium labiata*, from Mr. EDWARD V. LOW. We hope in our next issue to give a report of the Paris Show, pressure on our space preventing us from doing so this week.

SANDGATE ARBOR DAY.—At a meeting held at Enbrook on the 4th inst., to consider the question of instituting a local Arbor Day, it was unanimously resolved, "That the first celebration of Arbor Day in Sandgate take place on Saturday, December 2." Arrangements were made for a lecture to be given on November 22 by Mr. E. D. TILL, of Eynsford, on "The Origin and Use of Arbor Day."

MR. E. F. HAWES.—Mr. ELDERBERT F. HAWES, for the past 15 years garden superintendent for the Royal Botanic Society, Regent's Park, has retired from this position. In recognition of his services the Council has awarded Mr. HAWES the Society's gold medal, a unique distinction for a member of the staff. The employees have presented him with a gold albert. As principal of a new school of horticulture now being established at Hampstead, to be known as the Imperial School of British Horticulture, Mr. HAWES will find ample scope for further work.

WINCHMORE HILL PARK.—The Middlesex County Council is granting £5,626 towards the purchase by the Southgate District Council of 90 acres of land at Winchmore Hill for the formation of a public park. The land in the vicinity is to be used for building purposes, not, however, in the usual haphazard way, but according to a properly-planned scheme.

PAYMENT ON DELIVERY.—It is curious that in a commercial country no simple means exists whereby the vendor and purchaser are insured against dishonesty on the one side or other when transacting a small affair. A case has been brought recently to our notice, and as it is not unique we may use it to illustrate our point. A advertises for a certain commodity. B writes to say that he will provide it on certain terms to be paid in advance. A sends the money and B decamps. We have urged more than once that it would be a great boon to small traders if the Post-office would institute some such system as is in vogue in France. That system in the above case would work as follows:—B replies to A's advertisement and asks for pre-payment. A replies that he will pay on delivery, and B's career of dishonesty is interrupted. The fact that under present circumstances when A, irate, invokes the police, it is found that B has left behind him piles of envelopes, which indicate that the victimised are many. B changes his address and name and continues his nefarious practice in the certitude that the simple are still with us, and that for such the *Vicar of Wakefield* was written in vain.

THE UNIVERSITY OF MANCHESTER NEW BOTANICAL LABORATORIES.

—The new botanical laboratories of the University of Manchester were formally declared open by Dr. SCOTT on Friday, November 3. The laboratories, which are contained in a separate building in the new botanical block, are admirably planned. The building, which consists of four main floors and two mezzanines, was designed by Mr. PAUL WATERHOUSE. It provides ample accommodation, not only for large classes of elementary students, but also for more advanced classes and for research work. Ample space is set apart both for palaeobotany and for cryptogamic botany, both of which branches are actively pursued by the botanical staff of the university, the former branch under Professor WEISS, who maintains the traditions established by WILLIAMSON, and the latter branch under Professor LANG. The cryptogamic department is concerned not only with purely scientific investigations, but also with those relating to diseases of plants and their economic bearings on agriculture and horticulture. In connection with the economic side, the university is fortunate in the possession of an experimental ground on the Behrens Estate, Fallowfield, where experiments in genetics and kindred subjects are conducted. The cost of the new buildings is about £12,000, towards which sum Mrs. C. J. SPENCE has contributed £1,000. After the formal opening, Dr. SCOTT delivered an address, which dealt largely with the work of the late Professor WILLIAMSON, the first professor of botany in the Owens College. Later on in his

address Dr. SCOTT referred to the connection of botanical studies with the practice of agriculture. Students for the degree of B.Sc. in agriculture obtain in the Manchester University their training partly at the Agricultural College at Holmes Chapel and partly at the university, and this was quite in keeping with the traditions of the professorship of WILLIAMSON, who used to go about lecturing, among other subjects, on farming. He, Dr. SCOTT, had been asked to say something on this subject, about which he did not profess to know a great deal. In Hampshire there were a number of small holdings, not under the County Council, which were so far a failure, but by means of co-operation better things were hoped for. One felt that here agricultural science might be able to help. What was wanted was to help those who had been trained on the land, so that they might remain on the land and be able to make a decent living. At the conclusion of the ceremony a vote of thanks to Dr. SCOTT was proposed by Sir EDWARD DONNER, and seconded by Professor WEISS.

POTATOS FOR AUSTRALIA.—In our issue of July 22 we discussed the proclamation by the Governor-General of the Commonwealth, which appeared in the *Gazette* of March 25, 1911. Under that proclamation it was impossible for British firms to send Potatos for seed or for food to Australia. It has now to be noted that the impossible condition contained in sub. clause C of the March proclamation has been withdrawn. The condition was that senders had to declare that the Potatos were grown at least 20 miles from any place known, after due investigation, to be or to have been within five years infested with either the common Potato disease or the new black wart disease. The new conditions are reasonable, and will permit, in most seasons, of business being carried on. They are as follow:—The importation of Potatos is prohibited from any country unless (1) They are accompanied by an official certificate, dated and signed by a responsible officer of a Government department of the country of origin, identifying the Potatos, specifying the quantity, and certifying (a) that at the date of the issue of the certificate they were on inspection found free from disease caused by *Phytophthora infestans* (known as Irish Blight) and from the disease *Synchytrium endobioticum* (known as Potato canker, black scab, warty disease, or Cauliflower disease in Potatos); (b) that they were grown in the country named; (c) that they were grown on premises known, after due investigation, not to be or to have been during the preceding 12 months infested with either of the said diseases; (d) that they were packed in the country of origin in clean new packages. (2) The bags, crates, or other packages containing the Potatos are marked on the outside with the name of the country of origin, and with other distinguishing mark or marks. Provided that the Minister may permit Potatos which are certified by a Quarantine Officer to be free from disease to be imported under and subject to such conditions as the Minister may think fit to impose. The last clause permits a Minister to open a very wide door. We cannot see how it is to operate unless a Commonwealth Quarantine Officer be present at the port of embarkation. No sender will ship subject to the risk of a cargo or even a parcel being condemned on arrival by the Quarantine Officer. This fresh proclamation was published in the *Commonwealth of Australia Gazette* on July 29, and applied to the whole of the Commonwealth, but since then, on September 16, the new conditions are repealed so far as Western Australia is concerned, and Western Australia goes back to the regulations of March 25, published in our issue of July 22, in so far that Potatos after being landed are to be grown for the first year in quarantine.

OPUNTIA MISSOURIENSIS (POLYACANTHA).

ONE would not expect to meet with drought-resisting plants on the Pacific slope of British Columbia, for the annual rainfall of the district is 50 inches. *Opuntia missouriensis* (see fig. 146), however, grows in plenty in certain localities on the sea coast of Vancouver Island. The plant is hardy, and produces handsome yellow flowers in abundance, the flowering season being July and August. *Opuntia missouriensis* grows wild on sunny rocks in company with *Eriophyllum caespitosum* and *Brodiaea grandiflora* near to the sea, where almost all other vegetation withers early in the year. If it were afforded a dry, sunny place on the rockery and covered with a sheet of glass in the winter it should succeed in Britain, as it is sometimes subjected to a few degrees of frost growing wild. R. Glendenning.

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

INTERNATIONAL EXHIBITION OF 1912.—The publication of the revised scale of entrance charges to this exhibition makes possible some comment on them, and on your editorial of October 28, from the point of view of the ordinary R.H.S. Fellow. By "ordinary" is meant the subscriber of one guinea per annum, who repre-

FIG. 146.—OPUNTIA MISSOURIENSIS:
FLOWERS YELLOW.

sents an overwhelming majority of the entire Society. Not to occupy your space with figures, the amended scale is virtually a refusal by the directors to make any abatement to the great body of the R.H.S. for admission during the best part of the best days. And this is all that the Council of the R.H.S. has obtained for the great body of its supporters in return for a grant of £5,000, given or pledged, out of their funds. The only reply to remonstrances is that the Council has nothing to do with the exhibition, and is powerless in this matter of the entrance charges—surely a most extraordinary and indefensible position. Your plea that these high charges may be necessary for the financial success of the exhibition has no weight as regards the R.H.S. The Council could have ascertained beforehand that there would be this necessity of high charges, and it has morally, if not legally, exceeded its powers in granting a great sum to an exhibition which puts the bulk of its Fellows into an impossible or inferior position as regards admission. Similarly, your argument that the Council's grant is a donation and not a payment for tickets seems to me false. The Council can only make grants for the advancement of horticulture, and, by implication, for the advancement first and foremost of its own Fellows. But they are excluded from such advancement if they are excluded from the exhibition. In brief, such a grant to this exhibition can be justified only if it brings the fullest benefits of the exhibition within easy reach of the entire body of Fellows.

I write as a Fellow of the R.H.S., and not as one of the general public. But there must surely be something wrong about admission charges which are double what they were in 1866, although the people of small means who are interested in horticulture are tenfold, or, possibly, a hundredfold, more in number in 1911. G. H. Engleheart, V.M.H.

—I note with pleasure the altered charges for admission to this exhibition, especially for professional gardeners, as a big railway journey, together with hotel expenses for a few days, and the original scale, would have made it a strain to many, no doubt besides myself, who think that an annual visit to a big show is an absolute necessity nowadays; but there is no indication as to whether all professionals are to be included in the new arrangements; that is, both business men and gentlemen's gardeners. C. H. E., Mumbles, S. Wales. [All professional gardeners are included.—EDS.]

—My friend, Mr. Hemsley, in his note on this subject, in your last issue (p. 324), does not state the whole case when he says that "the exhibition of 1866 was a great financial success." It was a great success in the end, but at the end of the period originally fixed for holding the show, the financial results were most disastrous, and it was only by keeping the show open several days longer, by arrangement with the principal exhibitors, that financial success came. It was the popular shillings taken during the last few days that saved the situation, bought the Lindley Library, and put £1,000 into the coffers of the Gardeners' Royal Benevolent Institution. Senex.

JUDGING AT THE FRUIT SHOW (see p. 310).—*Fairplay* raises a shadowy goblin when he urges that judges will be biased in their judgments if they look over the show whilst it is in progress of arrangement. What is there to prevent a judge from turning over any card in a class in which he may be judging, before making the award, if he desired to do so? *Fairplay* must rest assured that not one who acted as a judge at the recent R.H.S. Fruit Show was in the least biased, or would be capable of using any knowledge he possessed for the purpose of making an unfair award. Not till the hall was cleared of the visitors did the judges know which class or classes they were required to examine. It is to be deplored that such distrustful and unfounded suggestions are raised by *Fairplay*, as they have no foundation. A Judge.

AGRICULTURAL EDUCATION.—All engaged in the work of agricultural and horticultural instruction are indebted to you for your timely article in last week's issue on agricultural education. You have stated what is well known to those who have to directly apply the instruction, after the schemes and regulations governing it have been turned out for their guidance by theorists. Nothing short of giving full control over land questions, and all the education connected therewith to one particular board representing the practical side, will ever bring matters to that progressive stage which those interested are longing to see. Under the present system, excellent practical instructors are so hemmed in by theoretical machinery and administration that it is practically impossible in many instances for their work, however good, to come to full fruition. It is only fair to add that the Board of Agriculture, and its officers, have for a long period recognised this, and no doubt would, if permitted, have speedily remedied matters, had not the funds, which should have been theirs for the purpose, been entrusted to the inexperienced Board of Education. With full control, and the necessary funds at their disposal, it should be possible for the Board of Agriculture to establish a proper and practical system of education. With inspectors drawn from the ranks of the profession, local committees selected for their knowledge of the subject, together with men of wide practical experience, this could be done now. At present we find many students crammed full of theory, yet lacking practical knowledge, and the foundations which have been laid at considerable cost to the community, have to be broken up and relaid before any practical good results. Were trained professional men in charge of the subjects at every stage, such a condition would be impossible, as experience would rub shoulder to shoulder with experience, science would be available for practice and

practice available for science, and by this means a system of education would be evolved which would place a great wealth-producing industry in the best possible condition to meet foreign competition, adverse weather conditions, attacks of insect and fungus pests, uncongenial soils, troublesome markets, and so on. I trust your suggestions may find their way to the proper quarters, and that the outcome will be the reversal of the present policy, which cannot be conducive to the best interests of the country. *Instructor.*

SEEDLING APPLES.—Mr. Edward A. Bunyard's contribution relative to seedling Apples in your issue of October 21 induces me to give my experience in such matters, and, in doing so, I am, perhaps, mainly justified by the length of time the matter has been under my observation. From the advent of the Newtown Pippin in the 60's of the past century, I attempted to include this king of Apples amongst a collection of best-known sorts, but, finding myself disappointed as to the quality of the fruits during successive years, I sowed seeds of the true New York variety. I grew the least weakly-looking amongst them for several decades, but its nature was and remains "Crab"; and, not only so, but no bloom ever appeared; besides which, the tree was the dirtiest among many sorts, and suffered regularly from American blight beyond what I have ever seen elsewhere. In the end, about 10 years ago, I grafted the seedling on the British paradise stock, and possess to this day five grafted trees, one a cordon of four leads, the others being single cordons, one of which is planted against a tall paling 10 feet high, where it shows such vigour as it is capable of, but so far without any signs of flower-buds. American blight is not very troublesome here. Before I came, some three years ago, from Sidcup, Kent, to live in this pleasant northern town with the entire contents of my southern garden transferred, there was on a single occasion one single bunch of blossom on one of the grafted single cordons, but, unfortunately, no fruit set. There is no change from the smallness of the foliage and spines, and, as from the very first, the wood is thin and tough, with numerous thin laterals and spines. The opportunity is favourable to mention a great failure of crops on hundreds of trees in my garden this year, the effect of the drought in the earlier summer months. But a rather curious exception is that the American varieties, Benoni, Mother, and Wealthy, have exceeded all my previous experience, both as to quality and quantity. Our British Duke of Devonshire and a few others are equally distinguished. The natural soil here is pure sea sand, extending to several miles from high-water mark at the coast, narrow stretches of a peaty, boggy nature excepted, the result being that success in gardening at this seaside place depends upon the soil brought by railways, a matter which renders gardening a serious expense. *H. H. Raschen, Birkdale, Southport, Lancashire.*

CELERY DISEASE (see p. 310).—A few years ago I was much troubled with disease in my Celery plants, and was at a loss to account for its appearance. In October, 1907, I sent some freshly-dug plants to the authorities at the University College, Reading, and the disease was named *Phyllosticta Apii*. How far this disease differs from *Ceriospora Apii* mentioned by your correspondent I cannot say. In the reply that I received from Reading, a probable cause was given—the use of pigs' dung, inasmuch as the pigs might have eaten some refuse or another containing spores of the disease, which would pass through the bodies of the animals without destroying their powers of germinating. I was advised to collect and burn all the affected leaves and not to grow Celery on the same ground for a few years. All the manure used in the garden here contains a considerable proportion of pigs' dung. In 1907, when the attack was worst, the manure was rather fresh when put into the bottom of the trenches. In the summer of 1908 I planted Celery in ground which had not been cropped with this vegetable for more than 20 years, if ever before, and more than half a mile away from where the crop was grown in 1907. The manure was the same—farmyard, including pigs' dung—only more decayed, but only about one-third the quantity previously employed was used. In that year no trace of the disease was noticed, nor in 1909, in which year the Celery

was grown in entirely fresh ground, with similar manure and of the same quantity as in 1908. Last year the Celery was planted a short distance from the ground that bore the 1908 crop, similar manure and the same quantity being used. All went well until the middle of September, when traces of the disease showed themselves. I at once sprayed the plants with Bordeaux mixture, and continued spraying once a fortnight until the frost set in, with good results, for the disease did not spread, and there was no loss of the crop. This season the Celery is growing in the same ground selected in 1907, with similar manure, decayed, and in less quantity. I cannot say if any trace of disease would have showed itself, for I did not wait until it appeared, but commenced spraying with the Bordeaux mixture about the second week in August, and continued spraying at intervals until 10 days ago. The plants are clean and healthy, with no trace whatever of the disease. In 1907, when the disease was so bad here, I gave surplus plants to a cottager for his garden; he planted them in ground without manure, and there was no trace of disease in his garden. The plants were pricked out in the same cold pit as those which I planted, and which were so badly diseased. My experience is that the soil or manure is the source of infection, and not the seed. During the years 1906-07-08, the disease was very bad in several gardens in this district, but this season I have heard no complaints, and only in one garden has spraying been practised. The disease showed itself here in the form of irregularly-shaped, brown spots on the leaves; at the same time, traces could be noticed in the stems, and also in the roots. It spreads very quickly all over the bed, and eventually the plants rot. We grow about 2,250 plants each season, and in 1907 more than 1,500 were unfit for use. *J. Jaques, Bryanston Gardens, Blandford.*

—This disease is, unhappily, not confined to Ireland. I have not seen growing plants affected by it, although Celery has come under my notice in many places, but several diseased leaves have been sent me from time to time. It may interest Mr. Calthorpe to learn that the Board of Agriculture has issued a leaflet descriptive of the disease and its treatment. But for any treatment to be effective, it needs to be applied in the earliest stages of the disease. The Board of Agriculture recommend spraying with the Bordeaux mixture three times at least, at intervals of a week. All the affected leaves should be gathered and burnt. The spraying of Celery with a poisonous solution is not desirable, if it is possible to avoid it; but if the fungus appears, it must be done. *A. D.*

HOGG'S "FRUIT MANUAL" (see pp. 272 and 294).—I agree with *A. D.*, on the latter page, as to striking out varieties of no general merit in any new edition published. When sending you an occasional note, I generally put my thoughts on paper twice, if not thrice, before posting. Even then, they require distilling again by you. In my first notes I put down "expurgated edition, with the addition of new varieties," but struck it out and tried again. I find now that the last edition of the *Manual* can be purchased for £1 10s., but I fear that this is a prohibitive price for gardeners generally. It is to me, anyhow. *Yorkshire Gardener.*

—The question of a revision or a new edition of *The Fruit Manual* needs no excuse for its discussion at the present moment. Your correspondent *A. D.* advises a "supplement," whilst in other quarters a new edition is recommended. It will be perhaps well, however, to consider first if the present form of this invaluable work is the best that can be devised before taking steps to supplement or revise it. In considering this it is necessary to realise that there are two kinds of readers asking for a new work (1) the amateur fruit-grower, the nurseryman who does not make a speciality of fruit, and the gardener; and (2) the fruit expert. Those in the first class require a concise work to which they can refer for synonyms and short descriptions of fruit, season, general habit and requirements of the different varieties. But the expert desires full and minute descriptions of fruit, leaves, flower, wood and growth, with such historical information as can be established. In the opinion of the writer the work of Dr. Hogg falls between these two classes. The descriptions, being largely limited to fruit, are not

full enough for the expert, and rather too technical for the amateur gardener. The information given is not sufficiently detailed to determine with absolute certainty the identity of many varieties, and it is not to be expected that descriptions of fruit alone can ever suffice. The botanist requires for his determinations not only fruits, but flowers, leaves, stem; in fact, the whole plant, and I venture to say that the minute differences between varieties of fruits are at any rate as difficult to determine as those of botanical species, on which the systematist exercises his skill. As an example of the two different works I would suggest the *Guide Pratique a l'amateur des Fruits* by Thomas, and the masterly and exhaustive works of Mas, published as *Le Verger*, and the continuation of the same as *Pomologie Generale*. The former is an excellent example of what judicious compression and terse description may bring together in the volume. In the space of an octavo volume of 385 pages, over 3,000 varieties are described, and some 17,000 synonyms given. In *Le Verger* both sides of a page are given to minute description of one variety, and it forms—for the expert—a work of reference which, for detail and accuracy, has not been surpassed. *Edward A. Bunyard.*

SCOTLAND.

PRESENTATION TO A SCOTTISH GARDENER.

MR. ALEXANDER BAIN, gardener at Ballater, who is leaving for New Zealand, has been presented by his numerous friends with a purse of sovereigns, and Mrs. Bain, with a gold brooch. The presentation was made by Mr. H. Anderson, of Oakhall, on behalf of the subscribers. The members of the local lodges of Freemasons have also made presentations to Mr. Bain for services rendered to the craft.

THE CALTON HILL IMPROVEMENT.

THE scheme for the improvement of the Calton Hill, Edinburgh, referred to in our issue of October 28, is not meeting with general acceptance, as the estimated cost turns out to be £10,000.

SOCIETIES.

ROYAL HORTICULTURAL.

NOVEMBER 7.—There was only a moderate exhibition at the fortnightly meeting, held on Tuesday last. Some of the exhibits were exceptionally good, notably the pot Chrysanthemums and winter-flowering Begonias, shown by Messrs. JAMES VEITCH & SONS, Nerines from Mr. FRANK LILLEY's Jersey Nursery, Begonias and Ferns shown by Messrs. H. B. MAY & SONS, and several exhibits of Chrysanthemums. The FLORAL COMMITTEE awarded Messrs. VEITCH a gold medal and granted eight Awards of Merit to novelties exhibited by various raisers. Mr. G. F. MOORE was awarded a Lindley Medal for a choice collection of Orchids, and the ORCHID COMMITTEE recommended two First-class Certificates, two Awards of Merit, and one Certificate of Appreciation. No award of any kind was made by the FRUIT AND VEGETABLE COMMITTEE.

At the afternoon meeting of the Fellows Mr. James Hudson gave a lecture on "The Culture of the Fig in Pots" (see p. 343).

Floral Committee.

Present: Messrs. W. Marshall and Henry B. May (Chairmen); and Messrs. Chas. Dixon, W. P. Thomson, C. Blick, W. J. James, J. F. McLeod, W. Howe, Jno. Green, W. J. Bean, G. Reuthe, C. R. Fielder, J. Jennings, R. Hooper Pearson, H. J. Cutbush, Jno. Dickson, J. T. Bennett-Poë, Charles E. Shea, Chas. E. Pearson, E. H. Jenkins, George Paul, R. C. Reginald Nevill, George Gordon, and James Hudson.

Messrs. JAMES VEITCH & SONS, LTD., King's Road, Chelsea, filled a large table with Begonias raised from tuberous varieties crossed with *B. socotrana*. On this occasion, Messrs. VEITCH showed three seedlings each exhibiting a distinct break in colour, and all three received awards. Amongst the older sorts none was more beautiful

than *Elatior*, of rose-carmine colour and with a centre like a small *Camellia*. Mrs. Heal, Julius (double pink flowers), and Agatha were also included in the collection. Messrs. VERTCH were also the exhibitors of a group of *Chrysanthemums* in pots, the display forming the largest group in the hall. They were all of the decorative type, and magnificently grown. The finest were Yellow Cap (golden yellow), Red Cap (rosy-crimson, tipped with yellow), White Cap, Kathleen Thompson (crimson, tipped with gold), Greening's Caprice (rosy-mauve), John Shrimpton (rich crimson), Daphne (yellow, "shot" with terra-cotta), Ladysmith (rose-pink), Mary Richardson (bronze), and Countess of Edmont. (Gold Medal.)

Messrs. STUART LOW & Co., Bush Hill Park, Enfield, showed a very bright exhibit of Carnations of the perpetual-blooming type. Such popular sorts as Rose Enchantress, Winsor, Pink Delight, Beacon, Perfection, and Lady Alington were arranged in large sheaves with greenery and a ground of Ferns. (Silver Flora Medal.)

Messrs. H. B. MAY & SONS, Edmonton, showed Begonias of the Gloire de Lorraine type, including Agatha and Mrs. Leopold de Rothschild, both pink varieties, and Turnford Hall, white, with a trace of rose. The plants were excellent specimens, and arranged in a setting of Ferns. (Silver Flora Medal.)

Messrs. W. CUTBUSH & SON, Highgate, showed miscellaneous greenhouse plants, including well-grown specimens of *Erica gracilis*, *E. nivalis*, the dwarf Polyantha Roses Jessie, Mrs. W. H. Cutbush, and Orleans; *Dracæna Brantii* variegata and other kinds, Oranges in fruit, tiny plants of *Myrtus communis*, and, in the centre, a large batch of Begonias, including Ensign, Julius, Mrs. Heal, *Elatior*, Emily Clibran, and Winter Cheer. (Silver Banksian Medal.)

Mr. L. R. RUSSELL, Richmond, Surrey, filled a table with small plants in pots of berried shrubs, all adaptable for indoor decoration and for furnishing window-boxes. Varieties of *Pernettya mucronata*, *Skimmias* of kinds, the best being *Skimmia japonica* Formanii, and *Aucuba vera*, were all well fruited. Interspersed in the groups were ornamental Ivies, and an edging was made with *Euonymus latifolius albus*. (Bronze Flora Medal.)

Mr. FRANK LILLEY, St. Peter's, Guernsey, showed varieties of single *Chrysanthemums*, all fresh and pretty blooms; also some splendid Nerines, prominence being given to the large, rosy-pink N. Bowdenii. There were also varieties of N. Fothergillii major and N. Mansellii, one of the choicest being N. M. Salmon Queen.

Mr. VINCENT SLADE, Staplegrave Nurseries, Taunton, showed Zonal-leaved Pelargoniums, the best being New York (scarlet, with a white eye), Corona (rosy-pink), Ascot (salmon), Mentmore (bright rose), Helen Countess of Radnor (cerise), George Coates (salmon-red), and a new variety named Mrs. V. Slade (with rose-pink suffusion on a white ground).

Mr. GEO. REUTHE, Keston, Kent, showed a few Alpines in pots and numerous hybrid Nerines, mostly of N. Fothergillii major. Other parents were N. pudica, N. Bowdenii, and N. flexuosa. The largest-flowered hybrid, a derivative of N. Fothergillii major and N. Bowdenii, was named Harold.

Messrs. W. WELLS & Co., Merstham, Surrey, filled a table with *Chrysanthemums* of all types, the blooms being exceedingly fresh and bright. Many were seedlings, and of these three received Awards of Merit. Other new sorts that were specially good were Polly Duncan (a yellow single), White Lady (a single with a yellow "anemone" eye), Black Prince (dark crimson), and Snowflake (with stiff, white, pointed florets, set off by a well-formed yellow disc). The white Japanese Mrs. Gilbert Drabble promises to furnish exhibitors with one of the finest white varieties for the show board; it was awarded the Silver-gilt Medal at the recent Paris show offered for the best bloom in the exhibition. (Silver Flora Medal.)

Messrs. CARTER, PAGE & Co., 52 and 53, London Wall, London, showed a large assortment of *Chrysanthemums*, principally singles. There were several vases of the white Incurved Mrs. W. Roots, Moneymaker (a very free-blooming white Japanese variety), W. Beadle (crimson), the delightful Pompon Elsie Dordan, Rayonante (with narrow, pink florets), and, in the centre, pot plants of the single Altrincham Yellow. (Silver Banksian Medal.)

A corner group of *Chrysanthemums* was exhibited by H. B. BRANDT, Esq., Capenor, Nutfield, Surrey (gr. Mr. T. Heron). Several bold cespuges were filled with large Japanese blooms, giving the group an imposing appearance. In the foreground were mainly singles and decorative varieties. The flowers were set off by autumn-tinted foliage, *Codiaeums* (Crotons), and Ferns. (Silver Flora Medal.)

Messrs. J. PEED & SON, West Norwood, exhibited a group of *Chrysanthemums*, arranging them very pleasingly, with the specimen blooms of Japanese sorts as a background against Palms. In the centre was a stand of the delightful white single Mensa. Other excellent singles were Edith Pagram (the white florets stained with purple and set off by a fine yellow eye), Queenie Jessop (yellow), and Roupell Beauty (crimson). (Silver Banksian Medal.)

Messrs. G. C. PRICE & A. B. FYFE, Grove Park Nursery, Lee, showed varieties of *Chrysanthemums* interspersed with autumn-tinted foliage. The yellow R. F. Felton was very good, also Rayonante, H. W. Thorp (a white incurved sort), and the large Mrs. G. C. Kelly (the magenta florets showing a silvery reverse).

Mr. G. J. TUBBS, New Eltham, Kent, showed a sport from *Chrysanthemum* Lizzie Adcock, a well-known yellow market sort, the novelty having light-bronze flowers.

A. KINGSMILL, Esq., The Holt, Harrow Weald, showed large sprays of *Pernettya mucronata* with clusters of berries, and trails of *Vitis heterophylla* in full fruit.

A noteworthy exhibit of floral paintings was shown by Miss M. WALTERS ANSON, The Studio, 3, Broadway, Streatham. The pictures were principally varieties of *Caladium*, raised by Mr. Richard Hoffmann, Lower House, Streatham, and were most faithfully executed. (Silver Banksian Medal.)

Floral paintings were also shown by FRANK GALSORTHY, Esq., Green Lane Farm, Chertsey, Surrey.

AWARDS OF MERIT

were recommended for the following novelties:—

Carnation Baroness de Brien.—This is still another pink-coloured perpetual-flowering or tree Carnation. It has exceptional qualities in its pleasing tint and good form. Shown by Messrs. STUART LOW & Co.

Begonias Acquisition, Exquisite, and Her Majesty.—Messrs. JAMES VEITCH & SONS, LTD., Royal Exotic Nurseries, Chelsea, exhibited on this occasion a very fine display of their winter-flowering Begonias, obtained from crossing *Begonia socotrana* with ordinary tuberous-rooted varieties. In addition to the better-known sorts, three new varieties were shown, and each gained an Award of Merit. The first one, "Acquisition," has flowers of moderate size, a beautiful pink in colour, with paler centre. Its floriferousness and robust growth were remarkable features of this brilliant novelty. "Exquisite" may be recommended from the fact that the flowers are larger than those of any *Begonia* of this type yet raised, whilst it is certainly more vigorous in growth. The colour is rich rose, with a lighter centre to the flower. "Her Majesty" is quite distinct in colouring, being a yellowish-salmon, with rosy margins to the petals. All three novelties are well worthy the attention of the cultivator.

Chrysanthemum Golden Cap.—This is a yellow, decorative variety shown by Messrs. JAS. VEITCH & SONS, LTD., and Messrs. W. WELLS & Co. The dwarf plants—some 18 inches to 2 feet high—showed the variety to be specially valuable from the decorative point of view.

C. Golden King.—This new Incurved variety will rank amongst the finest exhibition flowers in this section. The blooms are very large and of good form; the florets incurve well, and the colour is a rich, golden yellow. Shown by Messrs. W. WELLS & Co.

C. Mrs. Andrew Walker.—This sport from the well-known decorative variety Freda Bedford is of a coppery-red tint. Shown by Messrs. W. WELLS & Co.

C. Percy Arnold.—This is a beautiful single flower of pink colour with white centre. From W. G. RIDGEN, Esq., Englefield Green.

Orchid Committee.

Present: J. Gurney Fowler, Esq. (in the Chair); and Messrs. Jas. O'Brien (hon. sec.), Sir Jeremiah Colman, Bart., Harry J. Veitch, Gurney Wilson, R. G. Thwaites, W. Thompson, G. F. Moore, T. Armstrong, A. A. McBean, W. Cobb, J. Charlesworth, J. E. Shill, J. Cypher, W. H. Hatcher, H. G. Alexander, A. Dye, C. H. Curtis, J. Wilson Potter, W. Bolton, R. B. White, J. S. Moss, de B. Crawshaw, C. Cookson, and C. J. Lucas.

G. F. MOORE, Esq., Bourton-on-the-Water (gr. Mr. Page), was awarded a Lindley Medal for a very fine group, in which the prevailing feature was made by about 80 very fine specimens of *Dendrobium Phalaenopsis Schröderianum*, most of which had been in the collection for 18 years. All were fine plants, varying considerably in tint, the darkest being the variety *rubescens*. The pure white forms were represented by two good examples of the variety *hololeuca*. D. P. Louisa Deane had white flowers, with a pink veining on the lip. A good selection of hybrids of *Cypripedium Fairrieum*, the white C. Baltonii, C. *Elatior*, C. *Leeanum* varieties, and *Lælia pumila* were also included.

E. R. ASHTON, Esq., Broadlands, Camden Park, Tunbridge Wells (gr. Mr. A. Young), was awarded a Silver Flora Medal for a very good group of well-grown specimens, a remarkable plant being his specimen of *Cattleya Phrygia* (Portia × Enid), a very fine flower of rose-purple tint, with a well-expanded dark labellum. The plant bore six flowers on a spike. Hybrids of *Lælia Perrinii* included several good specimens of L.-C. Lady Rothschild and L.-C. Statteriana. *Cattleya Luegæ* bore a fine spike of large flowers, and the forms of C. *Fabia* included a very good white variety. *Lælio-Cattleya Russelliana* (L.-C. Wellsiana × C. *Dowiana aurea*) was very fine. The white *Cattleya Dusseldorfei* Undine bore a flower nearly 6 inches across, and *Brasso-Cattleya* Mrs. J. Leemann had fine yellow and rose-coloured flowers.

Messrs. J. CYPHER & SONS, Cheltenham, were awarded a Silver Flora Medal for a very fine group of *Cypripediums*, among which were C. Gaston Bultel, C. Baron Schröder, C. Priam, forms of C. Thalia, the dark-coloured C. Tityus superbum, C. Niobe "Westonbirt" variety, good forms of C. *insigne* and C. *Leeanum*, and many others. *Phaio-Cymbidium chardwarensense*, the clear white *Oncidium ornithorhynchum* album, a batch of *Dendrobium formosum giganteum*, and D. *Phalaenopsis*, several hybrid *Odonoglossums*, &c.

Messrs. SANDER & SONS, St. Albans, secured a Silver Flora Medal for a good group, in which hybrids and rare species were well represented. There was a good show of *Cattleya Fabia* and C. *Fabia alba*, C. Mrs. Pitt, and other hybrid *Cattleyas*, of which C. *spectabile* (bicolor × *Empress Frederick*) was an exceptionally fine and brightly-coloured flower. Among species, the best was the charming white *Dendrobium Sanderæ*, and *Gongora cassidea*, *Cypripedium Schomburgkii*, and other rare plants were also noted.

Messrs. CHARLESWORTH & Co., Haywards Heath, were awarded a Silver Flora Medal for a fine selection of Orchids, in which the varieties of *Cattleya labiata*, including the white-petalled C. *labiata* Penelope, were effectively combined with C. *Fabia* and other hybrids, *Brasso-Cattleyas*, &c. In the centre were several fine forms of *Vanda cœrulea*, some brightly-coloured *Odontiodas* and finely-spotted *Odonoglossums*, while among the species was a good specimen of *Zygopetalum Sanderianum*, of the Z. *Maxillare* section, and differing from that figured in *Gartenflora*, 1888, t. 1287, in having more brown markings on the green sepals and petals, and a white instead of a light-blue lip; also *Pescatorea Roezlii*, a pretty *Mormodes* allied to M. *Cogniauxii*, and *Stanhopea convoluta*.

Messrs. HASSALL & Co., Southgate, were awarded a Silver Banksian Medal for an effective group of varieties of *Cattleya labiata*, the labellums being very broad and richly coloured. With them were several C. *Fabia*, C. *Fabia alba*, C. *Minucia* (very finely flowered), and a selection of *Cypripediums*.

Messrs. STUART LOW & Co., Bush Hill Park, were awarded a Silver Banksian Medal for a good group of *Cattleya labiata*, C. *Fabia*,

C. *Armstrongiae*, Brasso-Cattleyas, a good selection of *Oncidium*s, including a very fine dark form of *O. crispum*, *Cycnoches chlorochilon*, *Rodriguezia fragrans*, and *Oncidium bicallosum*.

Messrs. J. & A. A. McBEAN, Cooksbridge, were awarded a Silver Banksian Medal for a group in which were some exceptionally fine hybrids. *Lælio-Cattleya Arachne* had very fine flowers of an uncommon tint, and the still more beautiful *C. Venus lutescens* secured an Award of Merit (see "Awards"). Others noted were a richly-coloured *Odontioda Charlesworthii*, of the Cooksbridge strain, a pure white *Dendrobium Phalænopsis*, *Cattleya Suavior alba*, *Cypripedium insigne Sanderæ*, with 15 flowers, and *Cattleya Mantinii*, with three spikes.

Messrs. ARMSTRONG & BROWN, Tunbridge Wells, were awarded a Bronze Medal for a group of well-grown *Cattleya Fabia*, a very good selection of *Cypripedium*s, including the stately *C. Dreadnought*, *C. Dallas superbum*, *C. Elatior*, *C. Thalia* Mrs. Francis Wellesley, *C. insigne Bohnhoffianum*, and other forms of *C. in-*

J. GURNEY FOWLER, Esq., showed a very fine spike of *Cymbidium Tracyanum*, and a new bi-generic hybrid (see Awards).

Mr. G. W. MILLER, Clarkson Nurseries, Wisbech, showed hybrid *Cypripedium*s, including *C. Ossulstonii*, *C. Sallieri*, *C. Clarksoniæ* (*Actæus* × *insigne* Laura Kimball), like the best dark form of *C. insigne Sanderæ*, and *C. Curtisii*.

Mrs. N. C. COOKSON, Oakwood, Wylam, showed the pure white *Calanthe Harrisii*, the pretty *Cypripedium A. J. H. Smith* (*Euryades* × *niveum*), and others (see Awards).

F. DUCANE GODMAN, Esq., Horsham, sent *Sophro-Lælio-Cattleya Alice* (*S.-L. heatonense* × *C. Mrs. Pitt*), a pretty rose-purple flower.

The Rev. J. C. B. FLETCHER, Mundham Vicarage, Chichester, sent a spike of a clear-white form of *Bulbophyllum Medusæ*, *Catasetum Gnomus*, and *Epidendrum*.

J. GURNEY WILSON, Esq., Glenthorne, Haywards Heath, sent an interesting form of *Cattleya labiata*, showing fixed peloria.

E. H. DAVIDSON, Esq., Borlases, Twyford, sent

purple. The broad, deflected petals are densely spotted with dark purple.

Cattleya Venus lutescens (*Iris* × *Dowiana aurea*), from Messrs. J. & A. A. McBEAN, Cooksbridge.—A noble flower like an expansion of *C. Iris*, with sepals and petals pale lemon yellow, with slightly darker veining. Lip broad, dark rose, with yellow markings on the base.

CERTIFICATE OF APPRECIATION.

Odontocidium Fowlerianum (*Odontoglossum cirrhosum* × *Oncidium Forbesii*), from J. GURNEY FOWLER, Esq. (gr. Mr. J. Davis).—A very pretty and interesting hybrid with sepals and petals having a yellowish ground and cross bars of chocolate red. The lip is showy, yellow, lighter in front, and marked with chestnut red.

Fruit and Vegetable Committee.

Present: G. Bunyard, Esq. (in the Chair); and Messrs. J. Cheal, W. J. Jeffries, W. Bates, A. Dean, E. Beckett, J. Davis, J. Willard, G. Reynolds, G. Wythes, and J. Harrison.

Numerous seedling Apples were presented for awards, including four handsome varieties shown by Lady THORNYCROFT, Bembridge, Isle of Wight. These were named respectively Sir John Thornycroft, Lady Thornycroft, Blanche, and Steyne's Seedling. The first-named variety was a round, handsome fruit with flesh of good flavour. The committee expressed a wish to see fruits at the next meeting accompanied by a description of the growth of the tree. H. W. THORNE, Esq., Teddington, showed fine fruits of Uvedale's St. Germain Pears, and Mr. R. HARTLAND, Cork, Ireland, exhibited bright-red fruits of Ballinora Pippin and highly-coloured fruits of Cox's Orange Pippin. W. J. VOSS, Esq., Rayleigh, Essex, staged a collection of 16 baskets of Apples generally of medium size. The varieties included Emperor Alexander, Waltham Abbey Seedling, Lane's Prince Albert, New Hawthornden, Mère de Ménage, The Queen, Duke of Devonshire, and Worcester Pearmain; Pear Beurré Bachelier, and Quinces.

MESSRS. STUART LOW & CO., Bush Hill Park, Enfield, exhibited 20 baskets and dishes of Apples, including Lane's Prince Albert, Lord Derby, Royal Jubilee, Newton Wonder, Mère de Ménage, Allington Pippin, King of the Pippins, Cox's Orange Pippin and Paroquet.

THE LECTURE.

Sir Albert Kaye Rollit presided at the afternoon meeting of the Fellows, when a lecture on "The Culture of the Fig in Pots" was given by Mr. Jas. Hudson, V.M.H. In order to illustrate the lecture, several examples of pot-grown Figs in a fruiting condition were shown from the collection at Gunnersbury House gardens. These were chiefly plants struck from eyes or cuttings in January last, and comprised such varieties as Negro Largo, D'Agen, White Ischia, Violette de Bordeaux, Violette Sepor, Brown Turkey, and Bourjassotte Grise. The object of the lecturer in showing the specimens was to demonstrate the rapidity with which the Fig may be grown, and to show how freely these varieties will bear fruit in 10 months from the time they are propagated. The plants were in the best condition of health, and should continue to yield fruit for some weeks to come. One tree was exhibited to show how long a Fig tree may be grown in a pot in a healthy, fruiting condition. It was about 12 years old, and carried several fruits, although the greater part of the crop had been gathered. It was trained in a columnar manner, and tied to one stake only. The variety was Negro Largo, one of the best of all late Figs, and was growing in a pot 11 inches in diameter, but with no superfluous growth whatever. The lecturer advocated the culture of Figs in pots, both for early and late fruiting. For very early cropping, either St. John or Pingo de Mel was recommended in preference to Brown Turkey, which is suitable for successional cropping. For late and extra late forcing, Negro Largo, Bourjassotte Grise, White Ischia, and D'Agen were named as the best varieties for the purpose. Comparatively small pots were advocated, since they are easy to move and better for storing when the plants are at rest. The earliest plants, when started into growth, are treated like vines, but in the case of late kinds, growth will have already commenced when room can be found

FIG. 147.—SINGLE CHRYSANTHEMUM MISS MARGARET WALKER: COLOUR GOLDEN-BRONZE.

Awarded the National Chrysanthemum Society's Certificate of Merit on the 1st inst. (See p. 327 ante.)

signe, &c. Interesting species were *Dendrobium Cælogyne*, *Cirrhpetalum appendiculatum*, and *Bulbophyllum Godseffianum*.

W. R. LEE, Esq., Plumpton Hall, Heywood (gr. Mr. Woodhams), showed the very fine *Cypripedium King George* in grand condition and *C. Hannibal* finely grown.

FRANCIS WELLESLEY, Esq., Westfield, Woking (gr. Mr. Hopkins), showed *Cattleya Olaf* (*labiata alba* × *Parthenia Prince of Wales*), a good flower with white sepals and petals, the crimped lip having rose markings in front of the yellow disc.

Mr. E. V. Low, Vale Bridge, Haywards Heath, staged a group in which were *Cattleya labiata* W. R. Lee, a fine white form with pink on the lip; varieties of *Cypripedium Thalia*, *C. Germaine Opois*, *C. Gaston Bultel*, *Lælio-Cattleya Decia alba*, and *Cymbidium erythrostylum*.

His Grace the Duke of DEVONSHIRE, Chatsworth (gr. Mr. Jennings), sent an example of the fine old red *Renanthera coccinea*, with a large, five-branched spike, for which the Committee passed a Vote of Thanks.

Odontioda Dora with scarlet flowers, and a white *Cypripedium Venus*.

C. J. LUCAS, Esq., Warnham Court, showed a nearly white form of *Brasso-Cattleya Digbyano-Mendelii*.

AWARDS.

FIRST-CLASS CERTIFICATES.

Cattleya Ashtonii alba (*Harrisoniana* × *Warszewiczii*), from Messrs. SANDER & SONS. A very fine, white flower, with well-expanded lip, having a yellow disc.

Calanthe Cooksoniæ, from Mrs. N. C. COOKSON, Oakwood, Wylam (gr. Mr. H. J. Chapman).—The largest and purest white *Calanthe*. The *C. Harrisii* which was one of the parents was also shown, but the new hybrid is by far the better.

AWARDS OF MERIT.

Cypripedium Sibyl superbum (*Francisiæ* × *Fairrieanum*), from Mrs. COOKSON.—A fine, bold flower, the large, white dorsal sepal tinged with rose and striped from the green base with dark

for them, consequently they are afforded more warmth than the early sorts. It was pointed out that two sets of Fig trees might be utilised for growing in one house—the first from January to June, the second from July to December.

Mr. Hudson said that at Gunnersbury the pot Figs are grown in the same houses as the early-forced Strawberries, Cherries, and some of the Peaches, Plums, and Nectarines. Thus the houses are never empty. One house that has Figs in a fruiting condition now will, in January, be filled with Cherries that will ripen their fruits in April and onwards. The lecturer advocated top-dressings, and said that repotting is not necessary every season. The old top-dressings, however, and some of the original soil should be removed and fresh soil added. In repotting, the mass of old soil should be reduced and pots of the same size used again, except in the case of young trees that require a shift.

FRENCH CHRYSANTHEMUM. EXHIBITION AT BIARRITZ.

OCTOBER 26-29.—The French Chrysanthemum Society held its sixteenth annual Congress in the Casino at Biarritz on these dates, in conjunction with an International Chrysanthemum Show. The place chosen was a most admirable one, the richly-decorated corridor and saloons of the Casino forming a delightful setting for the Show.

The jury was presided over by M. Henri Martinet, Editor of *Le Jardin*, and M. Blot, of the firm of Vilmorin Andrieux & Co. The vice-presidents, both foreigners, were Señor Alfred de la Peña, who represented Spain, and Mr. Harman Payne. The secretary for the jury was M. Philippe Rivoire, of Lyons.

After the work of judging was finished the members of the jury were entertained at luncheon at the Grand Hotel, when M. Martinet presided.

The exhibits of Messrs. VILMORIN ANDRIEUX & Co. were staged in a handsome room by themselves, and comprised two fine collections of plants in pots and a border on one side of the room. They were both edged with two lines of dwarf plants of Pompon varieties *Gerbe d'Or* and *Purpurine*. Many novelties were included, and amongst the best flowers we noted, in the big groups, *Casablanca*, *Soleil d'Or*, *Rose Pockett*, *Mrs. R. D. Eves*, and *Canariotte*. In the other *Alice Lemon*, *Capt. Julian*, *Pockett's Crimson*, *Lt.-Col. Ducroiset*, *J. H. Silsbury*, and others were noteworthy. The border contained some prettily-trained plants, including pyramids, of which *L'Africaine*, *Canari*, *Mrs. W. Wells*, *White Queen*, *Tapis de Neige*, and *Ouragan* were conspicuous. The premier Grand Prix d'Honneur was awarded to this exhibit.

In another saloon adjoining were two exhibitors, Messrs. GELOS FRÈRES and Mme. BÉGUÉ, who in collaboration supplied the table decorations. The effect was remarkably fine, and when lighted up at evening was delightful. A large centre table was decorated with white Roses, and around it 13 smaller circular tables, each having its special feature of colour design, including *Lily of the Valley*, *Roses*, *Ageratum*, *Carnations*, *Orchids*, and *Violets*. The windows of this hall were decorated with Bamboos and pots of Chrysanthemums, these latter being on pedestals at intervals. The second Grand Prix d'Honneur was awarded for this display.

The third chief prize was awarded to M. RODRIGUES, the Society's President, who staged a most meritorious group of pot plants in the best condition. We noted among them some very fine blooms of *Mme. Gustave Henry*, *Mary Mason*, *Paul Randet*, *Quai d'Orsay*, *President Loubet*, *Solferino*, *Dr. Gerard*, *L. Charvet*, *Beauté Poitevine*, and *Mme. Carnot*.

M. RODRIGUES was also the exhibitor of several other groups, *Dahlias*, *Roses*, &c., which contributed materially to the beauty and success of the exhibition.

Another excellent exhibit was put up by M. BONNET, who had *Electra*, *Le Bouvier*, *Mme. de Maziers*, *Mme. Montigny*, *Dr. Roche*, and others in fine style. Other exhibitors of Chrysanthemums were MM. CATROS-GERAND, LABASTE, DUGÈNE, and LOUBLIÉ.

In a side passage, just off the main corridor, was a collection of trained specimen plants of Chrysanthemums in all sorts of quaint forms, a practice much in vogue with French growers just

now. Unfortunately the plants were too late, the flowers being all in the bud stage.

Other exhibits were shown by M. A. ROUMAGNAC, who had a fine lot of cut blooms, the best being *F. S. Vallis*, *Australie*, *Fez*, *Le Bouvier*, *Louis Charvet*, *Bryant's Beauty*, and *Mrs. J. A. Miller*. A tall stand of *Roses* was also shown by this exhibitor. We noted in passing various exhibits from MM. LOUBLIÉ, DUGÈNE, PIERSON, LASSUS, and others. Then at the side of the farthest hall was a long border of Chrysanthemums staged by M. CATROS-GERAND, in which we noted *R. Hooper Pearson*, *Rayonnante*, *Soleil d'Octobre*, *Excelda*, *Bijou*, and *Capt. Julian*.

Some good cut blooms were shown by Comte. F. DE BEARN (gr. M. Pieuchot)—*Lt.-Col. Ducroiset*, *Rayonnant*, *Mrs. Coombes*, *Victoria* and *Albert* were excellent.

A number of exhibitors showed in the classes for new seedlings. The prizes awarded were: Prix d'Honneur to the CALVAT ESTABLISSEMENT (M. Remy, director); Prix d'Honneur to ALFRED CHANTRIER; Medals and Honourable Mention to MM. DOLBOIS, PRIoux, GALINIER, BRONDEL, HERAUD, ANDOL, LACROIX, LAFITTE, and RAILLON.

It did not appear from a casual examination of the Show that big exhibition blooms were so numerous as would be seen at an English exhibition. But this was compensated for by the excellent manner in which every exhibit was arranged. As is usual in France, there were no show boards and no tables. Briefly we may say without dealing with individual exhibits that the best flowers from the English point of view were *Bryant's Beauty*, *Lt.-Col. Ducroiset*, *Australie*, *Ma Provence*, *Alfonso XIII.*, *Mrs. C. H. Totty*, *Rayonnant*, *Sapho*, *Miss Dalton*, *Mr. R. F. Felton*, *Lady Hopetoun*, *Ferd. de Bievre*, *Paul Randet*, *Ant. Marmontel*, *Nathalie Bourseul* and a few others already mentioned in this report.

Other kinds of flowers were also shown in moderate quantity, the chief of these being undoubtedly *Dahlias*.

A large and varied collection, mostly Cactus varieties, was shown by Messrs. LABASTE FRÈRES. Messrs. CATROS-GERAND showed Cactus and decorative *Dahlias*, as also did M. RODRIGUES who had a long exhibit of cut blooms arranged on the ground level that practically carpeted the floor. There was another collection of *Collette Dahlias* close by, but to this no exhibitor's name was attached.

Dahlias, mostly of the Cactus type, were also shown by M. LOUBLIÉ.

The well-known firm of Biarritz florists, Messrs. GELOS FRÈRES & DUFILS showed floral devices.

Miscellaneous exhibits comprised an attractive group of Ferns, mostly *Nephrolepis*, in variety, from M. A. ROUMAGNAC; a collection of *Begonia Rex* with a semi-circular group of *B. pictavensis*, from M. LASSUS, and *Carnations* shown well by Messrs. LABASTE.

Fruit was shown in moderate quantity. An exhibit was shown by Mme. JULIEN consisting of fine Pears of such varieties as *Beurré Diel*, *Doyenné du Comice*, *Bergamotte d'Automne*, and *Beurré Clairgeau*. M. E. PUJO staged a meritorious lot of Grapes, Peaches, and Pears tastefully set up in baskets. Comte F. DE BEARN (gardener M. Vieuchot) showed Pears and Apples in considerable variety, as did also the *Propriété FOURNEAU*.

On the second day of the show the first meeting of the congress was held, and in the evening the members were entertained at a banquet at the Grand Hotel, presided over by M. Viger.

On Saturday, the 28th ult., the company proceeded by rail as far as the frontier town of Hendaye, where M. Henri Martinet entertained about 73 members to lunch at the Hotel Eskualduna. A visit was made to the ancient town of Fuenterrabía, in Spain, the party crossing the river Bidassoa in boats.

After this they returned to Hendaye, took train for San Sebastian, and visited the Miramar Palace (the Palace of the King of Spain) and the gardens.

On 29th ult. the last meeting was held, when M. Rodrigues made the distribution of the prizes and other awards.

At the congress meeting, held under the presidency of M. Viger, M. Blot read a paper, which dealt with the question of the Society publish-

ing a pocket edition of the *Repertoire des Couleurs*. He proposed a new arrangement of the colours and that they be printed on grey paper instead of white. Messrs. Oberthur and Clement expressed approval. It was resolved that the same be carried out. Another paper, by M. Decault, was on the taking of the bud of Chrysanthemum, whilst Dr. Chiffot dealt with insects and diseases affecting Chrysanthemums. M. Crepin called attention to the large number of plants that were non-productive of buds this year, and stated that nearly all his plants grown in the open had suffered in this respect.

Mr. Harman Payne stated that, although the Chrysanthemum was a hardy plant, yet in America it was grown for show purposes under glass, on benches, mainly because of the different climatic conditions. He thought that this system might in hot summers be useful to French growers. Dr. Chiffot and Mr. Charvet also addressed the meeting.

It was proposed that next year's congress be held at Nantes.

PORTSMOUTH CHRYSANTHEMUM.

NOVEMBER 1, 2, 3.—This autumn exhibition was held in the Town Hall, Portsmouth, a building very well adapted for the holding of a flower show. The exhibits were of a high grade of excellence, and groups of Chrysanthemums were more numerous than usual. Although the quality of the flowers was superior, in many instances the arrangement of the plants was faulty. Cut blooms, especially *Incurved* varieties, were superior to those usually seen so early in the season. Fruit and vegetables were unusually good. The arrangements of the show were well carried out under the supervision of the hon. secretary, Mr. W. E. Gill.

CUT BLOOMS SHOWN ON BOARDS.

JAPANESE VARIETIES.—In the class for 36 blooms, in not fewer than 18 varieties, Captain DALGETY, Lockerley Hall, Romsey (gr. Mr. W. Baxter), secured the leading award—a handsome silver cup with a cash prize—with very refined flowers. Especially good were the *Hon. Mrs. Dalgety* (a rich crimson variety), *Lady Talbot*, *Mrs. G. Hemming*, *Frances Jolliffe*, *D. B. Crane* (one of the finest of the yellow sorts), and *Mrs. A. T. Miller* (still one of the best of whites). PANTIA RALLI, Esq., Ashted Park, Epsom (gr. Mr. G. J. Hunt), was placed 2nd with many handsome blooms, but less uniform than those in the premier collection.

For 24 blooms, in not fewer than 12 varieties, Sir F. FITZWYGRAM, Leigh Park, Havant (gr. Mr. A. Herbert), was awarded the 1st prize, having handsome examples of such sterling varieties as *Duchess of Sutherland* (rich yellow), *Countess of Granard* (a new flower of the same colour), *Mrs. A. T. Miller*, and *W. Biddle*. 2nd, Mr. W. E. GILL, Osborne Road, Southsea.

INCURVED VARIETIES.—In the class for 24 varieties, Mr. PANTIA RALLI won the 1st prize easily with charming specimens of leading varieties. Those premier yellow-flowered sorts, *Romance*, *Buttercup*, and *Emblème Poitevine* were finely represented. 2nd, Mr. GILL.

SINGLE VARIETIES.—For 12 bunches of three blooms each, Mr. H. SNOOK, 5, Fitzroy Street, Portsmouth, won the 1st prize easily, showing handsome blooms of *Metta*, *Ideal*, *Draco*, and the bicolor *Sylvia Slade*. The 2nd prize was awarded to Mr. C. JOHNSON, 10, Garnier Street, Portsmouth.

Pompons were best shown by Mr. SNOOK, with such well-known sorts as *W. Westlake* and *W. Sabery*. 2nd, Mr. J. NANCE, 98, Hampshire Street, Portsmouth.

In a combination class of Japanese and *Incurved* varieties, 12 of each sort, and restricted to growers within a radius of 12 miles from Portsmouth, W. GARTON, Esq., Sainsbury Court (gr. Mr. D. Edwards), was placed 1st for an even set of full-sized blooms.

GROUPS OF CHRYSANTHEMUMS were represented by six competitors in the one class set apart for them, making a fine display on each side of the hall. Mr. W. E. GILL was distinctly 1st with dwarf plants, well clothed with foliage, and carrying full-sized, shapely flowers of both Japanese and *Incurved* varieties. 2nd, Sir F. FITZWYGRAM, with well-grown plants, not so well arranged.

Mr. LAMBERT, Chichester, secured the two leading awards for 12 and 8 specimen Chrysanthemums respectively, with medium-sized plants of popular sorts.

FRUIT was well shown. W. H. MYERS, Esq., Swanmore Park, Bishop's Waltham (gr. Mr. G. Ellwood), secured the leading award for two bunches of black Grapes with Gros Maroc, in fine condition, and he also showed the best six dishes of Apples.

Captain DALGETY won the 1st prize for white Grapes, showing Muscat of Alexandria, with rich, amber-coloured berries.

Mr. C. H. HOUSE, Privett, Gosport, excelled in the class for six dishes of Pears.

Mr. MYERS beat all other competitors in the four vegetable classes in which he competed.

The BARNHAM NURSERY Co. were awarded a Gold Medal for a superb collection of Apples.

A Silver Medal was awarded to Messrs. W. WELLS & Co., Merstham, for a collection of Chrysanthemums representing several sections.

COVENTRY CHRYSANTHEMUM.

NOVEMBER 2, 3, 4.—The seventeenth annual exhibition of this society was held at the Territorial Drill Hall, and though not so strongly representative numerically in respect to Chrysanthemums, due to the unfavourable season, the show was a most successful one. Excellent groups of Chrysanthemums were exhibited by Mr. W. FINCH and Mrs. W. I. ILIFFE, which gained 1st and 2nd prizes. The grouping of the 1st prize exhibit was excellent; in the one which was placed 2nd there were some superior blooms, but the arrangement was not so well carried out as in Mr. FINCH's collection. Mr. HUGH ROTHERHAM (gr. Mr. G. Griffin) and Councillor C. VERNON PUGH (gr. Mr. T. Kemp) staged two exceedingly attractive miscellaneous groups not for competition. The entries of cut blooms in the classes for Japanese blooms were very sparse indeed, but some good specimens were exhibited, and in this department Mr. A. HOYLE was successful. The 1st prize for a group of Chrysanthemums was awarded to Mr. J. P. WARD, whilst in the classes devoted to amateurs and cottagers only Mr. W. WETTON gained two 1st prizes for Japanese and incurred varieties respectively. As usual at these exhibitions, fruit was a strong feature. Messrs. G. BUNYARD & Co., Maidstone, exhibited more than 100 dishes of Apples and Pears, making a special feature of Uvedale's St. Germain Pear, some of the specimens weighing more than two pounds. The EXORS. OF THOS. WEBB, Coventry, were awarded a Gold Medal for a capital selection of fruit and vegetables.

CHELTENHAM FRUIT AND CHRYSANTHEMUM.

NOVEMBER 2, 3.—In almost every department the Cheltenham Root, Fruit, Chrysanthemum, and Winter Flower Society's show, which was held at the local Town Hall on these dates, displayed a distinct advance upon last year's exhibition. The entries on the whole were about the same, although the variety was greater.

The Chrysanthemum has always been, and probably will remain to the end, the great feature of the show, which is always briefly intitled the "Chrysanthemum Show," although year by year other features have come to share a larger proportion of the honours than was formerly the case.

Mr. C. J. MAYO, Ellenville, Naunton Lane, won the silver cup presented by the Mayor and Corporation for the best collection of six distinct varieties of Japanese Chrysanthemums, and Mrs. ST. CLAIR FORD (gr. Mr. F. Payne) was awarded Alderman Skillicome's silver cup offered for the best plant in the show. Other principal prize-winners were Mr. F. MAY, Mr. H. ANDREWS (gr. Mr. J. R. Tooley); Mr. C. F. CLIFT, J. BARRETT & SON, Victoria Nurseries, Mr. G. W. RESTALL, Mr. J. HORLICK, Cowley Manor (gr. Mr. J. Maddock), Mrs. BRIERLEY, Southwick Park (gr. Mr. W. Parker), Mr. E. ADLARD (gr. Mr. E. C. Young), Mr. H. J. TILLEY, Halls Road Gardens, Mrs. GREAVES, The Cottage, Wormington, and Miss A. RECKLESS, Sunnyfield, Hatherley.

In the classes for Carnations Mr. J. HORLICK, of Cowley Manor (who won two 1st and one 2nd prizes), and Mr. H. ANDREWS, of Toddington Manor (gr. Mr. J. N. Tooley) were the leading exhibitors. Begonia Gloire de Lorraine was shown splendidly, but Primulas appeared to be not so good as usual.

Exhibits of Grapes were not equal to the average quality, but hardy fruits showed remarkable colour. Apples were much better than Pears, being greater in number, firmer, larger, and more even in quality.

The chief prize-winners for fruit were: (Apples) Sir PERCY CUNYNGHAME, Mrs. ROBINSON, and Messrs. W. S. R. COX, T. SPENCER, J. BOTT, R. WILSON, H. WOORMAN, JAS. HORLICK, G. W. RESTALL, H. NEWMAN, and E. ADLARD; (Pears) Mrs. ROBINSON, Mrs. ARLEY, and Messrs. J. HITCH & SONS, C. M. FLETCHER, H. ANDREWS, T. SPENCER, H. G. BENNETT, and H. WOORMAN; (Grapes) Messrs. H. ANDREWS and J. PLAYER.

In the large hall honorary exhibitors made a grand display. Messrs. J. CYPHER & SONS, Cheltenham, showed choice Orchids, also stove and greenhouse plants; Messrs. YOUNG & Co., Hatherley, had an extremely fine collection of perpetual-flowering Carnations. Mr. COVILLE exhibited a representative collection of greenhouse plants; THE KING'S ACRE NURSERIES, Hereford, showed probably the largest and finest lot of hardy fruit ever seen in the county, whilst Mr. WHITEHEAD exhibited pot Carnations and Chrysanthemums.

TORQUAY DISTRICT GARDENERS'.

NOVEMBER 3.—The annual Chrysanthemum show of this society was held on this date, and was a great success, the entries being above the average and the exhibits of very high quality. The competition was keen in many of the classes. The class for groups of single Chrysanthemums was excellent, the National Society's Certificate and 1st prize being won by Mrs. LYON, with a very perfect stand. The 1st prize for a group of Chrysanthemums in the form of a semi-circle was won by Mrs. RICHARDSON, with a collection of very choice flowers. The trained Chrysanthemums were very fine, the Certificate of Merit and the 1st prize being won by Mrs. LYON, with plants about 5 ft. in diameter. The same lady also won the 1st prize in the class for single specimen plants. The cut blooms were hardly up to the standard of former years. The 1st prize for 24 Japanese blooms was won by Dr. T. G. SKARDON, who also won the 1st prize in the class for 12 Japanese blooms. For six flowering plants for the table and for six Ferns, Col. CARY won the 1st prizes, whilst for six foliage plants the 1st prize was awarded to Dr. QUICK. Capt. PHILLIPPS showed the best specimens of winter-flowering Begonias, and Dr. QUICK the best plants of Solanum capsicastrum.

In the class for artisans and cottagers, the silver cup offered for six Chrysanthemum blooms of any variety was won by Mr. T. GUEST, who also won the National Chrysanthemum Society's silver medal for the best bloom in the show, with a magnificent example of the pure white Miss A. T. Miller. There were pretty table decorations and several well-arranged vases of cut Chrysanthemums, as well as artistic baskets of berry-bearing plants. The exhibits of fruit were of a very high order of merit, the chief 1st prizes being won by Col. CARY, while other winners were Dr. QUICK, Dr. LEON, Mrs. TOTTENHAM, and Capt. PHILLIPPS. In the vegetable classes the chief prizes were taken by Mr. P. P. ALEXANDER. In the classes open only to residents in the borough, all the 1st prizes except one for cut blooms were won by Mrs. LYON, the remaining 1st prize being won by Mrs. Tottenham. There were also classes for vases of cut Chrysanthemums. Many special prizes were offered for various vegetables, the majority of which were won by Mr. P. P. ALEXANDER and Col. CARY.

The nurserymen's exhibits added much to the attractions of the show. The DEVON ROSARY, Torquay, staged Lilium longiflorum, Bouvardias, Nerine Bowdenii, Cyclamen, Crotons, Solanum capsicastrum, Eupatorium micranthum, Ericas (pink and white), Pandanus Veitchii, Acalypha hispida, fine Palms, Ferns, and a representative collection of Chrysanthemums. The same firm exhibited a collection of Apples and Pears in 80 varieties.

Messrs. ROBERT VEITCH & SON, Exeter, had an interesting stand, in which were many varieties of winter-flowering Carnations. Fruits of Thladiantha dubia were shown as well as Veronica Veitchii, Acacia Baileyana, Cedrus atlantica glauca, Abies pungens glauca, Correa cardinalis, C. magnifica, Metrosideros floribunda, Ceanothus Gloire de Versailles, &c.

Mr. W. B. SMALE, Torquay, showed Zonal Pelargoniums, variegated Phormium tenax, Anthuriums, Solanums, Begonias, Ericas, Bouvardias, Palms, and Ferns.

Mr. H. MAYNE, Torquay, exhibited Asparagus plumosus, Carnations, Ericas, Lilies, and Chrysanthemums.

Messrs. BURRIDGE & SONS, Torquay, showed Hydrangeas, Cocos Weddelliana, Lilies of the Valley, Violets, and other plants.

ABERDEEN ROYAL HORTICULTURAL.

NOVEMBER 4.—The annual general meeting of the members of this Society was held in the Music Hall Buildings, Aberdeen, on this date. Ex-Baillie Milne, vice-chairman, occupied the chair, and, despite the very inclement weather, there was a large attendance. The chairman moved the adoption of the annual report, which showed that the Society's exhibition, held in the Duthie Public Park, Aberdeen, in August last, was one of the most successful shows held under the auspices of the Society. The income for the year amounted to £497 15s. 7d., and the expenditure was £471 15s. 8d., leaving a surplus of £25 19s. 11d., which, with a balance of £1 7s. 11d. at the beginning of the financial year, leaves a credit balance of £27 7s. 10d. The chairman described the report as a very satisfactory one. The honorary president, vice-president, and directors were re-elected, Colonel W. S. Gill was re-elected chairman, Ex-Baillie Milne vice-chairman, Messrs. W. Reid and W. Wyllie auditors, and Mr. J. B. Rennett, advocate, Aberdeen, secretary and treasurer. The other officers were also appointed.

BIRMINGHAM CHRYSANTHEMUM, FRUIT AND VEGETABLE.

NOVEMBER 7, 8, 9.—The fifty-first annual exhibition, held in the spacious Bingley Hall on the above dates, was rather smaller than usual. Although cut Chrysanthemums were not strong numerically, they were of good quality, especially the Japanese varieties, which were large, shapely, and beautifully fresh. Specimen Chrysanthemum plants were well trained and profusely flowered, but competition in the classes provided for these was very disappointing, there being only seven exhibits in six classes.

Tables decorated with Chrysanthemum flowers were numerous and more attractive even than usual. Fruit was excellent, especially Grapes and Apples, the latter fruit being richly coloured. Vegetables were also good.

The recently-introduced class for Tree Carnations, for which a magnificent silver challenge shield and £10 were offered as 1st prize, failed to attract a single competitor. Primulas, once Birmingham's glory, were few in number and of indifferent quality.

The honorary exhibits constituted a feature, and occupied a very large area. They included fruit, vegetables, Chrysanthemums, Carnations, Orchids, trees, and shrubs.

It is surprising that this half-century-old Chrysanthemum society should receive only lukewarm support from the well-to-do residents in and near Birmingham. The list of annual subscribers is far from satisfactory, and if the Society is to continue its useful work, Birmingham will have to wake up.

The arrangements made for the convenience of exhibitors by Mr. A. Noakes, secretary, and Mr. John Hughes, staging manager, gave general satisfaction.

SPECIMEN PLANTS.

As already pointed out, competition in the specimen plant classes was poor. It was a walk-over for J. A. KENRICK, Esq., Berrow Court, Edgbaston (gr. Mr. A. Cryer), who was awarded 1st prizes for (1) six Japanese varieties, (2) six large-flowering varieties (Japanese excluded), (3) three Japanese varieties, (4) one large-flowering variety (Japanese excluded), (5) one Japanese variety, and (6) three single-flowered varieties.

T. W. PIGGOTT, Esq., Park Hill, Moseley (gr. Mr. R. Bullock), gained the 2nd prize in the last named class.

GROUPS.

There were two exhibits in the principal class, which was for a group of Chrysanthemums arranged on a floor space of 16 feet by 10 feet. Cut flowers in water were allowed, also Ferns and other foliage plants. The 1st prize of £10 was won by J. A. KENRICK, Esq., Berrow Court, Edgbaston (gr. Mr. A. Cryer), whose exhibit included a large number of very well-grown plants. A centre cone was formed of huge Japanese varieties, surmounted by a graceful Palm. The corners were composed largely of single-flowered varieties, and in the body of the group tall stands decorated with yellow and pale-coloured Japanese varieties were very effective and much admired. 2nd, HUME C. PINSENT, Esq., Lordswood Road, Harborne (gr. Mr. G. Corbett).

In a similar but smaller class, the 1st prize was secured by T. W. PIGGOTT, Esq., Park Hill, Moseley (gr. Mr. R. Bullock), for a representative collection of well-grown plants effectively arranged. 2nd, H. GREEN, Esq., Gravelly Hill (gr. Mr. L. Fewkes).

In a class for decorative Chrysanthemums, to be shown as grown, on a space of 15 feet by 10 feet, two very fine exhibits were placed before the judges, whose task was by no means easy in arriving at a correct decision, as the quality of the flowers and arrangement of same were fairly evenly balanced. 1st, Mr. C. H. HERBERT, Hazlewood Road, Acock's Green, Birmingham, whose best effect was produced by the use of crimson, yellow, and bronze-shaded varieties. 2nd, J. A. KENRICK, Esq.

CUT BLOOMS.

Four exhibitors competed in the principal class, which was for six vases of 18 Japanese varieties, one bloom each of three varieties in a vase, the stems of the flowers to be not less than 18 inches long. The 1st prize of £6 was won by Mr. W. IGGULDEN, Lock's Hill, Frome, who had handsome flowers of Reginald Vallis, Bessie Godfrey, Mrs. R. H. B. Marsham, F. S. Vallis, Frances Jolliffe, Miss Ella Greene, Master David, D. B. Crane, Gladys Blackburne, Hon. Mrs. Lopes, Mrs. R. Hooper Pearson, Mrs. F. C. Stoop, Mrs. W. Knox, Mme. P. Radaelli, Miss Annie Nicholl, Frank Payne, Kara Dow, and Annie Hamilton. 2nd, HUGH ANDREWS, Esq., Toddington Manor, Winchcombe, whose best blooms were Magnificent, Mrs. A. T. Miller, and Mrs. C. Penford. The last-named exhibitor had the leading vase of three crimson Japanese blooms in Pickett's Crimson, which were very fine.

The best of four exhibits of four Japanese varieties, three blooms of each, came from J. H. WHEATLEY, Esq., Berkswell Hall, Coventry (gr. Mr. W. H. Westbury), who showed splendid blooms of Mrs. Charles Penford, Reginald Vallis, Mrs. R. Hooper Pearson, and Frances Jolliffe. 2nd, Mr. W. IGGULDEN, Frome.

The best single vase containing three blooms of any pink variety was exhibited by Mr. H. WOOLMAN, Shirley, Birmingham, whose examples of Alice Lemon were uncommonly good. 2nd, Mr. W. IGGULDEN, with Reginald Vallis.

J. H. WHEATLEY, Esq., excelled in a class for three white Japanese blooms, with superb examples of Mrs. A. T. Miller. 2nd, Lieut.-Col. BEECH, Brandon, Coventry (gr. Mr. E. J. Brooks), who was placed 1st in a class for one vase of three blooms of any yellow Japanese variety. His blooms of F. S. Vallis were excellent. 2nd, J. H. WHEATLEY, Esq. (gr. Mr. W. H. Westbury), with the Hon. Mrs. Lopes.

For four vases of single-flowered varieties (distinct), F. W. G. WILLIAMS, Esq., Bredenbury Court, Bromyard (gr. Mr. H. Tribe), scored with good flowers of F. Stevens, Godfrey's Gem, Countess Egmont, and Lily Godfrey. 2nd, Mr. H. WOOLMAN, Shirley.

A number of classes were reserved for local growers, and of these the most successful exhibitors were Mr. T. W. PIGGOTT, Mrs. RICHARD PEYTON, Mr. E. WRIGHT, Mr. J. WAKEFIELD, Mr. E. CLIFF, and Mr. C. JUDGE.

For 12 Japanese blooms, distinct, arranged with foliage on a space of 6 feet by 3 feet, there were two exhibits. The 1st prize was won by HUGH ANDREWS, Esq., Winchcombe, for a nicely-arranged group of good-quality blooms. 2nd, Mrs. RICHARD PEYTON, Augustus Road, Edgbaston (gr. Mr. W. Young).

A popular class was that provided for single-flowered varieties arranged on a table space of 8 feet by 4 feet. 1st, F. W. G. WILLIAMS, Esq., Bredenbury Court, Bromyard (gr. Mr. H. Tribe). 2nd, Major EVERITT, Knowle Hall, Birmingham (gr. Mr. W. Newton).

Messrs. Wells & Co. offered prizes for the best bloom of any of their 1911 Wells Pockett novelties. Mr. W. IGGULDEN showed the winning flower, which was named Mrs. J. C. Kelly.

Tables decorated with Chrysanthemum flowers are always popular at Birmingham, and interest on the present occasion was as keen as ever. Tables 8 feet by 4 feet were allotted, and the schedule required these to be decorated with Chrysanthemum flowers. 1st, Mr. H. GREAVES, Wormington, Broadway; 2nd, Mr. E. DEAKIN, Hay Hall, Hay Mills; 3rd, Mr. C. H. HERBERT, Acock's Green. It was remarkable that all the above exhibitors confined themselves to flowers of various shades of pink. Many of the unplaced tables were very pretty.

MISCELLANEOUS PLANTS AND FLOWERS.

The best exhibit of 12 plants of Begonia Gloire de Lorraine grown in pots not exceeding 6 inches inside measurement came from Col. WALKER, Acock's Green (gr. Mr. J. Freeman). 2nd, J. A. KENRICK, Esq.

In a smaller class for Begonias, Mrs. RICHARD PEYTON, Edgbaston (gr. Mr. W. Young), was adjudged the winner, with profusely-flowered specimens.

The Rev. H. BUCKSTON, Sutton Hall, Derby (gr. Mr. A. Sharnborough), won 1st prizes in classes for (1) twelve Cyclamen and (2) six Cyclamen.

J. A. KENRICK, Esq., won 1st prizes in classes for (1) six Salvias, (2) six Palms, (3) three Palms, and (4) one Tree Fern.

Mrs. RICHARD PEYTON, Edgbaston (gr. Mr. W. Young), beat two contestants in a class for six single-flowered Primulas.

Mrs. GREAVES, Wormington, Broadway, secured the leading prizes in classes for (1) bouquet of Chrysanthemums, and (2) basket of natural autumn-tinted foliage and berries.

Prizes offered by Mr. H. H. Ellison for six varieties of exotic Ferns brought three contestants. 1st, J. A. KENRICK, Esq.; 2nd, Mr. JAMES R. SHAW, Handsworth.

Capt. W. H. STARKEY, Leamington (gr. Mr. J. L. Blackburn), secured the 1st prize in Messrs. Webb's class for six pots of Cyclamen.

FRUIT.

There were four exhibits in the class for a collection of British-grown fruit on a table space of 10 feet by 5 feet. The 1st prize was won by the Earl of HARRINGTON, Elvaston Castle, Derby (gr. Mr. J. H. Goodacre), who had very fine Barbarossa, Black Alicante, Appley Towers, and Alnwick Seedling Grapes; King of the Pippins, Washington, Malster, King of Tompkins County, Emperor Alexander, and Gascoyne's Scarlet Seedling Apples; Doyenné du Comice, Beurré Diel, and Beurré Clairgeau Pears; and Countess Melon. The dish of Golden Eagle Peach appeared to have travelled badly. 2nd, Lady HENRY SOMERSET, Eastnor Castle, Ledbury (gr. Mr. G. Mullins), whose Apples and Pears were finely coloured. 3rd, HUGH ANDREWS, Esq., Toddington Manor, Winchcombe.

For a collection of British-grown hardy fruits, Mr. C. W. POWELL, Warnham, Hereford, won the 1st prize with good-sized, well-coloured Apples and large Pears. One Apple (Gloria Mundi) was said to weigh 27 ounces. Walnuts, Chestnuts, Medlars, &c., were also included in this meritorious exhibit.

The best six bunches of Grapes (not fewer than three varieties) were exhibited by the Earl of HARRINGTON, who had handsome bunches of Muscat of Alexandria, Black Alicante, and Gros Maroc. 2nd, Mrs. F. NEED, Great Malvern (gr. Mr. J. Jones).

The Earl of HARRINGTON excelled in the class for three bunches of black Grapes, showing very fine examples of Appley Towers. 2nd, Lord HATHERTON, Teddesley, Penkridge (gr. Mr. H. Taylor), with Black Alicante. 3rd, Mrs. F. NEED (gr. Mr. J. Jones).

The best three bunches of white Muscat Grapes also came from the Earl of HARRINGTON.

In a class for two bunches of white Grapes (Muscats excluded), Mrs. NEED (gr. Mr. J. Jones) won the 1st prize with the variety Lady Hutt. 2nd, the Earl of HARRINGTON, with Chasselas Napoleon.

Mr. H. S. BATSON was successful in the local class for black Grapes, and Mr. A. G. BULLER in the class for white Grapes.

Lady HENRY SOMERSET, Ledbury (gr. Mr. G. Mullins), won 1st prizes for (1) six dishes of cooking Apples, (2) six dishes of dessert Apples, (3) eight dishes of Pears, and (4) four dishes of Pears. Both the Apples and Pears were of good size and highly coloured.

In the local classes for (1) cooking Apples and (2) dessert Apples, Mr. WALTER JONES, Acock's Green, and Mr. C. WINN, Selly Oak, were awarded 1st prizes respectively.

VEGETABLES.

The prizes offered by Robert Sydenham, Limited, were for nine distinct kinds. 1st, Mr. T. JONES, Ruabon, who had good Ailsa Craig Onions, Autumn Giant Cauliflowers, and Hollow Crown Parsnips. 2nd, Mr. W. FOLKES, Ampt-hill, Beds.; 3rd, Mr. JAS. WHITE, Bampton.

The 1st and 2nd prizes in the "Robert Sydenham, Limited" local class were awarded to Mr. E. DEAKIN, Hay Mills, and Mr. J. WHITE-BREAD, South Yardley, in the order named.

There was spirited competition in Messrs. Webb & Son's class for eight distinct kinds; 1st, Mr. F. BARRETT, Overton; 2nd, Mr. J. HUDSON, Leicester.

The strongest and best competition was in Messrs. Sutton & Sons' class for nine distinct kinds, no fewer than eight collections being placed before the judges, who awarded the premier prize to the Hon. VICARY GIBBS, Aldenham House, Elstree (gr. Mr. E. Beckett), for a superb collection and well set up; 2nd, Mr. FRED BARRETT, Overton; 3rd, Mr. J. HUDSON.

NON-COMPETITIVE EXHIBITS.

Messrs. WEBB & SONS, Stourbridge, were represented by a very handsome trophy of flowers and vegetables. (Large Gold Medal.)

Messrs. JOHN WATERER & SONS, Bagshot, Surrey, had a large group of evergreen shrubs, consisting principally of handsome specimen Hollies and Conifers. (Large Gold Medal.)

Messrs. CLIBRANS, Altrincham, exhibited an extensive collection of vegetables, together with a number of well-flowered plants of Begonias, in which the variety "Clibrans' Pink" was conspicuous. (Large Gold Medal.)

Messrs. HEWITT & Co., Solihull, brought a group of medium-sized evergreen shrubs, edged with Golden Privet. (Small Gold Medal.)

Mr. W. J. GODFREY, Exmouth, sent a collection of Chrysanthemums, in which were several new varieties of some promise. Mr. GODFREY also contributed a bright display of Zonal Pelargoniums. (Small Gold Medal.)

From Messrs. YOUNG & Co., Cheltenham, came a beautifully-arranged group of long-stemmed Carnations. (Small Gold Medal.)

Mr. H. WOOLMAN, Shirley, had a very attractive display of Chrysanthemums. (Small Gold Medal.)

Mr. H. N. ELLISON, West Bromwich, sent a pleasing collection of Ferns and Gerberas. (Silver Medal.)

Messrs. WELLS & Co., Merstham, set up a choice collection of Chrysanthemums and Carnations. (Small Gold Medal.)

Miss THOMPSON, Handsworth, sent an interesting collection of Cactaceous plants. (Silver Medal.)

Mr. E. V. Low, Haywards Heath, exhibited a choice collection of Orchids, consisting principally of Cattleyas and Lælio-Cattleyas. (Silver-gilt Medal.)

From Messrs. H. CANNELL & SONS, Swanley, came an extensive collection of Apples. (Small Gold Medal.)

THE KING'S ACRE NURSERIES, Hereford, exhibited Apples and Pears in great variety, the size and colour of the Apples being very meritorious. (Gold Medal.)

Messrs. PEWTRESS BROS., Hereford, also exhibited a well-coloured collection of Apples. (Large Gold Medal.)

Messrs. W. H. SIMPSON & SONS, Birmingham, had an assortment of vegetables. (Small Gold Medal.)

Messrs. T. B. GROVE & SON, Sutton Coldfield, sent a group of uncommon hardy shrubs. (Bronze Medal.)

Messrs. BAKERS, Wolverhampton, showed hardy shrubs, chiefly Hollies and Conifers. (Silver Medal.)

Messrs. TOOGOOD & SON, Southampton, showed a splendid display of vegetables. (Large Gold Medal.)

E. A. WILSON, Esq., Edgbaston (gr. Mr. A. D. Christie), showed an interesting collection of Cacti. (Bronze Medal.)

FRANK BIBBEY, Esq., Shrewsbury (gr. Mr. J. Taylor), staged a bright collection of Apples and Pears. (Small Gold Medal.)

Mr. A. W. THORPE, Lichfield, sent Chrysanthemums and Michaelmas Daisies. (Silver Medal.)

Messrs. GEORGE MASSEY & SON, Spalding, staged vegetables. (Large Gold Medal.)

Messrs. THOMSON & SON, Birmingham, showed a representative collection of vegetables.

NATIONAL HARDY PLANT.

NOVEMBER 7.—The annual meeting of the above society took place at Birmingham on Tuesday last. The annual report was read by the secretary, and, on the motion of Mr. E. F. Hawes, adopted unanimously. The balance-sheet showed a small credit balance. Mr. A. J. Macself was elected chairman of the committee, Mr. R. Pinches, Dr. McWatt, and Mr. W. H. Paine vice-chairmen, Mr. J. S. Brunton treasurer, and Mr. Frank Bouskell hon. secretary and solicitor. The existing members of the committee were reappointed, and Messrs. Clarence Elliott, W. H. Paine, T. W. Sanders, Ballard, W. H. Morter, A. Bryden, R. Moreton, Wonnycott, Reginald Loder and Mr. Robinson added to this body. The secretary announced that arrangements had been made to hold the first annual exhibition in the Royal Horticultural Hall, Westminster, on Wednesday, June 19, 1912.

Obituary.

HENRY HOLDING MOORE.—The death of this nurseryman occurred on the 2nd inst. at Chichester, after a long illness. Mr. Moore, who was 72 years of age, carried on the business of a nurseryman and florist in South Street, Chichester, and he occasionally acted as a judge at local flower shows. For many years he was a member of the City Council and the Board of Guardians. He leaves a widow, two sons and two daughters.

THE WEATHER.

THE WEATHER IN WEST HERTS.

Week ending November 8.

A warm, wet, bright and windy week.—The days during the past week have been all warm for the time of year, while only two of the nights proved at all cold. On the warmest night the exposed thermometer never fell lower than 41°, and on the coldest night the same thermometer showed only 39° of frost. Both at 1 and 2 feet deep the ground is now of about seasonable warmth. Some rain has fallen on each of the last six days, and to the total depth of three-quarters of an inch. These rains re-started the percolation gauge, on which short grass is growing, through which no rainwater at all had previously passed since June 24, or for 19 weeks. The percolation through the bare soil gauge during the week amounted to 2½ gallons. The sun shone on an average for nearly four hours a day, which is 1½ hours a day longer than is usual at the beginning of November. The winds were as a rule high, and on one day the mean velocity for the windiest hour reached 22 miles—direction W.N.W. The average amount of moisture in the air at three o'clock in the afternoon fell short of a seasonable quantity for that hour by as much as 11 per cent. E. M., Berkhamsted, November 8, 1911.

CATALOGUES RECEIVED.

W. SMITH & SON, Market Street, Aberdeen—Forest, Ornamental, and Fruit Trees; Shrubs; Conifers; and Roses. HOWDEN & CO., Inverness—Nursery Stock. WM. WATSON & SONS, LTD., Clontarf Nurseries, Dublin—Fruit Trees; Roses and Shrubs. PENNICK & CO., Delgany Nurseries, near Dublin—Shrubs; Trees; Alpines and Hardy Herbaceous Plants. CLIBRANS, Hale, Altrincham—Chrysanthemums; Winter-flowering Begonias; Forest and Ornamental Trees; Shrubs; Hardy Herbaceous and Alpine Plants. DICKSONS, LTD., Chester—Ornamental and Forest Trees. CHARLES TURNER, Slough—Roses; Fruit Trees.

SCHEDULE RECEIVED.

Chester Paxton Society's annual exhibition of hardy fruits, Chrysanthemums, &c., to be held in the Town Hall, Chester, on Tuesday and Wednesday, November 14, 15. Secretary, Mr. George P. Miln, Grosvenor Museum, Chester.

MARKETS.

COVENT GARDEN, November 8.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—Eds.]

REMARKS.—Supplies of home-grown Apples are decreasing. The arrivals of fruit from California this week consisted of 5,000 cases of Newtown Pippins, 11,000 barrels of Keiffer Pears, 2,500 cases of Doyenné du Comice Pears, and 600 cases of Cranberries. A consignment of Apples from Nova Scotia amounted to 40,000 barrels, the principal varieties being Ribston Pippin, Blenheim Pippin, and King of the Pippins. These quantities are considerably in excess of the demand. The Grape trade is firmer for ordinary samples; bunches consigned from Holland are arriving in excellent condition, and those from Almeria are very good; all are in better demand. Muscats are firm at last week's prices. Home-grown Tomatoes are not selling freely. This is mainly due to their bad colour and inferior condition. Supplies from the

Canary Islands are increasing, the quality and colour of the fruits being all that could be desired. There are fewer out-door Mushrooms, and those cultivated have an improving trade. There is an increasing supply of French Asparagus (Paris Green), which is meeting with a fair demand. The market is well supplied with Nuts, including Cobnuts, Walnuts, and Chestnuts; the bulk of the latter are French and Italian importations. Vegetables are a heavier supply, and prices have decreased all round. *E. H. R., Covent Garden, November 8, 1911.*

REMARKS.—Prices and conditions of trade remain about the same as last week. Consignments are quite equal to the demand. *Edward J. Newborn, Covent Garden and St. Pancras, November 9, 1911.*

DEBATING SOCIETIES.

REDHILL AND REIGATE DISTRICT GARDENERS'.—At the fortnightly meeting of this association held on October 31, under the presidency of Mr. W. P. Bound, Mr. J. Mackintosh, of Wye College, gave a lecture on "Manures and Artificial Fertilizers." The lecturer dealt with nitrogenous, phosphatic, and potash fertilizers in this order.

READING GARDENERS'.—At the meeting of this association, held in the Abbey Hall, on 31st ult., Mr. Alderman Parfitt presided over the largest attendance of the session. The lecturer for the evening was Mr. F. Townsend, his subject being "Hardy Annuals, including Asters and Stocks." The lecture was illustrated by a very fine collection of lantern slides, many of them beautifully coloured, and the display of these splendid pictures greatly added to the enjoyment of the large audience. As each picture appeared on the screen Mr. Townsend gave a description of the subject it illustrated, naming the best varieties to grow and stating, for the benefit of his audience, his method of treatment, which had brought him so much success as a grower of annuals.

GUILDFORD AND DISTRICT GARDENERS'.—The usual fortnightly meeting of the above association was held at the Workman's Hall, Guildford, on Tuesday, October 31. Mr. G. Johnson presided. Mr. F. Phillips, of Craigendowie Gardens, Reigate, delivered a lecture on "Chrysanthemums," which evoked a good discussion by the members.

LEE, BLACKHEATH AND LEWISHAM HORTICULTURAL.—At the meeting of this society, held on the 27th ult., Mr. Saunders gave a lecture on "Up-to-date Gardening." Mr. Saunders dealt with soils and explained the reason for using different chemical manures on different kinds of land. Mr. Saunders also dealt with spraying, especially the winter spraying of fruit trees, describing the best washes for the purpose and the implements used for distributing them, also the best time for the operation.

CHELMSFORD & DISTRICT GARDENERS'.—The third meeting of the winter session of this association was held in the County Laboratories, on the 3rd inst. Mr. Currie occupied the chair, and there was a good attendance of the members. Previous to the lecture, an exhibition of Chrysanthemums was held. Mr. C. J. Simpson acted as judge, and he awarded the 1st prize to Mr. Hurst, and the 2nd to Mr. White. Mr. N. M. Comber, of the Laboratories, afterwards delivered a lecture on "Soil Moisture." He stated that the soil was made up of very minute particles, which, when moist, are surrounded by thin films of water, but if too much water is present the air is excluded and the conditions become stagnant. Continuing, the lecturer pointed out no food could enter the roots except in solution. Mr. Comber described how the force of "surface tension" held the moisture in its place, and next showed that the surplus moisture was acted on by the force of gravity, and that it was raised by capillary attraction.

ADDRESS: *C. H. H.* The address of Mr. John Smith is Higher Education Department, Shire Hall, Durham.

BEGONIA: *W. G.* The roots of your Begonias are badly affected with Eelworm, as may be seen by the numerous excrescences. There is no cure. Your best plan would be to obtain stock from a fresh source another season, and your potting compost also must be selected from a different source.

BOTHY: *Anxious.* The word is of Scottish origin, and means a rude hut or barrack for unmarried farm servants, a shepherd's or hunter's hut. It has the same origin as booth.

CELERY DISEASED: *E. A., Bognor.*—The Celery leaves are injured by the Celery-leaf blight (*Cercospora Apii*). It is too late to save the crop, but next season select a fresh plot in which to plant the Celery plants, and spray them with ammoniacal carbonate of copper solution when they are young, repeating the sprayings occasionally during the period of growth.

CINERARIA DISEASED: *Warsash.*—The yellow, powdery patches on the under-surfaces of the leaves are the uredospores of the fungus *Coleosporium senecionis*. It is interesting that one stage of the fungus occurs on the needles of the Scots Fir and other Conifers, whilst the aecidiospores infest Groundsel and wild and cultivated species of Senecio. The plants should be sprayed with a rose-red solution of Potassium permanganate.

COCKROACHES IN PLANT-HOUSES: *J. M.* The following particulars are taken from a note by Mr. Raffill on destroying cockroaches published in *Gardeners' Chronicle*, January 15, 1910, p. 43. Stop up carefully with cement or mortar any holes in the walls, paying particular attention to cavities near the hot-water pipes, and the holes in the brickwork where the hot-water pipes are carried through, for it is in such warm, dry places that the cockroaches hide in the daytime. In small houses, this method of dealing with them is far more effective than traps or poisons; but in large houses, where the hiding-places are too numerous, other means of destroying them must be adopted. One of the best means of trapping cockroaches is by placing jam jars about the house containing sweet oil, which requires to be changed every third day, as it soon becomes rancid in a warm house and unattractive to the pests. It is best to place the jar against a plant or wall, so as to afford a foothold to reach the mouth of the jar. Other effective baits are treacle and water, and treacle and beer, which also require to be changed when they become sour. Of poisons, Phosphorous paste, Chase's beetle poison, and Beetlecute may be recommended. If a hedgehog is present during the night in a house, it will be found that it will destroy many of the cockroaches.

CORRECTION.—At the Brighton and Sussex Chrysanthemum Society's Show, a Gold Medal was awarded to Mr. J. A. Nix, Tilgate, Crawley (gr Mr. E. Neal), for a collection of fruit, not Mr. C. G. A. Nix, Crawley, as stated in our report.

DIPLOMA IN GARDENING: *J. E. H.* As you appear ambitious to succeed in your profession you should study horticulture from all standpoints, but particularly the practical work. A knowledge of the sciences which have a bearing on the subject, including botany, chemistry, entomology, and physics, will be useful, but you must remember that your first requirement is a thorough knowledge of practical gardening, without which any number of diplomas and certificates are useless. You may enter for either of the examinations you mention or both. Garden appointments under the Government are mainly filled from the garden staff at Kew.

FOWLS' DUNG AS MANURE: *G. W.* Poultry manure is all the better for being mixed with sand. It should be stored under cover, so that it becomes quite dry, when it may be used as a fertiliser for almost all kinds of plants. It is a very strong manure, and should be applied sparingly, not more than 4 ounces to the square yard.

NAMES OF FRUITS: *G. A. S. L.* 7, Cox's Orange Pippin; 8, Scarlet Golden Pippin; 11, Grange's Pearmain; 12, King of the Pippins; 13, Castle Major; 17, Pitmaston Pine Apple; 18, Hornmead Pearmain; 19, Delling Pippin; 20, Tower of Glamis; 22, London Pippin; 23, Dutch Codlin; 24, Calville St. Sauvier; 25, Hanwell Souring; 30, Golden Noble; the other numbers were detached.—No letter of identification of fruit in Friar Tuck box. 1, Small's Admirable; 2, King of the Pippins; 3, Claygate Pearmain; 4, Egremont Russet; 5, Rosemary Russet; 6, Yorkshire Beauty; 7, Dumelow's Seedling (Wellington); 8, Norfolk Beefing.—*W. D.* 1, Peasgood's Nonesuch; 2, Striped Beefing; 3, Knight's Codling.—*Heather.* 1, Benoni; 2, Queen of Sauce; 3 and 4, not recog-

nised, probably a local variety; 5, Yorkshire Greening; 6, Nancy Jackson.—*C. Fripp.* Resembles a fruit of Cox's Orange Pippin grown under glass or against a wall.—*T. W. T.* 1, Fearn's Pippin; 2, King of the Pippins; 3, Scarlet Nonpareil; 4, Ashmead's Kernel; 5, Beurré Sterckmans.—*High Ashurst.* Peasgood's Nonesuch.—*Bevis.* Reinette de Caux (syn. Dutch Mignonne).—*H. Smith.* 1, Annie Elizabeth, a very good keeper; 2, Golden Harvey.—*St. Ronan's.* Ribston Pearmain.—*Phoenix.* A fine fruit of Blenheim Pippin.

NAMES OF PLANTS: *Zelua.* *Cannabis sativa* (Hemp).—*Lich.* 1, *Codiaeum Baron Compté*; 2, *C. Warrenii*; 3, *C. Evansianum*; 4, *C. Johannis*; 5, send when in flower; 6, *Maranta albo-lineata*.—*B. B.* *Angracum bilobum* variety *Kirkii* (*Orchid Album*, iv., t. 162).—*W. S. B.* 1, *Veronica Andersonii* variegata; 2, *Crassula coccinea*; 3, *Escallonia rubra*; 4, *Nerine Fothergillii*.—*W. S.* *Cattleya labiata* and *C. Clarkiae* (bicolor \times labiata).—*V. M.* 1, *Brassia Lawrenceana*; 2, *Stelis micrantha*; 3, *Oncidium prætectum*; 4, *Odontoglossum cirrhosum*; 5, *Dendrobium Chlorops*; 6, *Epidendrum floribundum*.

PRIMULA OBCONICA: *H. H. L.* The nature of the poisonous principle in this plant has not been determined. The use of washing soda as a lotion would probably give relief, just as it does the pain from a burn or a wasp's sting. The next best remedy is Goulard water, a weak solution of sub-acetate of lead, but as this latter substance is both sweet to the taste and poisonous, the liquid should be labelled poisonous and placed out of the reach of children.

"RADAMANTHUS": *Perplexed.* There is no such genus as *Radamanthus*; you refer, probably, to *Rhadamanthus*, a member of the Liliaceae. There is only one species given in the *Kew Index*, *R. convallarioides*, but a second species, *R. cyanelloides*, is named in the supplement to this work published in 1904. *Rhadamanthus convallarioides*, a bulbous plant, is sometimes known as *Hyacinthus convallarioides*. It is a native of Africa.

VAPORITE: *R. H. W.* Yes, dig in the Vaporite between the Roses, applying 2 cwt. to the acre. Both Abol and Voss's nicotine wash are excellent insecticides. The latter is perhaps better for Roses. The flying insects you refer to are probably the Rose leaf hoppers (*Typhlocyba rose*).

VINE STEM DECAYING: *J. W., Ealing.* If you paint the affected part with some antiseptic substance, such as gas tar or Stockholm tar, it may possibly prevent the decay from spreading. It depends on the age and condition of the vine, also the extent of the rotting in the stem, whether the plant can be saved. In the meantime plant a new vine to take the place of the old one in a year or two.

YEW: *H. H. L.* The Yew-tree leaves and seeds contain a powerful alkaloid heart poison called taxine, but the pulp of the fruits is not poisonous. Children often eat the pulp, and birds eat it freely, but they do not break the seeds, which are found in their excrement. It is only if children break the seeds with their teeth and swallow them that symptoms of poisoning appear. With regard to cattle and deer, it has been proved that a definite amount of Yew leaves may be taken, mixed with food, without fatal results, but if the leaves are taken on an empty stomach, or by an animal that has fed but little, such as when the grass is covered by snow, the leaves often kill the animal very quickly. The proportion that can be taken by a well-fed animal has been determined by experiment. Some believe the male tree and some the female tree to be poisonous, but this is erroneous, as the same active principle occurs in trees of both sexes. The Irish Yew (var. *fastigiata*) has also been shown to be poisonous.

CARBON DIOXIDE AS FOOD FOR PLANTS.

IT was not my intention to write about my experiments before I could give you the results, but as notices have appeared in the Press I may as well take up the question at once.

Everybody knows that a considerable part of all plants consists of carbon: of quite dry vegetable matter (heated to 100° C. for some time) about 40 per cent. is made up of carbon compounds, but as cultivated flowers, fruit and vegetables contain on an average something like 85 per cent. water, the dry matter amounts to only 15 per cent.; and 40 per cent. of this makes 6 per cent. carbon compounds in 100 parts of fresh vegetable matter or 60 grams in 1 kilogram (about an ounce in a pound). Practically the only source of this carbon is the very small percentage of carbon dioxide contained in the air, which is absorbed by the leaves; of this carbon dioxide, the carbon is retained and the oxygen given off.

As the air only contains about three parts carbon dioxide in ten thousand (0.03 per cent.), 10 cubic metres (10,000 litres) of air contain 3 litres or 6 grams of carbon dioxide, of which 3-11th is carbon (or 1.6 grams), and since this quantity only suffices to make something like 27 grams (less than an ounce) of fresh vegetable matter, it is easily seen what large quantities of fresh air are necessary to supply growing plants with the carbon they require.

In the open air this is not alarming, as

the bulk of air is enormous and its movements maintain fresh supplies, so that the content of the atmosphere in carbon dioxide may be considered constant even where vegetation is strong and absorption heavy. The loss of the carbon dioxide absorbed by the plant is made good by fresh supplies from combustion of coal, wood, oil, &c., by respiration of animals and plants, decomposition of vegetable and animal matter, and last, but not least, by the eruptions of volcanoes. This last source is considered by Prof. Arrhenius as the most important; and to his most interesting work on the "*Evolution of the World*." I refer those who are specially interested in the modes by which the balance of carbon dioxide is maintained in the atmosphere. It is interesting to observe that Arrhenius does not fear a diminution, but rather anticipates an increase in the immediate future. This is the more satisfactory as he shows that past poor and rich periods of vegetation were determined by the smaller or greater content of carbon dioxide in the air at the time. His argument for a brighter future in this respect is acute. He reasons thus:—The sea contains carbon dioxide. The amount in the ocean is in correlation with that in the air. If the balance is disturbed it tends to restore itself; that is, if the amount of carbon dioxide in the air is on the increase then the oceans, having less than their proper share, will absorb some of it to restore the balance, and accordingly the atmosphere over great oceans will show a lower carbon dioxide content than it does over the continents. This being the case at present, we are to conclude that the quantity of carbon dioxide in the air is increasing at the present time. Hence we may expect in the course of time a warmer climate and a richer vegetation.

Scientific research seems to prove that vegetation becomes more vigorous in proportion as the amount of carbon dioxide in the air is augmented, and this at least up to 2 per cent., when the normal is 0.03 per cent. This means that a considerably larger crop might be obtained if we could supply the necessary 2 per cent. carbon dioxide. Experiment alone can determine whether this expectation is valid.

In the open air, of course, it is quite impossible to do anything at all for an augmentation of carbon dioxide, and that may be the reason why so little has been heard on the subject. Under glass it is quite another thing. Here we may supply as much carbon dioxide as we like, and thus we come at last to the point to which I wish to draw attention. A certain feeling of a lack of something in plant-house air is not new. I myself wrote 20 years ago (*Orchard House*), after drawing attention to the scarcity of carbon dioxide and the great consumption of it by plants: "It is very likely there may be a need of carbon dioxide, and that it is this deficiency that makes closed houses unwholesome." But neither I nor anybody else (so far as I know) has made any advance since then. Still, every gardener knows that it is impossible to get such a luxuriant growth of vegetables, for instance,

in a planthouse, as is obtainable in a hot-bed. May not the reason be—in part—the plentiful supply of carbon dioxide yielded by the fermentation of the manure? Another fact pointing in the same direction is the thriving condition of plants in small closed living-rooms in spite of other unfavourable conditions. Here it is the carbon dioxide respired by the inhabitants that feeds the plants.

These and other reflections made me, when I planned a new cow-stable this spring, place the latter against the back of a Rose-house and connect them by means of a one-foot opening in the wall, the hole being furnished with an electric ventilator capable of removing a volume of air equal to that of the stable (100 cubic metres) in five minutes. The necessary power is 50 watts. In the house, the stable air is carried from end to end in a galvanized sheet iron tube provided with small holes on the side next the Roses. As the arrangements have just been finished I cannot yet speak of results, but shall do so later. However, I do not expect much from my contrivance during our long dark winters; it is all very well to have plenty of carbon dioxide at the disposition of the Roses, but the utilization of it demands light, and we shall have very little sunshine here for the next three months.

According to information supplied by a veterinary surgeon, the amount of carbon dioxide exhaled by a cow is 0.9 grams per hour per kilogram weight. That is, an animal weighing 400 kilograms gives in 24 hours 400 × 24 × 0.9 grams or 8,640 grams of carbon dioxide, a quantity as great as is found in 14,000 cubic metres air or in 38 kilograms of flowers, fruit or vegetables. With five cows in the stable, it will be seen that there should be plenty of carbon food for my Roses and Carnations in the three houses I have connected thereto, though much of the gas is of course lost by ventilation.

It would be surprising if there do not exist unpublished experiments in this direction. [Experiments bearing on this question have been made. They will be referred to later.—Eds.] Has nobody had planthouses against stable walls with holes from one to the other? And what have been the results? Horse-stables I do not consider of like value; there may be, and usually is, a great deal of ammonia given off from horse manure, and the fumes of ammonia are, generally speaking, injurious.

Considering the care and expense it takes to supply our plants with the necessary manure to ensure a satisfactory growth, and, remembering that the mineral constituents of the manure only supply material for the two per cent. ash and ¼ per cent. nitrogen contained in the plant, it is curious that nobody before has made experiment, on a commercial basis, with a view to supplying larger quantities of carbon dioxide than are contained in the air.

If it is practicable to feed plants in houses with carbon dioxide there is a pleasing future for us gardeners; the product (smoke) of the coal and coke burned in our boilers is mostly carbon

dioxide. As it is now, it is very injurious to plant life, but it is not difficult to clean. I am told that the liquid carbon dioxide now on the market is made by burning coke. What a tempting thought to make use of the smoke as well as of the heat in our greenhouses! This may be a Utopia, but I consider the question worth ventilation, and I expect this better done in your paper and in England than here at home. This is my excuse for troubling your readers with my speculations.
M. P. Andersen, Jönköping, Sweden.

ORCHID NOTES AND GLEANINGS.

CALANTHE COOKSONIÆ.

MUCH good work in developing the winter-flowering, deciduous *Calanthes* was carried out by the late Norman C. Cookson, and the latest and best pure-white variety for which Mrs. Nor-

"THE ORCHID REVIEW."

THE November issue of this useful monthly journal contains a very interesting article on the nomenclature of hybrid Orchids. A contribution by Mr. W. S. Lyon, of Manila, on "*Cypripedes* on Limestone," gives as an example the *Cypripedium philippinense* in its native habitat; Mrs. Emily Thwaites contributes a page on the selection of parents for hybridising; and much useful cultural matter, as well as the usual reports of the Orchid Committee meetings during the past month are included in this issue. Illustrations of a group of yellow forms of *Cypripedium insigne*, *C. Lucifer*, and *Oncidium Mantinii* are also given.

SOME BRITISH GARDENS.

(Concluded from p. 332.)

GLASNEVIN BOTANIC GARDEN.

THE botanic garden at Glasnevin, Dublin, is of a large size, and contains a numerous collection of trees. There is an abundance of good water, both running and still; the soil is deep and

good specimen of *Cedrus atlantica pendula*, and also a beautiful plant of the rare *Abies bracteata*. The Caucasian Beech (*Zelkova crenata*) and the purple Beech are as strong here as the best in our Geneva arboretum; and a *Fagus laciniata* is equally noticeable for its strong, healthy growth. Some very old Yews were of special interest to me, as having been planted, probably, by our common ancestors—the Celts.

A Pinsapo, of modest height (we have some in Geneva measuring 60 feet) seemed healthy and in good condition, proving the existence of chalk in the soil. This tree never does well in a pure silicious soil; it requires a combination of limestone, sunshine and wind. *Abies nobilis*, *Pinus ponderosa*, and *P. Peuce*, all do well, the latter especially being in far better condition than a specimen sent me twelve years ago by King Ferdinand of Bulgaria, which has never been very satisfactory.

The shrubs at Glasnevin are much better than on the Continent. I saw an *Abelia triflora* 15 feet high, while my own best and oldest specimen (thirty years old) scarcely attains to 9 feet. A

very fine *Xanthoceras sorbifolia* flowers very freely, but bears no seeds, as it does with us.

The water and bog plants are perfection—and indeed, nothing less is to be expected in such a climate. This part of the garden is wonderfully beautiful and picturesque—a calm river, flowing between banks covered with bright flowers, with a background of green lawns—the real Irish green. Aquatic plants abound in the water; *Hottonia palustris* rears its long, pink spikes, resembling those of *Primula japonica*; on the banks, the giant *Gunneras*, and big groups of *Primula japonica* and *P. pulverulenta* are to be found, together with whole colonies of *Pinguicula grandiflora*, in perfect health, and, wonderful to relate, *Pyrolas* and *Shortias* growing in full sunshine.

The rock-garden is very interesting, though of modest dimensions. I saw there the best collection of *Cyclamen repandum* I ever remem-

ber; some of the plants were bearing twenty-five flowers! There were also the very rare *Sedum trifidum*; some plants of *Helichrysum frigidum* and *Raoulia glabra*. One of the finest features of the garden is a quantity of *Daphne Blagayana*, covering an area of more than 10 square feet—this is another shade-loving plant, which I was astonished to find growing in the open sun.

Sir Frederick Moore's invitation to me to visit Glasnevin was indirectly instrumental in procuring me an introduction to the author of the very clever and interesting *Tourist's Flora of the West of Ireland*—Mr. R. L. Praeger. This gentleman informed me in the course of conversation that the rare *Spiranthes Romanzoffiana*, which I had heard was no longer to be found, is by no means extinct, being still extant in abundance in the north-western districts of Ireland*.

The visit which I have described above was on the occasion of my first stay in the Emerald Isle, which made a deep impression on my mind. Abundance of water seemed its most striking

* *British Orchids*, by A. D. Webster, p. 41; and *Bulletin de l'Association pour la Protection des Plantes*, v. p. 24.

FIG. 148.—*CALANTHE COOKSONIÆ* (*C. HARRISII* × *C. VESTITA RUBRO-OCULATA GIGANTEA*).

(Photograph by H. J. Chapman.)

man Cookson, Oakwood, Wylam-on-Tyne (gr. Mr. H. J. Chapman), was accorded a First-class Certificate at the Royal Horticultural Society's meeting on November 7, is a seedling from his crossing. *Calanthe Harrisii* is a good pure-white variety, but *C. Cooksoniæ* is better, the very broad labellum especially being a marked feature. It is singular that no trace of the red blotch at the base of the lip of *C. vestita rubro-oculata* appears in the white *C. Harrisii*.

CYPRIPEDIUM SIBYL SUPERBUM.

OUR illustration (fig. 149) represents this pretty hybrid *Cypripedium* for which Mrs. Norman Cookson, Oakwood, Wylam (gr. Mr. H. J. Chapman), gained an Award of Merit at the Royal Horticultural Society's meeting on the 7th inst. It is a decided improvement on other hybrids of this class. The flower being white, tinged with bright rose, and marked with chocolate-purple lines. The parentage was given as *C. Francesiæ* (*callosum* × *Curtisii*) crossed with *C. Fairrieanum*. With regard to *C. Francesiæ*, it should be noted that the name *C. Goultenianum*, of the same parentage shown at R.H.S. meeting on January 16, 1894, takes priority.

rich, and the atmosphere always humid; a very happy combination of circumstances, and thoroughly favourable to successful culture. I have nowhere else seen Ferns in such luxuriance; and growing, too, in full sunshine!

The tree collection of Glasnevin is its most noted feature; and it is one of the most complete existent. Professor Balfour praised it to me so highly that I was almost persuaded into thinking that it must rival a collection of Conifers which we have near Geneva, one of the best in the world. I find that this is not the case; though certainly the arboretum at Glasnevin is marvellously complete for a maritime climate. The Italian Cypress (*Cupressus sempervirens*) and the Stone Pine are both well grown and healthy, although the first-named species has acquired a somewhat awkward shape, having lost its pristine architectural erectness. The Chilean and Australian Conifers are a very pleasant sight; I have never come across so good a collection elsewhere. I was also especially interested by some plants of *Prumnopitys elegans*; these were growing outside, and were quite healthy, though I have never known them planted in the open before. There is a very

feature—always adorned with *Menyanthes* and *Ranunculus aquatilis* (a beautiful flower). And then the Gorse—with its wealth of golden blossoms. I can well appreciate the feelings of Linnæus, who, seeing it for the first time, fell on his knees, and thanked God for its creation. But I fear that my praise of Irish scenery can go no further; Ireland is not a country I could live in. I have travelled from the west coast to the east, and I found the landscape on the whole dull and flat; no sharp outlines, no peaks or crags, to relieve the monotony of green plain. I must, of course, make an exception in favour of the western coast scenery, which is certainly more picturesque; and there are even some little hills, which might, by a stretch of imagination, be called mountains! The plants of this region are extremely interesting, among others *Saxifraga nivalis* and *S. sponhemica*; and among the beautiful rocks near the sea, my botanist's heart was gladdened by the discovery of the most beautiful of all the Ferns—*Asplenium marinum*.

LISSADELL.

Lissadell, in Sligo, remains impressed on my memory as being one of the most brilliant gardens—and more especially Alpine gardens—that I have ever seen. What a marvellous collection of flowers is there displayed! Of course, it will hardly bear comparison with the botanic garden at Edinburgh, for instance, nor even with the wonderful rock garden of Sir Frank Crisp, which is acknowledged to be the best in England. But, leaving all idea of comparison aside, the garden at Lissadell presents an extremely beautiful and picturesque appearance, comprising as it does all the choicest of the Alpine plants. I, for one, shall never forget so brilliant a picture. Here one may find the best of the rock plants, grouped together in colonies of ten, twenty, or even in some cases a hundred plants, looking as healthy and happy as in their own natural homes. There are some very good *Eritrichium nanum* and *Androsaces*—strange to say, the high Alpine species do better here than the Himalayan, which latter grow at Floiraire like weeds. Here may also be seen the best *Primulas*, *Geraniums*, *Campanulas*, and *Saxifragas*, together with plants from the far north and Antarctic regions; all growing and flourishing in the mild, damp Sligo air. The rock-garden is one of the largest I have seen, and is very well kept; the walls are covered with *Abutilon vitifolium*, *Crinodendron*, *Solanum crispum*, and Californian shrubs, reminding me of the garden of my late friend Mr. Ewbank, at Ryde. In the woods, *Fuchsias* are growing wild, and sow themselves freely between the stones of the walls. The new Asiatic *Primulas*, the *Mecynopsis*, and all those aristocratic beauties with which an English collection is always enriched and glorified, abound and luxuriate. A new hybrid *Primula Bulleyana* has just been raised and exhibited by Sir Jocelyn Gore-Booth, the happy owner of this paradise. This flower will be a welcome addition to the Alpine garden.

THE TULLY NURSERIES.

I next visited the Tully Nursery, near Kildare; a large, but still young garden, especially devoted to hardy plants. I was pleased to find there our Swiss *Daphne Cneorum* growing as a shrub, much better cultivated than I have ever seen it before in a garden, and as healthy as in its wild state on the limestone of the Juras. There is also a fine collection of our terrestrial Orchids, which are very well grown and tended *con amore* by Mr. Paine, the manager of the nursery.

I was most interested to find at Tully a feature of which I had heard, but had never seen, to wit, a "Japanese" garden, partaking also of the nature of an Alpine one.

It was most amusing to see the little rock plants of our mountains, growing in English rocks, in the shape of Japanese shrubs, and in

close proximity with Japanese lanterns, bridge and dwarf trees! It was of especial interest to me at the time, because only a few days before I had been talking to a friend of mine, Dr. E. van den Broeck, in Brussels, who is himself in course of erecting such a mixed garden. I gave him as my opinion that the idea was an absurdity—but now I have seen the realisation, I cannot say that it is ugly or unpleasing; and it certainly is both curious and characteristic.

Alpines are grown at Tully in immense quantities in pots, and they all look very healthy, even the rarest and most delicate of the *Gentians*. Still, I must add that the climate of Kildare seems to suit particularly the high Alpines.

A NEWRY NURSERY.

As a termination to my Irish tour, I went to Newry, a place celebrated of old for rare plants

FIG. 149.—CYPRIPEDIUM SYBYL SUPERBUM
(C. FRANCESIÆ X C. FAIRRIEANUM).

(See p. 350.)

and shrubs. I spent a whole day there, going over the gardens and plant collections of Mr. Thomas Smith, a connoisseur and true amateur of flowers, and one of the most skilful growers I have ever met—a horticulturist to the tips of his fingers. Daisy Hill Nursery covers a hill slope, facing (if I remember rightly) in a westerly direction. Long before I reached the nursery (indeed, as soon as I left the station) I could see this hill slope, covered with *Azaleas*, *Rhododendrons*, and flowers of all kinds.

The garden (for so it is, though called a "nursery") is extremely well arranged, and most artistic. In every corner is to be found some rare and choice plant; and a plant lover could pass there many hours with much profit and enjoyment. I found a number of old friends of which I had

lost sight for many years; *Stachys coccinea*, *Campanula Lewisii*, *Pyrola umbellata*, *Sedum trifidum*, *Lobelia sessiliflora*, *Ranunculus Lyallii*, and others, too numerous to name. There are altogether forty acres in cultivation, including here and there small ponds, marsh gardens, &c. I was much surprised to see some *Laurels* (*Prunus Laurocerasus*) grown as standards; and also here, as at Glasnevin, tender and delicate Ferns exposed to the sun. I think that Newry is, after Edinburgh, the richest in rare plants; and I only wish that I had time to study the collections more closely. Henry Corrèon, Floiraire, near Geneva.

INDIA.

GARDENING IN COIMBATORE.

THE recent outcry in England at the almost unprecedented drought has greatly interested us exiles, and, as I am keenly interested in horticulture, I have been led to contrast the conditions prevailing at home with those in many parts of Southern India. Here are some details for the past season in Coimbatore, where I am trying, with some measure of success, to establish a beautiful garden. We are in a very dry locality with, however, a fairly retentive soil. For the five months from November to March we had just over half-an-inch of rain, and during that time we had clear, burning skies and a very trying wind blowing over some 300 miles of bone-dry land. Whole months pass without a drop of rain, and, when we do occasionally get a shower, it is of little use, for evaporation is very rapid and very little enters the soil. I have had to dig a large quarry in the ground some 30-40 feet square to obtain water, and as the water table at the gardens is about 40 feet down, the depth of the necessary excavation is indeed great. This we call a well. The amount of water obtained, since there is no spring, would be sucked up by a small oil engine in an hour, and yet it must serve to irrigate eight acres of land.

Perhaps the method I have been led to adopt in forming grass lawns may illustrate our conditions as regards moisture better than anything else. There are many grasses in the neighbourhood, all of them of markedly xerophytic habit. Most are shallow-rooting and, after forming their seeds, die away, leaving the seeds on the ground for the next shower. But the *Hariali* Grass, the "dub" of Northern India, the "Devil's Grass" of the West Indian plantations and *Cynodon Dactylon* of the botanist, lives largely underground. Most of its growing shoots are some 6 to 9 inches below the surface, and its roots go much deeper. It is thus able to withstand long periods of drought. When about to make a lawn I scrape the ground clear of every vestige of vegetation. Soon tiny shoots of *Hariali* emerge and form small spots of colour. When the weather continues dry these turn brown, and are mown down wholesale by the white ants, and the *Hariali* resumes its underground condition. When, however, rain comes the *Hariali* shoots spread and, having the advantage of a deep root-system, soon leave the other Grasses behind. Sooner or later the whole ground, sometimes after several years, is covered by a close mat of this Grass. Its greatest rival is an ephemeral "Spear Grass," which, growing rapidly, forms its seeds and dies down. When the *Hariali* is poorly represented the first result of my operations has been to produce a thick covering of this irritating Spear Grass, which pierces our clothing with its sharp stinging points. But sooner or later the *Hariali* takes its place, and the method may be relied upon for ultimate success. We have far too little water to irrigate our Grass plots. It is a fight between two xerophytes, an ephemeral one and a perennial, and, in the long run, the perennial wins. Some day I may be tempted to send you some photographs of my garden. C. A. Barber, Coimbatore, India.

NOTES ON IRISES.

IRIS SULPHUREA KOCH.

THIS interesting Iris was described as long ago as 1848 (C. Koch in *Linnaea*, xxi., 1848, p. 637), but has suffered from an unfortunate mistake by which its name was reduced to a synonym of De Candolle's *I. flavescens* (Redouté *Liliaceæ*, p. 375). The latter Iris is well known in gardens as a pale, yellow-flowered, bearded Iris, which flowers in May shortly after *I. germanica*. The confusion of the two plants doubtless arose from the statement of De Candolle that Redouté's figure represented an Iris from the Caucasus. This statement is unsubstantiated, and gives the impression that it was not based on any accurate information, an impression which is strengthened by the fact that no wild specimens of this Iris appear to have found their way into herbarium collections. Moreover, repeated attempts to self-fertilise, or even to fertilise, *I. flavescens* have so often resulted in failure that we are led to suppose that it is really only a garden hybrid of unknown origin.

Two years ago I was fortunate enough to receive from the Caucasus some seeds and a couple of plants under the name of *I. flavescens*. These latter and six or eight seedlings have flowered this year, and there is no doubt that we have here a totally distinct Iris. The leaves are of a bright, yellowish-green, with a glaucous bloom, and die away altogether in winter. The first new leaves of each tuft have very blunt obtuse ends and a distinctive feature is the conspicuous white edge, which is particularly noticeable where one leaf crosses another.

The stem is not much more than 18 inches high, and the lowest flower barely overtops the leaves; indeed, it is sometimes concealed among them. The inflorescence consists of a terminal head of two flowers and two side branches, each set in a large inflated bract-like leaf, and bearing a single flower. The colour is a pale, sulphur-yellow, and the bases, both of the standards and of the falls, are veined with greenish-brown. The beard is bright orange-yellow.

The whole habit and appearance of the plant distinguish it at once from *I. flavescens*, and a very conspicuous difference is found in the spathes. In *I. flavescens* these are nearly wholly scarious when the flowers open, whereas in *I. sulphurea* they are wholly green, inflated, and of a curious, membranous texture. Moreover, the plants set seed fairly readily when self-fertilised and form large capsules, tapering to a conical point above and almost circular in section.

The Iris just described seems to agree in all points with the specimen of *I. sulphurea* described by C. Koch, and collected by K. Koch on the lower slopes of the Caucasus shortly before the middle of the last century. This specimen I was fortunate enough to find lately in the Herbarium of the Berlin Botanic Garden, and I have no doubt as to its identity with my Caucasus plants.

Of Iris names there are already so many that any additions are unwelcome, but in this case the rehabilitation of the name *I. sulphurea* seems to point not to an increase but to a reduction in the total number of species. Close observation of specimens of *I. Talischii* Foster and of *I. obtusifolia* Baker and of seedlings of both of them, and comparison with *I. sulphurea* have led to the conclusion that all three names refer to the same plant. This conclusion is hardly surprising when we remember that *sulphurea* comes from the Caucasus and *obtusifolia* from Masanderan, the Persian province on the southern shore of the Caspian, while *Talischii* is situated on the west shore of the Caspian, half-way between Masanderan and the eastern end of the Caucasus range. The net result, therefore, is that we are able to set up *I. sulphurea* as a good specific name, and reduce to synonyms of it both *obtusifolia* and *Talischii*. W. R. Pykes, *Charterhouse, Godalming*.

DELPHINIUM "MOERHEIMII."

THIS beautiful Delphinium (see fig. 150) was raised by Mr. B. Ruys, of Moerheim, Dedemsvaart, Holland, and is one of the best white varieties. The plant is a great favourite with lovers of hardy flowers, and its value has been recognised by the Floral Committee of the Royal Horticultural Society, an Award of Merit having been conferred on it at the meeting held on June 22, 1909. The following particulars are sent us by the raiser, to whom also we are indebted for the photographs reproduced in figs. 150 and 151.

"Messrs. Kelway & Son, Langport, sent out the first cream or creamy-white varieties of Delphinium, now generally known under the names of Beauty of Langport and Primrose. Mr. Charles Irvine, Jedburgh, next introduced the variety 'Albion,' a semi-double variety, but with a bluish shade, which turns to nearly white when the flowers are fully expanded in the sun. The French nurserymen, M. Lemoine and M. Ger-

batch of seedlings one plant with five spikes. Of these, three spikes bore pure white flowers, two bore blue flowers, and the remaining spike bore some light blue and some parti-coloured—half blue, half white—flowers. Next year, when the five divided plants flowered, I noticed that two only had white flowers, two only blue flowers, and one plant had some flowers white and others blue, whilst still others were half white and half blue. I succeeded in almost fixing the pure white variety, not more than 1 or 1½ per cent. coming blue-flowered.

"Delphinium Moerheimii has a very healthy growth, which is not subject to mildew. The dark green leaves are finely cut, and the stems attain to a height of 5 feet, producing many side spikes, which prolong the plant's flowering throughout the whole summer. The large, single blossoms are of the purest white, and the spikes have a loose and elegant appearance. The first flowers appeared this year on June 20, and fig. 151 shows a field in full flower on July 24.

"The blue variety, which may be regarded as the 'companion' of Moerheimii, I have named 'Capri.' It is in every respect a counterpart of the white sort, having the same habit, size of flowers, and freeness of flowering. The colour is sky-blue, of a finer shade than Persimmon and others of the Belladonna type."

FORESTRY.

SEASONABLE WORK.

THE season for planting has arrived, but, before proceeding with new plantations, examine carefully those that were made last season, and remove any plants that are dead. When removing them, the holes should be dug out as the work proceeds, as this will save time in replanting. After the renovation of each plantation has been completed, collect all dead plants and convey them to some spare, open space and burn them. In doing this, care should be taken to see that no part of the plantation is injured, either by the smoke or heat, as damage may be done by the former as well as by the latter. The past season has proved very disastrous to newly-planted coverts, especially on dry soils, and many plants will be found to be dead. In purchasing the new plants, insist on having those that have been transplanted, no matter what variety, as these have a great advantage over those that have not been moved. One often sees an advertisement of a cheap lot of Conifers, &c., but the plants are generally a sorry disappointment to the purchaser. Another very important point to bear in mind when ordering plants is to have them put on rail so that they reach their destination about the middle of the week; if they arrive on a Saturday they have perforce to remain unplanted until the following Monday. This is very detrimental, for the roots become dry, and the plants lose their vigour, and, probably, look stunted for a year. Should the roots become dry during transit, they should be dipped into a mixture of clay and water, which should be rather thinner than ordinary paint; this will greatly assist the roots to regain their plumpness. When planting standard trees of any kind in or near coverts, the following preparation will be found very effective in protecting them from injury by hares or rabbits. Take half a bucketful of clay, mix it with linseed oil until the clay has dissolved into a paint-like mixture, then add 1 lb. of soot and 1 lb. of lime, stir well until the whole is thoroughly mixed, then apply it with an ordinary paintbrush to the stems of the trees. The preparation will last for 12 months, at the end of which time the coating can be renewed if necessary. A. G.

FIG. 150.—DELPHINIUM MOERHEIMII:
FLOWERS WHITE.

beaux, introduced several novelties, including Mont Blanc and Sceptre Blanc, which, however, are not so white as their names would suggest; also 'Polar Star,' which has creamy-white flowers, with a sulphur-yellow 'eye.' This variety produces strong, erect spikes, and grows taller than the others.

"The following varieties may be mentioned, Jeannette, Fröken Scheltema, Progression, and Nulli Secundus, all having a more or less creamy colour, the last named with a dark brown eye, which gives the spikes a striking appearance. Nulli Secundus was introduced by Messrs. R. Wallace & Co., and received an Award of Merit from the R.H.S. in July, 1909.

"For about 20 years I have been interested in white Delphiniums, and have purchased all the light-coloured novelties which I could obtain, with a view to crossing them with large-flowered, light-blue varieties of strong constitution. Thousands of seedlings proved worthless, but at last I was successful. Some years ago, in the month of July, I found in a

THE MARKET FRUIT GARDEN.

AFTER five months of drought, October gave us a great deal more than enough rain, and this experience is similar to that of seven out of the last nine seasons, so far as a rainy October is concerned; while in several of them the excessive rainfall followed a very dry September. The results of such conditions are more serious on ordinary arable farms than in market gardens or fruit farms, as shown by the fact that, in the seven seasons referred to, it was impracticable for farmers to sow winter Corn crops on all the land intended for them, while in some of the seasons the deficiency was great. At my station the total rainfall of the five months ended with September was only 4.85 in.; whereas, in October, up to the morning of the 29th, the measurement was 5.44 in. The hindrance to work after the 18th, when all but a small proportion of the downfall took place, was, of course, very inconvenient; but if a generally fine November had followed, the thorough soaking of the soil might have been regarded as beneficial rather than otherwise in fruit planta-

in considerable quantity and on most days. In my own case, a third cause of delay arose from the extreme slowness of draining a piece of land before ploughing and sub-soiling it, the soil at a depth of 2 feet being so hard that a pickaxe had to be used in parts of each drain.

Plums have dropped their foliage entirely, and Gooseberries and Black Currants sufficiently for transplanting, so they may be put in whenever the weather is favourable. Sad to relate, a great many Plums and Black Currants planted last winter were killed, or so badly dwarfed by the drought that they will have to be replaced. On the other hand, Plums and Currants, as well as Apples, planted a year earlier, made particularly vigorous growth.

MANURES FOR FRUIT TREES.

The 15th annual report on the Worcestershire Experimental Garden, at Droitwich, contains the results of applying different dressings of manure to Apple and Pear trees. Unfortunately, only two trees were used for each treatment, and there were no unmanured trees as checks. The individual differences of fruit trees are so great that many times two trees are necessary for

Currants raised from cuttings, in the season succeeding the planting; but, on the other hand, no difference whatever is noticeable in Apples or Black Currants in an unmanured row, as compared with other rows dressed with artificials containing nitrogen, phosphoric acid and potash. In the Geneva case, the top foot of soil was found, on analysis, to contain sufficient of the three principal ingredients of a mixed manure to last for much more than a tree's lifetime. In my case, the trees are growing on land liberally manured with a complete mixture of artificial or town manure for Potatoes during some years, and it is probable that the residues of these manures afford full nourishment to the trees and bushes for the time being. That even artificial manures sometimes have a marked effect upon fruit trees is shown at Hadlow, in Kent, where Dr. Dyer and Mr. Schrivell have been carrying on experiments for many years. Some Apple trees there, dressed annually with nitrate of soda and other manures, including potash, have grown far too rankly, at the expense of fruiting, while unmanured trees beside them have made comparatively feeble growth. This is an example of excessive manuring, but, none the less, it shows the effect of the manures. Some Gooseberry bushes in the same place, regularly manured with mixed artificials, are strong and healthy, while others, from which potash alone was withheld, are worthless. Heavy manuring should not be pursued until after trees have got into the fruiting habit. After that, it is difficult to force too rank a growth by any amount of manuring, unless excessively hard pruning is also pursued.

CODLIN MOTH INJURY.

It appears that Apples have been injured by the maggots of the Codlin moth to an uncommon extent this season. Perhaps this is in consequence of the quite unusual second brood of the pest, referred to in these notes a month ago. It is easy enough to prevent injury by the first brood to a considerable extent, as we know precisely when to include arsenate of lead in a spraying, namely, just after the petals of the blossom have fallen. This poisons the maggots when they attempt to eat their way into the embryo Apples close to the calyxes. But, as in this country we probably do not have a second brood once in 10 years, it is hardly worth while to spray annually against it, and we cannot tell precisely when to spray even if we are disposed to do so. This year, the work of the second brood was first noticed by me early in September. It would have been useless to spray then, as the maggots were inside the Apples. Moreover, it would be dangerous to cover Apples nearly or quite full grown, with an arsenical spray-stuff, in spite of the fact that American growers, who get the second brood commonly, disregard that danger. Apart from this point, it would be necessary to watch for the first appearance of the moths, and to spray immediately after they were seen.

BITTER PIT OR FRUIT SPOT?

There is reason to fear that one of these two diseases of the Apple is increasing in prevalence in this country. I say "one of these two," because, as their appearance is similar, they are often confused, though a mycologist who has studied their respective symptoms can easily distinguish them. Both produce spots, which become sunken and brown, and both cause corky degeneration of portions of the tissues of the fruit, penetrating sometimes to the depth of several cells. Most persons, probably, have had Apples which, when pared, showed these brown specks, and have found that they penetrate, in some cases, nearly to the core. If "bitter pit" or "fruit pit" imparts a bitter flavour to the fruit, I have never noticed it, and this may indicate that my pitted Apples are subjects of fruit spot (*Cylindrosporium pomi*). The Board of Agriculture cannot enlighten me on this point. The latter is a fungus disease, controlled by the same spray-stuffs as scab, while "bitter pit" is not caused by a fungus, and no preventive or remedy for it has been discovered. A report on the recent fruit show of the Royal Horticultural Society states that Apples affected with "bitter pit" were noticed in several of the prize lots. It is astonishing that any grower should send such Apples to a show, and still more astonishing that the judges should award prizes to fruit so affected. *A Southern Grower.*

FIG. 151.—DELPHINIUM MOERHEIMII IN MR. RUY'S NURSERY, DEDEMSVAART.

(See p. 352.)

tions, and in fresh land to be planted. One would hesitate to plant trees or bushes in land as dry as it was a foot below the surface before the rainy period, which began on October 19. Moreover, either ploughing and sub-soiling or bastard trenching were almost impossible before that time. But November, so far, has proved even wetter than the first half of October, 4.12 inches of rain having been measured at my station up to the 11th, inclusive.

THE PLANTING SEASON.

Most fruit-growers, it may be assumed, would prefer to plant trees and bushes in November rather than in any subsequent month of the planting season. It is to be hoped, therefore, that the rest of the month will not be very rainy. At present, the foliage on young Apple trees is quite green, and, as is so often the case, delay in the commencement of the work will arise from this circumstance. Another cause of delay is the unprepared state of the land, due to the previous September drought. This delay was increased by the fact that after the land became soft enough for sub-soiling rain continued to fall

each treatment, in order to test results satisfactorily. Again, "garden refuse" (a very indefinite substance in relation to its fertilising qualities) was one of the manures. By far the greatest crops and best quality of fruit in 10 years were produced on a plot dressed (presumably annually) with stable manure and a mixture of inorganic fertilisers containing nitrogen, phosphoric acid, and potash. Stable manure alone was second in results, garden refuse being third, and artificial manures last. In the case of Pears, stable manure alone gave the greatest crops, the same with artificials being second, artificials alone third, and garden refuse last.

In the Woburn experiments, the results of experiments in different manurings were hardly, if at all, distinguishable for some years, farm-yard manure showing some good effect ultimately.

A report of experiments carried out at the Geneva Experiment Station, in New York State, shows negative results, and the conclusion of the writer is that the manuring of Apple trees in the district of the trials is not profitable. I have made several experiments of the kind myself, and have usually found it difficult to decide whether the applications did good. Mixed artificials had a wonderful effect upon young Black

The Week's Work.

THE KITCHEN GARDEN.

By JOHN DUNN, Kitchen Garden Foreman, Royal Gardens, Windsor.

FORCING ASPARAGUS.—This is an easy matter provided good, strong roots are available for the purpose. At Windsor, we lift a few of the plants from the oldest beds each season for forcing, which necessitates forming fresh beds each spring, a system that answers well. Gentle forcing only should be resorted to, as excessive heat will cause the shoots to grow spindly. We prefer hotbeds made of leaves which have been thrown together some time previous to use, in order to ferment and sweeten. These are placed in deep, slightly-heated pits when the heat of the fermenting materials has risen to 75°. The leaves are trodden lightly together and covered with a few inches of thoroughly-decomposed manure, finally placing a thin layer of sifted leaf-mould. When the temperature of the bed is 75°, and there is no danger of it rising higher, the roots may be carefully dug up and placed as closely together as possible, filling in the spaces between them with finely-sifted leaf-mould, which should be watered with clear water warmed to 80°. No further covering will be necessary until growth commences, at which stage a layer 6 inches deep of finely-sifted leaf-mould should be spread over the bed. This will cause the young shoots to hasten into growth. Fire-heat will not be necessary until severe frosts occur, especially if the pit can be covered up at night with mats or other suitable materials to maintain the top heat at about 50°.

FRENCH BEANS.—French Beans in pots should be given frequent waterings of weak liquid manure to keep them growing freely, and the foliage syringed twice daily with the same object in view. If supplies are desired throughout the winter, a sowing should be made every 10 days, using 7-inch pots. Place the pots in a house having a night temperature of 60°, and keep the plants close to the roof-glass, admitting fresh air whenever the weather is favourable. The soil for this crop may consist of three parts turfy loam and one part leaf-soil, with sufficient rough sand to keep it in a porous condition. Osborn's Prolific is a reliable variety for winter sowing, or Ne Plus Ultra may be selected. When the plants are a few inches high, they should have small sticks placed round them to keep the shoots from becoming entangled with each other. Stand the pots in a sunny position, within a short distance of the roof-glass; shelves that are used for forcing Strawberries are very suitable places.

LETTUCE.—Plants of Lettuce in cold frames should be frequently examined, and all decaying foliage removed. Stir the soil between the plants to prevent it from becoming sour, and remove the lights during dry days, replacing them again at night-time. Dampness is the worst trouble with this crop in winter, and should be avoided as far as possible by tilting up the lights in rainy weather. If any space is available in cold pits or frames, this may be filled with late-planted Lettuces from the open borders, before they are injured by frost or heavy rains. If lifted carefully, with a good ball of soil, they may prove a valuable crop before the winter is over. Autumn-sown Lettuces should now be a good size, and may be planted at once in some sheltered spot; this sometimes proves a valuable crop in April, when salad plants are scarce. A sowing of Lettuce seed may be made at once in a cold pit, in soil placed to within 1 foot of the glass. The plants will be ready for planting in box frames very early in the year, and should be ready for use in April. May King is a good variety for the purpose, forming heads of a good size, and making quick growth. If the frames are placed in a sheltered position, they may be removed from the Lettuces in March if they are required for more important crops.

MUSTARD AND CRESS.—A sowing of this salad should be made soon in gentle heat, making fresh sowings at least once weekly during the winter months, so that an unbroken supply may be maintained.

FRUITS UNDER GLASS.

By E. BECKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Hertfordshire.

STRAWBERRIES.—For a very early supply of forced Strawberries select plants with good, well-ripened crowns. The pots should be washed, the drainage materials examined, and, for the first few weeks, a very gradual system of forcing adopted. For the first week or two the pots may be stood on a shelf in a cool house, where plenty of air can be admitted during the daytime, gradually inuring the plants to increased warmth as growth becomes active. Though this method appears a somewhat slow one it is preferable to hastening the plants into growth during the early stages with fire heat, especially in the case of the earliest batches, as a sudden development is conducive to weak flower-spikes. Water must be afforded with discretion, and, though the plants do not require a lot of moisture, at the same time the roots must not be allowed to become dry. If the surroundings are kept moist when the weather permits, this will do much to keep down attacks of red spider, while should mildew appear, dust the leaves with flowers of sulphur, using the black kind for preference. In all cases elevate the plant as near to the roof glass as possible, and should it be considered at all necessary, fumigate the house with a mild application of the X.L.-All preparation.

PEACHES IN LATE HOUSES.—Trees that carried late crops of fruit may now be pruned and trained. At the same time, cleanse the house thoroughly, top-dress the borders, and get everything else in a proper condition to commence forcing. The forcing of late trees is done under more natural and favourable circumstances than in the case of early varieties; therefore, the wood may be trained in sparingly. Remove as much of the old shoots as possible, especially those that are deficient of the current season's growths, using a small pruning saw, and afterwards making a clean cut with a sharp knife. Young, coarse growths should be removed entirely, and any root-pruning that is necessary carried out without delay. Keep the trees in as dormant a condition as possible, and provided the fruit trees are the only consideration, open the ventilators both day and night, maintaining a little warmth in the hot-water pipes to prevent them being injured by frost. If the borders exhibit signs of dryness, water them copiously, as it is a mistake to allow the soil to become dry, even when the trees are at rest. Excessive dryness at the roots is probably the cause of "bud-dropping" when forcing is commenced. If other plants, such as Chrysanthemums, are in the fruit-houses, it may be necessary to afford warmth to prevent the blooms from damping, but even then a circulation of fresh air should be admitted through both the top and side ventilators whenever the weather permits.

CURRENTS.—Currants are occasionally forced to provide variety. No delay should be occasioned in lifting the bushes if this has not been done already, potting them firmly into pots 10 to 12 inches in diameter. The receptacles must be well drained and cleansed, as for other pot fruits. Select young plants with plenty of clean growth and well syringe them with an insecticide before introducing them to the fruit-house. Both Red and White Currants force well, but the Black is not so suitable. Do not subject the plants to too much heat, especially at the commencement, treating them much in the same way as advised for Peaches. Select varieties that produce fine berries and long bunches.

THE FLOWER GARDEN.

By R. P. BROTHERSTON, Gardener to the Earl of HADDINGTON, K.T., Tynninghame, East Lothian.

TURF OPERATIONS.—It is not unusual for the turf at the foot of pedestals, sundials and similar objects on lawns to become, in the course of time, above the general level. Now is the proper time to remedy this eyesore. The turf should be cut into strips each 9 inches wide, sliced underneath, rolled back and just sufficient soil removed to restore it to its original level. A gentle pat with the back of a spade completes the operation. Sometimes the turf near the edges of flower-beds needs to be levelled in the same manner; where flowers have been allowed to overgrow the edges the outline must be restored to the original form. In geometrical flower gar-

dens the lines are certain, sooner or later, to become untrue, and it may necessitate much trouble to go over each bed and lay it out again to its proper dimension and shape. The whole of the lawns, grass paths and other grass plots should be carefully swept when dry, to present a neat appearance for the winter.

ROSES.—The planting of Roses may now be proceeded with and completed as soon as possible. Old-fashioned sorts such as Rosa gallica, the Scotch and Cabbage and Moss Roses may be pruned, as they are perfectly hardy. Any of the old wood that needs thinning from Ayshire Roses and briars may be removed now, and the ground in which the plants are growing neatly pointed over with a fork. Those who wish to bud their own standards will find this the best time to visit hedgerows, where the briars grow wild, selecting only those with stout, straight stems. If these briars are planted in an exposed position it may be necessary to give each the support of a stout stake. Any time up to the end of the present month the more tender Roses should be protected by some suitable material, although nothing seems to prevail against intense and long continued frost. But it will prevent the bark from being injured, and sometimes killed through the sun shining on the plant directly after a sharp frost.

SEEDS.—It is remarkable that numbers of plants and shrubs that do not usually produce seed in this country have seeded during the present season. Those who have taken advantage of this to gather seeds will find most of them are ready for cleaning, after which operation they should be stored in paper bags. Late ripening kinds may be kept longer in the seed vessels. If more seed is saved than is required, it provides a good opportunity of exchange with other gardeners and flower lovers. Many possess plants that are not common, or which cannot be procured through the usual channels; in such cases it is not only a pleasure, but almost a duty to distribute seeds among people who are able to appreciate uncommon plants and to do them cultural justice.

VIOLETS.—Violets have, to a great extent, recovered the loss of vigour apparent during the summer months, and have been yielding a few flowers during the past few weeks. It is worth the trouble to make them tidy, by removing dead leaves and other rubbish, before the advent of winter, afterwards applying a light dressing of sifted compost all over the plants, which the first heavy rain will wash off the foliage. The effect of this top dressing will be apparent in the spring, when growth is renewed.

BORDER ASTERS.—Michaelmas Daisies are still flowering, and among them the following are specially good:—Asters ericoides, Tradescantii, diffusus (horizontalis), turbinellus, Novæ-Angliæ ruber, and the varieties Enchantress, Hon. Edith Gibbs, Jessie Croome, and Climax. The last-named is so very fine that it should be grown specially in pots for house decoration; on single stems it produces great pyramids of the most beautiful flowers.

THE HARDY FRUIT GARDEN.

By W. HEDLEY WARREN, Aston Clinton Gardens, Buckinghamshire.

RASPBERRIES.—The pruning of the Raspberry is a very simple operation, and may be carried out in mild weather at any time during the autumn or winter. If the old canes have not been removed, as advised in a former calendar, no time should be lost before doing this, cutting them off as close to the ground as possible, at the same time selecting the stronger and best-ripened canes of the current season's growth for fruiting next year. All small or misplaced canes should be removed, retaining those only that are placed nearest to the centre of the stool, thus keeping the plantation compact and orderly. When the canes for future bearing have been selected, they should be tied securely to the stakes, wires, or trellis, and the surface of the soil mulched with half-decayed manure. The canes may be shortened back according to the strength of the individuals, the weaker ones to about one-half, and the stronger to three-fourths of their entire lengths. The past season has proved most favourable for the ripening of the canes, most of them being in an excellent condition for fruiting. The Raspberry requires a deep, light, loamy soil, moderately enriched with

well-decayed manure. Young canes or suckers may be planted during October or November, in mild weather; they frequently form new roots before the winter sets in. If grown in groups, the canes may be planted in rows about 5 feet apart, allowing 4 feet between the rows. Many train the canes to wires, in which case they should be planted singly, at about 10 or 12 inches apart. In dealing with old plantations, where the plants are not very vigorous, a good dressing of well-decayed manure should be lightly forked into the soil about the roots, but under no consideration should a spade be used. It is not wise to work the manure into the ground to a greater depth than about 3 or 4 inches, otherwise many of the surface roots will be damaged or destroyed. New plantations of Raspberries should be made at least two years before they are intended to replace older ones; by that time the newly-planted canes will be in a good condition of bearing.

GENERAL REMARKS.—Replace any vacancies on walls where the trees have failed, and endeavour to have all wall trees in a proper order as soon as possible. When a tree is not doing well, there is generally something wrong at the roots. Almost all kinds of fruit trees do best in a good, deep, loamy soil, with a dry subsoil. Any trees that have proved unproductive, or in any way unsatisfactory, should now be lifted carefully, the drainage made perfect, fresh soil added to the border, and the trees freshly planted. When planting is completed, push on with the work of pruning as much as possible. Fig trees should have the branches unfastened from the walls and tied in bundles, so that, when very cold weather sets in, they may be easily and well covered with straw or dry fronds of Bracken Fern. This protection will often save the first crop of fruit the following season. The pruning of all kinds of fruit trees may now be commenced in earnest. Trees that are pruned regularly will not require much attention beyond removing a shoot here and there where they are too numerous, and thinning the spurs where these are crowded. Trees in orchards that have not been pruned regularly will require much more thinning and shortening. These should be carefully dealt with, well thinning the branches, particularly from the centre of the tree, which should be kept open, shortening and thinning the spurs and fruit-buds, retaining the plumpest and best buds nearest the origin of the spur. The object in view should be to obtain buds near at home, and to have the spurs at proper distances apart, so that both sun and air may have free access to them. The early thinning of the buds and spurs strengthens those that are left, and goes far to ensure the setting of the blossom the following season.

THE ORCHID HOUSES.

By H. G. ALEXANDER, Orchid Grower to Lt.-Col. Sir G. L. HOLFORD, K.C.V.O., C.I.E., Westonbirt, Gloucestershire.

PLEIONE.—Pleiones, known as Indian Crocuses, are charming little Orchids that make a bright and effective display during the dull days of winter. *P. lagenaria* commences flowering in the late autumn, being one of the most useful for gardens, and, also, one of the most generally grown. If a good stock of plants is cultivated, a display of blossom may be maintained for many weeks by introducing successional batches in a warm temperature. *P. maculata*, with its variety *alba*, is a charming species that closely follows *P. lagenaria* in flowering. *P. Wallichiana* and *P. humilis* produce beautifully-coloured flowers that are larger than those of *P. lagenaria*, and are especially valuable on account of their later blooming. Pseudo-bulbs of Pleiones usually last only one year, the old ones decaying as the new are being formed. The plants are deciduous, and produce their flowers concurrently with the young growths. They have distinct seasons of growth and rest, therefore, as they commence to grow at different seasons of the year, they need to be potted at different times. All are most satisfactory when repotted annually, the best time to do this being immediately after the flowers are over. In shaking the compost from the old pseudo-bulbs, the last season's roots will, as a rule, be found to be quite dead, and should be cut off about an inch from the base, the portion that remains fixing the plant firmly in the new compost. Some growers fill large, shallow pans

with pseudo-bulbs, making a good display in this way, but small pans are preferable for grouping and other decorating purposes. In either case the treatment is the same. The receptacles should be filled two-thirds of their depth with clean crocks for drainage. The compost must be a substantial one; a suitable mixture is good fibrous loam, two parts, peat or *Osmunda* fibre, one part, and chopped *Sphagnum*-moss, one part, with a liberal quantity of coarse sand, finely-broken crock and charcoal, the whole well mixed together. Care must be taken when repotting not to injure the young growths; the base of the old pseudo-bulbs may rest just on top of the compost, which should be kept rather higher in the centre of the pan than around the rim, so that the flowers may show to the best advantage. Fix the bulbs firmly, planting them about 2 inches apart, and make a neat finish to the potting by clipping off any ragged ends. If new roots are being emitted before the plants are potted, extra care will be necessary in performing the work. After the plants are potted great care will be necessary in affording water, for if the compost becomes too moist and close, the young, tender roots will not take kindly to it; but this does not obtain for long, and once they secure a good hold of the soil and the leaves begin to unfold, a liberal supply of moisture is needed. When in full growth, the plants enjoy plenty of atmospheric moisture, and, as with many epiphytal Orchids, a light, airy position is essential. Pleiones thrive best without much heat, but the cool house proper is not quite suitable for them. If a house having a cool, intermediate temperature is not available, the plants are best accommodated in the coolest part of the intermediate or Cattleya house. In this case growth will be very free, and care will be necessary to have the plants in flower at their proper season. Insects are not particularly troublesome to Pleiones, the worst pests being red spider and brown scale, but these may be easily kept under.

ONCIDIUM CHEIROPHORUM.—This species is the prettiest of all the small-flowering and dwarf-growing members of the genus, also one of the most desirable of autumn and winter-flowering Orchids. Although the fragrant, golden blossoms are small, they are borne in great profusion, and closely together, on short, sturdy-branched racemes. The plant is easy of culture, growing well in pans, vigorous specimens with a crowd of racemes being very beautiful objects. *Oncidium cheiroporum* does well in a cool, intermediate house, and requires the same compost and conditions of moisture as the other dwarf members of the genus.

PLANTS UNDER GLASS.

By JAMES HUDSON, Gardener to LEOPOLD DE ROTHSCHILD, Esq., Gunnersbury House, Acton, Middlesex.

HOUSING PLANTS AND RE-ARRANGING PLANT HOUSES.

—At no time of the year is it necessary to exercise more thought and care on the disposal of the stocks of tender plants than now; and this is especially the case where, as often occurs, more plants are grown than can be easily housed during the winter. Sometimes it is necessary to utilise the fruit houses for other plants, but a fruit house should never be overcrowded, as this is most injurious both for the introduced plants and the legitimate occupants. A house which is intended for the accommodation of fruit is best reserved for this purpose; but, if the introduction of other plants is unavoidable, the fruit should always have the first consideration. There are many plants which can withstand a temperature just above freezing point; some will even survive a few degrees of frost without harm. We have, at Gunnersbury, for instance, a rough erection, by no means frost-proof, in which we winter our large Myrtles with great success. If necessary, *Cordylines* may be stored in a similar place, and also Sweet Bays. *Rhododendron* (*Azalea indica*), when at rest, may be safely kept in a place only just frost-proof; this applies also to *Nerium Oleander*. Some plants may be semi-pruned and stored away in a frost-proof erection; I have adopted this plan, on occasions, with a large specimen of *Rhododendron* (*Azalea indica*). Specimen *Fuchsias*, *Lantanas*, *Sparmannia africana*, *Lippia citriodora*, *Erythrina crista-galli*, and other deciduous greenhouse plants should be placed in a dark, or semi-dark, building; and care must be taken that none of these is ex-

posed during a frost, or immediately when a thaw sets in. If precautions are taken against this contingency, and the pots are well covered with dry straw litter, they should come to very little harm; but it should be noted that protection of the roots is most essential.

WATERING PALMS.—As stated in last week's Calendar, all Palms in a healthy condition require liberal supplies of water at the roots, and must never be allowed to suffer from drought. There is a danger, when the fires are being driven hard, to maintain the necessary temperatures, that the soil and atmosphere may become too dry, and this must be guarded against. One of the chief dangers resulting from dry conditions is the spread of insect pests. Feed the plants occasionally with suitable stimulants, the best of which, in my experience, is Standen's manure.

BAMBOOS.—Bamboos may be regarded as companion plants to the Palms, and provide fine decorative subjects for the cool greenhouse and conservatory. They are easy of culture and specimens may be grown to a good size in pots or tubs of moderate dimensions. During the winter months they are very serviceable, on account of their light, graceful habit, as decorative plants, whilst for the embellishment of vestibules or halls they have few equals. During the summer season they may be made use of out-of-doors in the decoration of the flower-garden.

THE GREENHOUSE.—The plants known best to gardeners as Azaleas, but which are now included under *Rhododendron*, are almost indispensable for greenhouse decoration in winter. The fashion nowadays is to grow small plants, and if these receive proper attention they will, in course of time, develop into useful specimens. They are best trained in a semi-pyramidal form, and it is easy to do this if the plants are attended to in an early stage. Most of them are grown as round bushes, but this form does not lend itself to growing the specimens on so well as the pyramidal type, while bushes require more room. Now is the best time to replenish the stock of Azaleas. They are imported without pots, and should be potted as soon as they are received from the nurseryman, after which they should soon become established. It is well to encourage root-action at first by affording a little extra warmth, but afterwards the plants should be hardened to withstand the average greenhouse temperature. It cannot fail to be noticed that present-day varieties possess greater vigour than the older sorts, which is a very desirable feature. A selection of the best up-to-date varieties includes *Deutsche Perle*, *Ceres*, *Edmund Vervane*, *Hermosa* (all these are early sorts), *Niobe*, *Mme. Joseph Vervane*, *Apollo*, and *Souvenir du Prince Albert* (these being later varieties). Pay close attention to the watering of newly-imported plants, and, whilst avoiding an excess of moisture, do not allow the foliage to droop, as this will result in the weakening of the flower-buds. Examine the general stock of these plants to see if thrips are present, and take the necessary measures to destroy them, if any are detected. Plants of such kinds as *Deutsche Perle*, that have been forced in previous seasons, will soon respond to a generous treatment and yield flowers during the dull season. The flowers of this variety remain fresh for a long time when cut, and it is the best white sort to grow for cut blooms. If a house can be set apart for the culture of such plants as *Bouvardias*, early-flowering *Acacias*, *Carnations*, *Lupatoriums*, *Lassandra macrantha*, and *Jasminum*, the plants will furnish varied and large quantities of flowers at a time when they are most needed. The night temperature of such a house should be about 50°, with a drop of 5° the first thing in the morning. Although some growers devote houses entirely to *Carnations*, the plants may be grown in mixed collections such as I have indicated. It will be necessary to ventilate the house during the daytime on all favourable occasions, guarding continually against an excess of atmospheric moisture.

CROSS-BRED PINKS.—We have received photographs of two new Pinks—*Franksonia* and *Bavaria*—from Herr B. MÜLLERKLEIN, said to be crosses from perpetual-flowering *Carnations* and Pinks *Rose de Mai* and *Queen of the Market*. It is stated that cuttings of *Franksonia* rooted in June flowered on September 15.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, as well as specimens of plants for naming, should be addressed to the EDITORS, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Local News.—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.

APPOINTMENTS FOR THE ENSUING WEEK.

SATURDAY, NOVEMBER 18—
British Gardeners' Assoc. (London Branch) 4th Annual Concert at Carr's Restaurant, 264, Strand, at 7.30 p.m.

MONDAY, NOVEMBER 20—
Nat. Chrys. Soc. Executive Com. meet.

TUESDAY, NOVEMBER 21—
Roy. Hort. Soc. Coms. meet. (Lecture at 3 p.m. by Mr. E. White, on "The International Horticultural Exhibition, 1912.") National Vegetable Soc.'s Ann. Gen. Meet. at R. H. S. Hall, Westminster, at 2.30 p.m.

WEDNESDAY, NOVEMBER 22—
Darlington Hort. Soc. Autumn Fl. Sh.

FRIDAY, NOVEMBER 24—
Aberdeen Chrys. Sh. (2 days). Hawick Chrys. Sh. (2 days).

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last Fifty Years at Greenwich—42°.

ACTUAL TEMPERATURES:—

LONDON.—Wednesday, November 15 (6 P.M.): Max. 58°; Min. 41°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—Thursday, November 16 (10 A.M.): Bar. 29.5°; Temp. 57°; Weather—Dull.

PROVINCES.—Wednesday, November 15: Max 50° Colchester; Min. 47° Lincoln.

SALES FOR THE ENSUING WEEK.

MONDAY, TUESDAY, WEDNESDAY, THURSDAY AND FRIDAY—
Dutch Bulbs, at 67 and 68, Cheapside, E.C., by Protheroe and Morris, at 10.30.

MONDAY, WEDNESDAY AND THURSDAY—
English and Dutch Roses, Shrubs, Azaleas and Dutch Bulbs, at Stevens's Auction Rooms, 38, King Street, Covent Garden, London, at 12.30.

TUESDAY—
Roses and Herbaceous Plants, at 67 and 68, Cheapside, E.C., by Protheroe and Morris, at 12.30.

WEDNESDAY—
Miscellaneous Bulbs and Plants at 12; 4,210 cases Japanese Liliums, at 2.30; Palms and Plants at 5, at 67 and 68, Cheapside, E.C., by Protheroe and Morris. Annual Sale of Fruit Trees at Platt Nurseries, Borough Green, Kent, by Protheroe and Morris, at 11.30.

FRIDAY—
The "Underfell" Collection of Orchids, at 67 and 68, Cheapside, E.C., by Protheroe and Morris, at 12.45.

The National Rose Society's Catalogue.

The National Rose Society is issuing to its members a new edition of the Society's official *Catalogue of Roses*. It is two years since the last edition appeared, and it is understood that the Society proposes in future to issue a new edition every alternate year. The catalogue does not aim at being an exhaustive list of all known varieties of the Rose, such as that published a few years ago by Mons. Jules Gravereaux, enumerating the Roses cultivated at l'Hay, nor is it even a list of those Roses in general cultivation, such as is to be found in the Society's pruning book, but the aim of the official catalogue is rather to give a select list of those Roses which for one reason or another are considered to be most worthy of cultivation by amateurs.

Thus it will be found that in each new edition a large number of the Roses mentioned in former impressions has been

omitted, and the place taken by newer varieties, which for the several purposes for which they may be used in the garden, are thought to supersede the older varieties. A comparison, therefore, of the two successive editions of the work forms a not uninteresting review of the development of the Rose.

The catalogue consists of 3 parts. After some 12 pages of introductory matter, 60 pages are devoted to a descriptive list of rather fewer than 600 varieties, then follow 20 pages in which these varieties are arranged according to the classes to which they belong, while the remainder of the book consists of selections of Roses for the various purposes for which these plants may be used. It is the first and the third parts—the descriptive list and the selections—that will be found to be of most general interest. Two new departures may be noticed at the outset; one is that the new Roses added to the catalogue, instead of being incorporated in the general list, are enumerated in sections at the end of the general list, the object probably being to indicate that these are still on their trial, and are not recommended with the same confidence as are those which are retained in the general list. The other is the appearance for the first time of the description "Austrian hybrid," as applied to Roses of the class of Rayon d'Or and Juliet, which cannot conveniently be described as Hybrid Teas.

Turning to the Roses that have been excised from the 1910 edition, we find that some 70 names in the 1910 catalogue fail to appear in that of 1912. Of these no fewer than 24 are Hybrid Teas, 20 are Tea-scented Roses, 16 are H.P.s (or including synonyms, 19), 5 are Polyantha Pompons, 2 Noisettes, 2 are Wichuraianas, and the remainder come under various headings.

The places of these excluded Roses have been supplied by about 100 new varieties, for the most part introduced to commerce in the years 1909, 1910 and 1911, of which no fewer than 60 belong to the class of Hybrid Teas. Beside these there are 18 new Wichuraianas, 6 Tea-scented Roses, 6 Austrian Hybrids, together with 6 other Roses previously grouped under other descriptions, now brought into place under this section; 4 Polyantha Pompons, only 3 Hybrid Perpetuals, and the remainder of various denominations. The result is a considerable addition to the ranks of the Hybrid Teas, so that the members of this group, notwithstanding the number removed from the catalogue, now reach some 210 varieties, while the Wichuraianas amount to 40, making, with the 24 multifloras recommended in the catalogue, 64 modern climbing Roses. On the other hand, the Teas have decreased from 96 to 83 and the Hybrid Perpetuals from 74 to 58. In connection with these changes Tea Rambler now appears in the multiflora section, while Hiawatha has been transferred from this section to that of the Wichuraianas, alterations which are amply justified by the habit of growth of these varieties in our gardens.

In the selections of Roses for various purposes considerable changes have been made. Selection depends so much on individual taste and preference that it would be easy to criticise the separate lists, but criticism is not so much the object of this article as to notice the changes that have commended themselves to the Society. Taking, for instance, the selection of Roses for general garden cultivation, a matter of special interest at planting time, the following Roses, recommended as specially suitable for this purpose in the 1910 catalogue, have maintained their position: Antoine Rivoire, Caroline Testout, Commandant Felix Faure, Frau Karl Druschki, Gustav Grünerwald, Joseph Hill, Lady Ashtown, Mme. A. Chatenay, Mme. Jules Grolez, Mme. Mélanie Soupert, Mme. Ravary, Mrs. John Laing, Pharisæer, Prince de Bulgarie and Richmond. Those excluded comprise The Earl of Warwick, G. Nabonnand, Grand Duc A. de Luxembourg, Hugh Dickson, La France, Mrs. R. G. Sharman Crawford, Ulrich Brunner, Viscountess Folkestone and White Maman Cochet, and the place of these Roses is now taken by Dorothy Page Roberts, Ecarlate, Florence Pemberton, General MacArthur, Mme. Antoine Mari, Mme. Léon Pain, Mrs. E. G. Hill, Mrs. Theodore Roosevelt, and Sulphurea. The general result appears to be to substitute for the fuller and more heavily-petalled Roses, which find favour with exhibitors of specimen flowers, thinner and rather looser Roses which open more readily, flower more freely, and so present a brighter and more continuous effect of flower in the garden.

The selections of bedding Roses also show many changes, but it is not a little remarkable that they contain not a single Tea-scented Rose, a class which provides us with some of our very best and most continuously floriferous bedders.

This edition contains no fewer than 21 lists of selections for different purposes; in fact, it would be difficult to find any purpose to which the Rose is put, for which the most appropriate Roses are not named. It is perhaps a sign of the times and of the popularity which rock-gardening in its many forms now enjoys in this country that, for the first time, a list of Roses suitable for rock work is included. The Roses selected for this purpose are naturally of dwarf habit, and many of them are such as are classed under the head of species, being wild Roses of this or other countries. Many of these have become accustomed under natural conditions to do well in sandy or comparatively poor soils, and are therefore well suited to the conditions of the rock garden where modern garden Roses, accustomed to rich beds and borders, would soon look shabby and unhealthy.

Another indication given by the new catalogue is the increasing interest and attention bestowed upon the summer-flowering climbing Roses of the multiflora and Wichuraiana groups. This, again, is no more than might have been expected,

Photographs by H. N. King.

LEONARDSLEE, HORSHAM, THE RESIDENCE OF SIR EDMUND LODER, BART.

for the readiness with which these Roses lend themselves to decorative effect during their period of flowering and the brilliant results attained with them by the nurserymen at the shows have brought them into much favour with the public. The popularity of this group among owners of gardens has also increased since it was found that they are of easy culture and capable of employment in many different fashions. But those who look to the future will not be content with Roses that are, after all, only summer-flowering. It is true that by the inter-mixture of early and late flowering varieties a blossoming period of some two and a half months may be obtained and that some of the Wichuraianas do produce a few autumn flowers, but they are very few and the supply is poor and intermittent.

Let the rosarian but carry his thoughts back to 10 or 15 years ago, when for autumn flowers out-of-doors he had to seek the Dahlia, which perished with the first frost, or the hardy Chrysanthemum, too soon battered by the autumn gale, and then look in his garden to-day, when, in the middle of November, he may gather a bowl of Roses of the beautiful and fragrant Richmond from plants that have never been without blossom since early June, or he may now cut vases of Lady Battersea, Pharisaer, or Mme. Maurice de Luze. Let him note the advance that has been made with Hybrid Teas and refuse to be satisfied till he gets a perpetual climber. There are already promises of its advent. The hardier Noisettes, Aimée Vibert, Alister Stella Gray, and Wm. Allen Richardson we have cultivated for a long time, and Morgenroth and Sheilagh Wilson are steps in the direction of a perpetual Carmine Pillar, while Trier, of multiflora origin, is a true perpetual, though not much of a climber. Moreover, the pink and white varieties of Rosa Pissardi are autumn-flowering climbers. Of Sylvia the catalogue of 1912 tells us that it is a Wichuraiana flowering in both summer and autumn, and, moreover, a vigorous climber. If the promises held out to us are well founded it will indeed be an acquisition, and we may at least hope that another edition of the catalogue may show Sylvia to be but the forerunner of a goodly company of really perpetual-flowering climbers.

SUPPLEMENTARY ILLUSTRATION.—Woodland scenery is never more beautiful than in autumn, when the foliage puts on the rich tinting that foretells the approaching winter. But even in winter the woodland is made beautiful by the Conifers and other evergreens, which provide rich greenery all the year round, whilst Rhododendrons planted as undergrowth have a double charm, brightening their surroundings in winter with their glossy leaves, and in spring painting the woodland with flowers. At Leonardslee, the beautiful Sussex home of Sir EDMUND LODER, Bart., Rhododendrons grow in wild profusion, as may be seen from our Supplementary Illustrations, reproducing themselves from seed wherever allowed to do so. Those who have not the opportunity of visiting this noted garden may find the same thing obtaining in the woods and coverts of Richmond Park, where the seedling Rhododendrons may be counted in thousands.

ROYAL HORTICULTURAL SOCIETY.—The next meeting will be held on the 21st inst. At 3 p.m. a lecture on "The International Horticultural Exhibition, 1912," will be delivered by Mr. EDWARD WHITE.

BIRMINGHAM CHRYSANTHEMUM SHOW.—A further note from Birmingham states that a Gold Medal was awarded at the Chrysanthemum Show to Messrs. THOMSON & Co., Birmingham, for a non-competitive exhibit of vegetables.

SOUTHAMPTON ROYAL HORTICULTURAL SOCIETY.—In order to mark the society's Jubilee next year, it has been decided to hold a Rose Show at Southampton on June 26, under the auspices of the National Rose Society, and a great Jubilee Show and Gala during the third week in July, probably on the 16th and 17th of the month. The exhibition will include the usual Carnation and Sweet Pea Show, and there will be sections for fruit, miscellaneous plants, flowers, and vegetables. The autumn show will be held as usual in November. At the meeting when these arrangements were made, the secretary read a list of those who have promised their patronage and special prizes, including a 15 guinea trophy from the Hon. Mrs. YORKE to be offered for a display of Roses.

ROYAL SOCIETY OF ARTS.—The Royal Society of Arts opened its 158th Session on Wednesday, November 15, with an address from Lord SANDERSON, G.C.B., the Chairman of the Council. Five meetings are announced before Christmas, and four Cantor lectures on "The Carbonization of Coal" will be delivered by Professor VIVIAN LEWES. The list of papers for the meetings to be held after Christmas includes "The World's Decreasing Timber Supplies," by Mr. JOHN NESBIT, late Conservator of Forests, Burma, and "The Manufacture of Nitrates from the Atmosphere," by Mr. ERNEST KILBURN SCOT.

HONOUR FOR A TOWN GARDENER.—In recognition of 33 years' service in the public gardens at Eastbourne, Mr. JOSEPH SMITH was recently presented at the Town Hall with an illuminated address and a purse of gold by the Mayor. Amongst other work under Mr. SMITH's direction is the care of some 10,000 street trees.

PRESENTATION TO A SECRETARY.—Mr. ANGUS MCKINNON, secretary of the Machen Flower Show, and Miss MCKINNON have received presentations from the members and friends as expressions of their appreciation of the services rendered to the society.

L.C.C. AND BOY GARDENERS.—At the weekly meeting of the London County Council, on November 7, the Parks and Open Spaces Committee stated that their attention has been directed to certain unsatisfactory features in the conditions of employment of boy labourers in the Council's parks and open spaces. Under the existing regulations, boy labourers are employed between the ages of 14 and 16 years, their rate of pay being 2½d. an hour whilst under 15 years of age, and 3d. an hour on and after that age. When 16 years, the boys are, as a general rule, discharged. If there should be a vacancy when a boy reaches the maximum age for boy labourers, he may, in the event of his showing sufficient aptitude, be promoted to the rank of improver, at the wages of 14s. a week, rising to 24s. a week, by two annual increments of 2s. a week and two annual increments of 3s. a week. The number of vacancies is, however, very small, and it has only been possible to retain in the service a small proportion of the boy labourers employed. To meet this difficulty as

far as possible, and in order to secure to the lads a measure of training which should qualify them ultimately for the position of gardener in the Council's service, they now submit a scheme for utilising the services of all the boys engaged, subject to satisfactory conduct, first as improvers and ultimately as gardeners. The scheme provides for the employment of boys as boy labourers for four years, instead of two years, as at present, for their promotion to the rank of improver on attaining the age of 19 years, in which capacity they would serve five years, three years in the second class and two years in the first class, and, ultimately, at the age of 24 years, for their promotion to the rank of under-gardener. The Committee consider that the promotion of an improver from the second to the first class should be subject to his passing, in the first or second class, the public parks examination held by the Royal Horticultural Society, and that the promotion of an improver to the rank of under-gardener should be subject to his passing the examination in the first class. They recommend that the boys be paid 10s. a week until they attain the age of 15 years, subsequently rising each year by 2s. a week to 18s. a week; second-class improver, 21s. a week; first-class improver, 24s. a week. Under the scheme for the employment of boy labour, approved on July 27, 1909, boys under the age of 18 years are required to attend education classes, facilities to attend such classes being given for a period not exceeding six hours a week, and the Parks Committee think that, in the event of the scheme now presented being approved by the Council, similar facilities should be afforded to boy labourers and second-class improvers, i.e., all those under 22 years of age, the regular hours of duty at parks being 54 in the summer and 48 in winter. The Education and Establishment Committees concur in the proposal, and, in the event of the scheme being approved by the Council, arrangements will be made for the boys or men in question to attend suitable classes free of charge. The average number of vacancies in the gardening staff at the Council's parks and open spaces is 18 a year, and the Committee were of opinion that six of these vacancies should be reserved for the absorption of boy labourers, of whom they propose that four should be nominated each year by the Education Committee from boys in the Council's elementary schools. The Park Committee's proposals have since been adopted by the Council without discussion.

L.C.C. PARKS EMPLOYEES.—In March last the London County Council decided that all employees should, unless otherwise ordered by the Council, have the equivalent of one complete day's rest in seven. The Parks and Open Spaces Committee, however, have not found it practicable to dispense with the employment on their leave days of a portion of the staff under their control. During the two weeks ended October 11 and 18, the number of employees engaged for a part of their leave days was 203 and 194 respectively. The Committee have been in communication with the General Purposes Committee with regard to the difficulties which they have experienced in carrying out the regulation, and the question of reorganizing the staff in such a manner as will have the effect of minimising the employment of men on their leave days is engaging their attention.

THE GARDENS OF ENGLAND.—The Hon. HENRY W. McLAREN, M.P., in opening the Hinckley Chrysanthemum Show on the 3rd inst., said that he did not think there was another country in the whole world in which greater interest was shown in gardens than in England.

One might travel all over the Continent, but nowhere could be seen the number of large gardens and cottage gardens that are characteristic in England. In French villages there was either no garden at the back or front of the houses near to the street, or the gardens there were entirely devoted to vegetables. But in Britain it was not necessary to go to the most favourable parts of the country to find lovely gardens; they existed even in the manufacturing districts of Staffordshire and Lancashire.

SWEET PEAS IN THE TRANSVAAL.—The popularity of the Sweet Pea seems to be assured wherever it is cultivated. At the recent show of the Transvaal Horticultural Society held at Johannesburg, a prize of £20 was offered for the best 12 sprays. In order that the conditions should be equal for exhibitors from all parts of the country the exhibits were required to be posted two days before the show. In consequence many flowers suffered, but the desired object of securing equal conditions for growers over a wide area was attained. The 1st prize was awarded to Mrs. A. COOTE, Parkview, who staged a dozen sprays, each bearing four blooms of fine size and colour. Mrs. C. B. LLOYD, of Highlands, Natal, was awarded the 2nd prize. There were 200 entries.

JOURNAL OF THE PARIS CHRYSANTHEMUM COMMITTEE.—For some years past this committee has issued annually a *Journal* containing a résumé of the past year's work. The volume for 1911 is quite equal to its predecessors, and is a large octavo, of 170 pages, containing a large amount of information relating to the flower. There are illustrations also of the Paris Show last year, and among other contents of interest to members may be mentioned the lists of the officers of the committee, members of the floral sub-committee, various notices, annual report of past year's work, revised list of best Chrysanthemums for various purposes, schedule, list of prize-winners at last show, report of show and international conference, with text of papers then read and discussion that ensued, reports of local shows, and, finally, list of members of the committee.

THE RIVIERA FLOWER-TRADE.—The statistics for the past year, as quoted in *La Tribune Horticole* (October 23), give the export of cut-flowers from Nice as 7,550 tons (French), of the value of upwards of one million pounds sterling. Some 18,500 persons are employed in this trade in the environs of Nice, and one consequence of the enormous demand for labour in connection with this industry is that general agriculture suffers not inconsiderably.

TEA CONSUMPTION IN RUSSIA.—That the Tripolitan war should have an effect on the tea-drinking habits of Russians is not at first sight very obvious. Nevertheless, as a correspondent points out in the *Standard*, this is the case. Thus, the Russian loves to drink his tea with Lemons. The supply of Lemons to Russia enters that country by Odessa, and comes from S. Italy. In consequence of the war there is an absolute dearth of supplies, and hence the Russian drinks his tea with grumbling but without Lemons.

"JARDINAGE."—This is the title of a new monthly periodical devoted to gardening. It is printed in French, and is edited by M. GEORGES TRUFFAUT, of Versailles. The style is commendable, and the printing is well executed; the illustrations also are of a high order of merit. The cover bears a coloured illustration, and altogether the new monthly promises to be artistic, practical, and interesting. The list of authors in the first number comprises Messrs. GEORGES TRUFFAUT, JULES VACHEROT, PH. DE

VILMORIN, and GEORGES BELLAIR. The subscription outside France is 6 francs per annum, and the office of our new confrère, to whom we wish success, is 90 bis, Avenue de Paris, Versailles.

PUBLICATIONS RECEIVED.—*Fifty Useful Metric Equivalent Tables.* (The Central Translations Institute, 16, Eastcheap, E.C.) Price 6d.—*Among the Hills*, by Reginald Farrer. (London: Headley Brothers, Bishopsgate.) Price 10s. 6d. net.—*Bulletin of Popular Information*, No. 13, Arnold Arboretum, Harvard University. (Jamaica Plain, Mass., U.S.A.)—*North of England Horticultural Society's Monthly Magazine and Circular for October.* Secretary, Rev. J. Bernard Hall, Rawdon, Leeds.

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

THE RECENT R.H.S. FRUIT EXHIBITION.—Far too much was made at this great show of the recently-introduced Apples obtained from crossing Peasgood's Nonesuch with others, the seedlings including, amongst others, Rival, Houblon and Coronation. We have a good many excellent varieties for dessert that are fit for use at the same season as those mentioned, superior in flavour, and of a more suitable size for the dessert. The crosses from Peasgood's Nonesuch have excessively large fruits and they are dry and spongy. If we could only get some good varieties that would ripen at the same time as Northern Spy, Fearn's Pippin, Lord Burghley, and Court-pendû-plat, we should perhaps help to steady down the enormous quantity of foreign Apples, but we shall have to have them with a flavour approaching to that of Newtown Pippin, as imported. G. F. H.

MARKET GROWING AND LOW PRICES.—F. B., on p. 319, has called attention to a serious state of affairs in connection with market-gardening. The decline of the industry is of no recent date. It began many years ago, when ordinary farmers, to an increasing extent, became growers of plants of the Cabbage tribe and others on a large scale for market. Next a great increase in the number of allotments converted hundreds of thousands of buyers of vegetables into producers, who sell vegetables not required for their own use. As small holdings become multiplied, the position cannot fail to become worse and worse. As F. B. points out, only those small producers who can sell their produce by retail get a fair living by market-gardening, and if their number is to be greatly increased, competition with one another is likely to become ruinous. I pointed this out when the Small Holdings Bill was introduced. Although in favour of an increase of small holdings, I cannot ignore the fact that too great an increase will lead to disaster, unless some better method of distribution than the existing one can be devised. The point as to the high prices charged by greengrocers and fruiterers causing artificial gluts in the markets by checking the consumption has often been raised by me. A kind of "vicious circle" is created. By checking consumption by means of high prices, the retailer causes gluts in the markets, which enable him to buy at prices barely, if at all remunerative to producers. But this is not the only disadvantage the producer suffers who sells in the wholesale markets. He has no proof that he gets what his produce makes, but has to accept whatever his salesman thinks proper to return to him. The commissioner salesman is in a position which no man should be allowed by law to occupy. The defence of retailers is that if they adopted the system of small profits and large returns, their expenses would be greatly increased, perhaps unprofitably. A greengrocer, for example, would need to keep an extra horse and cart and to employ an extra carter. The system by which produce is conveyed to consumers is also an excuse for the high profits of retailers. A man with a car is sent round to customers to obtain orders, and then a second time to deliver produce to the value of only about 6d. to many a customer. So long as housekeepers will have goods brought

to their doors, they must pay comparatively high prices. The only remedy for a state of affairs which prevents producers of vegetables and fruit from obtaining remunerative prices for their products is some plan of supplying consumers directly, but this is most difficult to arrange, even by co-operation. The great markets which exist in the Midlands and the North, but very rarely in the South of England, and helps producers who have stands in the markets. But it is doubtful whether the great majority of housekeepers would patronise such markets, if established where they do not now exist. In some places they have been tried, and have failed. *A Southern Grower.*

MECONOPSIS INTEGRIFOLIA.—To the best of our knowledge, all the seed of *Meconopsis integrifolia* sent home by our collector, Mr. G. Forrest, also the plants and seed distributed by Messrs. Jas. Veitch & Sons, are of the type represented in your Supplementary Illustration of November 11, that is with incurved petals and slightly nodding flowers. The southern form referred to in your note as possessing a widely-expanded corolla has not come under our notice; but in 1900 Mr. A. K. Bulley received from the Koslov Expedition a packet of seed labelled *M. integrifolia*, from which plants were raised and which flowered at our Neston nursery late in the summer of 1904. These plants had larger blossoms than any *M. integrifolia* we have since seen and the fully-expanded flowers were held erect on stems which, to the best of our recollection, were more densely clothed with longer and more silky hairs. The foliage also was decidedly more hairy than that of the plants now in cultivation. An illustration of this plant appeared in *Flora and Sylva*, 1905, p. 80. Some correspondence took place in your columns in reference to the differences between the two forms, and eventually the Neston plant was (rightly or wrongly) named *M. pseudo-integrifolia*. Unfortunately this magnificent form is lost to cultivation for the present. Notwithstanding assiduous care in cross pollinating the flowers, both under glass and in the open, they failed to set seed, although, in several cases, capsules were formed which contained ovules having the appearance of sound seed. Admirers of *Buddleias* may be interested to know that a species collected for us by Mr. Forrest has been determined as *B. lichiangensis*. *Bees, Limited, Liverpool.*

POTATOS FOR AUSTRALIA.—We were pleased to see by your article on "Potatos for Australia," p. 340, that there was a prospect of again doing business with that country. This morning, however, we have received the following letter from the Board of Agriculture, which practically closes the door. *Dobbie & Co.*

[COPY.]

Board of Agriculture and Fisheries,
4, Whitehall Place,
London, S.W.

November 10, 1911.

Gentlemen,—I am directed by the Board of Agriculture and Fisheries to advert to your letter of the 28th ult., addressed to Mr. W. S. Douglas, and to acquaint you that the certificate to which you refer as being required in respect of Potatos imported into Australia must, in accordance with the Commonwealth regulations, be dated and signed by a responsible officer of a Government Department of the country of origin, who must identify the Potatos, specify the quantity, and certify that the Potatos have been inspected and have been found free from the ordinary Potato disease and wart disease, that they were grown in the country named, that they were grown in premises known, after due investigation, not to be or to have been during the previous 12 months infected with either of the said diseases, and that they were packed in the country of origin in clean new packages. The Board regret that, in view of the widespread distribution of the ordinary Potato disease in this country, it would not be possible for them to give a certificate that the disease was not present in Mr. Bryce's farm last year.—I am, Gentlemen,

Your obedient servant,

(Signed)

T. H. ELLIOTT,

Messrs. Dobbie & Co.

Secretary.

November 12, 1911.

GIVE THE JOURNEYMAN A CHANCE!—I should like to ask head gardeners and foremen, through the medium of the *Gardeners' Chronicle*, why journeymen are but seldom allowed to assist with the pruning of vines, Peaches and other indoor fruit trees at this time of year? It seems to be the rule in most places for the foreman to do all the pruning and the journeyman only to clear up afterwards. Surely, under the supervision of the foreman, an under gardener could be trusted sufficiently to assist in this important work. I have always been under the impression that practice is better than theory. *A Royal Journeyman.*

Hogg's "FRUIT MANUAL" (see pp. 272, 294, 341).—It would be a pity, I think, to omit any varieties of fruit, however undesirable, from any revision of this work. Many persons like to identify and see described the fruits of old trees not used for market purposes. As to Mr. Edward A. Bunyard's "counsel of perfection," its adoption, however valuable, would render a new edition too costly, cause much delay in bringing it out, and render the selling price too high for many who might wish to purchase a copy. *A Southern Grower.*

Rhus Toxicodendron (see p. 310).—I am under the impression that Mr. T. Smith's supposition is right, and that there are two plants doing duty for the one name. Here we had *Rhus Toxicodendron* and *Ampelopsis japonica* growing on the same wall facing north. The *Rhus* I was requested to destroy for fear of any accident, but the *Ampelopsis japonica* was allowed to remain, and is still in good condition. The two plants were quite distinct in character, *A. japonica* is much slower in growth and makes stronger wood, and the autumn colouring of the leaves is very superior to the *Rhus*. The *A. japonica* here was obtained from the late Earl of Annesley, of Castlewellan. I have also had the same plant from Messrs. Dicksons, of Chester. *Fredk. Bedford, Straffan House Gardens, Co. Kildare.*

THE PROTECTION OF CROPS.—May we, through your columns, remind readers who are interested in the Protection of Crops Essay Competition, announced in your advertising columns some little time ago by the Royal Society for the Protection of Birds that essays should be sent in during the first week in December? It will be remembered that the society offer a silver medal and prizes of five guineas and two guineas for essays on the best means of guarding agricultural and horticultural produce from the attacks of birds, without destroying the birds. It is hoped that many suggestions of practical utility will be received and subsequently published. *L. Gardiner, Secretary, R.S.P.B., 23, Queen Anne's Gate, S.W.*

DOUBLE STOCKS.—No one who has written about double Stocks appears to know very much about them as they were grown 50 years ago. I was told to select seeds from the flowers having five petals, and the resulting plants were mostly double. At that time the various clubs used to walk, and it was the ambition of every walker to wear a longer spike of Brompton Stock than his neighbour. Later, I endeavoured to see the old Brompton Stock once again, and got some seed from the neighbourhood of Birmingham for that purpose. I was assured that the seeds sent were the real Simon Pure, and no doubt they were, for not one ever grew! *T. Smith, Newry.*

WINTER-FLOWERING BEGONIAS.—The beautiful winter-flowering Begonias introduced by Messrs. James Veitch & Sons, are doubly welcome, because not only are they valuable for indoor decoration, but they will provide variety in the Begonia classes at the November shows. One gets tired of seeing Gloire de Lorraine in such quantities year after year. The flower-show schedules should require six winter-flowering Begonias to include not fewer than three distinct varieties. This might be gradually increased to six distinct varieties. A batch of Begonias of the socotrana strain staged at the November shows would create a pleasing change, and no doubt be the means of extending their cultivation. *A. D.*

SOCIETIES.

PARIS AUTUMN SHOW.

NOVEMBER 3-13.—M. Fallières, President of the French Republic, opened this annual exhibition of the National Horticultural Society of France on the Cours-la-Reine, Paris on the 3rd inst. There was a very large display of fruit, flowers, vegetables, and horticultural sundries there being between 300 and 400 entries. The jury comprised 45 members, and was divided into 16 sections. The Floral Committee met on the 2nd inst. to examine the new seedlings and award certificates.

Grand prizes of honour and other special prizes were given by the President of the French Republic, the Ministers of Public Instruction and of Agriculture and others. The premier awards were as follow:—1st Grand Prix d'Honneur to M. NOMBLOT-BRUNEAU for fruit and fruit trees; 2nd Grand Prix d'Honneur to M. PINON for trained Chrysanthemums. Other Prix d'honneur were awarded to Messrs. CORDONNIER for Grapes, to M. DEBRIE for floral decorations, to M. CALVAT for seedling Chrysanthemums, and to M. BERANEK for stove plants.

The show was approached through an ornamental gateway leading to a long promenade that extended to the door of the exhibition building, a large, temporary structure, about 400 yards long, covered with canvas. This promenade was an important feature of the show, being decorated with groups of hardy ornamental shrubs and trained fruit trees. In addition, to the right of the promenade and around the outside of the exhibition building, were arranged the numerous exhibits of horticultural sundries.

The principal exhibitors of trees and shrubs in the open were Messrs. MARTIN-LECOINTE, BARBIER ET FILS, PAUL LECOLIER, BOUCHER, CROUX ET FILS, NOMBLOT-BRUNEAU, KIEFFER ET FILS, A. MONNIER, and MOSER ET FILS.

FRUIT.

The principal doorway led to an anté-room, in which, on tables arranged round the sides, was a large and varied collection of Apples and Pears staged by M. OPOIX, of the Luxembourg Gardens. Handsome semi-circular piles of choice fruits were arranged at intervals with other fruits in pretty baskets decorated with coloured ribbon. Amongst the Pears were Le Lectier, Belle Angevine, Beurré Clairgeau, Catillac, Chas. Ernest, Beurré Diel and Doyenné d'Hiver.

A special feature of the show were the very large exhibits of Apples and Pears. M. DESCHAMPS arranged a collection in glass cases, with the addition of Grapes Gros Colman, Muscat of Alexandria, Black Alicante, Plums and Peaches. M. MASLE had a fine exhibit of Passe Crasanne and Doyenné d'Hiver Pears. Apples and Pears were also shown by the ECOLE HORTICOLE DE PLESSIS-PICQUET. M. H. LEQUEU showed Pears in boxes, four in a row, 25 feet long, principally big fruits of Duchesse d'Angoulême, Belle Angevine, Doyenné du Comice, Beurré Diel, Passe Crasanne, and Beurré d'Aremberg.

Yet a few other exhibitors of hardy fruits deserve a word of mention. Abbé BELLIERI had Apples and Pears; M. L. GROUAS showed, in pyramids and low stands intervening, very fine Apples and Pears Passe Crasanne, Olivier de Serres, Canada and Calville; M. DUCLOS showed immense pyramids of Pears; Messrs. CROUX ET FILS set up two very long tables draped with olive-green hangings, the fruit being staged principally on plates: the design of the whole was excellent, and each table measured about 40 feet run. Apples, Pears and Grapes were the chief kinds of fruits in this exhibit.

M. LOUIS RIBET had an imposing display of Apples and Pears alternately staged in very large semi-circular pyramids of 8 to 13 rows of fine fruit in each, with others in flat baskets. Here again Pears were of an immense size, especially Passe Crasanne, Beurré Diel, Doyenné du Comice, Doyenné d'Hiver and Beurré Clairgeau. M. A. LE DOUX filled two glass cases with Apples and Pears, and among other exhibitors may be mentioned Messrs. TH. ROUSSEL, GERBOUT, A. PESTEL, RICOIS, TREBIGNAUD, LOUIS HOT, COUTARD, CHARTON, ARNOUX, PELERIN, CONDAC and last, but not least, NOMBLOT-BRUNEAU, to whom was awarded the Grand Prix d'Honneur.

At the beginning of the great show hall was a pergola formed of vine branches, with festoons of vine foliage, under which Messrs. SALOMON ET FILS, of Thomery, arranged a series of glass cases containing Grapes of all kinds. It was an artistic show and an object lesson to Grape growers. Messrs. DUPONT-BARBIER filled show cases some 60 feet in length mainly with Grapes, Peaches and Pears.

Close by were other exhibits of this nature from Mme. MARIE AUCLAIR, Messrs. GIRAULT-MAGNES, TESSIER, MERCIER, MASLE, and BERGERON, while at the far end of the show Messrs. WHIR, HAMEL-PIGACHE, EUG. LUQUET, and the SYNDICAT DE VITICULTEURS DE THOMÉRY had exhibits of Grapes.

Messrs. CORDONNIER ET FILS, of Bailleul, always show Grapes finely, and this year they staged along one side of the great hall a series of ornamental plate-glass cases filled with choice hothouse fruit of various kinds. Grapes Gros Colman, Muscat of Alexandria, Forster's Seedling and Black Alicante were shown superbly in their beautiful setting. Another case contained choice bunches of white varieties only, such as Minister Viger, Abel Chatenay, Prof. Ravaz and Pierre Méguin.

CHRYSANTHEMUMS.

The collection of seedling Chrysanthemums have to-day far less interest for English readers than formerly, and we pass them over as being chiefly staged by such growers as Marquis DE PINS, Messrs. CALVAT, CHANTRIER, VILMORIN, BACQUÉ, NONIN, and a few others.

There were some very interesting collections of cut blooms, by far the best being the various exhibits staged by Mr. Thomas Stevenson, from the gardens of E. MOCATTA, Esq., Woburn Place, Addlestone, Surrey; the collective group faced the principal entrance. The awards he received were enumerated in the last issue (see p. 339). The blooms exhibited were of fine quality and of far greater merit than anything else of the kind in the show.

Some very good cut blooms were shown by M. PAUL L'ABBÉ in a smaller collection. Exhibits also came from M. CH. GERVAYS, M. LOUIS LECLEERC, and M. HENRI CREPIN. The latter exhibitor took great pains to arrange his collection in a bed on the ground level, making a most attractive display. He showed in the class for 75 cut flowers, and arranged the flowers rather loosely in oblong form, with a few pot plants in the middle, including *Salvia splendens* and *Musa*, the whole being edged with *Achyranthes*.

Other exhibitors, including Messrs. VERNIER FRÈRES, LEVEQUE, FERON, LAVEAU, LACROIX, and DUFOUR, showed cut blooms in variety. The Henri Crepin Challenge Cup was won by Messrs. ZIMMERMANN ET FILS.

The largest groups throughout the show were composed of pot plants of Chrysanthemums, and in this respect Messrs. VILMORIN, ANDRIEUX & Co. made a grand display. They had several immense parterres filled with trained specimens of very large proportions, and in a variety of forms, the square-shaped pyramid and the circular pyramid being, perhaps, the more frequent. These parterres were enclosed within a raised turf border, an inner edging of dwarf plants of Dr. George Barrie and Gerbe d'Or, in one case, and in the other a similar double-row edging of Ville d'Avanches and Gerbe d'Or. The third big group was composed almost exclusively of bush plants, comprising novelties of the year. Some new seedlings also adorned the larger groups, being placed effectively in little batches of cut blooms at the extremities. We noted among them Sonate, Opera, Allegro, Andante, Harmonie, and Symphonie.

Pot plants were also shown by Messrs. LAZARD, LECOMTE, MORIN, MERIGEON, PINON, CREPIN, and MASCAUX. M. AUG. NONIN staged two long groups, among which we noted, in decorative, Bordeaux, Marocain, Chrysanthémiste Tondelier, and some good singles named Oiseau bleu, Cote d'Argent, Fontarabie, and Hendaye, all promising varieties. Other remarkable exhibits of pot plants may be briefly referred to. There were some capital plants of Chrysanthemums from the ECOLE HORTICOLE DE PLESSIS-PICQUET, very well flowered, and neatly edged with the yellow pompon Gerbe d'Or. We noted Réverie, Soleil d'Or, C. Schwarz, Marie Dufour, L'Africaine, Alb. Maumené, and others.

M. MARCHAUD was also the exhibitor of a group of plants, but the most striking feature were blooms of *Emblème Poitevine*.

M. PINON staged, in several large beds, an infinite variety of pot plants, trained in many forms—pyramid, bush, standard, baskets, stars, a round table, pagodas, &c., making a novel display; they were nearly all single varieties. He also showed, in a side border, standards of *Globe Rose*, Mrs. W. Wells, Mr. T. Carrington, Tokio, Edward VII., Mrs. Luxford, and others.

MISCELLANEOUS FLOWERS.

Flowers other than *Chrysanthemums* were freely shown. Almost the first exhibits on entering the show was one by M. GEO. BOUCHER, who put up a group of *Clematis*. We noted *Xerxes*, *Ville de Paris*, *Venosa*, Mme. Grange, *Gipsy Queen*, Mme. Van Houtte, *Ville de Lyon*, M. Hope, and others among the more attractive varieties.

M. TABAR had a small collection of *Gerberas*; Messrs. MILLET displayed a group of striped single *Dahlias*, showing very large blooms. *Dahlias* were also shown by several other well-known growers. A *LA PENSÉE* sent *Cactus* and decorative *Dahlias*, the cut blooms being laid flat in green moss—not by any means a desirable mode of presentation. Messrs. C. ANGEL ET FILS showed *Dahlias* in a more pleasing manner; but by far the most important exhibit of these flowers was shown by Messrs. CAYEUX & LECLERC, who had two large, double-faced, sloping banks of *Cactus* and decorative varieties. A few *Begonias Claire de Lune* and early *Chrysanthemums* contributed variety. *Carnations* were shown by several exhibitors. Messrs. STUART LOW & Co., Bush Hill Park, Enfield, had a neat collection, staged in good form. We noted *Rose Dorée*, *Royal Purple*, *Rival*, *Mikado*, *Beacon*, *Britannia*, *Fire Glow*, *White Enchantress*, Mrs. Burnett, *White Perfection*, and several varieties of similar character. In M. NONIN's big display we noted *Carnations* on one flank. Messrs. LEVEQUE ET FILS, as is the invariable rule at the Paris Show, showed some capital examples of their new *Carnations*. *Tuberous-rooted Begonias*, brilliantly displayed on sloping banks, were well shown by the well-known firms of Messrs. VALLERAND and BILLARD.

THE MAISON FÉRARD put up a little square bed of *Cyclamen*. There was a good exhibit of *Hydrangea hortensis* from M. AUG. NONIN; he staged the varieties *Radiant*, *Vieux Chateau*; Mme. Emile Mouillère, and *Bouquet Rose*, with fine heads of bloom. M. FONTENEAU showed *Lilium speciosum* in variety, together with well-flowered plants of *L. auratum*, *L. tigrinum*, and *L. longiflorum*. In addition, he showed a collection of Japanese dwarf trees.

THE MAISON FÉRARD, within a *Primula* edging, staged in a pretty bed a collection of single *Chrysanthemums*, varied in style. *Snowdon*, *Mary Richardson*, *Donald Ferguson*, and *Lady-smith*, with a white sport from the latter, predominated. This sport, named *Le Garennois*, does not appear to be of exceptional interest, the parent variety being, in our opinion, of infinitely greater decorative value.

The side room allotted to stove plants and *Orchids* did not contain a very large display. Mr. EDWARD V. LOW, Vale Bridge, Haywards Heath, showed a collection of *Cypripediums*. Messrs. MARON ET FILS showed in their group *Cattleyas* and *Lælio-Cattleyas*. M. BERANEK had a group of exotic *Palms*, *Codæums* (*Crotons*), *Dracænas*, *Cattleya labiata*, and other plants. M. REGNIER exhibited a small group of *Habenaria Regnieri* and *H. militaris*.

Floral art was well represented by several choice exhibits. M. GEORGE TRUFFAUT had a splendid decorative exhibit of *Roses* in vases, on a circular lawn, with another on a high pedestal in the middle. M. LACHAUME put up a monumental exhibit of *Orchids*. M. E. DEBRIE also had a series of floral decorations of various kinds; and M. PILLON also contributed to the same section.

VEGETABLES.

Only those who know the Paris autumn show can form an idea of the way in which vegetables are staged there. Once again the famous house of VILMORIN, ANDRIEUX & Co. took the premier place. They set up a border 160 feet long by 7 feet wide, containing a grand display of every kind of vegetable in season. L'ETABLISSEMENT "A

LA PENSÉE" also staged a long border of excellent vegetables, enlivened with *Cactus Dahlias*. The same exhibitor had a large and varied collection of *Potatos*. A large group of vegetables and saladings was shown by the ÉCOLE D'HORTICULTURE ST. NICHOLAS. Messrs. ANGEL ET FILS displayed a small collection of vegetables. Messrs. RIGAUT ET FILS showed *Potatos* in variety, as also did the JARDINS OUVRIERS XVI. ARRONDISSEMENT. M. COMPOINT, in a glass case 35 feet in length, demonstrated the art of *Asparagus* culture, showing plants, beds in bearing, seedlings, &c.

The usual festivities accompanied the opening of the show. The society gave a lunch at Ledoyen's Restaurant in the Champs Elysées to members of the jury, officers of the society, and visitors.

LINNEAN SOCIETY.

NOVEMBER 2.—A general meeting of the Fellows of this society took place on the above date. The President read the following reply by Sir Joseph Hooker, in response to the letter of congratulation sent to him from the general meeting of June 15:—

The Camp, Sunningdale,
June 25, 1911.

My dear President,

The warm congratulations with which I have been greeted by my fellow-members of the Linnean Society on the approach of my 94th birthday have moved me more deeply than I can express. From no other association of scientific labourers could greetings be so welcome to me, because of the esteem and affection I feel for the Society as one of its oldest members and because of my descent, as grandson and son of two of its earliest.

Requesting you to make known to my fellow-members my hearty appreciation of their affectionate congratulations and my own best wishes for the continuation of its increasing prosperity,

Believe me, sincerely yours,

(Signed) JOS. D. HOOKER.

The President,

Mr. Alfred O. Walker read a paper on "The Distribution of *Elodea canadensis* in the British Isles in 1909." He stated that *Elodea canadensis*, Michaux, is said to have been first seen in Ireland in 1836, and in Berwickshire in 1845. By 1850 it had become so abundant in many parts of the British Isles as to be a serious nuisance by choking up canals, watercourses, and drains, and all attempts to clear it out failed. It was found, however, that after a few years it died out, or became comparatively scarce and feeble. Information on the subject is given in the paper from 24 counties in England and Wales, six in Scotland, and three in Ireland, showing on the whole that the plant has decreased of late.

Mr. ALFRED O. WALKER exhibited *Clerodendron trichotomum*, Thunb., in fruit, a result of the past abnormal summer, explaining that, although the plant frequently flowered, this year is the first time it has fruited, the same occurrence being also observed at Kew.

NATIONAL VEGETABLE.

OWING to the poor attendance of visitors to the two shows held by the above society in London during 1910 and 1911 respectively, the committee have arranged to hold their exhibition next year in the Clarendon Hall, Watford, Hertfordshire, on Wednesday, October 2. By doing so they hope to bring the work of the society before a more rural population. Watford is noted as a large vegetable-growing centre, and considerable interest is taken in all phases of horticulture by the residents. It is situated on the main line London and North-Western Railway, and is easily reached from most parts of the country. The Clarendon Hall is situated in the centre of the town, and offers every facility for the holding of a large and interesting exhibition. The annual general meeting of the members of the society will be held at the Horticultural Hall, Vincent Square, Westminster, on Tuesday, the 21st inst., at 2.30 p.m. The hon. secretary is Mr. E. G. Quick, "Kelmescott," Harrow View, Wealdstone, Harrow.

RAYLEIGH AND DISTRICT HORTICULTURAL.

NOVEMBER 3, 4.—On these dates the above-mentioned society held its annual autumn show of *Chrysanthemums*, fruits, flowers, and vegetables, the results—regarding the number of entries, quality of the exhibits, and attendance of visitors—being very satisfactory. The 85 classes provided in the schedule were well contested. Mr. S. TAYLOR, Alpha Nursery, Rayleigh, won the 1st prizes in the classes for a group of *Chrysanthemums* and three dishes of *Pears*, his exhibit including a fine dish of *Marguerite Marillat*. Mr. LONGSTONE had the best half-dozen dishes of *Apples*, Mr. S. TAYLOR being a close 2nd; both staging fine fruits of *Bramley's Seedling*, *Warner's King*, and other approved varieties.

HORTICULTURAL CLUB.

A MINIATURE ALPINE GARDEN.

NOVEMBER 7.—The monthly meeting of the members of the Horticultural Club took place on the above date, Mr. George Bunyard presiding. The house dinner was followed by a lecture given by Mr. Reginald A. Malby, descriptive of his miniature Alpine garden at Woodford, Essex. The lecturer explained that he had only the limited area of an ordinary suburban villa garden—a garden surrounded by houses and situated well within an eight miles radius of the Bank of England.

The soil is a wax-like clay, and the London smoke frequently hangs about the locality, yet in spite of these drawbacks Mr. Malby succeeds in growing several hundred varieties of choice Alpine plants and in getting many of the admittedly more difficult sorts to flower in a manner which called forth repeated exclamations of admiration when the slides were exhibited on the screen.

A large number of beautiful slides were shown from negatives made by Mr. Malby. In the course of his remarks, the lecturer pointed to the great value of Alpine plants for small gardens that are required to be attractive at every season of the year, for in the Alpine garden there is some plant or other in flower from January to December to cheer and delight the cultivator.

Most of the illustrations were in ordinary monochrome slides, but the lecturer showed a few slides in colour prepared by a process which he has been experimenting upon. These slides showed the harmonious colour scheme which characterises this "miniature Alpine garden" within the bounds of Greater London.

Following upon the lecture, some very interesting remarks on Alpine plants in their native homes were made by Mr. Reginald Farrer and Mr. H. Stuart Thompson.

It was announced by the Hon. Secretary that the next meeting will take place on December 5, when Mr. Arthur W. Sutton will deliver a lecture on "Four Hundred Miles on Horseback East and West of the Jordan, being an account of a camping tour made in 1896, illustrated by 100 painted views of the Lebanon, Gilead, Basham, Moab, and Southern Palestine."

SCOTTISH HORTICULTURAL.

NOVEMBER 7.—The monthly meeting of the above association was held in the Goolld Hall, 5, St. Andrew Square, Edinburgh, on this date. Mr. Massie, the President, was in the chair, and there was an attendance of 125 members.

A paper was read by Mr. Wm. Roadley, Comely Bank Nursery, Edinburgh, on "Propagation." He dealt with the subject from the point of view of the practical nurseryman, and gave an extremely interesting account of the various vegetative methods of propagation—cuttings, buds, grafts, &c. Propagation by seed, he said, was Nature's principal method, and generally it was the most advantageous method, but when exact counterparts of the parent plant had to be produced this was not always reliable, and the alternate systems referred to above had to be resorted to.

The exhibits included decorative *Chrysanthemums* Betty Spark, Cranford Yellow, and Miss Collier, and single yellow *Chrysanthemum* Mrs. T. Gilbey (a yellow form of *Edith Pagram*), and

Charles Kingsley, from Messrs. DOBBIE & Co., and various Chrysanthemums from Mr. W. WILLIAMSON, Edinburgh, and J. BRUCE, Davidson's Mains. A Certificate of Merit was awarded to the single yellow Chrysanthemum Mrs. T. Gilbey, shown by Messrs. DOBBIE & Co.

As the result of the suggestion made by Mr. Cuthbertson, at the October meeting, that the members should send to the secretary the names of what they considered the best twelve early-flowering Chrysanthemums, in a variety of colours, it was found that the favourites were—Goacher's Crimson, White Massé, Lillie, Polly, Nina Blick, Abercorn Beauty, Leslie, Elstob Yellow, Hector, Carrie, Diana, and Horace Martin.

At the meeting on December 5, a lecture will be given by Mr. Thos. Anderson, M.A., B.Sc., Edinburgh, and East of Scotland College of Agriculture, on "Insects and Flower Pollination" (with lantern illustrations).

Twenty-four new members were elected.

WEST OF ENGLAND CHRYSANTHEMUM.

NOVEMBER 7.—The above society opened its twentieth show in the Guildhall, Plymouth, on this date. The exhibition was very successful and of high merit. The cut blooms, though fewer than in former years, were very fine, and there was a splendid show of fruit, and especially of Apples. In the class for 24 blooms of Japanese Chrysanthemums, the 1st prize was won by Rev. T. SHEEPHANKS with an excellent collection of flowers, among which some of the best were Beecham Keeling (red and yellow), Madame G. Rivol (yellow), Master David (dark red), Shanklin (pale pink), and Frances Jolliffe (a pale yellow). Mr. SHEEPHANKS also won 1st prizes for 18 Japanese blooms, displayed in vases, and for 12 blooms, as well as in two classes for singles. Messrs. J. WEBBER & SON won the 1st prize for a miscellaneous group of stove and greenhouse plants with a tastefully arranged collection, including Orchids of many varieties, Lilium longiflorum, Carnations, Codiaums (Crotons), Ericas, Begonia Gloire de Lorraine, Cyclamen, Chrysanthemums, Palms and Ferns. Messrs. MEARS & SONS showed three baskets of ripe Raspberries, which this season have been fruiting more or less continuously since the spring. An Award of Merit was made to Col. the Hon. H. F. TREFUSIS for nine vases of Violets, in seven varieties, which were very fine. One of the most attractive features of the show was a table of salads, with which Mrs. BAINBRIDGE won the 1st prize. At the back were two tall pillars carrying a profusion of large, red and yellow Capsicums, while towards the front were pyramids of Mustard and Cress. Among other kinds were Corn Salad, English and Italian Chicory, Batavian and Moss-curved Endive, Tomatos, Radishes, Dandelion, Chicory, Celeriac, Cress, Chilis, Coriander, Tarragon, Cucumber, Beetroot, Lettuce, Celery and Watercress. The collection was most tastefully set up. Mr. F. R. RODD won the 1st prize in the class for a collection of 24 dishes of fruit, showing of Grapes, the varieties Canon Hall Muscat, Muscat of Alexandria, Appley Towers, and Gros Maroc, ten dishes of Apples, seven dishes of Pears, Ringleader Melon, Quinces, Tomatos, and Medlars. The 1st prize for 20 dishes of Apples, of distinct varieties, was won by the Earl of MORLEY. Mrs. BAINBRIDGE won the 1st prize for six table plants, while in the class for six Begonias of the Gloire de Lorraine varieties, the 1st prize was won by Sir R. POLE-CAREW. Mr. C. BEWES was awarded the 1st prize in the class for six Primulas, and Sir JOHN JACKSON the 1st prize for six Zonal-leaved Pelargoniums. The nurserymen's exhibits were especially attractive. Messrs. ROBERT VEITCH & SON, Exeter, showed new single Chrysanthemums, including Manor House Beauty (large red, with yellow centre), Ceddie Mason (maroon-red), Snowflake (white), W. Jarman (rose), Miss Lilian Bullivant (pale yellow), Florrie Stevens (orange and red), Jean Edwards (pale pink), Exonia (yellow), and Mrs. J. Lawrence (white). They also showed Physalis Franchettii, Acacia Baileyana, Correa cardinalis, C. magnifica, C. curiosa, Gerbera Jamesonii, Colletia cruciata (well flowered), Clematis Nellie Moser, Nerine Bowdenii, and other interesting plants. A Silver Medal was awarded to this exhibit. The KING'S

ACRE NURSERIES, Hereford, was awarded a Gold Medal for a collection of Apples in about 200 varieties. Amongst the most noticeable were King's Acre Pippin, Tyler's Kernel, Encore, Rival, Wealthy, Frogmore Prolific, Golden Noble, Golden Spire, Melon Apple, Royal Jubilee and Sanspareil. The DEVON ROSERY, Torquay, exhibited a splendid selection of Apples and Pears. A Silver Medal was awarded this firm. Messrs. WEBBER & SONS, Plymouth, showed a large stand of perpetual-flowering Carnations.

SOUTHAMPTON ROYAL HORTICULTURAL.

NOVEMBER 7, 8.—The autumn show of this society was held in the Victoria Hall, Southampton, and the exhibition was in every respect a success.

In the class for a group of Chrysanthemums arranged for effect, Mr. F. BEALING, Bassett Nurseries, Southampton, was easily 1st with well-grown plants of incurved, Japanese, and single-flowered varieties arranged in a series of mounds, each being topped with a suitable-sized plant of Kentia Belmoreana. The 2nd prize was won by Lady ELLEN SWAYTHLING, South Stoneham House (gr. Mr. T. Hall). The best exhibit of six specimen Chrysanthemum plants suitable for conservatory decoration were shown by Mr. S. JOYNER, Freemantle; 2nd, Mr. BEALING, whose exhibit of six single-flowered varieties was remarkable for the wealth of flower the specimens presented. Growers of "bush" plants grown freely and without stiff training receive much encouragement at this exhibition. The premier award for plants of this type was won by J. C. D'ESTERRE, Esq., Glenfield Hill, Southampton (gr. Mr. C. Hosey), for plants nearly 4 feet in diameter and freely flowered.

CUT BLOOMS IN VASES.—There were four exhibitors in the class for 24 Japanese blooms in eight varieties. A. TATE, Esq., Downside, Leatherhead (gr. Mr. W. Mease) was distinctly ahead with fresh highly-coloured examples of popular varieties, among which Duchess of Sutherland was remarkable for its broad florets and rich-colouring; Kara Dow, crimson and gold, is an improved J. H. Silsbury. Mrs. A. T. Miller is still the best white, and F. S. Vallis a good yellow. 2nd, Captain DALGETY, Lockerby Hall, Romsey (gr. Mr. A. Baxter), with good blooms generally, yet showing one or two distinctly faulty specimens.

For three blooms of any two white-flowered varieties Major CHICHESTER, Embley Park, Romsey (gr. Mr. W. Hall) won the 1st prize with W. F. Lever and Mrs. A. T. Miller, one bloom of the latter sort being so fine that it was adjudged the premier Japanese Chrysanthemum in the Show; 2nd, J. C. D'ESTERRE, Esq., with slightly smaller specimens.

Major CHICHESTER, with Rose Pockett and Bessie Godfrey, won the leading prize in the class for six blooms other than white; 2nd, Captain DALGETY, who won the 1st prize in the class for four varieties of the Japanese type suitable for decoration.

For sections other than Japanese and single varieties Mr. F. BEALING led with four vases of high-class blossoms of the incurved varieties Romance and Emblème Poitevine in conjunction with the Anemone-flowered varieties Delaware and Mrs. Heneage; they were all magnificent flowers and arranged effectively. In the class for six single-flowered varieties, an unlimited number of blooms being allowed, a pretty effect was produced. The premier exhibit was shown by M. HODGSON, Esq., Kingsworthy, Winchester (gr. Mr. A. J. Marsh); the collection included fully-developed blooms of Mrs. R. C. Pulling, Keston Gom, Altrincham Yellow, Mensa, Sylvia Slade, and Mrs. E. Roberts; 2nd, Mr. BEALING, with a handsome exhibit.

In a class for six single-flowered varieties, not disbudbed, Mr. C. DYMOTT, Freemantle, had the best exhibit of five.

Blooms were shown well on boards. The best collection of 24 Japanese blooms in not fewer than 16 varieties amongst five competitors was shown by Captain DALGETY, who had Mrs. G. Hemming (purple), Hon. Mrs. Lopes, Lady Talbot, and the pure white Eclipse, remarkably good. M. HODGSON, Esq., was placed 2nd, having good blooms, but not quite so even generally. Major CHICHESTER was the most successful ex-

hibitor in the class for 12 Japanese blooms, Mr. F. CHANDLER being placed 2nd.

Blooms of incurved varieties were remarkable for their high quality, large size, and good finish. M. HODGSON, Esq., excelled in the class for 18 blooms, showing such sterling varieties as Emblème Poitevine, Romance, the pure white H. W. Thorp, Mrs. G. Denyer, silvery pink, and the cream-tinted Clara Wells. A. TATE, Esq., was awarded the 2nd prize.

In the fruit classes, W. H. MYERS, Esq., Swanmore Park, Bishop's Waltham (gr. Mr. G. Ellwood), won the 1st prize for two bunches of black Grapes with fine bunches of Alnwick Seedling. Major CHICHESTER, who staged Appley Towers, was placed 2nd. This gentleman had the best two bunches of Black Alicante in the class for that variety, also the premier exhibit in the class for two bunches of any white Grape with Muscat of Alexandria.

Apples were a strong feature. For four dishes of dessert varieties Mrs. W. KNOX, Holt Hatch, Alton (gr. Mr. West), was easily 1st, all the varieties being remarkably well coloured.

Vegetables were handsomely displayed by W. H. MYERS, Esq., who won the leading awards offered by Messrs. Toogood & Sons, Southampton, and Messrs. Sutton & Sons, Reading.

NON-COMPETITIVE EXHIBITS.

Messrs. TOOGOOD & SONS were awarded a Gold Medal for an exhibit of vegetables.

Messrs. B. LADHAMS & SONS, Shirley, Southampton, had a fine display of rock and hardy border plants. (Silver Medal.)

Messrs. E. HILLIER & SON, Winchester, showed a collection of Apples. (Silver Medal.)

Messrs. W. H. ROGERS & SON, Southampton, received a similar award for an exhibit of Apples.

One of the finest features of the show was a collection of three dozen dishes of Apples, all richly coloured and tastefully arranged with Grevillea robusta sprays from the gardens of W. H. MYERS, Esq. (Silver-Gilt Medal.)

CARDIFF CHRYSANTHEMUM.

NOVEMBER 8.—As usual, this exhibition was held in the Park Hall, Cardiff. The show was, on the whole, satisfactory, although the entries in the cut bloom classes were not quite so numerous as in past years. One notable exhibitor, who has done much to make the Cardiff shows a success in former years by his magnificent exhibits of cut blooms, was unable to be present. The groups of Chrysanthemums were well arranged, and of good quality, and the single-flowered varieties were noteworthy. Trade exhibits added to the general interest of the show.

The principal group class was for an exhibit occupying a space of 60 square feet, and arranged in the centre of the Hall. Mr. W. TRESEDER, Cardiff, won the premier award with finely-developed blooms, pleasingly associated with foliage plants, including Ferns.

The "Thomas Andrews" Challenge Cup was offered for a group of Chrysanthemums only. The EXECUTORS of the late J. HOWELL, Esq., Grove House, Cardiff (gr. Mr. A. Brown), were well 1st, the flowers being of fine quality, and the arrangement almost faultless; 2nd, Mr. W. HATHERDALE, 53, Shakespeare Street, Cardiff, his display being very little inferior to the premier exhibit.

Mr. John Basham, Fair Oak Nurseries, Bassaleg, Newport, offered a silver cup for a group of single-flowered varieties occupying a space of 40 square feet. Mr. S. J. T. GRINTER, Cardiff, was the only exhibitor, but he put up a magnificent display of finely-grown and disbudbed plants, with blooms of high quality; such varieties as Altrincham Yellow, Eureka, and Bronze Pagram being excellent.

The most meritorious group of miscellaneous plants arranged for effect was exhibited by Lady HILL, Rookwood, Llandaff (gr. Mr. Mackintyre).

CUT BLOOMS.—The principal class for cut blooms was for eight varieties of the Japanese type, three blooms of each sort, arranged in vases. F. S. WILLIAMS, Esq., Bryn Glas, Newport (gr. Mr. J. Duff), was easily 1st, with large flowers of Mrs. A. T. Miller (premier bloom in the show), Master David, Mrs. W. Knox, President Viger, The Hon. Mrs. Lopes, Bessie Godfrey, and Reginald Vallis. The Marquis of BUTE,

Cardiff Castle (gr. Mr. Farmer), followed closely. The varieties Mme. P. Radaelli, W. A. Etherington, and Master James were conspicuously good in this exhibit.

W. GODFREY CLARK, Esq., Talygarn (gr. Mr. J. E. Davies), won in the class for 12 Japanese, distinct, in a keen competition, the Marquis of Bute being placed 2nd.

Incurved varieties were neither numerous nor good. Sir C. E. G. PHILLIPS, Picton Castle, Haverfordwest (gr. Mr. J. Evans), was awarded the 1st prize for large, rather coarse blooms, Fanny Lemon (pale yellow), Romance, Emblème Poitevine, and the pink Duchess of Fife being the best examples.

Singles were shown well. For six varieties, five sprays of each, Dr. WALLACE, Newport Road, Cardiff (gr. Mr. T. Bindon), was 1st, with typical blossoms of Metta (deep magenta with white zone), Mrs. E. Roberts (pink), Altrincham Yellow (pale yellow), George Williams (bronze yellow), and Eureka (pure white); 2nd, Mr. G. H. SCREEN, Assay Street, Penarth.

In the class for the best-arranged vase of single Chrysanthemums, there was a keen competition between the two former competitors. In this case Mr. SCREEN beat Dr. WALLACE, both staging handsome blooms, although none too well arranged.

NON-COMPETITIVE EXHIBITS.

Trade exhibits were of an interesting character. Messrs. STUART LOW & Co., Bush Hill Park, Enfield, showed Orchids and Carnations. Amongst the Orchids we noted *Cynoches chlorchilon* (Swan Orchid), *Brasso-Cattleya Norvæ*, *Cypripedium insigne Sandere*, and C. i. "Harefield Hall" variety. (Gold Medal.)

A Gold Medal was also awarded to Messrs. MANSELL & HATCHER, Rawdon, Leeds, for Orchids in variety; and to Messrs. J. BASHAM & SONS, Fair Oak Nurseries, Bassaleg, for a display of Apples.

ROCHFORD AND DISTRICT HORTICULTURAL.

NOVEMBER 7, 8.—This society held its first annual exhibition of Chrysanthemums, fruits, flowers, and vegetables in the Corn Exchange on these dates, and the show proved to be a complete success for a first venture. JAMES TABOR, Esq., The Lawn, Rochford (gr. Mr. J. Burles), was the most successful exhibitor in the open classes; he won the 1st prizes for a group of Chrysanthemums in pots arranged for effect, and for a group of miscellaneous plants similarly arranged, as well as in each of the five leading classes for cut blooms, staging grand blooms of up-to-date varieties, including Mrs. A. T. Miller, Duchess of Sutherland, Reginald Vallis, and Bessie Godfrey. Dr. LEWIS, Roche House, Rochford (gr. Mr. R. Bright), and Mr. W. THURLEY, Southend-on-Sea, also showed well in these classes. Apples and Pears were shown in good condition by Mr. HERBERT, The Nurseries, Eastwood, near Rochford, and by Mr. R. MAY, Jun., Stroud Green, Rochford. Mr. MEZEN and Mr. J. BURLES were placed 1st and 2nd in the order in which their names appear for collections of vegetables. Mr. H. E. CAMPKIN and Mr. W. THURLEY were the most successful exhibitors in the amateur (cut bloom) classes, staging very creditable specimens. The Cup offered by Alderman J. C. Ingram (Mayor of Southend-on-Sea) for the best trade exhibit was won by Mr. PILGRIM, London Road, Southend-on-Sea, with a fine exhibit.

WESTON-SUPER-MARE CHRYSANTHEMUM.

NOVEMBER 8, 9.—This society held its 25th annual exhibition on these dates. It was decided this year to extend the show over two days, and this resulted in a financial success, the receipts enabling the deficit of last year to be eliminated. The group and cut bloom and decorative classes were well filled, but there was a falling off in the classes for vegetables. For a group of Chrysanthemums, arranged for effect, Mrs. BRAMBLE, Seafeld, Weston-super-Mare (gr. Mr. Daffurn), won the 1st prize with a group of choice blooms, well arranged; 2nd, Mr. W. BROOKS, Whitecross Nursery. Mr. C. J. ELLIS, Weston Nurseries, won the 1st prize easily in the class for a group of stove and greenhouse

plants, arranged for effect, with a bright and tastefully-arranged group; 2nd, H. CORNELIUS, Esq. (gr. Mr. C. Cook); 3rd, Mr. W. BROOKS, Whitecross Nursery. There were four exhibits in the class for a group of single Chrysanthemums arranged with foliage plants: the 1st prize was awarded to Mr. CORNELIUS, the 2nd to Mr. C. J. ELLIS, Weston Nurseries, and the 3rd to Mrs. R. J. BRAMBLE (gr. Mr. Daffurn). Mr. W. BROOKS was placed 1st for table Ferns, Orchids and Zonal-leaved Pelargoniums in the cut-bloom classes. THE FROME FRUIT AND FLOWER Co. was awarded the 1st prize for 24 blooms of Japanese Chrysanthemums; 2nd, Col. COLFEX, whilst for 12 distinct varieties, Miss NEAL, Wheatleigh, Taunton (gr. Mr. W. Hayward), won the 1st prize; W. A. TODD, Esq., Portishead (gr. Mr. G. Sutton), being placed 2nd. Miss NEAL was also first for six Japanese blooms, distinct, but Mr. E. E. BAKER, Glebe House, Weston-super-Mare, followed closely. THE FROME FRUIT AND FLOWER Co. won 1st prizes for (a) six vases of three Japanese blooms; (b) three vases of white varieties; and (c) three vases of yellow varieties.

In the amateur classes for 12 Japanese blooms, Mr. J. ANDREWS, Weston-super-Mare, was awarded the 1st prize, having some remarkably fine blooms; he was also successful in the class for singles, and gained an Award of Merit for a choice bloom of Mrs. A. T. Miller.

In the decorative classes, the chief prize-winners were Mr. W. BROOKS and Mr. C. J. ELLIS. Exhibits of fruit and trade groups helped to make a very attractive show. Great interest was centred in a large group of Chrysanthemums composed entirely of the pink, single-flowered variety Mrs. W. Buckingham, shown by Mr. C. J. ELLIS, Weston Nurseries.

LIVERPOOL HORTICULTURAL.

NOVEMBER 8, 9.—The 32nd autumn exhibition of the Liverpool Horticultural Association was held in the spacious and well-lighted Corn Exchange. The entries were satisfactory, and the quality of the exhibits equal to the average. Cut blooms of Chrysanthemums, as usual, proved the most important feature of the show, and it was generally admitted that they were the finest ever staged at Liverpool.

The leading class was for 18 Japanese and 18 incurved blooms, staged on boards, and the premier award was gained by Sir GILBERT GREENALL, Bart., Warrington (gr. Mr. C. Goves), who staged a very fine exhibit, his best blooms being (Japanese) Eclipse, Frances Jolliffe, Hon. Mrs. Lopes, and Mrs. A. T. Miller, and (Incurved) Buttercup, Emblème Poitevine, Mrs. G. Denyer, W. Biddle, and Pantia Ralli; 2nd, Sir WILLIAM BASS, Bart. (gr. Mr. R. Nisbet), who won the National Chrysanthemum Society's Certificate offered for the best blooms in the show with Mrs. W. B. Marsham and Godfrey's Eclipse. The other prize-winners were Sir W. H. TATE, Bart. (gr. Mr. G. Haigh), and R. R. HEAP, Esq. (gr. Mr. H. Osborne). For 18 incurved blooms, T. HENSHAW, Esq. (gr. Mr. J. George), was placed 1st, whilst for 12 blooms, Mrs. CLARK (gr. Mr. J. Clarke) won the 1st prize. In the classes for 18 and 12 incurved blooms, the principal prizes were won by Messrs. C. GOVES and H. BELK (gr. Mr. J. Copple). Mr. L. THOMSON was placed 1st for (1) six vases and (2) three vases of single-flowered Chrysanthemums. The best six vases of Japanese Chrysanthemums were shown by Sir W. B. FORWOOD, Bart. (gr. Mr. P. Jakeman).

CHRYSANTHEMUMS IN POTS.—In the class for three large-flowered, trained specimens and for one large-flowered trained specimen A. EARLE, Esq. (gr. Mr. T. Hitchman), won the 1st prize in each case. The best group of three trained plants of singles and the best trained plant of a single variety were shown by T. W. WRIGHT, Esq. (gr. M. F. Atkin). This exhibitor also showed the finest group composed of single varieties. W. J. LOCKETT, Esq. (gr. Mr. E. R. Finch), had the best six plants trained to stakes.

PLANTS.—W. TOD, Esq. (gr. Mr. G. Eaton), showed the finest group of three Ferns and one Fern, having splendid specimens of *Davallia fijiensis plumosum* and *D. Mooreana*. Mr. F. ATKINS led for two Palms. Mr. P. JAKEMAN and Mr. T. ELSWORTHY showed the choicest

Orchids, and Mr. J. FINDLAY the best Begonias in the class for four plants.

FRUIT.—The 1st prize for six dishes of fruit was won by J. AMPHLETT (gr. Mr. R. Jones), his collection including good Grapes. Mr. T. ELSWORTHY led in the class for four bunches of Grapes with good bunches. J. W. RAYNES, Esq. (gr. M. J. Barker) showed the best bunches of Black Alicante, whilst the best bunches of any other Black Grape were shown by Mrs. KENDALL with Barbarossa. Mrs. S. COOK (gr. Mr. T. Barclay) excelled in the class for Muscat of Alexandria, his bunches having richly-coloured berries. Mr. T. ELSWORTHY won the 1st prize in the class for any other white Grape with Golden Queen. Apples and Pears were well represented, Messrs. F. BIBBY, Mrs. DUNCAN, Mr. W. MACKERALL, and Mr. R. R. HEAP being prominent exhibitors.

NON-COMPETITIVE EXHIBITS.

Gold Medals were awarded to Messrs. MANSELL and HATCHER for a fine display of Orchids, Mr. NORMAN DAVIS for Chrysanthemums, and to Mr. J. LEE for a collection of Apples. Silver Medals were awarded to Messrs. FISHLOCK BROS., Liverpool, for wreaths, crosses, and other floral devices; R. P. KER & SONS, Liverpool, for Cyclamen, Palms, Begonias, and other indoor plants; Messrs. W. WELLS & Co., Merstham, for Chrysanthemums; and THE LIVERPOOL ORCHID Co. for a group of Orchids. Messrs. T. DAVIS & Co., W. ROWLANDS, H. MIDDLEHURST, T. DAVIES & Co., and Messrs. DICKSONS, Chester, also exhibited groups in this section.

HASLEMERE CHRYSANTHEMUM.

NOVEMBER 9.—The eleventh annual show of this society was held on this date. The Challenge Cup offered by the society for a group of Decorative Chrysanthemums was for the second time, won by Mrs. HULSE, Nutcombe (gr. Mr. W. Trangmar); Sir R. GARTON, Lythe Hill (gr. Mr. J. Thorne), being a close 2nd. Mr. D. F. DUDMAN, Godalming, led in the class for 24 Japanese blooms; Messrs. THORNE and TRANGMAR being placed 2nd and 3rd respectively, but Mr. DUDMAN was beaten by Mr. TRANGMAR in the class for 18 incurved blooms. The best exhibit of 18 Japanese blooms in vases and 12 blooms on boards was shown by Lady PHILIPSON STOW, Blackdown (gr. Mr. W. Brooks). This exhibitor also won three 1st prizes in the fruit classes, and was awarded the special prize for the best Japanese bloom in the show, a very fine specimen of the white Mrs. A. T. Miller. Buttercup, as shown by Mr. TRANGMAR, was the best incurved variety. So close was the competition in the class for nine varieties of vegetables that an additional prize was awarded. Sir R. GARTON was deservedly awarded the 1st prize. A feature of the show was a fine exhibit put up by the OAKLANDS NURSERIES, Haslemere, consisting of Chrysanthemums, floral decorations, and fruit.

UNITED HORTICULTURAL BENEFIT AND PROVIDENT.

NOVEMBER 13.—The monthly meeting of this society was held at the Royal Horticultural Hall, Vincent Square, Westminster, on the above date. Mr. Thomas Winter presided. The death certificate of the late Mr. F. Morris was produced, and the sum of £29 5s. 7d. standing to his credit was granted to his nominee. Mr. H. Heims desired to be put on the benevolent fund, and it was agreed to grant him 5s. per week. Sick pay distributed since the last meeting has amounted to £54 5s. Mr. R. Weatherby was granted 19s. 6d. from the benevolent fund to pay arrears of contributions. The Government Insurance Bill was discussed at some length, and a special committee meeting will shortly be held for the purpose of deciding the best course to adopt in the matter.

BRITISH GARDENERS' ASSOCIATION. (LONDON BRANCH.)

The fourth annual social evening in connection with the above branch will be held at Carr's Restaurant, Strand, on Saturday, November 18. Mr. E. F. Hawes will preside. All interested in horticulture are invited to be present.

PERSHORE HORTICULTURAL.

NOVEMBER 9.—The 17th annual Chrysanthemum and fruit show of the Pershore and District Horticultural Society was held at Pershore on this date. The display was a record one, and the committee had shown praiseworthy enterprise in arranging for the first time commercial classes for fruit. These were a notable feature, and were open to all commercial growers residing within 25 miles of Pershore. Some excellent fruit was to be seen in these classes, and no fewer than 80 growers from Evesham, Malvern, Blockley and Winchcombe and the surrounding districts competed. The total entries for the show were 366, which was an advance of 120 upon the previous year's exhibits.

The chief prize-winner for Chrysanthemums in the commercial classes was Mr. J. T. COATES. In other classes, Miss EVA DAVIS, Mrs. W. G. V. PITCHER, Miss A. DAVIS, Miss E. A. DAVIS, Mrs. B. HALL, Mr. A. FERRIS, Mrs. C. E. DUFFY, Mrs. RUDGE, Mr. G. DUDLEY SMITH, Lady NORTHWICK, Mr. T. G. HYDE, Miss E. HICKS, Mr. J. DAWSON, Mr. J. TAYLOR, and Mr. H. WORKMAN.

The principal prize-winners in the open classes for fruit were the TODDINGTON ORCHARD CO., Col. HUDSON, Lady NORTHWICK, Mr. G. JONES, Mr. G. DUDLEY SMITH and Mr. J. B. DAWSON. For amateurs, Miss A. M. DUFFY, Mr. F. DAVIS, Mr. J. TAYLOR, Miss HOPKINS and Mr. P. HANSON.

Pershore market gardeners, Mr. J. B. DAWSON, Mr. H. MUMFORD, Messrs. T. HALL & SON, and Mr. G. HARRISON.

GLOUCESTERSHIRE ROOT, FRUIT, AND CHRYSANTHEMUM.

NOVEMBER 9.—The 48th annual exhibition in connection with the Gloucestershire Root, Fruit and Chrysanthemum Society was held at the Shire Hall, Gloucester, on the above date, and, like its predecessors, proved an unqualified success. The total number of entries was 847, being 100 more than last year, while the all-round quality of the exhibit was the subject of general comment.

The great feature of the show were the exhibits of fruit, which numbered 250 entries. Some of the classes for Apples were very keenly contested. In the class for Apple Cox's Orange Pippin, there were no fewer than 21 entries.

An interesting exhibit was sent by Mr. M. W. COLCHESTER-WEMYSS, consisting of some specimens of Apples that he had lately brought back with him from Canada. The exhibit was an object lesson on the Canadian system of fruit packing. Mr. M. P. PRICE, of Tibberton Court, also exhibited a collection of Apples, not for competition, as illustrating the advantage of orchard spraying with lime and salt spray, and Mr. HAROLD PHELPS, one of Gloucestershire's chief fruit growers, who believes in the value of lime spraying, exhibited some magnificent fruits of Blenheim Pippin Apples, which won 1st prize in strong competition, picked from standard trees in his orchards.

The Chrysanthemums, although not very numerous, made an exceedingly pretty show, the cut blooms shown by Sir HUBERT PARRY, of Highnam Court, Gloucester, were remarkable for their dimensions and exquisite colours. In his exhibit of 18 Japanese blooms, the following varieties were conspicuous: W. H. Thornton, J. Bunce, Master David, Mrs. Marsham, Beecham Keeling, Mrs. A. T. Miller, Maud Jefferies and James Lock. The other chief prize-winners for Chrysanthemums were: Mr. HUGH ANDREWS, Teddington Manor; Mr. W. GORDON CANNING, Hartpury House; Mrs. H. T. T. HIGGINS Tuffley; Sir WILLIAM WEDDERBURN, and Mrs. S. H. BRIERLEY, Southwick Park, Tewkesbury.

In the fruit classes the chief prizes for Apples were won by Mr. W. GORDON CANNING; Mr. A. J. COOK MORTON; Messrs. POWER & WHIFFEN, Aston Court, Ross; Mr. E. W. CADDICK, Caradoc, Ross; Mr. W. S. R. COX, Ashe Leigh, Ross; Sir WM. MARLING, Sidbury Park, Chepstow; Mr. HAROLD J. PHELPS, Tibberton; Col. HENRY, Haffield, Ledbury; Sir WM. WEDDERBURN, Meridith, Gloucester; Mr. E. C. FORD, Newent; Mr. J. BOTT, Breinton, and Mr. REED, Newham-on-Severn.

In the Pear classes the chief exhibitors were Mr. W. GORDON CANNING; Mr. E. J. CUMMINS, Newent; Sir HUBERT PARRY, Highnam; Mr. T. PONTING, Taynton, and Col. HENRY.

The prizes for Grapes were divided between Sir HUBERT PARRY, Col. HENRY, and Mr. G. N. WALKER, Gloucester.

MALVERN HORTICULTURAL.

NOVEMBER 9.—A show of Chrysanthemums and other flowers, also fruit and vegetables was held by this society at the Assembly Rooms, Malvern, on the above date. The exhibition was of a high order of merit throughout, and better than last year's show, although there was a slight falling off in the number of entries. Chrysanthemums were specially good, and the fruit was remarkable for its good quality and rich colouring. There was, in addition to the new classes added last year (which were very successful), a class for vases of decorative Chrysanthemums. Sixty vases were entered, and the leading winners, Mr. W. T. ACOCK and Mr. O. N. HOLT-NEEDHAM, exhibited choice specimen blooms of the Japanese type. Another new class was for 12 pots of Cyclamen, which made an interesting addition to the show. Mr. W. T. ACOCK received the premier prize in this class.

Certificates of merit were awarded to a number of honorary exhibitors. Mr. W. T. ACOCK, Priory Road, made an excellent show of Chrysanthemums, Lilies and Cyclamen; Mr. J. H. MARSDEN, of Malvern Link, was represented by a choice collection of hardy Chrysanthemums, Carnations and decorative plants. Choice Roses were shown by Mr. WILLIAM COYLE, successor to Mr. G. H. Towndrow; and an admirable display of "Gloire de Lorraine" Begonias was made by Mr. G. MASON. Mr. F. A. INVERSHELL exhibited a handsome group of Chrysanthemums, as did also Messrs. R. M. FISHER & SON, of St. Andrew's Nurseries, who also included Roses and a variety of flowering plants, while Messrs. J. H. WHITE & Co., Worcester, were among the honorary exhibitors with plants and Apples.

The principal prize-winners for Chrysanthemums were, in the open classes, Mr. W. T. ACOCK (Silver Cup), Messrs. R. M. FRASER & SON, Mr. O. N. HOLT-NEEDHAM, Mr. W. B. HUNTINGTON (Blackmore Park), Miss E. COX, and Mr. S. H. BICKHAM.

In the classes for local exhibitors the chief prizes in the Chrysanthemum classes were won by Miss E. COX, Mr. W. B. HOLT-NEEDHAM, Mr. J. NELSON, Mr. J. HANDY, Mr. W. B. HUNTINGTON, Mr. A. FIRKINS, and Mrs. BOWLES.

The chief prize-winners in the fruit classes were Mr. S. H. BICKHAM, Mr. G. E. LANE, Mrs. GRICE HUTCHINSON (open classes), Mr. W. B. HUTCHINSON, Mr. O. N. HOLT-NEEDHAM, Mr. C. F. ROBOTHAM, Mr. G. LANE, Mr. J. HANDY, and Mr. J. KITCHING.

DEVON AND EXETER HORTICULTURAL.

NOVEMBER 9, 10.—The 211th exhibition of the above society was held in the Victoria Hall, Exeter, on these dates, the principal exhibits being fruit, Chrysanthemums, and vegetables. Although the exhibitors were fewer than usual, the number of entries were about the average for this show. Apples showed a high standard of quality throughout, but Pears were not up to the standard usually reached at this exhibition. The common experience of the exhibitors, as expressed at the show, was that Pears this season are keeping very badly. Vegetables were exceptionally good for the season.

CHRYSANTHEMUMS.—CUT BLOOMS.

The president, E. H. Bayldon, Esq., offered the 1st prize in the class for 12 vases of Japanese varieties, distinct, three blooms of each sort, and it was won by Mrs. GIDLEY, Hoopern House (gr. Mr. W. R. Baker); Rev. T. SHEEPSHANKS, Stoke-lake (gr. Mr. A. Dunkley), being placed 2nd. In Mrs. GIDLEY's exhibit were Beecham Keeling, Lady Talbot, Rose Pockett, Mrs. A. T. Miller, Henry Poulton, and President Viger. There was little to choose between the 1st and 2nd prize collections.

In the class for 24 Japanese blooms, in not fewer than 18 varieties, the 1st prize was awarded to a fresh exhibitor, Mr. T. C. LOOSEMORE, Weymouth, and again Rev. T. SHEEPSHANKS was 2nd. Mr. LOOSEMORE's best blooms were Mrs. A. T. Miller (which was awarded the N.C.S. Medal offered for the best bloom in the show), Willie Rawlings, Pockett's Crimson, Bessie Godfrey, and Sir Frank Crisp.

Only one exhibit was staged in the class for a collection of cut blooms, representing not fewer than six types of the flower of the 10 enumerated in N.C.S. catalogue namely, from Mr. C. M. COLLINGWOOD, Exeter, but it was in all respects an excellent one. All the 10 sections of the flower were represented, the blooms being fresh and bright in colour, and the collection one of great merit. The 1st prize was awarded. Mr. COLLINGWOOD also won the N.C.S. large Silver Medal and the N.C.S. small Silver Medal for the best bloom exhibited by an amateur, this being a very fine specimen of "Romance."

Rev. SHEEPSHANKS was placed 1st for the best exhibit of 12 Japanese blooms; A. ST. MAUR, Esq., Stover (gr. Mr. G. F. Richardson), being 2nd. Rev. SHEEPSHANKS had good blooms of Master David, Mrs. Marsham, Lady Talbot, Frances Jolliffe, F. S. Vallis, and P. Radaelli.

CHRYSANTHEMUMS IN POTS.

The best decorated group, both pot and cut blooms together, was shown by Mrs. W. J. PRING, Exeter (gr. Mr. F. Webber). This prize also carried with it the Silver Challenge Cup, presented by H. E. Duke, Esq., K.C., the member for Exeter. The Cup has to be won three times by the same competitor, and this is the second time Mrs. PRING has won it.

FRUIT.

GRAPES were fairly well shown; Sir W. FERGUSON DAVIE, Bart., Creedy Park (gr. Mr. W. Seward), was 1st for Black Alicante, and Captain MORRISON-BELL, M.P., Pitt House (gr. Mr. W. North), 1st for White Muscats.

In the class for any other Grape, Captain MORRISON-BELL was 1st with well-finished bunches of Appley Towers, and Sir W. FERGUSON DAVIE 2nd, with Gros Maroc.

The best collection of six dishes of fruits was shown by Captain MORRISON-BELL, who exhibited Muscat of Alexandria and Appley Towers Grapes, Durondeau Pear, Cox's Orange Pippin Apple, and Green Gem Melon. This prize also carried with it the Silver Challenge Cup, presented by Councillor Linscott, J.P., and as it had now been won for the third time by Captain MORRISON-BELL, it becomes his absolute property.

APPLES.—In nearly all the collections of Apples the same kinds were staged, the more popular varieties being shown. In the class for 24 varieties, HAROLD ST. MAUR, Esq. (gr. Mr. G. F. Richardson), was placed 1st, and Sir W. FERGUSON DAVIE, Bart., 2nd. In the class for six dessert sorts, Mr. ST. MAUR was also 1st, and for six varieties of culinary varieties, Sir W. FERGUSON DAVIE was successful.

PEARS.—The 1st prize in the class for a collection of nine varieties was won by F. R. RODD, Esq., Launceston (gr. Mr. F. A. Bellings).

VEGETABLES.—Mrs. GIDLEY won the 1st prize in the class for a collection of eight kinds with well-grown produce, Cranston's Excelsior or Ailsa Crag Onion, Veitch's Intermediate Carrot, Renton's Monarch Leek, Exhibition Brussels Sprouts, Improved Parsnip, and Veitch's Glory Tomato being all good. Messrs. Robert Veitch & Son's prize was won by Mrs. W. J. PRING, Mrs. GIDLEY being a very close 2nd. Other special prizes were won by Mr. F. R. RODD, Dr. SAMWAYS, and Mr. LOVELL.

NON-COMPETITIVE GROUPS.

Trade exhibits were a feature of the exhibition. Messrs ROBERT VEITCH & SON showed single Chrysanthemums, Carnations, Nerines, ornamental-foliaged shrubs, conservatory plants, and fruit; Mr. GODFREY, Exmouth, made a fine display with Pelargonium blooms, Carnations, and other plants; while Messrs. JARMAN & Co., of Chard, had a fine stand of table fruit.

PUTNEY, WANDSWORTH AND DISTRICT CHRYSANTHEMUM.

NOVEMBER 9, 10.—The 34th annual exhibition of this society was held in the Cromwell Hall, Putney, on these dates. The show was, in most respects, equal to those of the previous years, but there were only two exhibits in the class for a group of Chrysanthemums, being fewer than usual. The 1st prize in this class—a silver cup given by the tradesmen of Putney—was won by an amateur, Mr. R. H. VINCENT, Wimbledon. The 2nd prize was awarded to J. H. PAVITT, Esq., Tudor Lodge, Wimbledon Common (gr. Mr. A. Wood).

The 1st prize for a miscellaneous group was won by Mrs. DICKIE, Putney Hill (gr. Mr. T. Pett), and the 2nd prize by Dr. LACROIX, Bryndir, Roehampton (gr. Mr. F. Cresswell).

In the classes for cut blooms some remarkably fine flowers were shown. The principal class was for eight vases of Japanese Chrysanthemums, three blooms of one variety in each vase. The 1st prize, a silver cup given by Alderman A. D. Dawnay, Mayor of Wandsworth, was won by Mme. THUNDER, The Convent, Roehampton (gr. Mr. A. Smith), with splendid blooms of the following varieties: Rose Pockett, Bessie Godfrey, Reginald Vallis, Frank Payne, F. S. Vallis, Master David, J. H. Silsbury, and Geo. Hemming; 2nd, G. G. ANDERSON, Esq., The Wilderness, Wimbledon Park (gr. Mr. H. Barrett). A specimen of Bessie Godfrey in this exhibit was adjudged the premier bloom. The 3rd prize was awarded to A. J. PICKETT, Esq., Keswick Lodge, East Putney (gr. Mr. W. Limmer).

Mme. THUNDER also won the following prizes for cut blooms:—(a) 1st for 24 Japanese blooms; (b) 2nd for 12 Japanese blooms; (c) 1st for six blooms of a white variety; (d) 1st for six yellow blooms; and (e) 1st for six blooms of any other colour, staging in this last class the variety Rose Pockett.

Incurved blooms were shown well by Mrs. GOOD, Wynnstay, Putney Hill (gr. Mr. J. A. Fry); a fine flower of Godfrey's Eclipse was awarded the prize for the premier bloom of this type.

Single Chrysanthemums were shown well by the Dowager Countess of KINTORE, Oaklea, Wimbledon Park (gr. Mr. D. Anderson), and Dr. HOFFMAN, Coombe Lodge, West Hill, Putney (gr. Mr. T. Dolley).

Winter-flowering Begonias were a great feature, the 1st prize being won by THOS. AIKMAN, Esq., Pendreath, Clifton Road, Wimbledon (gr. Mr. W. Pink).

In the vegetable section, the 1st prize in Messrs. Jas. Veitch & Sons' class was won by Dr. HOFFMAN. A 1st prize for vegetables was also won by GEO. FORES, Esq., Blenheim, Raynes Park (gr. Mr. Chas. Pullen).

The fruit classes were not quite so well filled as usual. The best black Grapes were shown by Sir W. J. LANCASTER, South Lynn, Putney Hill (gr. Mr. F. H. Goddard), and the best white Grapes by Dr. LACROIX. Both kitchen and dessert Apples were shown well by Mme. THUNDER, and Pears by OWEN SEAMAN, Esq., The Tower House, West Hill, Putney (gr. Mr. C. Alexander).

NON-COMPETITIVE EXHIBITS.—A fine group of foliage and flowering plants was arranged by Messrs. JAS. VEITCH & SONS, Chelsea. Mr. L. R. RUSSELL, The Richmond Nurseries, put up a display of hardy, ornamental-foliaged and berried plants. Floral designs were staged by Messrs. J. WALBORN & SON, Messrs. MAHOOD & SON, and Mr. W. R. MANN, all local florists.

BRADFORD AND DISTRICT CHRYSANTHEMUM.

NOVEMBER 10, 11.—The 25th annual exhibition of the above society was held in St. George's Hall, Bradford, on these dates, and proved a great success. The society is in a flourishing condition, and has at all times the support of the Lord Mayor of the borough. At the opening ceremony, performed by the present Lord Mayor, there were six ex-Lord Mayors present.

The principal class, that for 24 Japanese blooms, in not fewer than 18 varieties, was contested by eight exhibitors, and provided a magnificent display of blooms. The 1st prize of £10 was won by ARTHUR JAMES, Esq., Coton

House, Rugby (gr. Mr. A. Chandler), who showed splendid examples. This gentleman has been successful on former occasions at Bradford, but never before, probably, has he shown such highly-developed flowers. The varieties included Lady Talbot, R. H. B. Marsham, Frances Jolliffe, Hon. Mrs. Lopes, Master James, F. S. Vallis, Evangeline, Reginald Vallis, Bessie Godfrey, J. Lock, O. H. Broomhead, A. Lemon, Marie Loomes, President Viger, and Lady Talbot. The 2nd prize of £7 was won by A. TATE, Esq., Downside, Leatherhead (gr. Mr. W. Mease), whose best flowers were Mrs. G. Drabble (premier bloom), R. Vallis, Kara Daw, A. Lemon, Evangeline, and G. Mileham; 3rd, Miss BENNETT, Grimsby (gr. Mr. G. Burrows). Mr. H. WOOLMAN, of Shirley, Birmingham, and Mr. CHAS. JONES, of Abergele, North Wales, were placed 4th and 5th respectively.

In the class for 12 Japanese blooms, dissimilar, the 1st prize was won by Mr. A. CHANDLER; 2nd, Mr. WOOLMAN; 3rd, Mr. TATE.

For 24 Incurved blooms, in 18 varieties, the 1st prize was won handsomely by the Marquis of BUTE, Cardiff Castle (gr. Mr. H. B. Farmer), who showed splendid specimens, his best flowers being Edwin Thorpe, Le Peyrou, a seedling, Wm. Biddle, Eclipse, Nellie Threlfall, Emblème Poitevine, Clara Wells, Romance, Mrs. F. Judson, and Ma Perfection. The 2nd prize was won by Mr. TATE, whose best blooms were Edwin Thorpe (premier incurved flower), Duchess of Fife, Mrs. F. Judson, Clara Wells, Pantia Ralli, and G. Denyer; 3rd, PANTIA RALLI, Esq., Epsom (gr. Mr. G. Hunt).

The prizes for 12 Incurved blooms were awarded as follow:—1st, Mr. TATE; 2nd, Mr. H. R. FARMER; 3rd, Mr. PANTIA RALLI.

The vase classes for 18 blooms, in six varieties, three blooms in each vase, formed a very pleasing display; the blooms were somewhat smaller than those exhibited on the boards. The 1st prize was awarded to Mr. WOOLMAN; 2nd, Mr. A. Chandler; 3rd, Mr. IGGULDEN, Frome.

In the local class for 18 blooms, in not fewer than 12 varieties, the 1st prize was a silver cup presented by the Lord Mayor. This class created a keen interest, and eight exhibitors provided a very creditable display. The trophy was won by Mr. J. W. BRIER, Halifax; 2nd, Mr. J. THORNTON; 3rd, J. HILL, Esq., Bradford (gr. Mr. G. W. Dunsmore).

Mr. THORNTON showed the best exhibit of 12 Incurved blooms; 2nd, H. CLARK & SON, Rodley; 3rd, T. BIRD.

The quality of single Chrysanthemums, combined with the numerous entries in the whole of this section, provided a difficult task for the judges, on account of the very limited space allowed for the display of the vases; but the arrangement of the show, from a decorative aspect, was admirable. In the orchestra gallery specimen Chrysanthemums occupied the whole of the space available. Either side of the Hall was flanked with numerous exhibits in the open classes; immediately in front of the platform the bouquets were displayed to advantage; and at the bottom of the Hall were arranged the vase classes, which have not yet succeeded in supplanting the boards used in the larger classes.

GARDENING APPOINTMENTS.

Mr. J. ROWE, for 10 years Gardener to J. D. KOHLER, Esq., Barton Lodge, Winkfield, Windsor, as Gardener to Lady CAMOYS at the same place.

Mr. W. S. STARK, until recently Gardener for 9 years to Col. G. F. SCOTT, Dolgelly, North Wales, as Gardener to Sir JAMES W. SCOTT, Bart., The Yews, Windermere.

Mr. T. HAYWARD, for 4 years Gardener at Thornleigh, Vicar's Cross, Chester, and previously Inside Foreman at Ince Hall, Chester, as Gardener to W. F. PARKER, Esq., Warcop House, Warcop, Westmoreland.

Mr. WILLIAM E. EAST, for the past 4½ years Foreman at Copped Hall, Totteridge, Hertfordshire, and previously at Breaksped Gardens, Harefield, Middlesex, as Gardener to SHEPHERD CROSS, Esq., The Oaklands, Preston Brook, Cheshire.

Mr. H. GRAY, for 7½ years Gardener to STANLEY BOULTER, Esq., Garston Park, Godstone, Surrey, as Gardener to E. W. BLESSIG, Esq., at the same place.

Mr. E. F. HAZELTON desires us to say that he will not be leaving Knowsley until the end of the year to take up his appointment at North Mymms Park.

Mr. G. H. SEMARK, for the past 2½ years Gardener to J. R. FEATHERBY, Esq., J.P., Bleak House, Gillingham, Kent, as Gardener to Admiral Sir CHARLES DRURY, K.C.B., Holmwood, Tenterden, Kent.

Mr. A. THOMAS, for 4 years Gardener at Burnhopeside Hall, Lanchester, co. Durham, as Gardener to A. C. ARMITAGE, Esq., Kirroughtree, Newton Stewart, N.B.

Obituary.

ALFRED BAILEY.—We regret to announce the death, on the 30th ult., of Mr. Alfred Bailey, gardener at Pen Hill, Bath, and hon. secretary of the Bath Gardeners' Association. Deceased was found lying injured at the bottom of a flight of steps leading to a cellar, and died as the result of his injuries. Mr. Bailey, who was 42 years of age, was a native of Wiltshire. The annual Chrysanthemum Show of the society of which he was for many years secretary was held on the 1st inst., and at the luncheon the president, Mr. Charles Foxcroft, and others, referred to the great loss the society had sustained in the death of their colleague.

ROBERT MACMILLAN.—We regret to announce the death of Mr. Robert MacMillan, of MacMillan & Co., Greenwich, Connecticut, U.S.A., who died at his home on October 9, aged 51 years. Mr. MacMillan was born in Scotland, and at the age of 22 emigrated to the United States of America, and settled at Boston. Later he went to Pearl River, N.Y., where he acquired a reputation as a grower of Chrysanthemums and Mignonette. Subsequently he opened a florist's establishment at Greenwich, Connecticut, where he succeeded in building up a prosperous business.

GEORGE M. WOODWARD.—Mr. George M. Woodward, for 14 years gardener to the John T. Lester estate, and recently gardener to Mr. J. J. Mitchell, of Lake Geneva, Wisconsin, U.S.A., died on October 24. Mr. Woodward was a native of Malvern, Worcestershire. He settled in America 35 years ago, and was a former president of the Chicago Florists' Club.

DEBATING SOCIETIES.

KILMARNOCK AND DISTRICT HORTICULTURAL.—At the meeting of this society, held on the 6th inst., the second lecture of the present series was delivered by Mr. Priest, of Eglinton, his subject being "Notes on French Gardening." Mr. R. K. Fillars presided over a good audience and several new members were elected. On December 13 Mr. Smith, Redheugh, will give a lecture on "The Culture of the Chrysanthemum."

LOUGHBOROUGH AND DISTRICT GARDENERS'.—The subject of fungus diseases was dealt with by Mr. J. H. Woolley, of the Kingston College, at the last meeting of the association, held in the Town Hall, Loughborough. The lecture was rendered additionally interesting by lantern slides. Specimens of diseased plants, with microscopic slides, were also on view.

READING GARDENERS'.—This society held recently an exhibition of a non-competitive character, the proceeds of the exhibition being given to the Gardeners' Royal Benevolent Institution and the Royal Gardeners' Orphan Fund. The show took place in the Corn Exchange. Choice Chrysanthemums were exhibited by Sir Rufus Isaacs, M.P., Leonard Sutton, Esq., Mrs. Bland Garland, and M. H. Foquet Sutton, Esq. Leonard Sutton, Esq. (gardener, Mr. F. Townsend) sent some fine specimens of seedling Chrysanthemums and Gloire de Lorraine Begonias. These were grouped on one side of the platform, a similar group on the other side being shown by M. H. Foquet Sutton, Esq., Erleigh Park (gardener, Mr. H. C. Loader). S. Griffiths, Esq. (gardener, Mr. G. Carter) staged a collection of Begonias. J. Okey Taylor, Esq. (gardener, Mr. T. Brown) exhibited a fine collection of Solanums and Begonias. Down the centre of the hall was a magnificent collection of Begonias, provided by S. B. Joel, Esq. (gardener, Mr. Johnson). Mr. W. Howard Palmer, of Wokingham, showed stove plants. An exceedingly pretty rose stand was staged by Mr. Elisha J. Hicks, of Twyford, the flowers being displayed on a decorative framework. Roses in stands were shown by H. Dunlop, Esq. (gardener, Mr. A. Giles). From the gardens at Reading University were shown Apples, Grapes, Orchids and Chrysanthemums. Another exhibit showing the result of both skill and patience was a framed fretwork arrangement of the Lord's Prayer, by Mr. H. J. Wynn. Other exhibitors included Mr. G. Bryant, Miss Cripps (gardener, Mr. G. Durrant), Mr. H. Collins (gardener, Mr. A. F. Bailey), Mr. T. Allsopp (gardener, Mr. G. Hinton), Mrs. Bird (gardener, Mr. A. Abrahams), and Mrs. C. Smith (gardener, Mr. R. Taylor).

GAMBERLEY, FRIMLEY AND YORKTOWN GARDENERS'.—At the meeting of the above society held in St. George's Room, on the 9th inst., Mr. W. Gregory in the chair, a paper was read by Mr. John Crooks, late of Forde Abbey Gardens, on "Propagation by Seedlings versus Cuttings." Previous to the lecture an exhibition of Chrysanthemums took place and the Society's Certificate was awarded to Mr. F. G. Hull, of Heatherside House Gardens.

SCHEDULE RECEIVED.

Darlington Horticultural Society's autumn flower show, to be held in the Drill Hall, Darlington, on Wednesday, November 22. Secretary, Mr. A. H. Harrow, Priestgate House, Darlington.

MARKETS.

COVENT GARDEN, November 15.

We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—Eds.]

REMARKS.—Shipments of Apples and Pears from Nova Scotia this week amounted to 23,000 barrels, mostly Apples. The Californian shipments consisted of 5,000 cases of Apples each containing about 10½ dozen fruit, also 1,500 barrels of Pears of the variety "Keiffer." English Pears are practically finished, and supplies from the Channel Islands are limited. The Grape trade is fairly good, with no apparent increase in prices. Spanish Grapes appear to be in a very sound condition and are good value at the present prices. Supplies of home-grown Tomatos are limited, and those from Tenerife are meeting with a better demand. Cultivated Mushrooms, owing to a considerable falling-off in the out-door crop, are in much better demand. "Paris Green" Asparagus is a limited supply and prices have risen. English Walnuts are a decreasing supply, but Walnuts from France continue to be very plentiful. Cobnuts remain a good supply, their prices ruling lower. Both French and Italian Chestnuts are, as usual at this period of the year, a good average supply. Supplies of vegetables are considerably in excess of the demand. E. H. R., Covent Garden, November 15, 1911.

REMARKS.—Trade is quiet, due no doubt to the mild weather. The stocks of Potatoes in London are still large, and consignments are about the same as last week. Edward J. Newborn, Covent Garden and St. Pancras, November 15, 1911.

LAW NOTE.

FAILURE OF A MARKET GARDENER.

At the offices of the official receiver for the southern district on the 14th inst., the first meeting of creditors was held concerned under the failure of William Robert Alderson, market gardener and farmer, residing and carrying on business at Melrose, Bell Farm, Hersham Road, Walton, Surrey. The debtor has not yet filed a statement of affairs, but he estimated his debts at about £3,500, between 40 creditors, and disclosed assets valued at £8. Debtor was brought up to assist his father, who was a market gardener at Vauxhall, and also at Bell Farm. His father died in 1878, and debtor remained as manager for his trustees, of whom his mother was one. On November 7, 1889, he took over the Bell Farm on lease from the trustees. The causes of his insolvency are: "Speculating in land and depreciation in value of land. Carrying on business at a loss for eight or ten years. Exceptionally bad seasons, and high rate of interest on money borrowed from money-lenders." The official receiver said that debtor's public examination was to have been adjourned in the first instance, owing to the absence of a statement of affairs, and in order to give the trustee time to look into the estate. The petition was filed by a firm of money-lenders, the Act of Bankruptcy being the debtor's failure to comply with the requirements of a bankruptcy notice.

ANSWERS TO CORRESPONDENTS.

BEGONIA LEAVES DROPPING: S. H. W. The leaves have fallen as the result of excessive atmospheric moisture. Keep their surroundings drier. If grown in a stove, place the plants on a shelf or stage by themselves, and afford water with caution.

BEGONIAS UNHEALTHY: H. M. M. The roots of your Begonias are infested with eelworm, as may be seen by the numerous excrescences. The compost is the source of infection, therefore discard the old soil and thoroughly cleanse the pots before using them again.

VARIETIES OF FRUIT FOR A LOW WALL: E. Y. Culinary; Potts's Seedling (August and September), Lord Grosvenor (September and October), Stirling Castle (October and November), Lane's Prince Albert (November to April), Ecklinville Seedling (September and October), Grenadier (September). Dessert; Cox's Orange Pippin (November to January), Mr. Gladstone (July and August), King of the Pippins (October to January), Sturmer Pippin (February to June), Duchess of Oldenburgh (August and September), Worcester Pearmain (September), Newton Wonder (January to March). Pears (dessert): Jargonelle (August), Durondeau (October and November), Beurré Superfin (October), Beurré Diel (November), Glou Morceau (November), Nouvelle Fulvie (December to January), Joséphine de Malines (January). Cooking; Catillac (December to March). Plums (dessert); Bryanston Gage (mid September), Greengage (early September), Rivers's Early Transparent (early September). Culinary: Victoria (late August), Rivers' Monarch (end of September). Damsons: Bradley's King (mid season) or Farleigh Prolific. Cherries (dessert): Archduke (mid season), Elton (early), Black Eagle (mid season). Culinary: Kentish (mid season), Morello. Currants: Red Dutch (early), Raby Castle (late), White Dutch and Boskoop Giant (black). Gooseberries: Crown Bob (early), Sulphur, Warrington, Whinham's Industry, Whitesmith, and Lancashire Lad.

BLACK ITALIAN POPLAR: *H. W.* This plant (*Populus nigra pyramidalis*), would do very well in the heavy, yellow clay, and it is a quickly-growing plant. In addition, Sycamore, Beech, and Hornbeam may be grown. We should, however, advise you to employ a certain number of evergreen trees, especially in those positions where a screen is desired. For the outskirts Austrian Pine would prove satisfactory, whilst Scots and Corsican Pines might be given inside places. All the Pines ought to be planted when not more than 1½ foot high, for they establish themselves more quickly than larger plants.

BOOKS: *H. S., Rochdale. Apples and Pears*, by George Bunyard, price 1s. 9d., post free, from our publishing department.

CREOSOTE ON HOT-WATER PIPES: *J. M.* Your best plan will be to remove all the plants from the greenhouse on a mild day and then heat the hot-water system to the fullest extent, throwing the doors and ventilators wide open. In this way most of the creosote would be given off as fumes. If, at the same time, you could borrow a blow-lamp, such as is used by painters, you would be able to burn what creosote remains.

DAPHNE INDICA: *E. W.* The leaves of *Daphne indica* often turn yellow on account of over-watering or a sudden change of temperature. The plants ought to be left in a cold frame or a cold house with an ash bottom, and only placed in a conservatory or warmer structure during the time they are in flower. If kept in a cool house on a stage covered with damp ashes, the plants require but very little water at this time of the year, but thorough drainage is absolutely essential at all seasons to the success of this species.

EXAMINATIONS IN HORTICULTURE: *N. R.* Students at the R.H.S. examinations in horticulture are not inspected in practical work, and for this reason the certificate has less value than those awarded at the gardening colleges and by the British Gardeners' Association for a knowledge of practical as well as theoretical gardening. The R.H.S. examination is open to all, whether professional gardeners or not. The examination in botany you mention is the only one of its kind in this country.

FRUIT FOR A LOW WALL: *E. Y.* As the soil is heavy, it would be desirable to improve it by deep trenching and working into it a liberal supply of chalk or lime and burnt garden refuse or burnt earth; then you could grow horizontal double cordons of choice Apples and Pears. As you wish for a quick return, the best plan would be to buy trained trees.

GERARDE'S HERBALL: *W. R. H.* The price, £50, seems excessive, considering that Quaritch had Gerarde's first edition, 1597, priced at £20, and £21 in his catalogue of 1902-3, and in his catalogue for 1907 £17 10s. and £18 10s., and in Wesley's catalogue for 1905 the price quoted is £18 15s.

GERBERA JAMESONII: *A. H.* This plant requires a cold greenhouse or frame, although in very favoured situations it may be grown successfully in a border in the open garden, or in a rockery, merely protected during the winter by a covering of dry leaves, or light litter. If grown in pots and wintered in a cold frame, the plants will be benefited by a protection of dry leaves or litter in the same way, removing some of the plants to the cold greenhouse early in the New Year. The best compost is one consisting of turfy, yellow loam mixed with a good sprinkling of silver sand. The type has fine scarlet flowers, but there are varieties of various tints, and all are very pretty. The plant may be propagated from seeds very freely. Although scarcely so hardy as *G. Jamesonii*, the hybrids are very easy to grow as greenhouse or frame plants. Gerberas thrive best in a sunny position, where they last a long time in bloom.

HERBACEOUS AND ALPINE PLANTS FOR A SEA-COAST GARDEN: *Geo. Lawrence.* Much depends on the aspect of your garden, whether it is partly sheltered or fully exposed to wind and sun, and on the nature of the soil. The following plants are most likely to succeed, except in very unfavourable conditions:—*Alyssum saxa-*

tile, *A. s. var. citrina*, *Aubrietias* (various species), *Arabis albidia*, *Achillea Ptarmica* "Pearl," *Althæa rosea*, *Anchusa italica*, *Anthemis tinctoria*, *Aquilegia* "Long-spurred," *Campanula persicifolia*, *Catananche cœrulea*, *Centaurea montana*, *Cheiranthus Cheiri* ("Wall-flowers"), *Delphinium*, *Dianthus plumarius*, *D. cæsius*, *Erigeron speciosus*, *Eryngium amethystinum*, *Geranium armenum*, *Gypsophila paniculata*, *G. repens*, *Helenium autumnale*, *Hemerocallis flava*, *Iberis sempervirens*, *Oenothera fruticosa* var. *Youngii*, *Papaver orientale*, *Lilium candidum*, *Pentstemons*, *Polemonium cœruleum*, *Potentilla argyrophylla atrosanguinea*, *Saponaria ocymoides*, *Saxifraga umbrosa*, *S. cordifolia*, *Scabiosa caucasica*, *Campanula medium* ("Canterbury Bell"), *Silene maritima*, *Solidago canadensis*, *Spiræa Aruncus*, *Statice limonium*, and *Zauschneria californica*.

HONEY FERMENTING: *Anxious.* The honey ferments because it is not ripe. You must either place the honey in a ripener (one holding ½ cwt. can be purchased of any appliance dealer for 7s. 6d., carriage paid), or no honey must be extracted from combs unless it is sealed. Sealed honey will never ferment if kept in a dry place. When little honey is extracted it may be kept in the extractor for a few days in a room where the temperature is more than 80° F., the unripe honey will then rise and may be fed back, while the thicker portion may be run off through the valve at the bottom.

INSECT ON PHLOX: *T. R.* The larva sent is that of the garden swift moth (*Hepialus Cupulinus*). These larvae continue to work until the spring. They may be cleared out of the soil by hoeing in Vaporite or Finnite.

MICHAELMAS DAISIES: *V. S.* The *Amellus* section of the genus *Aster* consists of three species:—*A. alpinus*, *A. Amellus*, and *A. pyrenæus*. *A. Amellus* is the Italian Starwort; it grows about 2 feet high and has large purple flowers. All three species are natives of Europe. *A. ericoides* is a native of North America; it grows about 3 feet high, is much branched, and has small leaves and white flowers. Of this species there are now many garden varieties. *A. laevis*, also from North America, grows from 2 to 4 feet high, and has ovate or oblong leaves 4 to 5 inches long, with medium-sized, violet-coloured flowers. *A. Novæ-Angliæ*, or New England Starwort, grows up to 7 or 8 feet high, with stout stems, leafy at the top, and large rose-coloured or violet-purple flowers. The whole plant is coarsely hirsute or hispid. This species mainly inhabits Canada, but it is also found in the United States. *A. Novi-Belgii* (New York Starwort) is found on the eastern side of the United States, and varies from 4 to 8 feet in height. The flowers are large, and vary in shade of colour from light purple to white. It is the commonest of our *Asters*, and there are many varieties, one of the most typical being that known as "Robert Parker." *A. turbinellus*, *N. America*; *A. pyrenæus*, *Pyrenees*; *A. Thomsonii*, *Himalaya*; *A. cordifolius*, *N. America*; *A. dumosus*, *N. America*; and *A. corymbosus*, *N. America*, are all good species.

NAMES OF FRUITS: *W. G. C. B.* 1, Hanwell Souring; 2, not recognised; 3, Annie Elizabeth; 4 and 13, Melon; 5, a very fine fruit of Claygate Pearmain; 6, Queen Caroline; 7, Emperor Alexander; 8, Beauty of Kent; 9, Northern Greening; 10, not recognised; 11, Dumelow's Seedling; 12, Waltham Abbey Seedling.—*G. White.* 1, send a better specimen; 2, Waltham Abbey Seedling; 3, Dumelow's Seedling; 4, probably a local variety; 5, Winter Greening.—*E. F. C. F.* 1, Cox's Orange Pippin; 2, Worcester Pearmain; 3, Winter Nonesuch.—*Denby.* 1, Golden Russet; 2, Rivers' Nonesuch.—*W. H. S.* 1, A fine fruit of Emperor Alexander; 2, Alfriston; 3, Adams's Pearmain; 4, Cornish Gilliflower; 5, Gennet-Moyle.—*Sheventon:* 1, Cornish Gilliflower; 2, Annie Elizabeth; 3, American Mother; 4, Prince Albert; 5, Histon Favourite; 6, Warner's King.—*Bentley:* 1, Mère de Ménage; 2, Hoary Morning; 3, Brabant Bellefleur; 4, Beurré Diel; 5, Vicar of Winkfield; 6, Winter Windsor.—*Harrison:* a,

Emperor Alexander; b, Prince Bismarck.—*J. A. J. B.* 1, Cornish Aromatic; 2, Roundway Magnum Bonum; 3, Fearn's Pippin.—*H. J. C.* 1, Gravenstein; 2, not recognised; two fruits without numbers.—*Ickleton:* 1, Baxter's Pearmain; 2, Mabbott's Pearmain; 3, Franklin's Golden Pippin; 4, Pitmaston Nonpareil; 5, Sheep's Nose; 6, Colonel Vaughan; 7, Directeur Hardy.—*Miss Baird.* Uvedale St. Germain, a stewing variety, never fit for dessert.

NAMES OF PLANTS: *A. Williams.* *Viburnum Lantana*.—*W. H. L., Wells.* 5, *Cratægus orientalis*; 6, *Saponaria officinalis* (not valuable); 7, *Juglans nigra* (Black Walnut). We do not undertake to name varieties of Roses.—*H. M. M.* 1, *Codiaeum* (*Croton*) *longifolium*; 2, *C. Weismannii*; 3, *Viola cornuta*.—*H. J. Marcham.* *Helianthus orgyalis*.—*Denby.* 3, *Rhamnus hybrida*.—*A. W. T.* *Osmanthus aquifolius myrtifolius* (the adult state of this species).—*B. & S.* *Reineckia carnea*.—*McGredy & Son.* A species of *Diosma* or *Agathosma*; send when in flower.—*H. C., Oakfield.* 1, *Catasetum macrocarpum*; 2, *Maxillaria picta*; 3, *Eria bicolor*; 4, probably a *Pholidota*; a single flower is not sufficient for identification.—*W. B. K.* A small form of *Cyrtanthus angustifolius*.—*Cheshire.* 1, *Asplenium bulbiferum*; 2, *Pteris tremula*; 3, *P. longifolia*; 4, *Cyrtomium falcatum*; 5, *Sansevieria zeylanica*.—*W. T.* *Cypripedium Harrisianum*. The other flower cannot possibly be a sport from it. It is a seedling which has become associated with the original plant of *C. Harrisianum*.—*W. F., York.* 1, *Codiaeum interruptum*; 2, *C. chrysophyllum*; 3, *C. angustifolium*; 4, *C. Weismannii*; 5, *C. variegatum*; 6, *Adiantum Farleyense*.—*W. H. J.* *Amaranthus tricolor*.—*V. W.* 1, *Oncidium abortivum*; 2, *Angræcum Kindtianum*; 3, *Odontoglossum blandum*; 4, *Cypripedium venustum*; 5, *Ada aurantiaca*; 6, *Lycaste cruenta*.—*R. H.* 1, *Pteris tricolor*; 2, *P. argyræa*; 3, *Adiantum concinnum*.—*Ponica.* *Maurandya scandens*, generally known in gardens as *Lophospermum*. This summer climber may be grown from seeds annually, or propagated by means of cuttings. It needs the protection of a greenhouse during the winter.—*Florence.* *Taxodium distichum*.

ORCHIDS DISFIGURED: *A. W.* There is no disease present in the leaves of your Orchids; the injury has been caused by the precipitation of moisture on the foliage, due to damping the house when the temperature was declining.

PEARS DISEASED: *E. P. D.* Your Pears are affected with Pear scab. Great care must be taken to remove all the diseased and dead shoots, and more especially the affected spurs. Spray the trees with the Bordeaux mixture, commencing spraying when the leaves are unfolding.

PIGEON'S DUNG AS MANURE: *J. C. Dunlop.* See reply to *G. W.* on fowl's dung as manure, in the last issue, p. 348.

PLANTS DYING OFF: *A. J. H.* There is no disease present. The trouble is due to some wrong treatment of the plants.

"SPRAIN" IN POTATOS: *G. E. G.* The cause of "sprain" in Potatos is not known. A lack of lime in the soil favours its development.

WEIGHT OF GRASS SEED: *M. B. G.* The weight of grass seed varies considerably. A bushel of high quality seed will weigh more than the same quantity of inferior seed. Again, well cleaned seed will weigh more per bushel than only partially cleaned seed, whilst in mixtures of grass seeds, whether for agricultural purposes or for lawns, the weight of a bushel will vary considerably according to the seeds of which the mixture is composed. A mixture of extra fine dwarf varieties weighs about 32 lb. to the bushel, whereas mixtures of ordinary grass seed weigh about 25 lb. and often less to the bushel. This is in consequence of larger seeds being used, such as rye grass.

THE REGENT'S PARK AND PRIMROSE HILL.*

THERE was a time not so long since, and remembered by all who are now of middle age, when history concerned itself mainly with copious records of august trivialities. Of recent years the discovery has been made that history, like charity, begins at home, and that local history is far more interesting, and, indeed, more instructive than general history.

Mr. Webster's book on the Regent's Park and Primrose Hill is an admirable illustration of this fact, and of it we may say at once that it does not contain a dull page.

The Londoner in particular will enjoy this well-written account of one of his finest parks, and his enjoyment will be emphasized by the fact that the writer of the history has already laid his fellow-townsmen under a deep obligation, in that Mr. Webster has himself played a large part in adding to the attractiveness of the Regent's Park. Mr. Webster now demonstrates his

versatility in writing well about what—though he himself does not mention it—he has done well.

The Regent's Park was known originally as the Marylebone Park Fields, and we are rendered grateful to Mr. Webster, whilst perusing the first page of his book, for setting us right with respect to the etymology of the word Marylebone. In former times a brook, the Tybourne—of sinister memory in that the City of London hanged its criminals thereby—which rose in Hampstead, flowed through the park, to meet the Thames near Vauxhall Bridge. Tybourne village church was replaced in 1400 by another dedicated to the Virgin and styled St. Mary-at-the-bourne—hence Marylebone, and its later corruption, Marylebone.

Marylebone Park dates from the days of Henry VIII., and so late as the beginning of the 17th century Marylebone was a small village surrounded by fields, and some three-quarters of a mile from London.

The Regent's Park, as we now know it, has undergone great changes from the time when Pepys wrote "Then we went abroad to Marrow-bone and there walked in the garden, the first time I was ever there, and a pretty place it is": though the description holds good to-day, as all Londoners with a love for trees and flowers will acknowledge. The modern park was constructed between the years 1812 and 1838, and was named after the Prince Regent, for whom it was intended to build a palace in the grounds. The plans of the park were drawn by Mr. Nash, and the work was executed by Mr. James Morgan. The area is 472 acres, and the outline of the park is nearly circular; ornamental water occupies some 22 acres, and roads and paths 47; of roads there are about 29 miles.

As Mr. Webster remarks, the general public can have no idea of the amount of care, labour, and foresight required to maintain a great park such as that of which he writes. His brief statistics may enlighten them: of Violas, 24,000 plants per annum are raised from cuttings, and a like number of Pelargoniums: about 100 acres are set apart for cricket and other games, and, as we are delighted to learn, five grounds are maintained for the use of children of the London County Council schools; the dearly-loved sandpit is not lacking, whilst a gymnasium at Primrose Hill completes the tale of the provision which the park makes for the enjoyment and exercise of the Londoner, old and young.

The flower-garden, the laying out of which was due originally to Prince Albert, is some 12 acres in extent, and the beds are planted twice, and sometimes thrice, in the course of the year. Bulbs, which flourish remarkably well, are used on a lavish scale—nearly 200,000 per annum, chiefly of Hyacinth, Tulip, Narcissus, and Crocus.

Of noteworthy trees, mention may be made of the magnificent specimens of London Plane by the lake-side, the Elms in the flower-garden, the fine avenue of Horse-chestnuts, the Poplars on Primrose Hill, and the trees planted in commemoration of the 60th year of the reign of Queen

Victoria, the Coronation of King Edward, and the Coronation of King George.

Mention must be made also of the charming account of the birds and animal life generally in the park, though for details we must refer the reader to Mr. Webster's own account.

In conclusion, we may express the hope not only that London gardeners will read Mr. Webster's book, but also that it may find its way into the hands of the children of the Council schools, who love the park already, but who, by the perusal of Mr. Webster's account, will learn to love it all the more.

THE MARKET FRUIT GARDEN.

POLLINATION.

MR. BACKHOUSE's article on "Self-sterility in Plums," in the issue of this journal for October 28, is highly interesting. The real Greengage is named among the self-sterile Plums. In my private orchard are four great trees, planted 11 years ago, which have never borne a quarter of a crop yet, and which yielded less than a quart of fruits altogether this year. Yet side by side with them are Coe's Golden Drop, which has fruited much better, although self-sterile, and several other varieties. Bud-eating birds appear to be particularly fond of Greengage fruit-buds, and their depredations have sufficiently accounted in some seasons for the failure of the trees to yield fruit, but not in those in which they blossomed well. Their barrenness is all the more puzzling on account of the nearness of a number of beehives. Two trees of Reine Claude-Violette or Purple Gage, of the same age as the Greengages, have not yielded a quart of Plums in 11 years, and two trees of Black Diamond have not given me three bushels in that time. The last-named variety appears to be self-sterile, judging from evidence given on a former occasion.

It is strange that notice of this subject to any considerable extent should have been left for the 20th century, and that very little investigation of it has been made up to the present date. Let me urge those who are now engaged in such investigation to extend their observations to an endeavour to ascertain relatively how far distant a self-sterile Apple or Plum may be from another variety without endangering the fertilisation of its blossoms by insects or wind. Cox's Orange Pippin is, incidentally, mentioned by Mr. Backhouse as a self-sterile Apple. Presumably this has been proved by experiments. But that the blossoms are fertilised with pollen from some other variety grown at a considerable distance from it my experience amply proves. Two blocks of the variety, eight rows (96 feet wide), bore as good a crop in the middle as on the outsides. Similarly, Rivers's Early Prolific Plum, in a block 108 feet wide, fruited abundantly this season in all parts of the block, although there are no Plums except newly-planted trees—which have not blossomed—on one side of the block. Consequently, the outside row is 108 feet from any other blossoming variety, yet that row had by far the greatest crop in 1910. The trees in it are younger than the rest.

In market orchards it is very inconvenient to have varieties of Apples or Plums more intermixed than is necessary, and, for that reason, it is important to learn how far distant from another variety a self-sterile variety may be placed. Mr. John Smith's suggestion for planting a few Crabs among self-sterile varieties of Apples is good for small orchards; but in a large market orchard, in which some hundreds of a given variety are grown, one Crab to 25 trees of a self-sterile variety would involve the production of more Crab Apples, perhaps, than could be sold easily. *A Southern Grower.*

* *The Regent's Park and Primrose Hill*, by A. D. Webster. (Greening, 5s. net).

BOWES MUSEUM PARK.

THE Bowes Museum Park at Barnard Castle extends to about 20 acres and contains the beautiful museum shown in fig. 153. Both park and museum were presented to the public by the late Mr. John Bowes, of Streatham Castle, Co. Durham, and his wife, Josephine Benoit, Countess of Montalbo. The foundation stone was laid on November 27, 1869, and the museum, which cost a quarter of a million, was formally opened to the public on June 10, 1892, by Sir Joseph Whitwell Pease, Bart., M.P. It contains a collection of natural history specimens, some exceedingly fine porcelain and pictures, as well as a general collection of interesting objects from all parts of the world. The park towards the front of the building is laid out as an Italian garden, with sloping banks on either side, and contains in the centre a series of geometrical flower-beds, some of which are planted with perennial plants, including such Roses as the varieties Hugh Dickson, Caroline Testout, La France, Grüss an Teplitz, General McArthur, Richmond, and Mrs. W. J. Grant. There are also many climbing varieties, and the bed of Dorothy Perkins (see fig. 154) was planted three years ago, and measures 18 feet in diameter. In spring the beds are gay with the flowers of all kinds of bulbous plants, Wallflowers, and many other spring-flowering subjects.

The park immediately surrounding the building is beautifully laid out with flower-beds, and is well wooded throughout. Hardy herbaceous plants are extensively planted, and there are beds furnished with Rhododendrons, and, in summer, with Lilliums of all the hardy kinds. The illustration in fig. 152 affords a view of this portion of the grounds in summer, when the beds are furnished with flowers.

Within the last five years, since which time Mr. F. C. Dalgarno has had charge, great alterations have taken place in the arrangement of the park. New lawns have been laid down, flower borders planted, many fine varieties of trees and shrubs planted, and the grounds generally laid out. Last year a new nursery was formed for the rearing of trees, shrubs, &c., and this year a range of greenhouses has been erected. A public bowling green, 40 yards square, has been formed, and its boundaries planted with

shrubs. A tea-house has also been opened in the grounds.

The park is situated close to the river Tees, 15 miles from Darlington, westwards, at an altitude of 800 feet. Trees and shrubs succeed remarkably well, including the Spanish Chestnut, *Cedrus Deodora*, most of the Coniferæ, the London Plane, *Quercus Ilex* (Holm Oak), *Q. cerris*, *Acer pictum rubrum*, and *A. Ne-*

FIG. 153.—BOWES MUSEUM, BARNARD CASTLE, NEAR DARLINGTON.

gundo. Verbenas and Violas do especially well. It is intended to form a sub-tropical garden, and also an ornamental lake. The park is visited by large numbers of visitors during the summer, and, with the museum, is one of the chief attractions in the north. Ample funds, vested in trustees, have been left to maintain the park and museum, and the future of this pleasant rendezvous for those interested in natural history and pleasure gardening is thus secured.

and during 1911 has proved better still, for it has evidently revelled in the continuous sunshine of this torrid summer.

It seems, moreover, to be capable of supplying what we had long been looking for, a really first-class white bedding Rose. Such a Rose must flower continuously, like a *Pelargonium*, from June to November, and the flowers must not be produced here and there, but over the whole bed for the whole period. Molly Sharman Crawford has done this for me during the present year, and I can say the same as regards my own garden of but two other varieties, namely, Richmond and Dr. J. Campbell Hall. Moreover, during the very hot weather Molly Crawford had the pull of both of these, for the sun took all the shape out of the Doctor and both colour and shape out of Richmond; the buds and flowers were there, but, except for the bright colour they showed when viewed at a distance, they were useless. Not so was it with Molly Sharman Crawford; the flowers produced during the hot weather were no doubt small, but they never really lost their form, while the colour, being white, was unaffected.

Molly Sharman Crawford was introduced by Messrs. Alexander Dickson & Sons in 1908, and before that date, excluding the dwarf *Polyantha*, perhaps our best white bedding Roses were Hon. Edith Gifford (Tea), Mme. Pernet-Ducher (H.T.), and Augustine Guinoisseau (H.T.). All these were, and still are, quite good bedding Roses, but the liability to mildew, the attention to dis-budding required by the first, and the want of real continuity of flowering in the two last named Roses must prevent their attaining the front rank in this capacity.

Frau Karl Druschki is, perhaps, one of the very worst Roses we have for bedding. It has unfortunately been recommended for that purpose in the N.R.S. Catalogue, and its popularity is such that many have tried it in that fashion, but the bed is satisfactory, if at all, for only a short time at the beginning of the season. After

FIG. 152.—VIEW IN BOWES MUSEUM PARK, DURHAM.

a green interval the bed no doubt gives us a second and even a third flowering, but these later flowers are for the most part borne on great straggling shoots thrown up, after the manner of the H.P.s, from the base of the plant, and though flowers for cutting may often be found, the bed becomes untidy and a failure. Some try to regulate this extravagance of autumn growth by pruning very lightly, and leaving long leggy plants; to some extent they may attain their object, but I fear only at the expense of unsightliness through the whole year, and even then the period of flowering of the bed, as a whole, is but short; in fact, the habit of growth makes the Rose altogether unsuitable for a bedder, admirable and beautiful though it may be in other capacities.

Habit of growth is, in fact, a most important factor in the making of a bedding Rose, and

fatal to many of our most beautiful Tea-scented Roses regarded as garden plants. The foliage also is good and healthy, showing little liability to the attack either of mildew or black spot, so far as my experience has gone. The young shoots are of the beautiful red tint, familiar to us in the Tea-scented family, and the bark ripens to a good dark green with a smooth surface.

In considering the merits of a Tea-scented Rose, hardiness is a question of the first importance. Since the introduction of this Rose we have not suffered from a really trying winter, and therefore it is necessary to write with some reserve on this point, but in the four years during which I have grown Molly Sharman Crawford I have not yet lost a plant, nor had one badly damaged by frost, while the only protection they have had has been that about the end of the year the plants have been lightly earthed

Rose, generous treatment and a rich root run are necessary, the constant and continuous production of the wealth of blossom we now expect from Roses in the first rank as bedding plants must necessarily make a great strain on the resources of the plant, and this strain must be met by the supply of sufficient and abundant food within reach of the roots to make good the waste that is taking place. When I first had Molly Sharman Crawford I planted it in the higher and sandier part of my garden in the neighbourhood of a south wall, thinking that it belonged to a delicate class and might require this protection. Later, however, it was moved to a lower part of the garden into a well-made bed with a deeper root run in more generous material, and the plants have responded well to this treatment. They received the usual supplies of weak liquid manure in May and early June,

FIG. 154.—ROSE DOROTHY PERKINS IN BOWES MUSEUM PARK.

The bed is 19 feet in diameter.

Molly Sharman Crawford is in this respect very good. It is true that it does not, like Mme. A. Mari or Mme. Jean Dupuy, spread over the bed till the latter is completely covered, so that the individuality of each plant is merged in the unity of the whole bed. In this respect the effect produced by Molly Sharman Crawford may not be quite so satisfactory, but it is very good nevertheless; and it carries this compensating advantage that the stems are carried erect, or but slightly branching, so that we get a well-shaped little bush of straightish stems, on the top of which the flowers are carried well above the general level of the foliage. The carriage of the flowers is, in fact, excellent for a bedding Rose, the flower-stalks, being fairly rigid, hold the flowers well, with little or none of that tendency to droop the head, which is so

up with a little fine soil or sifted ballast (i.e., burnt clay), which last-mentioned material makes perhaps the most satisfactory and efficient protection for all dwarf Roses. This protection has been allowed to remain round the plants until it is scraped away and hoed into the beds at pruning time in early April. So far, therefore, as my experience has gone, I think the Rose may be pronounced hardy for its class, and it does not seem to be one of those Teas which perversely make their finest shoots in autumn just as growth should be ceasing, and so cannot possibly ripen, but have to be cut away in spring. On the contrary, the wood generally ripens well, and therefore may be relied on to make good growth in the following year.

I should perhaps add that to get the best results from this, or, indeed, from any bedding

but since the middle of June no water whatever was given, nor have they shown any signs of wanting it.

No doubt the Rose has, with many other Teas, revelled in the sunshine of the past summer, but a Tea-scented Rose that will do so well, both this year and in the wet summer of 1910, seems worthy of more than the passing attention of Rosarians. *White Rose.*

ROSE MADAME HECTOR LEUILLIOT.

I HAVE found this Rose very free flowering here if treated as Gloire de Dijon and allowed to grow to its full limit and to get furnished with small twigs at the end of the branches. The flowers are of a most wonderful colour, and quite equal in beauty to Turner's Crimson Rambler. *F. K., Bath.*

THE ROYAL INTERNATIONAL HORTICULTURAL EXHIBITION, 1912.

(A lecture given before the Royal Horticultural Society on Tuesday last by Mr. Edward White, hon. managing director.)

THE Council of the R.H.S. has courteously placed the lecture hall this afternoon at the disposal of the directors of the Royal International Horticultural Exhibition, and so enabled them to call attention to the great event of next year. Perhaps one may go so far as to call it the great horticultural event of this generation.

Many of the flower shows held throughout the country have developed into important affairs, but not one has approached, in the British Isles, the great International Horticultural Exhibition of 1866. Although at first sight it seems surprising that no attempt has been made to repeat the great success of that show, those who have taken a part, however modest, in the organisation of such an event can appreciate tolerably well the reason for such a long interval.

But there have been some international displays in recent years at Paris, Ghent, Berlin, Haarlem, Florence, Lyons, Turin, and elsewhere, and one will also take place in Russia in 1913.

Each of these important affairs has presented special and valuable lessons in horticulture, and English visitors have quitted them with a persistent feeling that the time has arrived for British gardeners once more to show the world the utmost efforts of which they are capable.

The Flemish town of Ghent claims an important place in the history of horticultural exhibitions. It is there that the Royal Society of Agriculture and Botany holds every five years a great show, which dates back intermittently for some 300 years. Visitors to the last show, held in 1908, will remember particularly the magnificent displays of Azaleas, Camellias and Orchids, and the charmingly-artistic effect of the arrangement of the exhibition with roomy paths and panoramic backgrounds. It may be claimed that, on that occasion, English exhibitors scored a great triumph in the Orchid class by the marvellous display made by Sir George Holford.

The relations between leading French and English horticulturists are of a very happy nature, and many of the latter make a point of attending the periodical shows at Paris, which always add to one's admiration for the artistic and decorative ability of our neighbours.

The completeness of the Berlin Exhibition in 1909, which was held as early as April, was a revelation to English visitors. The show of fruit for such a time of the year was surprisingly good.

A wonderful show of Tulips was seen at last year's Jubilee Exhibition at Haarlem, where the great hulk gardens, for which the town is famous, were to be seen displaying a galaxy of beauty in form and colour.

The chief characteristic of our own exhibition of 1912, at the end of May, will probably be the all-round quality of the exhibits rather than the supremacy of any one class, except perhaps Orchids. Some few objections, by the way, may be raised to the date of the show, but objections would be inevitable whatever season was fixed, and the days decided upon after the most careful consideration by the directors are undoubtedly the most convenient generally and offer the best all-round opportunities for the display of British horticulture in all its branches. It has also been proved by experience on many occasions that the public are more eager to attend spring shows than those held later in the summer.

The dear old phrase, "horticulture in all its branches," falls very easily from one's lips. This is not to be wondered at, considering the amount of oratory for which it has been responsible since the days of Gerarde and Parkinson. It would be useful sometimes to consider what it really means, instead of using it in the automatic fashion to which we have become accustomed. As the exhibition is designed to serve horticulture in all its branches, it will be legitimate to give a moment's consideration to some of the branches and see how broadly they spread.

Many of us are too busy clinging to our own particular limb to realise of what a giant tree

it forms part and the great economic importance of that tree in our country.

We ought to be in an exceptional position to appreciate these facts when we have before us the statistics of the census of production with regard to the horticultural industry which will very shortly be published, and should be well worth the study of all who are interested in the progress of the art.

Taking first that branch of chief interest to the members of this society. We should look for particulars of the great nursery, florist, bulb and seed trades; incidentally we might hope to learn the extent of the acreage of the most highly or intensively-cultivated land to be found in the country, and we might estimate roughly therefrom the number of employes occupied and maintained in the handling of these great industries.

Well organised though they may be, thanks in a great measure to the Royal Horticultural Society, these trades represent in volume, however, but a small proportion of the horticultural industry, or even of that part concerned with the management of gardens.

To realise this, we need only picture the comparatively few gardens we know personally, and think of the quantity and value of the other materials used in their construction and maintenance, the architectural features and adornments in conservatories, horticultural buildings, garden ornaments, fencing and gates, the varied machinery, implements, tools, manures, fertilisers and all other details which represent some branch or other of the craft.

Among other points of information we might glean some idea of the number of owners of private gardens of a considerable area and how many million acres of land in this country are devoted altogether to gardens and parks, both public and private, or compare the area of glass-covered land now existing in the country with that of fruit and market gardens.

In these days of small holdings, innumerable market gardens, and fruit farms, it is difficult to say exactly where horticulture ends and agriculture begins, and it is not unlikely that the latter industry will be credited in the census returns with a large share of these, the most extended branches of the tree of horticulture. This point will be noted by those anxious to assert on behalf of the art all the importance that rightly belongs to it.

In short, an ideal census of the productions of horticulture in all its branches would contain statistics concerning nurserymen, seedsmen, and florists, vegetable and fruit growers, in field and under glass, wholesale and retail distributors, manufacturers of horticultural buildings and the many accessories required for the maintenance and upkeep of gardens, professional gardeners, artisans, and labourers. We must not forget the scientific, literary, and artistic professions and crafts which influence so greatly the practice and popularity of the industry, and do so much to initiate trade and employment.

There is little doubt that it would be possible to extract from a comprehensive census of horticultural production a strong case for the formation of a special department of horticulture subordinate to the Board of Agriculture. A decision to this effect by the Board would be an appropriate coincidence with the great demonstration which the horticultural industry is preparing for next year.

I have laboured somewhat at this question of the economic importance of horticulture in the aggregate, because this special side of what is generally called "gardening" does not often receive the attention it deserves.

One of the greatest assets that horticulture possesses is the unceasing sympathy shown by the Royal Family in its welfare, and the pleasure with which the directors received King George's gracious promise to open the exhibition on May 22 next, at 12 o'clock, will be shared by all who are interested in the success of the exhibition.

The considerable difficulty in securing a suitable site was eventually overcome by an arrangement to occupy 21 acres of the grounds of the Royal Hospital at Chelsea, which include the Ranelagh Gardens. The position is ideal in many respects, among its advantages being two ample entrances from Queen's Road and the Chelsea Embankment respectively, within a few minutes' walk from Sloane Square station. There is open space for tents covering nearly

5 acres, and there are, in addition, several broad, shaded avenues, and the sheltered and mature gardens, which offer a good sample of Middle Victorian landscape gardening, and will make a perfect background for outdoor exhibits and the rock and water gardens, which are expected to be of particular interest.

It is proposed to illuminate the grounds and engage the best military bands available, so that, given fine weather, a series of delightful floral fêtes will be feasible. A provisional plan of arrangement has been issued, and it is the determination of the directors that there shall be no avoidable cause of complaint in the matter of ventilation and space in the gangways. In this respect I may mention that the largest tent, which will cover nearly $3\frac{1}{2}$ acres, is divided into five spans, 45 feet in height, with special ventilation for the whole length of each ridge, the total length of the tent being about 220 yards. The gangways are from 15 feet to 20 feet wide. The show space in this tent amounts to nearly 75,000 square feet, and will provide, if necessary, table run of nearly half a mile.

It is necessary to state that the tenancy of the premises will be too short to enable the production of an artistic scheme to compete on equal terms with the permanent sites of some Continental exhibitions, but at salient points striking effects will be produced from views of the great expanse of flowers, and the general arrangements will be much less complicated than are usually found at such exhibitions. It may be mentioned that the 1866 exhibition was held on the site now occupied by the Natural History Museum at South Kensington, adjoining the then existing premises of the Royal Horticultural Society.

Experience has proved—fortunately in realms other than of horticulture—the folly of entering upon such an enterprise without ample financial guarantees. We are happy to state that the support already accorded, both in the matter of guarantees and subscriptions, has been very encouraging. This is not to say that the guarantees and subscriptions are no longer earnestly invited. They are still wanted, and may be confidently expected in view of the substantial privileges which are offered in return. A subscriber is in effect the prudent person who buys a ticket or tickets beforehand at a cheap rate, and at the same time is entitled to the happy feeling that he is becoming the patron of a most worthy cause. This would, of course, be an ungracious way of describing the liberality of many donations, among which may be mentioned that of your own great Society to the amount of £1,000, with a further guarantee of £4,000. From all appearances there is little need to worry about the guarantee, and it is worth noting that £1,000 represents the contribution of a trifle over 1s. for each guinea member of the society. In return for this the reductions of the charges to Fellows are about 25 per cent. on the first day, which may be looked upon partly as a subscriber's day, and of 50 per cent. on all days other than the 1s. days, so that the Fellows may congratulate their council on having achieved another of those strokes of business which do so much to popularise their Society.

The published lists respectively of guarantees and subscriptions are £4,000 and £16,000.

The directors have recognised the desirability of encouraging the attendance of professional gardeners, and have therefore reduced the charges of entry very considerably to this class of visitor.

The directors have been assisted immensely in their work of organisation by the systematically kept records of the 1866 exhibition, and the balance sheet of that show has also been of great use in estimating costs. We find that the expenses of this exhibition amounted to something over £12,000, the final profit being about £3,500. This substantial sum was expended in making a donation to the Gardeners' Royal Benevolent Institution, and in the purchase of the valuable Lindley library, which is such a cherished possession of horticulturists. Needless to say, the expenses of 1912 must be considerably greater. Putting aside other considerations, this will be easily understood in examining the respective schedules for 1866 and 1912.

In order that I might have an authoritative statement on this subject, I asked Mr. Harry J. Veitch (who, as is well known, is the only

surviving member of the committee of the 1866 exhibition) to supply me with a few notes in his capacity of Chairman of the Schedule Committee for 1912. Mr. Veitch says it is not easy to compare the two schedules. There were 220 classes in 1866 as against 428 in 1912. Exhibitions in groups, as such, were practically unknown in 1866, all classes specified the number of plants to be staged.

For 1912 the applications for spaces for groups of a more or less miscellaneous character, already number no fewer than 100.

In 1866 the largest class for stove and greenhouse plants comprised 16 plants. This is in striking contrast with the requirements for next year.

The Orchid classes have grown from nine in 1866, the largest class being one for 50 plants, to 29 classes in 1912, including two classes for groups of 500 square feet.

The prizes offered for Roses tell the tale of the development of that favourite flower, for besides the novelty classes there are 26 classes as against eight in 1866. In the last exhibition the largest class was for 20 Roses in pots 8 in. across. In 1912 prizes are offered for groups not exceeding 500 square feet. We have nine classes for cut Roses against one class in 1866, and so on throughout the schedule.

These figures indicate something of the development of horticulture since 1866 and of the advance particularly in the specialisation, which is such a great feature to-day.

It may be noted that rock and water-gardens were not seen in 1866, nor many of the handsome florists' flowers as we know them to-day.

While on this subject we may mention that applications for space for collective exhibits have come in from several foreign countries, as well as from individual counties in Great Britain, and that the entries of various sorts already exceed 400, irrespective of the exhibition of horticultural sundries. This section promises to be the most complete and interesting that has as yet been seen.

It is not desirable to give particulars of the exhibits entered, but I am at liberty to mention that a commission has been given by an American gentleman for a very remarkable piece of garden statuary on the express condition that it is shown at the exhibition.

It may be mentioned that no special prizes were offered in 1866, whereas already no fewer than 38 very fine cups and awards have already been promised for the 1912 exhibition, in addition to the special cups given by many counties. It will not be invidious to inform Fellows of your Society that, in addition to the cup graciously promised by the King and the one offered by the president of the exhibition, the Duke of Portland, others are being given by Sir Trevor Lawrence, Sir George Holford, Sir Jeremiah Colman (Treasurer), and Mr. Gurney Fowler (Chairman). The total prize list will probably exceed £4,000.

The work of the Science and Education Committee should be mentioned, because it is hoped that this will be one of the most efficient and permanently valuable features of the exhibition. The president of the committee is the Right Hon. A. H. Dyke-Acland, P.C., who is throwing the greatest energy into the work, and the secretary is Mr. F. J. Chittenden, whilst a glance through the list of distinguished men forming the committee will complete the feeling of assurance upon the question of the efficient work to be expected.

Their labours are divided into two parts, one dealing with horticultural education and the other with the scientific side of horticulture.

There will be no exhibits in connection with education, but a special building has been allotted to the scientific exhibits, and this will contain some highly interesting specimens under the following sections—:

- (1) Vegetable physiology.
- (2) Genetics.
- (3) Economic entomology.
- (4) Economic mycology.

Several very valuable and interesting exhibits have been promised by gentlemen, to whom horticulturists have every reason to be grateful. It may be added that many of the leading investigators on the Continent and in America have also promised their assistance.

All scientific exhibits will have a bearing on practical horticulture, so that this department

of the exhibition will be of popular interest, and not merely a happy hunting-ground for the scientific student or a place of refuge for those who are seeking a quiet part of the exhibition.

The conference, which will be held in the fine recreation hall at the hospital, will be devoted to two subjects only, since it has been determined by the committee, wisely, it will probably be agreed, that it is much better to thoroughly thrash out two subjects only than to rush frantically through numerous lectures, which no one has time to listen to, still less to criticise.

I may mention that there were something like 40 or 50 papers presented at the congress of 1866 dealing with subjects, many of them trivial and uninteresting.

The first subject for consideration will be the broad question of horticultural education. In preparation for this discussion, the committee is making thorough enquiry into the system of education in horticulture in this country and the public and private facilities which are open to students.

It is hoped that an exhaustive report will be completed and ready for placing in the hands of those who attend the conference to serve as a basis for discussion. Many prominent educationists from the Continent and America have undertaken to assist in the discussion or to read papers dealing with special points on horticultural education in their own countries.

The second part of the conference will deal generally with legislation in connection with plant diseases. Information on this important subject is being obtained both in this country and abroad, and will serve as a basis for a report to be presented to the conference on lines similar to those proposed in connection with education. Many prominent people in this country and from abroad have undertaken to participate; and the Board of Agriculture have promised maps, showing the progress and distribution of certain plant diseases and pests which it has been deemed advisable to legislate against.

One of the most pleasant duties in connection with the exhibition will be the entertainment of the many distinguished foreign guests who will visit this country next May. The reception committee is under the chairmanship of Sir Albert Rollit, and a programme is being drawn up for the entertainment of our visitors, which is being simplified by the hospitality already promised from private and other sources. The president of the exhibition, the Duke of Portland, has generously offered to hold a reception at his town house. Permission has been graciously given for a visit to the Royal Gardens at Windsor. The distinguished president of your society in his private capacity and Mr. Leopold de Rothschild, The Royal Horticultural Society and others have also intimated their hospitable intentions. If the history of 1866 were to repeat itself, there would be a great banquet at the Guildhall. There should be little fear that the British gardeners who have visited foreign exhibitions and enjoyed the hospitality offered them will feel any shame at the way their former hosts are treated on their arrival in this country.

I cannot do better than conclude my remarks by quoting, by permission, some opinions with which I have been favoured by one or two foreign gentlemen intimately connected with the management of their own international horticultural exhibitions.

Herr Siegfried Braun, the secretary of the Berlin Exhibition in 1909, writes:—

Much could be said in a general way on this subject, but if you wish to know what tangible advantages for the horticultural industry of my country resulted from the International Horticultural Exhibition of 1909, I personally believe that one cannot value them too highly.

An exhibition, such as the one which took place in Berlin, affords to the experts in their many-sided interests lasting inducements to further efforts. It shows clearly what has already been achieved, and what there is still to learn. This knowledge is in itself a powerful lever to progress in any profession. Besides, such an exhibition stirs up the gardening enthusiasm of both professionals and amateurs, and induces them to spend more money on plants and flowers, thus conferring an added blessing on the industry.

It is as instructive as it is interesting to follow up how far these results sometimes reach in isolated cases. I trust that your proposed exhibition for the year 1912 may be the means of bringing tangible profits to your country.

Monsieur Abel Chatenay, the general secretary of the French Agricultural and Horticultural Committee, says:—

I have had the opportunity of noting personally how far International Exhibitions have had influence in business relations between the countries taking part. The small number of your English colleagues who have taken part

in our exhibitions could testify sufficiently as to the results obtained by the growers of Sweet Peas and Carnations and a few other specialties, by virtue of the excellence of their products and through their exhibits, have obtained numerous orders from the Parisian public.

I consider from another point of view that it is beneficial for horticulturists of various countries to be able to get into touch with their colleagues. It is impossible for questions of general interest to be limited by geographical frontiers, and professionals from the various countries should be able to exchange their views from time to time. It is only in a large exhibition where they can meet and know one another, either as jurors or as exhibitors. The interchange of ideas is of great interest to all.

From this point of view Belgian horticulturists, who are excellent exporters, have realised fully the utility of such manifestations, of which their quinquennial show at Gand is a good example.

The present secretary of the Ghent Society, to which I have so frequently referred, is Monsieur Albert Ceuterick, and he has favoured me with the following views:—

One cannot fully define the immediate effects of our exhibition on the horticulture of Belgium, but our society, which for a century has not relaxed its efforts to develop and improve these demonstrations of horticultural industry, is convinced that the result is incalculable profit to the producers.

With this view our society and our horticulturists impose heavy sacrifices upon themselves to make our exhibitions successful.

Horticulture is a subject specially appropriate for exhibitions, but these exhibitions by their importance and their fame attract to Ghent the chief botanists, the amateur and professional gardeners of Europe. Some come as judges, others to satisfy their curiosity, and to follow the progress of horticulture.

Existing commercial relations are confirmed, and new connections are created. Firms which exhibit make the acquaintance of numerous foreigners and widen their outlook.

In one word, it is an advertisement of extraordinary importance, and it is not necessary nowadays to insist upon the value and advantage of advertisement, although its effects are not immediately apparent. Nevertheless, it is our profound conviction that the development and prosperity of our horticulture are intimately bound up with our quinquennial exhibition.

You are good enough to suggest that my efforts had something to do with the success of the exhibition in 1908. May I say that the success of all of our exhibitions of which our society is very proud is to be attributed not to the individual efforts of one member or another, but in the perfect union which has existed from time immemorial, first between all the members of the committee, and then between the committee and all the horticulturists in our country.

These last words of Monsieur Ceuterick deserve letters of gold, and present an ideal worthy of emulation by everyone connected with the Royal International Horticultural Exhibition.

It would be premature to boast, but there is every reason to believe that when the history of the great enterprise of 1912 is recorded a verdict equally creditable to British horticulture will be forthcoming.

ORCHID NOTES AND GLEANINGS.

ORCHIDS AT MESSRS. HASSALL & CO'S.

THE beauty, usefulness, and variation of *Cattleya labiata* are shown in a remarkable degree in this compact Orchid Nursery at Chase Side, Southgate, near Palmers Green Station. A large span-roofed house about 150 feet in length and 20 feet in width is entirely filled with good plants of this Orchid in full bloom. The flowers are mostly of the typical rose-coloured form, with more or less crimson-purple on the lip, but a few are wide departures, in the richness of their colouring rivalling the best forms of *C. Warneri*, while in two instances the blooms are of a decided pale violet-blue tint, the labellums being slate-blue. Out of such a large quantity, mostly flowering for the first time, the buds are carefully watched for the hoped-for pure white varieties, and the greenish-white buds marked. In the end most of these are found to develop colour, but occasionally a pure white, or white flower with a blush tint on the lip, appears, and a few of these are now present. One has pure white flowers with a pale pink front to the lip, and *C. labiata virginea* has white flowers with a light pink flush on the tips of the petals. Many of the plants have five or six flowers on the spike, and even the ordinary varieties pay for their culture as cut flowers, 250 dozens having already been disposed of. Another low span-roofed house is filled with *C. labiata*, also well in bloom, at the end being *C. Bowringiana* and some hybrids in flower.

Cattleya Mossiae is also grown in great quantities, and the plants are now well furnished with flower sheaths. The cherished forms are the

white varieties Wageri, Reineckiana, Victoria Regina of a sky-blue tint, Queen Mary, Vestalis, Arnoldiana, and similar forms. All the showy Cattleyas are represented in numbers, especially good being *C. Dowiana aurea*, some of which are in flower; *C. Mendelii*, and a good recent importation of *C. Gaskelliana*.

It is in this nursery that the first good white *Lælia purpurata* was flowered, and a selection of the best forms are still retained, although the species is not now grown in such quantities as formerly. The stock is so varied that it must suffice to mention only the important large batches noticed on a recent visit. Among these was a fine lot of the pure white *Trichopilia Backhousiana*; a quantity of the pretty *Oncidium pulchellum*; a fine stock of *Oncidium flexuosum*, which is so useful for cut flowers and which is grown as dwarf plants by taking off the top two or three pseudo-bulbs of the tall pieces and potting them several together. Thus they make stronger plants, which are more compact and floriferous. There were white varieties of *Lælia anceps*, fine specimens of *Angræcum sesquipedale*, and a few *A. infundibulare*, one bearing its large funnel-shaped white flowers; *Vanda cœrulea*, *V. Kimballiana*, and other *Vandas*, *Saccolabiums* and *Aërides*; a batch of *Oncidium macranthum* in spike; another of *Maxillaria Sanderiana* and *M. grandiflora*; *Lælia pumila* of the best old type, with some in flower; *Renanthera Imschootiana*; a large quantity of *Odontoglossum crispum* from the recently-imported stage up to the strong specimen with stout spikes showing; a good selection of *Cymbidiums* with two plants of *C. grandiflorum* in spike. A good collection of *Lycastes*; a batch of *Fernando Po* Orchids, which include *Ansellias*, *Angræcums*, and *Eulophia lurida*; *Dendrobium Phalænopsis Schröderianum*, *D. Statterianum*, and *D. formosum giganteum* in bloom; a house of *Cypripediums* with yellow and other forms of *C. insigne* in bloom, and various hybrids, including *C. Minos Youngii*, *C. Germaine Opoix*, *C. Southgatense*, and *C. Thalia* Mrs. Francis Wellesley.

Home-raised hybrid Orchids are rapidly encroaching on the space given the species here, as in most other establishments, and great interest is taken in raising them from seeds, for which purpose a low, span-roofed warm house is arranged, the one half fitted with cases containing the seedlings in their earliest stages. An interesting experiment is being made here to catch the very small flies which do mischief to the seeds. Plants of *Pinguicula caudata* are raised on pots among the seed-pans, and they effectually trap a large number of the insects. The other part of the house has young plants of various interesting crosses, and in other houses are good batches of plants, especially *Lælio-Cattleyas*, *Brasso-Cattleyas*, *Odontoglossoms*, and *Odontiodas* in all stages of growth up to the flowering size.

Of batches in flower or bud, there are some very fine *Cattleya Fabia*, *C. Maggie Raphael*, including the white form; *C. Empress Frederick*; *C. Hassallii* (*labiata* × *Empress Frederick*), a fine bold flower of bright colour; *C. Portia* and other hybrids of *C. Bowringiana*; *C. Minucia*, one plant having 12 flowers; *C. Clarkii*, *C. Iris*, and the pretty, fragrant, and variable *C. iridescens* (*bicolor* × *Eldorado*) raised here.

A very interesting batch is *Lælio-Cattleya Walter Gott* (*L.-C. Bletchleyensis* × *C. bicolor*), some of which have been in flower for months past, and yet others are in bloom or bud. The batch has given many indifferent varieties, but a proportion have very showy flowers, one section showing the elongated labellum of *C. bicolor*, while the other has in some degree the more ample lip of *L.-C. Bletchleyensis*. Good specimens of *Lælio-Cattleya Canhamiana*, *L.-C. Dominiana*, *L.-C. eximia*, *L.-C. Aphrodite*, &c., are well furnished with sheaths, and the showier hybrid *Odontoglossums* and *Odontiodas* are promising well for flower. J. B.

NURSERY NOTES.

KELWAY'S NURSERIES, LANGPORT.

FOR more than 20 years the name "Kelway" has been sufficient to conjure up before my mind's eye glorious visions of all the varied and beautiful flowers of the hardy border. I have very frequently wished to see with the visual eye what has so often been seen in imagination, but until a few months ago my desires remained unfulfilled. Now, however, through the kindness of the firm in sending me a special invitation to visit their grounds at Langport, a long-felt desire has been gratified, and I possess at last some idea of the magnitude and importance of the work they carry out in Somersetshire, and at the same time have pleasing recollection of a most interesting visit.

Langport is a typically old-world English town, where the streets are by no means numerous nor yet remarkable for their width. To anyone interested in gardening a walk through this quaint old place cannot fail to be deeply interesting, on account of the numbers of houses in which the front-room windows are devoted to plant-growing. The plants as a rule are so well grown that it is rather difficult to restrain oneself from standing and staring at them through the windows—a proceeding which may perhaps, after all, please the owners rather than otherwise. Whether or not the influence of Kelway's Nurseries in the neighbourhood has anything to do with the extensive window gardening carried out in the town it is difficult to say, but it certainly seems to me that there is some kind of connection between the two.

Langport Nurseries lie about a mile beyond the town, and are very easily reached by means of a main road leading direct from the station. They are beautifully situated among well-wooded estates, and, as may be readily imagined, add at certain seasons of the year considerable colour and beauty themselves to the already pleasing scenery of the neighbourhood. Fortunately for the proprietors, there is a plentiful water supply. In some parts of the grounds this is obtained from deep wells, from which it is pumped by means of picturesque windmills, while in another portion of the nursery a steady, flowing stream provides all the water required to supply the various crops with sufficient moisture.

Although the primary object of my visit to Langport was to view the great wealth of *Pæonies* growing in these nurseries, I was, unfortunately, unable to go at the time appointed, owing to unavoidable delays, so did not see these beautiful flowers at their best. The wreck of their glory, however, gave some faint indication of what they must have appeared like while in full bloom. Several acres of land are devoted to the culture of this popular plant, and it is propagated by the thousand every year. The method adopted at these nurseries for increasing the stock is to split up large plants into single pieces, and plant them out in well-prepared ground in rows a couple of feet apart and about 18 inches from plant to plant. After the first season every alternate plant is taken up year by year and sold, until those remaining are about 6 feet apart, when they are used as stock and divided up into single pieces. As one views the acres of these *Pæonies*, one cannot help wondering where purchasers are found for them all, and what actually becomes of the millions of plants that are distributed from this and other nurseries every few years.

Next to the *Pæonies* in importance at these nurseries is the remarkably fine and extensive collection of *Delphiniums*. These, too, are multiplied by hundreds of thousands every year, and still there appears to be no falling off in the demand for them by amateur and other gardeners. The *Delphiniums* are propagated by cuttings, which are struck during autumn and spring and during early summer planted out in rows a foot apart, to be thinned out (after the first season) year by year in the same way as is done in the case of the

Pæonies. There were so many lovely varieties in evidence that it was difficult to pick out any for special mention. However, I noted four which appeared to be extra fine, even for such a select collection. The Rev. E. Lascelles is a variety having delightful, cobalt blue sepals with a plum and white eye and a very massive inflorescence; *Persimmon* is a very striking variety with deep-blue flowers borne on a branched raceme, and continues to flower for several months at a time, while *Thunderbolt* produces large, dark-purple blooms. The fourth especially good variety noted was *D. grandiflorum* fl. pl., which was bearing at the time a light, graceful inflorescence, and its appearance indicated that it was admirably suited either for the herbaceous border or as a cut flower for room decoration.

In addition to the huge collections of *Pæonies* and *Delphiniums*, Messrs. Kelway & Son have also very extensive collections of Sweet Peas, and about 10 acres of nursery ground is set aside for their culture. It is purely for the purpose of seed production that these are grown, and the firm sends the seed of Sweet Peas, as well as that of other flowers and vegetables, to every part of the world where the conditions are suitable for their cultivation. All the newest varieties, as soon as they are offered for sale by their raisers, are grown, and, after being thoroughly tested, put on the market. Every precaution is taken in the selection of seed to see that it is gathered only from the healthiest and best-grown stock. Great care is also taken to keep the plants properly staked, as it has been found from experience that if the pods touch the ground the quality of the seed is considerably lowered.

While the three classes of plants mentioned seemed to me on the occasion of my visit to be the outstanding features at Langport, there is scarcely any hardy florist's flower which is not well and extensively grown. *Gladiolus*, *Scabious*, *Pentstemons*, *Erygerons*, *Geums*, *Gaillardias*, and *Phloxes* are a few of the numerous showy plants which I admired during a far-too-hurried, but exceedingly pleasant, visit to these progressive nurseries. P. C.

AMERICAN NOTES.

INFLUENCE OF THE STOCK ON SCION.

THE comments of a *Yorkshire Gardener* (see p. 272) upon the influence of the stock upon certain varieties of Grapes reminds me of an experience of over 30 years ago, when an apprentice at Lockerly Hall, Romsey, Hampshire. Someone from the United States was a guest of my employer, and told him of the wonderful Grapes of America. Rooted cuttings were sent the next spring and a house was prepared for their reception. The vines grew up and out of the ventilators the first summer in a lean-to house, but the fruit left to mature the next year proved of very indifferent quality; the varieties I remember were *Elvira*, *Martha*, *Concord* and *Catawba*. We were all very much disappointed, including Mr. Jas. Budd, the gardener, but he inarched *Muscat* of Alexandria on the American stocks, and the vigour of this Grape on these stocks was a revelation; I noticed for years that he was invincible at the Southampton shows with these *Muscats*, the well-known vigour of the root system of the stock made the weaker vine free, and no shanking appeared, as was often the case in the heavy clay soil there.

When visiting Lockerly 20 years later, Mr. Budd was surprised to hear that I remembered the circumstance. He showed me the vines, and they may be there yet. When it was necessary to plant *Muscats* here in this country, the previous experience served me well. We used the "Clinton" Grape, it being the variety exported to France for the vineyards there by the million to overcome the ravages of *Phylloxera*, owing to its great root-system. The results were so evident, that a novice could visit our vineries and tell which were inarched and which were on their

own roots, for, for purposes of experiment, we left some to grow without being inarched.

Phylloxera is very generally distributed in this country in the soil; no one seems to know it until trying to cultivate European vines under glass; but then their troubles begin. The experience, gathered as it were by accident, has proved of value to many here when it was desired to cultivate the European Grapes.

NOTICES OF BOOKS.

MENDELISM.*

THE first edition of *Mendelism*, published in 1905, met with wide and well-deserved success, and though the present, much-enlarged third edition, is in many respects an improvement on the first, we confess to a preference for

the first edition you could hear them crow over their heterozygousness and its significance to Mendelians; in the third, their gametic constitution scarcely causes them a flutter. They are now merely heterozygotes, and they are nothing more. Our regret at the merging of a little masterpiece in a larger text-book is, no doubt, mere sentimentality, and we know that the older Universities are not exactly forcing-pits for the cultivation of explicit enthusiasm; therefore, we smother our regrets, and turn to consider Mendelism on its merits. When we do so, we have unqualified praise for Professor Punnett's book. No one to whom it has not fallen to undertake the task of expounding the science of genetics can have any idea how difficult it is for the teacher to carry an audience along with him, and to present his subject-matter in such a way that the essentials remain in the memory of the student. Yet the book is so well planned, and the examples so carefully chosen, that these difficulties are reduced to a minimum, and the student who wishes to obtain an outline of genetics cannot find a better guide than Professor Punnett.

We hope that *Mendelism* will be widely read by horticulturists interested in plant-breeding, and we would draw their attention specially to the excellent chapters headed "Reversion," "Wild Forms and Domestic Varieties," and "Economical." Each is a model of concise and judicial statement, and all contain facts which the practical man should read and ponder over. The only error of importance which we have noticed is in the statement, several times repeated, that ovules and pollen grains are the reproductive cells of plants. This is as wrong as it would be to affirm that the ovary and testis of an animal are reproductive cells. Two misprints should be corrected in the next edition. On the top line of p. 50, the printing of "white" for "while" may puzzle the novice, and on p. 51, the printer should be asked to ascribe five and not four stamens to the flower of *Primula sinensis*.

In the chapter dealing with sex the hypothesis is sustained that, in certain animals at all events, the female is heterozygous for a "female character" (F) which is lacking in the male, the gametic constitution of which is (ff).

The hypothesis offers an explanation of the approximate numerical equality of the sexes.

Thus female $Ff \times ff$ male = Ff and ff in equal proportions. Whether, however, this hypothesis will apply to sex in plants remains to be determined.

The book is well printed, though the student, who is in the habit of making marginal notes, would prefer a paper which takes pencil marks more readily. The black-and-white illustrations are numerous and excellent. The five coloured plates are well executed, and of great assistance to the student in enabling him to follow the modes of inheritance which they depict.

HELENIUM "RIVERTON BEAUTY."

THIS beautiful variety of *Helenium autumnale* provides an ideal subject for the hardy herbaceous border, being one of the most effective flowering plants in late summer and autumn. From August onwards, for a period of six weeks or more, the plants are covered with flowers. On first expanding, the flower-heads are coloured a pale yellow; later, as they open, they reveal a deep purple centre. The plant grows from 3 feet to 5 feet high.

* *Mendelism*, by R. C. Punnett, Professor of Biology in the University of Cambridge. Third edition. (London: Macmillan & Co.) 1911. Pp. 175, with 7 plates and 35 text figures. 5s. net.

[Photograph by James E. Tyler.]

FIG. 155.—HELENIUM AUTUMNALE "RIVERTON BEAUTY."

It may be absolute heresy, but I desire to say, at this time, that there are no Grapes that have the character that is found in the Concord or Niagara Grapes as grown here and sold at the rate of about a shilling a basket of 10 lbs. It is true they do not keep long, but while they last their season is as truly a time of feast as that of the Peach or Strawberry season. *E. O. Orpet*, "Walden," Lake Forest, Illinois.

the original. The first edition was, it is true, but a slender sketch, but it betrayed the hand of the artist. The present edition is a more finished picture of genetic science, and the lines thereof are drawn with more restraint; but the hand is the hand of the professor. To confirm this impression, we may contrast the accounts given in the earliest and latest editions of those heterozygous "blue birds," the Andalusian fowls. In

The Week's Work.

THE HARDY FRUIT GARDEN.

By W. HEDLEY WARREN, Aston Clinton Gardens, Buckinghamshire.

NAILING AND REGULATING WALL TREES.—

The nailing of fruit trees to walls requires to be done carefully, for, when performed in a careless or indifferent manner, the appearance of the tree is spoiled, and often its cropping is impaired. Fortunately, the old-fashioned and objectionable method of training fruit trees to wooden trellises is now almost a thing of the past, for, under the most favourable conditions, the woodwork soon became a harbour for insect pests and other vermin, while the branches of the trees, being away from the face of the wall, do not get the greatest benefit from the warm bricks during the summer. When a wall is built of stone, and the joints are, in consequence, far apart, or when the wall is faced with cement, suitably-placed wires are undoubtedly the best means of securing the branches of the trees. The wires, however, must be painted, otherwise they will prove injurious to the trees, and especially to the young shoots. Nailing the trees to the wall by means of shreds is an old method, and, in some respects, difficult to improve upon. Every branch of the tree should be unfasted from the wall at the time of the winter pruning, the wall swept clean, and, if necessary, washed with an insecticide. The re-nailing of the trees should take place as soon as possible after they have been pruned and dressed, in order to preserve them from injury by snow and strong winds, which often break the spurs and buds. It is still the habit of some to allow their trees to remain unfasted until the spring, but I regard it as a wrong practice, and fail to see any benefit derived from it. In fixing a fan-trained tree to the wall, place the main branches in their proper positions first, then proceed to nail in the younger shoots, beginning with the lowest main branches on either side, and disposing of the young wood as regularly as possible throughout the tree. Suitably-shaped wrought-iron nails are now more generally employed than the old-fashioned, square-headed nails, made of cast-iron, as the former may be straightened if bent, and do not break. Those of the old type often snap off short, rendering the shoots liable to injury by the hammer. But, whether the nails be of wrought or cast metal, they should not possess sharp edges or corners, which frequently damage the young shoots through rubbing against them during the growing season. When it is considered necessary to use the nails a second time, they should be dipped in paraffin oil, or boiled in water, to destroy the larvæ and eggs of insects. Medicated shreds are the most suitable to use, these affording little harbour for insects in comparison with those of a woolly texture, neither are they so liable to tear, nor are they so conspicuous. Never use more shreds than are absolutely necessary, always placing them between the buds along the branches, arranging them, if possible, alternately on each side of the branch. It is seldom necessary to use the shreds a second time; indeed, it is a false economy to do so, but if they are used again, they should be boiled in strong soda water for several minutes, but not dipped in oil, or the young shoots may be injured. Without this precaution, their second use may incur endless trouble from insect pests during the ensuing season.

FRUITS UNDER GLASS.

By E. BECKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Hertfordshire.

THE VINERY.—With the exception of the very late varieties the majority of Grapes keep much better if the bunches are cut and the shoots placed in bottles of water in the Grape or fruit room. Their removal will allow a longer rest for the vines, and permit of the cleansing of the house earlier. The special bottle for this purpose now on the market is to be preferred to those of the ordinary kind. A small piece of charcoal placed in each vessel will greatly assist in keeping the water pure. The necessity for

frequent examination of the bunches with a view to the removal of any berries that show signs of decay cannot be too fully emphasized. Bunches of the variety *Madresfield Court* do not keep very well, and should be made use of without delay. Houses containing late Grapes will need very carefully ventilating, and especially during damp, foggy weather, whilst as little atmospheric moisture as possible should be created, and the pipes warmed to maintain a buoyant atmosphere. No further waterings at the roots will be needed until after the Grapes are all cut.

CUCUMBERS.—Plants intended for fruiting late in winter have made a good growth, the mild, open weather having suited them. In order to conserve the energies of the plant, the fruits should be cut as soon as they are of a sufficient size. Attend carefully to the regulating of the foliage, avoiding overcrowding of the leaves, as this will favour red spider when much fire-heat has to be employed. Encourage surface rooting by affording slight top-dressing of rich soil, and sprinklings of some suitable artificial manure just before watering the roots. Syringe the foliage with tepid water as often as the weather is favourable, and sprinkle sufficient moisture about the house to counteract the effects of fire-heat.

PINES.—Pineapples require all the light possible during the winter months to promote a healthy, strong growth, therefore the glass should be thoroughly cleansed both inside and out at intervals. The plants are benefited by a circulation of fresh air when circumstances allow, and top air should be admitted when the thermometer rises 10° above the normal night temperature. Too much moisture at this season should be avoided; do not spray the plants overhead unless the day be exceptionally bright. Afford water at the roots only when the soil is approaching dryness; young plants that are to be kept gradually growing through the winter months will benefit by applications of weak guano water. Plants of *Queen Pines* that are expected to fruit early next year should not be grown in too high a temperature for a few weeks. Suckers on fruiting plants may be taken off after the fruit is cut, and either potted up or heeled in a propagating pit with a view to placing them in pots in the spring.

CHERRIES IN POTS.—Where ripe Cherries are required towards the end of May, a start must be made with the forcing of the plants not later than the end of the present month. Assuming that proper attention was given to pinching the growths during the growing season, little pruning beyond shortening back the fruiting spurs, in some instances, will be required. Have the pots well washed, some of the old surface soil removed, and the branches syringed with an insecticide. They may be accommodated in a Peach house, where forcing is being started. Afford water carefully, and admit air freely at the commencement when the weather permits. Fumigate the plants mildly before the flower-buds commence to show the colour of the petals, to destroy any aphids that may be present. No attempt must be made at this season to hasten Cherries into growth or failure will be inevitable. When the flowers are expanded they should be pollinated some time during the middle of the day.

THE ORCHID HOUSES.

By H. G. ALEXANDER, Orchid Grower to Lt.-Col. Sir G. L. HOLFORD, K.C.V.O., C.I.E., Westonbirt, Gloucestershire.

CATTLEYS AND LÆLIO-CATTLEYS.—Of late years numerous fine varieties and hybrids have been added to the autumn and early winter-flowering section of these plants, which greatly enhance their value for garden purposes. Cattleyas and Lælio-Cattleyas are, unquestionably, the most showy and desirable Orchids for blooming during the winter season, whilst for exhibition and decorative purposes, either as plants or cut blooms, there is nothing to surpass these gorgeous flowers. Amongst the many kinds that bloom at this season are *C. aurea*, *C. labiata* and *C. Bowringiana*, which represent the pick of the species, and the following hybrids: *C. Mantinii*, *C. Ariel*, *C. Mrs. J. W. Whiteley*, *C. Portia*, *C. Fabia*, *C. Iris*, *C. Hardyana*, *C. Cleopatra*, *C. Ashtonii*, *C. Wendlandii*, *C. Mrs. Pitt*, *C. Adula*, *C. Basil*, *C. Clarkia*, *C. fulvescens*, *C. Miranda*, *C. Rhoda*, *L.-C. Ophir*, *L.-C. Irene*,

L.-C. Cornelia, *L.-C. Clive*, *L.-C. Berthe Four-nier*, *L.-C. luminosa*, *L.-C. Cappei*, *L.-C. Charlesworthii*, *L.-C. Golden Oriole*, *L.-C. Barbarossa*, *L.-C. Cooksonia*, *L.-C. illustrious*, *L.-C. Ortrude*, *L.-C. St. Gothard*, and *L.-C. Stat-teriana*, these being some of the best. Many of these are now in their full beauty, and the fine size and colour of the flowers bear remarkable evidence of the great benefit the plants have derived from the unusual amount of sunlight and heat during the past season. The blooms of some of the above-mentioned kinds possess exceptional lasting qualities, but it should be borne in mind that large, heavy flower-spikes are very exhaustive to the plants, hence, they should be cut after being open for a reasonable length of time. When flowers are allowed to remain for a longer time than is good for the plants, the effect is not always apparent immediately, but will almost certainly be seen the following season by the production of weakly growths and inferior flower-spikes. After the flowering stage is past, the plants should be afforded a position where plenty of light and air can reach them, and, from this time onwards, until the growing season comes round again, very little water will be needed to keep the pseudo-bulbs plump and the roots healthy. Most Cattleyas have completed their growth, but the nature of many of them is such that no defined resting season must be allowed. For instance, in the cases of the early-flowering members, such as the species *C. Trianae*, *C. Percivaliana*, and many hybrid kinds that commence flowering early in the New Year, although no signs of growth may be visible, and apparently the plants are quite dormant, the flowers are forming in the sheaths, and root moisture must not be too sparingly afforded; in fact, a certain amount of root action is always going on. As referred to in the calendar for July 1, some of the late summer and early autumn-flowering Cattleyas break into growth at the base, and already many of these have developed sturdy secondary growths. Many plants of the late spring and early summer-flowering section, including *C. Mossia*, *C. Mendelii*, *C. Skinneri*, the *Brasso-Cattleyas*, and other hybrids, completed their season's growth earlier than usual this season, and some of these are now making secondary growths. When once growth has started nothing is gained by checking it, therefore the shoots should be encouraged to develop by keeping the plants well up to the light, and paying strict attention to watering the roots. Endeavour another season to have them growing in their normal season. Members of the upright-growing, two-leaved section, such as *C. bicolor*, *C. guttata*, *C. granulosa*, *C. intermedia*, and their hybrids, seldom grow out of their season, provided the plants are rested in a group in a well-ventilated house and watered carefully. Though it is not the usual time to practise potting, yet any plants that require a shift and are growing and rooting freely may be given a larger receptacle. At Westonbirt we never hesitate to repot Cattleyas at any season, if the plants have plenty of young roots just bursting from the rhizomes. But be careful to guard against over-watering.

THE KITCHEN GARDEN.

By JOHN DUNN, Kitchen Garden Foreman, Royal Gardens, Windsor.

CHICORY.—As Lettuces out-of-doors become scarce, a good substitute will be found in Chicory. If sufficient roots are available, it will be an easy matter to have a daily supply of Chicory through the winter months. The roots should be placed in some dark place, where sufficient heat may be maintained to start them into growth, but do not allow the atmosphere to become excessively moist, or the young shoots will be injured by damping. Avoid a high temperature, as the best crop will be produced under a cool treatment. At Windsor, we grow Chicory in the same manner as Seakale. The roots are placed in a dark pit, over a very mild hotbed, composed of leaves, the bed being covered with a layer, 9 inches deep, of rich soil, into which the roots are planted to within 1 inch of the crowns. One copious watering may be afforded when the roots are placed in position, and this should be sufficient moisture until the crop is ready to cut. The roots should then be thrown away, and fresh plantations made. If fresh roots are placed in heat at regular intervals

during the winter, an unbroken supply will be maintained. The number of roots to be placed in heat at one time will depend on the requirements of the establishment.

BATAVIAN ENDIVE.—Batavian Endive is much more reliable than Lettuce as a winter salad. The plants should be lifted from the garden when the weather is dry, and placed closely together in cold pits. In transplanting, take care to retain as much soil as possible on the roots. After planting, afford a good watering to settle the soil about the roots, and this will be sufficient moisture for some time to come. The lights should be removed from the pit on dry days, as the atmosphere must not be allowed to become damp or stagnant.

BROAD BEANS.—If an early supply of Broad Beans be desired, seeds should be sown as soon as the ground is in a suitable condition for the work. Choose a sheltered place, and soil of a rather sharp nature, for, although Broad Beans delight in a somewhat heavy soil in summer, it would be unwise to sow them in such ground at the present time, because at this season of the year germination is slow, and many of the seeds would probably perish where excessive moisture exists. The Broad Bean is a deep-rooting plant, and some time previous to sowing the seeds the ground should be trenched or dug deeply. The seeds should be sown in rows formed at 30 inches apart, and covered with a mulching of manure in order to protect the roots from frost.

CUCUMBERS.—Cucumbers planted in August will now be bearing freely, and frequent applications of tepid liquid manure will be beneficial. Top-dress the bed as often as the roots appear above the surface of the soil. A mixture of sandy loam and leaf-soil in equal quantities will be suitable as a top-dressing, and the materials should be placed in the house on the day previous to being used, so that they may become warmed through before being spread over the roots. Remove all deformed fruits and decaying foliage from the plants, also any fruits over and above the number required for the needs of the establishment. Care should be taken to regulate the young growths, avoiding overcrowding. Soft growth, which would be welcome in spring, is now undesirable. Late plants, from which fruits are expected in January and onwards, should be kept well thinned. Nothing is more detrimental to this batch of plants than to allow the foliage to become crowded. The shoots should be tied regularly over the trellis, allowing sufficient space between them for the light to reach the interior of the house. A little air may be given on fine, sunny days, but never open the ventilators sufficiently wide to cause the temperature of the house to fall. The night temperature may be 70°, but if cold weather causes it to drop a few degrees, it will do no harm. Damp the walls and floor of the house frequently, and, on bright days, lightly syringe the foliage in the early afternoon to keep insect pests in check.

PLANTS UNDER GLASS.

By JAMES HUDSON, Gardener to LEOPOLD DE ROTHSCHILD, Esq., Gunnersbury House, Acton, Middlesex.

THE COLD GREENHOUSE.—In this house early plants of *Erica* and *Epacris* will be coming into flower. If any stock has been purchased this autumn a close attention must be paid to the watering. As showing how important this is, if, for instance, the roots of *Erica hyemalis* (one of the best Heaths of early spring-flowering) are allowed to suffer from want of water, the flowers will probably open in a crippled condition, and it not infrequently happens that many of them turn a yellow colour. All plants of the class known as New Holland plants need to be watered with great care. None of these plants should be potted during the winter season. A few kinds of plants cultivated in this house, such as *Acacias* and *Chorizemas*, are very liable to attacks of the white scale insect. Directly the pest is detected measures to exterminate it should be employed. I have found it very troublesome to both these plants, especially specimens grown as climbers in the conservatory. The best plan is to apply a strong insecticide by means of a painter's soft brush, and if the specific is applied once or twice it will soon kill all the scales. Trouble may also arise from mildew, which often attacks *Ericas*, such as *E. Cavendishii*. In this case the plants should be dusted

with flowers of sulphur at an early stage of the mildew. If no fire-heat is applied, aphids will give very little trouble. A little fresh air may be admitted by the top ventilators at night-time whenever the weather is favourable, increasing the amount, correspondingly, during the day-time. Aim at having the growth of the plants as hard as possible to withstand the comparatively low temperatures later in the year.

WINTER BERRY-BEARING PLANTS.—Berried plants are valuable for decorative purposes when flowering plants are too precious to employ for decoration in very cold weather. Amongst hardy shrubs that carry bright fruits at this season are the *Aucuba* and *Skimmia*. Specimens in fruit, if potted now, should be covered with bright red berries by the end of December. *Berberis Wilsonii* is another excellent plant for the purpose; indeed, I do not know a more distinct and handsome plant for winter-fruiting; it is quite new to gardens, being only recently introduced from China. The berries, which are suffused with a dark orange tint, are produced very freely in long racemes. Dwarf plants may be obtained, and form very suitable subjects for pot culture. The berries are more abundant on plants that have been lifted, and, if need be, divided annually. Division offers a suitable means of increasing the stock, and by this method handsome little bushes may be obtained. If these are planted out again when their fruiting is over they may be grown for fruiting another season. The new Snowberry, *Symphoricarpos occidentalis*, bears a profusion of its white berries when quite small, and may be employed as a pot plant indoors. As the leaves will have fallen by the time the berries are mature, the plants may be crowded together, but they should be placed against a background of some bright flower, when the contrast will be charming. After the berries have fallen, cut the plants hard back and plant them outside for another season. The varied forms of *Pernettya mucronata* are excellent as pot plants, and their fruits provide diversity of colouring. *Solanum Capsicastrum* is a well-known greenhouse plant and one of the most decorative fruiting subjects. When well established, the plants last a long time in good condition of fruiting. If any berries are still green, a little warmth will assist them to colour, but do not encourage young growths to develop; rather pinch them off. Dwarf plants of the small-fruiting Orange, carrying good crops of fruit, may need a little extra warmth to perfect the colouring of the latter, and this should be afforded them at once. The fruits will last a long time in a good condition, but they are exhaustive to the plants and should not be allowed to remain for too long a period. Aim at keeping the plants in a healthy condition by removing the fruits in the early spring, and then encourage the development of new growth and blossom. Dwarf-fruiting plants of the decorative type of *Capsicum* are very useful. See that red spider does not injure the foliage. Of stove-fruiting plants, *Combretum purpureum* is one of the best and most distinct, its long shoots, when well clothed with berries, being a feature in a cool stove. These shoots should be bent down to make a more compact plant; semi-standards make the best plants for the purpose. *Ardisia crenulata* and *A. c. alba* are both well worthy of careful culture, especially the type, which is the more showy of the two. I have raised plants from seeds, but it takes two years at the least to get them into a fruiting condition. Then they will continue to live for some years and in relatively small pots. *Rivinia humilis* is more fitted for the stove than any other house. This plant may be treated as an annual, and it will grow freely and berry most profusely in damp houses. The long racemes of Currant-like fruits are very pretty. It makes an excellent table plant in a 3-inch (60) pot. *Dracena Godseffiana*, though generally grown as a foliage plant, is very pretty when furnished with its *Aucuba*-like berries. As basket plants, both *Asparagus deflexus* and *A. Sprengeri* are rendered more attractive when furnished with berries. See that all those I have mentioned do not now suffer from want of water.

EUPHORBIAS.—The past season has been most suitable to Euphorbias, as both warmth and sunshine are congenial to their requirements. Guard against plants of *E. pulcherrima* receiving a check from a chill. As the brilliant bracts

are now developing, a little additional warmth will be an advantage and favour their larger development. The pots, being well filled with roots, an occasional dose of weak liquid manure will be an assistance. Guard against an excess of atmospheric moisture. Plants of *E. jacquiniæflora* should be kept well up to the light; in fact, the nearer to the roof-glass the better. *E. splendens* may be safely accommodated in an ordinary greenhouse, although it is often classed with stove-plants, but under these conditions keep the roots on the dry side.

THE FLOWER GARDEN.

By R. P. BROTHERSTON, Gardener to the Earl of HADDINGTON, K.T., Tynninghame, East Lothian.

SHRUBBERIES.—The planting of shrubberies should now be brought to a conclusion for the year. During the past week I have been increasing my stock of flowering Currants and *Prunus Pissardi*. These, like Willows, require pruning to the ground every one or two years, in order to induce the production of long, straight shoots for decorative purposes. Others which are also very useful in this way are *Cornus alba*, *Leycesteria formosa*, *Neillia opulifolia*, Black Currant *Victoria*, *Piptanthus nepalensis*, varieties of *Rosa alpina*, *R. rubrifolia*, &c., *Rubus leucodermis*, *Azara microphylla*, *Aucuba japonica*, *Jasminum nudiflorum*, and *Corchorus japonicus*. Like the bed of the immortal Goldsmith, these "contrive a double debt to pay," being decorative as shrubs and furnishing a supply of cut sprays. The cleaning of a shrubbery, especially one which contains also deciduous trees, entails much labour: now that the Oaks, the latest to shed their leaves, are defoliated, the work may be commenced, for the shrubbery should be quite cleared by the end of the year. The leaves taken from the ground should, if possible, be stored in heaps near the shrubbery, and when they are well decayed they will form an excellent top-dressing for the shrubs. All dead branches should be removed from large specimens, as dead material attached to a living organism exerts a pernicious influence. This applies especially to Hollies and the common Laurel. Two weeds that are very common in shrubberies are the common Nettle, and the Bishop Weed (*Ægopodium Podagraria*). The best method of dealing with these, and all other perennial weeds, is to root them up, as the underground stems of the Nettles are never far below the surface. The Bishop Weed sends its roots deeper into the ground, and the best plan is to dig a trench slightly deeper than the underground growth, and, working the soil from below, examine each spadeful, extracting every scrap of root turned up. I have also found this method successful in the case of *Triticum repens*. *Polygonum convolvulus* and *P. persicaria* (here known as Diels Lingels) are almost impossible to eradicate on account of the roots penetrating to an enormous depth.

IRIS SUSIANA.—Clumps of this old favourite Iris have already produced growth several inches in length, and though the plant is apparently hardy, I find it a good plan always to have material ready with which to cover it in case of a hard frost. A little well-rotted manure scattered over the clumps induces extra strength of growth on the approach of spring. Hellebores of many varieties also appreciate a similar top-dressing; these are later than usual in making their growth.

PLANTS WHICH HAVE FRUITED OUTDOORS

AT BITTON.—One good result of the fine summer is seen in the fact that many shrubs and other plants which do not usually bear fruit and ripen seeds have done so this year. I think this is worth recording, and I send a list of plants which have fruited in my garden this year in fully exposed positions. *Umbellularia*, Catalpa, Tulip Tree, *Fremontia californica*, *Myrtus communis*, *M. tarentina* (white fruit), Persimmon (a good crop, but fruit small), Pomegranate (a few well formed fruits), *Magnolia Lennei*, *Ægle sepiaria* (a small crop, but good seeds), *Vitis pumilifolia*, *Hibiscus Hamabo* (blue and others), *Pavia humilis*, *Solanum Torreyi*, White Wistaria, *Pardanthus chinensis*, &c. To these must be added the haws of the Thorns and the hips of the single Roses. My bushes of *Rosa Seraphini* and *E. pomifera* were worth coming many miles to see. Henry N. Ellacombe, Bitton Vicarage, Bristol.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, as well as specimens of plants for naming, should be addressed to the EDITORS, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Local News.—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Illustrations.—The Editors will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c., but they cannot be responsible for loss or injury.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.

APPOINTMENTS FOR THE ENSUING WEEK.

WEDNESDAY, NOVEMBER 29—

National Chrys. Soc. Annual Dinner at the Holborn Restaurant, at 6.45 p.m. Irish Gard. Assoc. & Benev. Soc. meet.

THURSDAY, NOVEMBER 30—

Roy. Hort. Soc. Colonial Exh. (3 days).

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last Fifty Years at Greenwich—41.2°.

ACTUAL TEMPERATURES:—

LONDON.—Wednesday, November 22 (6 P.M.): Max. 89°;

Min. 30°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—Thursday, November 23 (10 A.M.): Bar. 29.8°; Temp. 44°; Weather—Dull.

PROVINCES.—Wednesday, November 22: Max 43° Sligo; Min. 37° England E.

SALES FOR THE ENSUING WEEK.

MONDAY, TUESDAY, WEDNESDAY, THURSDAY AND FRIDAY—

Dutch Bulbs, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 10.30.

MONDAY, WEDNESDAY AND THURSDAY—

English and Dutch Roses, Shrubs, Azaleas and Dutch Bulbs, at Stevens's Auction Rooms, 33, King Street, Covent Garden, London, at 12.30.

TUESDAY—

Sale of Nursery Stock at Nineham's Nursery, Caterham, by Protheroe & Morris, at 12.

WEDNESDAY—

Roses and Herbaceous Plants, at 12.30; Palms and Plants at 5; at 67 & 68, Cheapside, E.C., by Protheroe & Morris.

FRIDAY—

Rare and choice Orchids from the "Oakwood" and "Chessington" collection, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 12.45.

The Worcestershire Experimental Garden. The 15th annual report (1910) of the County Experimental Garden, at Droitwich, has recently been issued, and contains an interesting account of the work which has been carried on under the direction of Mr. J. Udale, the Chief Horticultural Instructor. A noteworthy feature of the experimental work which is undertaken in this garden is its utilitarian nature. The prime function of such a garden is to provide sound information on practical horticulture, with special reference to the surrounding area. This is fully recognised by Mr. Udale, and the results of his work are bound to be of more service to local horticulture than many which emanate from more highly-endowed institutions which attempt the solution of more ambitious and less wisely-limited problems.

The sound common-sense nature of the work may be illustrated from the account given of observations in the fruit quarter of the garden. Besides providing object lessons for the more ignorant cultivators of the superior fruit yield of pruned

(Apple) trees as against unpruned, the report contains the record of crops (of Apples and other fruits planted in 1896) from 1900 to 1910. From these records it appears that the following varieties of Apples grown as standards—the great majority being on Apple stock—may be recommended to first rank for planting in the locality:—Bismarck, Bramley's Seedling, Ecklinville Seedling, Lane's Prince Albert, Lord Grosvenor, Lord Suffield, Potts's Seedling, The Queen, Worcester Pearmain, and Stirling Castle. The soil of the garden is sandy, has a depth of about 1 foot, and rests on a subsoil of gravelly-clay with traces of lime.

A further interesting fact with respect to the Apple crop is indicated in the table (p. 4), giving total annual yields since 1896. From this table, it appears that the crop of 1910 (8,062 lbs.) surpassed that of any previous year by no less than 2,200 lbs.

In the case of half-standards the following varieties have proved most fruitful:—Betty Geeson, Baxter's Pearmain, Royal Jubilee, Potts's Seedling, Schoolmaster and Devonshire Quarrenden; the total yield from Betty Geeson (1900-1910) was 825 lbs., whereas that from Schoolmaster was 430 lbs.

Of cordon-trained Apples, most fruit has been produced by Cellini Pippin, Winter Hawthornden, Lord Grosvenor, Lane's Prince Albert, Beauty of Hants, Cox's Orange Pippin, Worcester Pearmain, Early Rivers, Ecklinville Seedling, Domino, Stirling Castle and Warner's King.

Similarly, records are given in the reports for other kinds of fruit, small fruits and vegetables.

Among other useful experiments are those on the prevention of injury by frost to the flowers and young fruit of fruit trees, which experiments were commenced in 1909 and continued in 1910 in co-operation with the Board of Agriculture. The object of the experiment was to determine whether heaters are likely to prove of success commercially.

One plot of half-an-acre, containing Apple, Pear and Plum trees, and another of a quarter-of-an-acre planted with Black Currants, dwarf Apples and standard Apples, were set apart for the experiment. The heaters used were of two kinds, the Colorado orchard heaters, each charged with 20 lbs. of coal, and heaters supplied by Mr. F. Paget Norbury, Malvern, each charged with 15 lbs. of coal. Thirty of the former were used on the half-acre plot and 15 of the latter on the quarter-acre plot.

Mr. Udale speaks with caution as to the results of the experiment, but holds that the favourable impression, as to the utility of heaters, which was formed in 1909, was confirmed in the subsequent year. Further experiments are to be made, the results of which should prove valuable.

Among the many activities of which the experimental garden is the seat, mention should be made of the "French" garden, which was established in 1909. It appears that though the net returns reckoned "per acre" were high, yet Mr. Udale

is inclined to think that if a balance-sheet were prepared, it might show a loss. Such a balance-sheet should, we think, be prepared, if it is at all possible to do so. It is most desirable that figures on the profits of "French" gardening should be available, for there is no doubt that many of the statistics which have been put forward are representative rather of aspiration than of fulfilment.

In conclusion, whilst congratulating Mr. Udale and the Education Committee of the Worcestershire County Council on the excellent report and on the sound lines on which the experimental work is laid, we would draw attention to the report on evening gardening classes which is appended to the general report. From it we learn that 248 boys received instruction in gardening at 19 evening classes, and 441 at 33 day school classes during the past year. One omission we notice with regret. There is no mention of classes for young gardeners, and the only suggestion we have to make is that unless their educational requirements are provided for already in the county, something should be done for them at Droitwich.

PALIURUS AUSTRALIS.—The "Christ Thorn," formerly known as *Paliurus aculeatus*, but now as *P. australis*, was regarded by the older writers with veneration on account of its supposed association with the Crown of Thorns. GERARDE, in his *Herbal*, gives a long account of it, and records with pride that he had a specimen in his garden "brought forth by sowing of the seed." It is common in the countries bordering on the Mediterranean, including Palestine, where it is used to form hedges, the spiny branches offering a formidable resistance, owing to the fact that one of the two spines with which the leaves are subtended has the form of a hook. The branches are slender and wiry, the leaves alternate, three-nerved and shiny, and from 1 to 2 inches long. In very favourable circumstances the plant grows from 20 to 30 feet high, but in most places it forms a shrub from 6 to 10 feet high. It is hardy in the warmer districts of the British Isles, and it flowers freely in favourable seasons, the small yellow flowers being borne on short axillary racemes. The species rarely fruits in this country, but this year it fruited freely in the nursery of Messrs. ROBERT VEITCH & SON, Exeter, and we are indebted to them for the branch represented in our illustration (see fig. 156). The fruit when ripe, consists of a round, hard, enlarged disc, surrounded by a membranous rim, suggesting a hat. It was a matter of much speculation amongst the older writers as to which plant provided the material for the "Crown of Thorns," and although the claims of the *Paliurus* were generally favoured, some believed it to have been a species of *Cratægus* or *Zizyphus*, a genus allied to *Paliurus*. *P. australis* is figured as *Zizyphus Paliurus* in the *Botanical Magazine*, tab. 1893.

ROYAL INTERNATIONAL HORTICULTURAL EXHIBITION, 1912: REGULATIONS FOR EXHIBITORS.—The directors desire to draw the attention of exhibitors at the International Show to the fact that they have decided not to enforce the condition printed at the foot of the entry forms already distributed in the schedules, to the effect that specimens (plants, &c.) must have been cultivated by the exhibitor for at least two months prior to the date of the show. Regulation 20, in the revised schedule, is the only stipulation

of the kind that will be retained, namely, that the "Exhibits must be the property of the exhibitor, or of the employer in whose name they

are shown." The directors also announce that they will provide all necessary plates and vases; the plates will be of cardboard or papier maché.

AUTUMN ORCHID SHOW.—The R.H.S. Council have appointed a sub-committee to consider the arrangements for the Orchid Show to be held on November 5-6, 1912. The sub-committee consists of Mr. J. GURNEY FOWLER (chairman), Mr. JAS. O'BRIEN (hon. sec.), Lt.-Col. Sir GEORGE L. HOLFORD, K.C.V.O., Mr. GURNEY WILSON, and Mr. JOHN CYPHER. The sub-committee met on Tuesday last, and considered some of the chief points necessary to ensure a good and effective display, and more especially to secure the co-operation of Orchidists in the provinces. Suggestions for the most important classes were made, which the Secretary will circulate and invite suggestions.

R.H.S. GARDENERS' DIARY FOR 1912.—There is always something fascinating about the diaries that make their appearance in the late autumn of the year. This season, however, a diary is before us which has special claims on the interest of horticulturists. It is published by Messrs. LETTS & Co., specially for the Royal Horticultural Society, and is edited by the Secretary, the Rev. W. WILKS M.A. *The R.H.S. Gardeners' Diary* contains in a remarkably small compass much information that gardeners require. "The Hints on Cultivation" which occupy the front portion of the book are of a practical nature, and calculated to give valuable assistance not only to the amateur, but also to the more advanced grower. Immediately after the calendar, which includes the R.H.S. fixtures for 1912, we find a "Daily Wants Dictionary," which consists of an alphabetical list of common subjects, after the style of a small encyclopædia. This is of general utility, and although it occupies only four pages, it covers a very wide range of subjects, as, for instance, the Derby winners for the past five years, rates of fire insurance, the cost of a marriage licence, and the measurements of a tennis court! At the end of the memoranda for each week, directions are given for the work to be done in the garden during the week. It may be mentioned that scarcely enough room is given under each day for memoranda, but naturally portability is one of the chief points of a diary. The preface, by the Editor, shows signs of having been written hastily; there are several small errors, and the word "advisably" should surely read "advisedly." However, every gardener will do well to keep a copy of the R.H.S. Diary in his pocket.

ROYAL METEOROLOGICAL SOCIETY.—The Council of the Royal Meteorological Society have awarded the Symons Gold Medal to Professor CLEVELAND ABBE, of the United States Weather Bureau, in recognition of the valuable work which he has done in connection with meteorological science. The medal will be presented at the annual meeting of the Society on January 17, 1912.

PERPETUAL-FLOWERING CARNATION SOCIETY.—The 11th exhibition of this society will be held on Tuesday and Wednesday, December 5 and 6, in the Royal Botanic Society's Gardens, Regent's Park. Particulars may be obtained from the Secretary, Mr. HAYWARD MATHIAS, Stubbington, Fareham, Hampshire, or the Show Superintendent, Mr. E. F. HAWES, Clysses, Fortune Green, London.

THE GARDENERS' COMPANY.—The LORD MAYOR presided over a meeting of the Court of Aldermen of the City Corporation on November 15, when a petition was presented by the Gardeners' Company, applying for an increase to their number of liverymen. The Master, the Wardens and the Clerk attended in support of the application, and it was stated that the increase suggested was from 60 to 150. The last increase was granted 20 years ago, and the Duke

FIG. 156.—PALIURUS AUSTRALIS, "CHRIST THORN."

Branch with bat-like fruits.

of TECK and other eligible Freemen were anxious to take up their livery in the Guild. The Court of Aldermen referred the petition to the General Purposes Committee for consideration.

SOUTHAMPTON CHRYSANTHEMUM SHOW.—

A gold medal was awarded at this Show to the Hon. Mrs. YORKE (gr. Mr. Turner) for a group of Begonias, and a similar medal to Mr. E. WILLS, Winchester Road, Southampton, for a group of miscellaneous plants and floral designs.

RESEARCH SCHOLARSHIPS IN AGRICULTURAL SCIENCE.—

The Board of Agriculture and Fisheries have awarded Research Scholarships in Agricultural Science to the following gentlemen:—P. G. BAILEY, B.A. (Camb.); J. CLAYTON, B.A. (Camb.); J. T. EDWARDS, M.R.C.V.S.; E. T. HALNAN, B.A. (Camb.); J. HAMMOND, B.A. (Camb.); J. A. HANLEY, A.R.C.S.; G. E. JOHNSON, M.Sc. (Birm.); C. G. P. LAIDLAW, B.A. (Camb.); A. E. LECHMEER, M.Sc. (Bristol); J. W. LESLEY, B.A. (Camb.); A. NEVILLE, B.Sc. (London); F.I.C., F.C.S.; G. T. SPINKS, B.A. (Camb.). These scholarships have been established in connection with the scheme for the promotion of scientific research in agriculture, for the purposes of which the Treasury have sanctioned a grant to the Board from the Development Fund. The scholarships, which are of the annual value of £150, and are tenable for three years, have been established in order to train promising students, under suitable supervision, with a view to their contributing to the development of agriculture, either by carrying out independent research or by acting in an advisory capacity to agriculturists.

PRIMULA KEWENSIS.—The history of the acquisition of fertility on the part of this hybrid is extraordinarily interesting. Raised at Kew in 1899 from a chance seedling found among a batch of *P. floribunda*, *P. kewensis*, which is a hybrid between *P. floribunda* and *P. verticillata*, was at first, and remained for some years, absolutely sterile. The sterile plants occurred in one form only, named thrum-eyed (short styled). After some years, however, a single pin-eyed plant was discovered in Messrs. VEITCH's nurseries. This plant was, as we learn from Messrs. VEITCH, remarkable in several ways. In the first place, its main inflorescence bore pin-eyed (long styled) flowers. In the second place, though the style of these flowers was long the stamens were in the position which they occupy in thrum-eyed flowers. In other words, these flowers, though pin-eyed, as judged by their styles, were thrum-eyed, so far as their stamens were concerned. In the third place, other inflorescences which developed on this long-styled plant bore ordinary thrum-eyed flowers. Self pollination of the pin-eyed flowers resulted in the production of good seed, from which has been raised all the fertile plants of *P. kewensis* now in cultivation.

MALE AND FEMALE SEEDS IN DIOECIOUS PLANTS.—

Professor CIESIELSKI, of Lwow, has just published a paper stating that he has discovered the secret of sex, and that he can produce at will "male" or "female" seeds. This question must, of course, be investigated in plants where the sexes are completely separate, and, for ease in investigation, plants which mature in a single year should be used. Professor CIESIELSKI selected *Cannabis sativa*, because of the extreme rarity with which stamens appear in the female flowers, though, in other dioecious plants this is not uncommon. He began his experiments in Breslau, in 1871, under the auspices of the late Professor GOEPPERT, and during the first six years he proved that density of planting, the phase of the moon when the seeds were sown, the amount of sunshine, exposure to drought, variation in manuring, and

the part of the inflorescence where the seeds were matured, were all alike of no importance. In none of these cases did the proportion of male and female plants vary appreciably from the average given by unselected seeds; and in no case did either sex exceed 60 per cent. of the whole. In the year 1877, having planted out his female plants a full hundred yards from the male ones, with buildings between, he pollinated them artificially. He carefully cut off the male inflorescences and simply shook the pollen out over the female ones. The inflorescences were cut in the morning, and one bed of female plants was pollinated at sunrise, while another, at a distance, was pollinated at sunset. The seeds of the former gave no less than 85 per cent. of male plants: those of the latter no less than 92 per cent. of female plants. This striking result induced Professor CIESIELSKI to carry out a more accurate experiment, and in the next year he put three female plants in one case and three in another, and fertilised them by transference of pollen with a brush. For fertilising the first group he used pollen from anthers which were just beginning to open, and transferred it at once to the stigmas: for the other group he used pollen which had been collected in the morning and kept in a paper envelope till evening. The first group produced 120 seeds, of which 112 grew, and 106 were males: the second produced 96 seeds, of which 89 grew, every one of which was a female plant. This experiment he repeated on several occasions, and, invariably, with a similar result, leading him to formulate the law that sex depends on the condition of the impregnating pollen, fresh pollen producing males, and pollen which is not fresh producing females. Further experiments were made to see if there were any physical characters by which the male seeds could be distinguished from the female ones before sowing, but no distinctive feature could be discovered. Since completing his experiments on plants, Professor CIESIELSKI has made a series of experiments—much fewer in number and less striking—on animals, which suggest that a similar law holds good in the animal kingdom, though, naturally, the conditions there are not so fully under the experimenter's control. The cautious will demand further evidence before accepting this invitingly simple theory.

NITROGEN GATHERING PLANTS.—A brief and well-illustrated summary of our knowledge of the plants which are capable of fixing nitrogen is supplied by Mr. KARL F. KELLERMAN, in the Year-book of the Department of Agriculture (U.S.A.) for 1910. So far as is at present known, the power of bringing free nitrogen into combination is limited to certain bacteria, and possibly some few fungi and algæ. Of nitrogen-fixing bacteria some occur free in the soil and some live in association with the roots of the higher plants. The chief of the former free-living class are species of *Clostridium* and of *Azotobacter*: to the latter class belong the bacteria which occur in the root nodules of leguminous and other plants. The root-nodules are produced as the result of the presence of the nodule bacteria, and are, in many cases, abnormally developed lateral roots. The shape and size of root-nodules vary very considerably, and the shapes which they assume range from small spherical swellings in Pea, Bean, Vetch and Gorse, through coral-like, much-branched structures in the Alder and various Cycads, to masses as large as a cricket ball in the Velvet Bean (*Stizolobium duringianum*). As just indicated, the nodules and the nitrogen-fixing bacteria which produce them are not confined to leguminous plants. Up to the present they have been found on the following non-

leguminous plants:—Alder, *Ceanothus americanus* (New Jersey Tree), *Ceanothus velutinus*, *Lepargyrea canadensis*, *Eleagnus argentea*, *Comptonia peregrina* and, curiously enough, various Cycads, including *Cycas circinalis*, *C. Seemannii* and *Encephalartos horridus*.

PUBLICATIONS RECEIVED.—*Journal of Agricultural Science*, vol. iv., part 2. October. (Cambridge: University Press.) Price 5s. net.

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

MECONOPSIS INTEGRIFOLIA (see p. 358).—The only difficulty I have found in the cultivation of this plant is in getting the seeds to germinate. Both home-saved and purchased seeds have failed alike in this respect, although the seeds appeared to be perfect and were treated exactly as in the case of *M. racemosa*, which usually come up as thickly as Mustard and Cress. Seeds of *M. racemosa* are sown soon after ripening, and the seedlings kept in a cool, moist pit under glass until they are fit for planting out. It is a pity *M. integrifolia* does not succeed in a like manner, as it is such a glorious plant when it does well. The first two plants we had grew upwards of 3 feet in height and flowered well; the only care they received after planting out was protection of their centres from wet during the winter. *W. H. Divers, Belvoir Castle Gardens, Grantham.*

AN OLD DUTCH FLOWER "MASTER"; AND ITALIAN PERGOLAS.—At the present time there can scarcely be fewer than 20 shows of pictures—representing almost every school of painters, ancient and modern—in London alone. At the Grafton Galleries there is a collection of Old Masters, lent by private owners, the receipts are to go to the "National Arts Collection Fund." Amongst other treasures there is one canvas of special interest by reason of its subject. It is a "still-life" group, representing a collection of fruit and flowers, arranged on a table of yellow stone. The picture is large—at least 6 feet long—and presents a magnificent feast of colour. Roses, Grapes, Pears and Peaches delight the eye with their luscious reds, greens and yellows; they are charmingly grouped in a basket on a blue velvet cloth. Besides them, a blue and white bowl displays its contents—a scarlet lobster, surrounded by various appropriate objects; a cut Lemon, bread, a Pomegranate. The claim of the painting to the quality of "still life" is jeopardised by the presence of a disconsolate-looking parrot—chained to a perch just above, and out of reach of, the dainties on the table below, and a monkey, of evidently mischievous intent, who, seated comfortably between a bundle of Asparagus and a Cauliflower, is holding up a bunch of Grapes, intended to form part of the impending banquet. The painting is by Pieter de Ring, and is dated 1660. So brilliant a piece of colour, in full preservation, is a striking testimony to the craftsmanship and chemical skill of the oil painters of the early Dutch school, the members of which ground and mixed (or "made") their colours, as well as using them. At the Modern Gallery, E. Philip Cormsh is holding an exhibition of his work, and garden lovers will do well to visit this, if only to see a charming sketch entitled "The Vine Pergola." This picture gives a very fair idea of the colouring of Southern Italy; the strong sunlight, so characteristic of the country, is well represented. The peculiar methods of training vines in this part of Europe are well worth observation; these are planted on each side of a garden walk, and trained over a framework formed of light Bamboo poles placed at right angles, and the interlacing leaves and tendrils overhead form a delightful shelter from the noontide sun. The subject is very successfully handled by Mr. Cormsh; the deep purples of the cast shadows, chequered by the sunbeams filtering through the interstices between the dancing leaves, give an air of charming reality to the scene, and a few white goats, well drawn, and thoroughly in keeping with the character of the locality, complete this clever sketch. *Mary L. Breakell.*

GIVE THE JOURNEYMAN A CHANCE!—I read with interest *Royal Journeyman's* note re the pruning of vines. I would remind him that the pruning of vines is a very simple matter compared with the pruning of hardy fruits, including Peaches. Does *Royal Journeyman* understand this work, or does he think it degrading to prune a Gooseberry or Currant? If he observes closely, he will see that the pruning of vines is a comparatively easy matter. *J. S. H.*

No doubt, at first sight, *A Royal Journeyman* would appear to have a grievance, in that, as he says, "Journeyman are seldom allowed to assist with the pruning of vines, &c." It may be admitted that every young man who aspires to the position of head gardener must know how to prune; but I do not think very much knowledge would be gained by "assisting," as I understand the word. For instance, a man might be one of two pruning a Peach tree, yet he might work in this way for a long time and never learn to do the work alone. Keen observation of what is being, or has been, done, supplemented by a few explanatory remarks and a close study of good works on pruning by thoroughly practical men, are necessary. After all, the main point is to grasp the object of pruning, the end which is to be gained. I have seen many a tree which has been cut, but in no sense pruned; and many a man will learn more by keen observation than another by any amount of assisting. On the other hand, it is to be admitted that the system at present in vogue in private gardens does not allow much time for the foreman or head gardener to supervise the journeyman's pruning; the time thus employed would be twice as long as that required by one who understood the work. This is a point which should be considered. In many cases time is found by the foreman or head gardener during the pruning operation to explain the method to an enquiring journeyman; and if attention has been paid, the journeyman should be able afterwards to make use of the knowledge thus gained. In large gardens, where there is an abundance of fruit trees, I have no doubt that if a request were made by an intelligent journeyman to be allowed to prune a tree or a vine rod, permission would be granted readily. I need not say that the head gardener would desire to satisfy himself that such a request was really made with the object of gaining knowledge and experience; but the next season's crop depends so much on judicious and careful pruning, that the reputation of the gardener might suffer considerably if a really serious error were made. *Head Gardener.*

JAPANESE DWARF TREES IN BATTERSEA PARK.—Many frequenters of London's West-End parks and gardens do not know the beauties of Battersea Park, which, being "over the water," is somewhat neglected, particularly by strangers. One of the newest features on the Albert Bridge (west) side is a Japanese garden raised on an ornamental stand, some 3 feet from the ground. In the space of about 12 by 16 feet there is a diminutive and typical Japanese landscape with wooded slopes, crowned by temples and palaces, and banks shelving down to a winding water-track crossed by bridges. Few of the trees are more than a foot in height, and many of them are only 3 to 6 inches. There is a "flowering Cherry" 42 years old, under 1 foot, and a Japanese Maple, planted in 1858, about 7 inches high. The White Cedar (3 to 6 inches high) is the most effective species in the perfection of its form, and a group of these dwarf Cedar trees, arranged on a sloping rock, gives all the illusion of a pictured forest scene. Near by is a table of Dates. Cedar trees, planted in 1825, have attained the height of 1 foot 7 inches! Other species are Japanese Cedar, *Buxus sempervirens* and *Pinus pentaphylla*. Round the raised garden are arranged other somewhat larger specimens of dwarfed trees and shrubs. The general impression produced by these miniature gardens is depressing, probably because the majority of the trees are evergreen, and so dark and gloomy in colour. A charming exception is the Japanese Maple, which enlivens the fairy scene with its fan-shaped leaves of rosy-red. The main defect in the dwarfing of trees is that the size of the leaves cannot be reduced in proportion to the rest of the growth, and so, in many cases, the effect resulting is merely that of a detached bough planted, instead of a perfect tree. *Mary L. Breakell.*

MARKET GROWING AND LOW PRICES.

The article on this subject on p. 319 deals principally with the depreciation in the price of Tomatos and the hardships thereby inflicted on the small grower who still takes his produce to market. With regard to decorative plants and flowers for Covent Garden Market, I was from 35 to 40 years ago engaged in that branch of horticulture, and I often think what a golden age it was for the producer compared with the present time. The system of retarding different subjects has quite revolutionised the culture of many popular flowers and the lower prices contrasted with the period I name are extraordinary. It must be borne in mind that the cost of production is now quite equal to what it was then, hence the market-grower of the 70's may reasonably refer to the good old times. Among the subjects which I handled in those far-off days, the Lily of the Valley stands out prominently. The only way to get these in flower early was to obtain well-ripened Berlin crowns and force them hard, to have them in bloom by Christmas. The price that good flower spikes realised at that season, and often for two or three weeks afterwards, was 8s. per dozen wholesale, a price to make a present-day grower's mouth water. From 12s. to 15s. a dozen for Maidenhair Ferns in 48-sized pots, and 30s. when grown in 6-inch pots, was a common price in those days. Palms, too, used to realise high prices, the principal sorts available being *Livistonia chinensis* (*Latania borbonica*) and *Hyophorbe* (*Areca*) *lutescens*, for the Kentias and *Cocos Weddelliana* were at that time rare. Of present-day popular subjects then unknown to the market-grower may be mentioned *Marguerites*, double Ivy-leaved *Pelargoniums*, and Rambler Roses, while the different species of *Lilium* were but little grown. Zonal *Pelargoniums* were not much employed for winter flowering, but large quantities of a good form of *Tropæolum Lobbianum* used to be cultivated. *W.*

JUDGING AT THE FRUIT SHOW.—It is evident that my letter on p. 310 touched a rather tender spot, as *A Judge* appears to resent the question being brought to the notice of the public. What I referred to was a general complaint amongst the exhibitors at this particular show. *A Judge* does not refute my point, that it is not the correct thing for judges to intermingle with the exhibitors during the time the exhibits are being staged. If *A Judge* reads my note again he will find that I did not suggest that any one of the judges at the R.H.S. Fruit Show acted unfairly. What I contend is that it is unfair for judges to be present during the time of staging the exhibits, and all thinking persons will hold the same view. With regard to the point raised by him of not knowing before the exhibitors had left the hall what classes he was to adjudicate upon, what would it matter, if he had been privileged to a general inspection of the whole show beforehand, as it is not often one sees a thing one minute and forgets it the next? I notice that *A Judge* did not clear up any of the points raised by *A. Fairplay*.

POLLINATION AND SETTING OF FRUIT.—Some months ago I read a leading article in your paper on the subject of pollination and setting of fruit, and since that time I have discussed the matter with many of my gardener acquaintances. All agree that the subject has a distinct bearing on the problem of sterility in certain varieties of fruits. But I should like to remark that I once had charge for many years of a garden where I found it quite impossible to secure a good crop, either of Greengage Plum or of the Apple Cox's Orange Pippin. The usual cultural conditions were all present, and root-lifting and liming of the land were resorted to several times. Referring to the remarks of Mr. John Smith (p. 310), I may mention that within 20 yards of the trees of Cox's Orange Pippin there stood a large tree of Siberian Crab—usually full of fruits, and other varieties of Apple on the same plot generally gave good crops. I have seen Cox's Orange Pippin at Gunton Park, in Norfolk, fruiting well on cordons by the side of the paths, a considerable distance from any other Apple trees, and with no Crab trees at all with reach. It is evident, therefore, that soil and atmospheric conditions have very great influence. *Yorkshire Gardener.*

SOCIETIES.

ROYAL HORTICULTURAL.

NOVEMBER 21.—We doubt if a finer exhibition of fruits and flowers has been seen in London in November than the show held on Tuesday last in connection with the usual fortnightly meeting of this Society. A large number of visitors was present, and at times the Hall was crowded. Chrysanthemums were the most conspicuous subjects, and imposing displays of these flowers were staged by nurserymen. Mr. H. J. JONES put up the largest group, making a magnificent display, principally with large exhibition blooms arranged with taste. Messrs. W. WELLS & Co., J. PEED & SON, and JAMES VEITCH & SONS also contributed splendid groups in this section, whilst Messrs. SUTTON & SONS had a group of seedling Chrysanthemums in an infinite variety of colours. Besides Chrysanthemums there were bright exhibits of Begonias, Carnations, Gesneras and zonal-leaved *Pelargoniums*, whilst a magnificent group of Dahlias, shown by Messrs. H. B. MAY & SONS, provided further variety. The FLORAL COMMITTEE recommended no fewer than 12 Awards of Merit.

The groups of Orchids were remarkably fine, most of the usual exhibitors contributing choice groups or individual specimens. The ORCHID COMMITTEE recommended five First-class Certificates and four Awards of Merit.

The FRUIT AND VEGETABLE COMMITTEE had a larger number of exhibits to inspect than usual, and this Committee recommended an Award of Merit to a seedling Apple. There was a good attendance at the 3 o'clock meeting in the lecture room, when Mr. Edward White gave an address on "The Royal International Horticultural Exhibition, 1912" (see p. 370).

Floral Committee.

Present: Messrs. W. Marshall and Henry B. May (Chairmen); and Messrs. John Green, G. Reuthe, A. Kingsmill, E. A. Bowles, W. J. Bean, C. R. Fielder, J. T. Bennett-Poë, J. Jennings, W. Cuthbertson, R. C. Reginald Nevill, Chas. Dixon, John Dickson, F. Page Roberts (Rev.), Chas. E. Shea, Chas. E. Pearson, W. P. Thomson, E. H. Jenkins, W. J. James, George Paul, R. Hooper Pearson, R. C. Notcutt, J. W. Barr, H. B. Cranfield, Walter T. Ware, H. J. Jones, and Herbert J. Cutbush.

LORD HILLINGDON, Hillingdon House, Uxbridge (gr. Mr. A. R. Allan), showed numerous well-flowered plants of winter-flowering Begonias, including the varieties Mrs. Heal, Ensign, and Julius, and others of the Gloire de Lorraine type. The inclusion of suitable foliage plants enhanced the effect. (Silver-gilt Banksian Medal.)

MESSRS. JAMES VEITCH & SONS, LTD., King's Road, Chelsea, again contributed a magnificent display of winter-flowering Begonias, surpassing anything of the kind in the exhibition. The plants were superbly grown and literally smothered in flowers. This firm showed two new varieties, one of which received an Award. The other was of a shade of rose and named Rose Queen. Amongst the older sorts Mrs. Heal, Success, Julius, and Ensign were all good, and in some cases interspersed amongst white and coloured Bouvardias, making a delightful association. At the back were fruiting plants of *Calli-carpa purpurea*, and at one end a batch of the blue-flowered *Exacum macranthum*. As a separate group, Messrs. VEITCH also showed a large exhibit of pot plants of Chrysanthemums. These also were exceptionally good, such varieties as Primrose Girl (new), Beauty (pink), Countess of Egmont, Elusive, Mensa, Exclusive, E. Nottell, and Strawberry being shown in well-flowered dwarf specimens. (Silver Flora Medal.)

MR. L. R. RUSSELL, Richmond, filled a large table with bright batches of Gesnera Orange King, the fine trusses of bloom showing well against the ruby-marked, velvety leaves, and Begonia Gloire de Lorraine. There were several dozen pot plants of the Begonias, all freely bloomed and splendidly trained. The exhibit was completed by a batch of small plants of *Aucuba vera* bearing numbers of the scarlet berries. (Bronze Flora Medal.)

MESSRS. W. CUTBUSH & SONS, Highgate, showed a large exhibit of winter-flowering Begonias, prominence being given to the variety Ensign, with double flowers of a deep rose colour. There was also a collection of greenhouse flowering and

foliage plants, Orange trees in bearing, *Skimmia japonica* in berry, and a batch of Carnations. A seedling Carnation of promise named Mrs. Waldorf Astor has a yellow ground with bright-red markings. The variety Henderson's Purple is of a pure magenta shade, the nearest approach to a blue Carnation.

Messrs. STUART LOW & CO., Bush Hill Park, Enfield, exhibited a collection of Carnations, making a very pretty group with epergnes and vases of these flowers. A large stand of the fine rosy-salmon variety Lady Alington was in the centre; other good varieties were Baroness de Brien, a new sort of salmon-pink colour; Gloriosa, clear pink, and White Wonder, a new variety of this season's introduction. (Silver Banksian Medal.)

Mr. H. BURNETT, Guernsey, showed remarkably fine blooms of Carnations of the perpetual-blooming type. Mandarin, a yellow-ground flower striped with rose-pink is a novelty; the blooms are large and of good form. Amongst the older sorts, Britannia and Scarlet Glow were particularly good. (Silver Banksian Medal.)

Messrs. ALLWOOD BROS., Wivelsfield Nurseries, Haywards Heath, contributed Carnations of the perpetual-blooming type, amongst them being the new White Wonder, which recently received an Award of Merit. A white-ground Fancy named Wivelsfield Wonder, May Day and Mrs. R. F. Felton were conspicuous amongst others.

Hon. VICARY GIBBS, Aldenham House, Elstree (gr. Mr. E. Beckett), showed posies of *Streptocarpus* from the fine strain of these flowers in his collection. The exhibit demonstrated the great advance made with this pretty greenhouse flower in recent years. This exhibitor also filled a table with varieties of single Chrysanthemums, having a representative collection of the best sorts in cultivation.

Messrs. H. CANNELL & SONS, Swanley, showed about 60 bunches of Zonal-leaved Pelargoniums, the finest in their respective colours being Dublin (cerise), New York (scarlet), Madresfield (purple), Sir Thomas Hanbury (crimson), Lady Folkestone (pink), and Snowstorm (white). This firm also showed single Chrysanthemums arranged as a bank of colour, the tones ranging from blush to deepest crimson. A selection of the choicer sorts includes Cannell's King, Cannell's Crimson, Mensa, Lady Furness (a distinct shade rosy-buff), Mr. James Rowley (clear yellow) and Sylvia Slade (plum purple). Other novelties were seedlings of the White Honeysuckle, having rose and yellow florets; Reine du Japon, a new variety of the spidery type, and very quaint in appearance. (Bronze Flora Medal.)

Mr. REUTHE, Keston, Kent, again showed seedling Nerines and a few choice Alpines in pots.

The Misses HOPKINS, Shepperton-on-Thames, exhibited a small collection of Alpines and hardy flowers, also a pink Carnation named Lady Meyer.

Mr. VINCENT SLADE, Staplegrove Nurseries, Taunton, showed numerous vases of Zonal-leaved Pelargoniums, having a selection of the most popular varieties.

Messrs. H. B. MAY & SONS, The Nurseries, Upper Edmonton, showed 80 species and varieties of *Davallia*, some of the plants being 6 feet high. The largest specimens were *D. filix-foemina*, *D. f. elegans*, and *D. solida superba*. Other remarkably fine plants were *D. plumosus*, *D. magnifica*, *D. heterophylla*, *D. retusa*, *D. parvula*, *D. brasiliensis*, *D. Mooreana*, *D. rufa*, *D. intermedia*, *D. platyphylla*, and *D. Veitchii*. (Silver-gilt Flora Medal.)

CHRYSANTHEMUMS.

Mr. H. J. JONES's fine display of Chrysanthemums extended the entire length of the Hall at the end opposite to the clock. Big Japanese blooms, in tall stands, decorated with autumn foliage and brightly-coloured *Codiaeums*, arose from a ground of vases of single and decorative varieties, interspersed with Ferns, Palms, *Asparagus plumosus*, and other greenery. Nearer the front were handsome vases filled with big posies of Chrysanthemums, with here and there a charmingly-arranged basket of some choice decorative variety, the whole being edged with a green band of small Ferns. The exhibit was in every respect an excellent one, and comprised a large number of novelties, as well as the choicer sorts of former seasons. Amongst those of recent introduction may be enumerated

Mrs. W. E. Roope (yellow), Bob Pulling (yellow), G. J. Bier (white), Maguelonne (a creamy-white, incurved flower), J. Surrey (crimson), and Mme. Mague (an incurved flower of the Japanese section). Others that were specially good are:—W. H. Iggulden, Lady Frances Ryder (white), Edith Jamieson, Hon. Mrs. Lopes, and E. G. Mocatta. (Silver-gilt Flora Medal.)

Messrs. W. WELLS & CO., Merstham, showed a large bank of Chrysanthemums as a floor group, giving prominence to their fine novelty, Mrs. Gilbert Drabble, a white, Japanese Chrysanthemum, of the best exhibition type. Some of the blooms measured 31 inches in circumference. They were disposed as a tall centre-piece, likened by some to a cascade of white flowers. A basket of the pink single Mrs. W. Higgs was another good feature. We may enumerate the following as a selection of the many other varieties:—Margaret Lloyd (a single, of rosy, terra-cotta shade), Miss A. Brooker (a new decorative variety, of rich crimson colour, showing a paler reverse), Josephine (a pretty yellow single), Mensa (white), Golden King, Caledonia (pink), Merstham Gem (crimson), and Crimson Jewel, these being all of the single type. (Silver-gilt Flora Medal.)

Messrs. JOHN PEED & SON, West Norwood, London, exhibited a floor group of Chrysanthemum, as at the last meeting. On this occasion, prominence was given to a new yellow decorative variety named Mr. Rider Bird. The pretty, white single Felicity, Merstham Jewel (ruby-bronze), Doreen (yellow), and Delphinus (very faint purplish-rose) were other varieties of special interest. (Silver Flora Medal.)

Messrs. GEO. WILLIAMS & SONS, Manor House Nurseries, Cardiff, showed a bright group of Chrysanthemums, including several seedlings raised from the well-known Lady Talbot variety.

Mr. W. J. GODFREY, Exmouth, Devonshire, showed novelties in Chrysanthemums, including Sir Frederick (a fine crimson-coloured single), Godfrey's Crimson (a decorative variety), and Reginald Godfrey (a single, of clear yellow colour).

Mr. JAMES BOX, Lindfield, Sussex, displayed a tall group of Chrysanthemums against the wall immediately opposite the entrance. The exhibit was well arranged, a tall epergne of the beautiful white single Mensa forming a pleasing centre-piece. (Silver Banksian Medal.)

Messrs. WHITELEGG & PAGE, Chislehurst, Kent, showed Chrysanthemums of the decorative type. Some of the singles were remarkably pretty, such as Mrs. William Buckingham (rose pink), Mensa (white), and Cannell's Crimson.

J. CLAYTON, Esq., Oak Bank, Newhaw Road, Addlestone, showed a dozen vases of single Chrysanthemums of well-known sorts.

Messrs. SUTTON & SONS, Reading, exhibited a corner group of Chrysanthemum seedlings, raised from seeds sown in February of this year. The growing of the Chrysanthemum as an annual is a comparatively new departure. The flowers presented a wide range of colours.

Mr. PHILIP LADDS, Nurseryman, Swanley, displayed a collection of Carnations of the type cultivated by market-growers. This firm always shows well, and on this occasion their finest flowers were Dr. Stores, a pink variety with narrow florets; Mensa, Kathleen May, one of the richest of the crimson varieties; Cannell's Crimson, also a fine rich colour; Edith Pagram, and Constance (white). (Silver Banksian Medal.)

Major G. F. WHITMORE, The Glebe Wood, Methwold, Norfolk, exhibited Tobacco as dried leaves and manufactured ready for use to demonstrate the possibility of cultivating this crop profitably in this country.

AWARDS OF MERIT.

Begonia Fascinator.—Messrs. JAMES VEITCH & SONS showed another first-class novelty in winter-flowering *Begonias* obtained from crossing *Begonia socotrana* with the tuberous-rooted varieties. The novelty known as *Fascinator* was shown as a perfect specimen, covered with the most gorgeous flowers of a salmon-yellow tint over red.

Casalpinia pulcherrima.—This is a very old inhabitant of the plant stove, having been introduced from the West Indies towards the close of the 17th century. It is a prickly shrub, 10 or

12 feet high, with pinnate leaves and rich orange-coloured flowers, produced on long pedicels. It belongs to the Natural Order Leguminosae, and was formerly known in gardens as *Poinceana pulcherrima*. An allied species named *Regia* is known as the Royal Peacock flower. Shown by G. EVANS, Esq., Baldock.

Chrysanthemum "Mrs. Walter Hemus" (single).—A fine crimson variety having a raised yellow disc. The blooms last fresh for a long time, making the variety especially valuable for market purposes.

C. "Thomas Page".—This is a Japanese variety of the type cultivated for market; the bright pink florets are remarkably pretty, the tint being pure. The plant is a very vigorous grower, and profuse in flowering. Both these were shown by Mr. PAGE, Tangley Nursery, Hampton.

C. "Godfrey's Perfection" (Anemone).—The ray florets are white, and the Anemone centre ivory colour. Some of the sprays were shown naturally grown, but others were disbudded. The flower is very suitable for decorative purposes, and has a remarkable lasting quality. Shown by Mr. GODFREY, Exmouth.

C. "Miss Margaret Gray" (single).—The florets are of a rich apricot-bronze colour with a faint rose flush, producing a beautiful sheen.

C. "Miss Phyllis Bryant" (single).—A large flower of pale sulphur yellow colour, the several rows of florets drooping pleasingly at the tips. The variety is one of the best of its type. Both these were shown by Mr. PHILIP LADDS, Swanley.

C. Lorbury Yellow.—This is a decorative variety with very smooth, reflexed flowers of moderate size even when thinned; the colour is a pleasing yellow. Shown by Mr. GEORGE KENT.

C. Margery Lloyd.—A very large, single flower of light chestnut colour, with a lighter tint round the disc.

C. Merstham Gem.—An orange-coloured, single flower with yellowish ring around the disc.

C. Josephine.—A very large, neatly-formed flower of pure yellow. These three varieties were shown by Messrs. WELLS, LTD.

C. Primrose Girl.—This variety flowers best as dwarf specimens not more than 15 inches in height. The single flowers are of a pleasing shade of yellow, and the variety may be recommended as extremely valuable for decorative purposes. Shown by Messrs. J. VEITCH & SONS, LTD.

Orchid Committee.

Present: J. Gurney Fowler, Esq. (in the Chair); Sir Jeremiah Colman, Bart., and Messrs. Jas O'Brien (hon. sec.), Harry J. Veitch, R. G. Thwaites, F. J. Hanbury, W. Thompson, F. M. Ogilvie, A. A. McBean, T. Armstrong, J. Charlesworth, J. Cypher, W. H. Hatcher, J. E. Shill, H. G. Alexander, A. Dye, W. H. White, Gurney Wilson, J. Wilson Potter, W. Bolton, W. Cobb, J. S. Moss, C. J. Lucas, and de B. Crawshaw.

Orchids were a great feature in the show, and a large number of novelties were submitted to the Committee.

The Duke of MARLBOROUGH (gr. Mr. Hunter) was awarded the Society's Gold Medal for a grand group of artistically-arranged Orchids, principally *Vanda coerulea*, this species being grouped in three elevated masses with a backing of *Cocos plumosus*. The plants were finely grown and well flowered, the largest specimen having six spikes. The front was filled in with good specimens of *Cypripedium insigne* *Sanderæ*, the central plant having 40 flowers; other varieties of *C. insigne*; *C. Lord Blandford*, a pretty flower like a finely-spotted *C. nitens*; *C. Baron Schröder*, and other hybrids; and the richly-coloured *Cattleya labiata* "Blenheim" variety.

H. S. GOODSON, Esq., Fairlawn, Putney (gr. Mr. G. E. Day) was awarded a Silver Flora Medal for an effective group of forms of *Cattleya labiata*, including the handsome variety *Schofieldiana*, white with pink lip; *C. Iris*, and other hybrid *Cattleyas*; *Laelio-Cattleya* *Felicia* Goodson's variety of charming colour; *L.-C. Decia*, and other *Laelio-Cattleyas*, *Odontoglossums*, and *Odontiodas*. *Cypripedium insigne*

Sanderæ was displayed along the front, with *C. callosum* Sanderæ, *C. Maudiae*, and others.

Messrs. CHARLESWORTH & Co., Haywards Heath, were awarded a Silver Flora Medal for a select group in which were many interesting hybrids. A batch of the bright orange-scarlet *Epidendrum vitellinum autumnale*, another of forms of *Cattleya labiata*, including the white variety *Schofieldiana*, some hybrid *Cattleyas* of which a special form of *C. Venus* and some brightly-coloured *C. Fabia* were very attractive.

Messrs. SANDER & SONS, St. Albans, received a Silver Flora Medal for a very interesting group in which were a batch of home-raised *Cattleya Hardyana*, varying in colour; brightly-coloured *C. Fabia*; a large number of *Lælia Perrinii* crosses, including *L.-C. Lady Rothschild*, *L.-C. Statteriana*, and *L.-C. Decia*. A good selection of *Cypripediums*, *Tainia barbata*, *Bulbophyllum cylindraceum*, *Cœlogyne Swaniæna*, *Bulbophyllum Careyana*, *B. (Ione) paleaceum*, and others of botanical interest.

Messrs. J. CYPHER & SONS, Cheltenham, were awarded a Silver Flora Medal for a fine group, principally of good *Cypripediums*, among which handsome forms of *C. insigne*, *C. Leeana*, *C. Tityus*, *C. Leeana-Swinburnei*, *C. Germaine Opoix*, *C. Thalia*, and *C. Felicity* were conspicuous. Other showy Orchids were arranged with them, the whole forming an effective display.

A Silver Banksian Medal was awarded to Messrs. HASSALL & Co., Southgate, for a group of varieties of *Cattleya Clarkiæ* of special interest, *C. labiata*, *C. Fabia*, *Lælio-Cattleya Lambeauiana*, a batch of *Cypripedium insigne* Harefield Hall, *C. i. Sanderæ* and other varieties, and a good specimen of the remarkable *Angræcum infundibulare* with one very large white-lipped flower.

Messrs. J. and A. A. McBEAN, Cooksbridge, staged a very pretty group for which a Silver Banksian Medal was awarded. Prominent plants were a fine blue *Vanda cœrulea* set up with brightly-coloured *Cattleya Fabia Vigeriana*; a few good forms of *C. labiata*, including a very clear white form with no colour on the lip; *C. Holmstediana*, very pretty and novel; good forms of *C. Leeana*, including *Clinkaberryana* and *giganteum*; some specially good *Odontoglossum crispum*, *O. Harryana*, and the new white *Brasso-Cattleya Leucothæa*. (See Awards.)

Mr. E. V. Low, Vale Bridge, Haywards Heath, was voted a Silver Banksian Medal for a group of handsome *Cypripediums*, among which were noted the showy *C. Thalia* Mrs. Francis Wellesley, *C. Priam magnificum*, a long way the best of the forms of *C. Priam*; *C. Fairriana* with six blooms; *C. Germaine Opoix*, *C. Actæus Fowlerianum*, *C. Leeana Corona*, and other varieties; *Cattleya Hardyana*, *C. Fabia*, and *Lælio-Cattleya Lambeauiana*.

Messrs. W. BAYLOR HARTLAND & SON, Cork, secured a Silver Banksian Medal for an effective display of hybrids of *Cattleya Bowringiana*, the showiest being some excellent varieties of *C. Portia*. A good lot of *Cypripedium insigne* Harefield Hall, *C. i. Sanderæ*, *C. Thalia* Mrs. Francis Wellesley, and *C. Rossettii* were also included.

Messrs. JAS. VEITCH & SONS, Chelsea, were awarded a Bronze Banksian Medal for a group of the beautiful pure-white *Calanthe Harrisii*, whose flowers closely resembled the *C. Cooksoniæ* illustrated in the last issue of the *Gardeners' Chronicle*; also *Cypripedium James O'Brien* (insigne Harefield Hall \times Mons. de Curte), a large flower like a darker form of *C. i. Harefield Hall*.

FRANCIS WELLESLEY, Esq., Westfield, Woking (gr. Mr. Hopkins), showed *Cattleya labiata* Her Majesty the Queen, a stately white form with a pure pink tint on the lip. (See Awards.)

Sir TREVOR LAWRENCE, Bart, K.C.V.O. (gr. Mr. W. H. White), showed splendid plants of *Trichosma suavis*, *Maxillaria phœnicantha* and *M. picta*, all freely flowered and delightfully fragrant, Mr. White being accorded a "Cultural Commendation."

Messrs. EDGAR & Co., Woodford, Essex, showed a fine seedling *Cypripedium insigne* with very dark spotting.

The Lady AUDLEY NEELD, Grittleton, Chippenham, showed *Cypripedium Grittletonense* (Stevensii \times Curtisii) and *C. Fascination* (Fascinator \times insigne Harefield Hall).

Monsieur MAURICE MERTENS, Ghent, showed

Miltonia vexillaria Leopoldii, *M. Hycana*, and other interesting Orchids.

Captain LAYCOCK, Wiseton Hall (gr. Mr. Musk), sent *Lælio-Cattleya Hy. Greenwood Laycock's* variety, a very handsome flower, much larger than the original.

C. J. PHILLIPS, Esq., Sevenoaks (gr. Mr. Bucknell), sent *Brasso-Cattleya Mme. Chas. Maron* of a dark rose colour.

AWARDS.

FIRST CLASS CERTIFICATES.

Lælio-Cattleya Prince of Orange (*L.-C. Hippolyta* \times *C. Dowiana aurea*), from Lieut.-Col. Sir GEORGE L. HOLFORD, K.C.V.O. (gr. Mr. H. G. Alexander).—A charming hybrid of novel colour, the sepals and petals bright chrome-yellow, the lip intense ruby-red. The spike bore seven flowers.

Brasso-Cattleya Digbyano-Mossiae Holford's variety (*B. Digbyana* \times *C. Mossiae Reineckiana*), from Lieut.-Col. Sir GEORGE L. HOLFORD, K.C.V.O.—Probably the largest white *Brasso-Cattleya*, the fine flowers being broad and well expanded. The disc of the fringed lip is greenish-primrose, the base having rose markings.

Cypripedium Chapmanii Westonbirt variety (*bellatulum* \times *Curtisii*), from Lieut.-Col. Sir GEORGE L. HOLFORD, K.C.V.O.—Flowers of the largest of the section, cream-white, heavily tinged and spotted with claret-purple.

Odontoglossum Chione (parentage unrecorded), from W. R. LEE, Esq., Plumpton Hall, Manchester (gr. Mr. Woodhouse).—A grand flower with bright purple sepals and petals with white tips, and white markings at the base of the segments. The lip is white with purple spots at the base.

Odontoglossum Thais (parentage unrecorded), from W. R. LEE, Esq.—Resembling one of the finest blotched *O. crispum*, but with broader lip. Segments heavily blotched with rose-purple.

AWARDS OF MERIT.

Lælio-Cattleya Danganii (*L.-C. Cappei* \times *C. Dowiana*), from FRANCIS WELLESLEY, Esq., Westfield, Woking (gr. Mr. Hopkins).—A novelty of good size and rich colour. Sepals and petals golden-yellow tinged with copper-red. Lip glowing ruby-crimson. A most effective hybrid.

Cypripedium Elatior The Shrubbery variety (*Leeana* \times *Baron Schröder*), from F. M. OGILVIE, Esq., The Shrubbery, Oxford (gr. Mr. Balmforth).—A very pretty, dark-coloured hybrid with flat, white dorsal sepal heavily spotted with purple.

Lælio-Cattleya W. J. Biggs (parentage unknown), from W. J. BIGGS, Esq., Browning Road, Enfield.—A very desirable novelty, with pretty flowers having bronzy-yellow sepals and petals and dark ruby-claret, crimped lip.

Brasso-Cattleya Leucothæa (*B. Nodosa* \times *C. Schröderæ*), from Messrs. J. & A. A. McBEAN, Cooksbridge.—Plant of dwarf habit, and the flowers of good shape and pure white.

Fruit and Vegetable Committee.

Present: J. Cheal, Esq. (in the Chair); and Messrs. C. G. A. Nix, A. W. Metcalfe, A. Dean, J. Vert, W. Pope, W. A. Humphreys, G. Kelf, G. Reynolds, J. Davis, P. D. Tuckett, J. Jaques, G. Wythes, J. Harrison, O. Thomas, and E. Beckett.

Two seedling Apples, named *Excelsior* and *Redway*, the latter a richly-coloured fruit, raised by Mr. Charles Ross, were shown by Mr. W. POPE, of Welford Park Gardens, Newbury. Messrs. JAS. VEITCH & SONS, LTD., King's Road, Chelsea, and Lord HILLINGDON, Uxbridge (gr. Mr. A. R. Allan), showed fruits of *Pear Dana Hovey*, which received an Award of Merit on November 24, 1908. Lord HILLINGDON also staged 12 dishes of choice Pears, including *Duchesse d'Angoulême*, *Beurré Diel*, *Olivier des Serres*, *President Barabé*, *Easter Beurré*, *Passe Colman*, *Josephine de Malines*, and *Duchesse de Bordeaux*. (Silver Banksian Medal.)

G. W. TYSER, Esq., Mortimer, Berkshire, set up a collection of 24 dishes of handsome, well-coloured Apples, including *Peasgood's Nonesuch*, *The Queen*, *Dumelow's Seedling*, *Lane's Prince Albert*, *Emperor Alexander*, *Blenheim Pippin*, *Court-pendû-plat*, *Cox's Orange Pippin*, and *Adams's Pearmain*.

Mr. J. RUTHERFORD sent from Gastereaux, Nova Scotia, baskets and dishes of exceptionally fine fruits of *Calville Blanc Apple*.

An interesting exhibit of Apples was shown by Mr. W. POPE from Welford Park Gardens. It consisted of 32 diverse varieties, named and unnamed, raised by Mr. Charles Ross, such a collection as probably no other raiser could equal. There were excellent fruits of such well-known, although comparatively new sorts, as *King Edward*, *Hector MacDonald*, *Charles Eyre*, *Guelph*, *Charles Ross*, *Excelsior*, *Ella*, *Rival*, *Encore*, and *The Houblon*. (Silver Banksian Medal.)

The Hon. VICARY GIBBS, Aldenham House, Herts. (gr. Mr. E. Beckett), exhibited a very superior collection of Apples, comprising 80 dishes. Varieties specially noticeable were *Bramley's Seedling*, *Potts's Seedling*, *Tower of Glamis*, *Bismarck*, *Mère de Ménage*, *Beauty of Kent*, *Peasgood's Nonesuch*, *Sandringham*, *The Queen*, *Lord Derby*, *Newton Wonder*, *Charles Ross*, *Wealthy*, *Blenheim Pippin*, *Annie Elizabeth*, *Melon Apple*, *Allington Pippin*, *Adams's Pearmain*, *American Mother*, and *Rival*. (Silver-gilt Knightian Medal.)

Mrs. V. BANKS, 102, Park Street, W., showed a remarkable collection of bottled vegetables and fruits, having 120 sorts. It was one of the best of this class of exhibit yet seen at these exhibitions. (Silver Banksian Medal.)

Mrs. J. MILLER, Moylean, Marlow, exhibited numerous glass jars of chutneys, jams, pickles, syrups and marmalades. (Silver Banksian Medal.)

AWARD OF MERIT.

Apple "Sir John Thornycroft."—A handsome, round fruit of good size, and possessing a pleasant flavour. The variety was submitted at the last meeting, and the Award was granted after receiving a favourable report on the tree from a local gardener. The parentage was reported to be *Newton Wonder* and *Cox's Orange Pippin*. The novelty was shown by Lady THORNYCROFT, Bembridge, Isle of Wight.

Scientific Committee.

NOVEMBER 7.—Present: Mr. E. A. Bowles, M.A., F.L.S., F.E.S. (in the Chair); Dr. A. Voelcker, Sir Everard im Thurn, Messrs. W. E. Ledger, J. Fraser, G. Wilson, J. W. Odell, G. Gordon, J. T. Bennett-Poë, W. C. Worsdell, E. M. Holmes, W. Hales, W. Fawcett, J. O'Brien, A. W. Sutton, R. Hooper Pearson, A. Worsley, R. A. Rolfe, and F. J. Chittenden (hon. sec.).

Octomeria sp.—Dr. RENDLE reported that the *Octomeria* referred to him at the last meeting, and shown under the name *Octomeria Baueri*, did not agree with the figure given by Bauer. Mr. ROLFE recognised it as *O. crassifolia*, a Brazilian species, described by Lindley, with whose type specimen in the Kew Herbarium it agrees well.

Crosses with Pisum.—Mr. A. W. SUTTON gave an interesting account of his experiments in crossing a Pea which he found in Palestine in 1904 with forms of the cultivated Peas. The plant found was a weak-stemmed plant, about 3 feet in height, and bearing very small, blunt pods. It had no purple colour in the leaf-axils, and was, therefore, supposed to be white-flowered (the plants being past flowering), and seed was collected. The seed was olive-green, heavily mottled with brown, varying to a dark brown. The seedlings raised in England had serrated leaflets, self- (not bi-) coloured magenta flowers, but no colour in the leaf-axils; the pods were small and obtuse, and curious in containing a white, woolly substance, similar to that contained in the pods of Beans. It appeared to resemble, in some measure, *Pisum quadratum*, which he had obtained from Kew; but in that the flowers are bicoloured, the leaflets entire, the seeds rounder, and not so dark in colour. In addition to these two, the only Pea with bicoloured flowers and no colour in the leaf-axils known to Mr. SUTTON is one obtained from Svalof, under the name "Solvar." With the idea of discovering whether this wild form could be the ancestor of the white-flowered culinary Pea (*Pisum sativum*) or the bicoloured field Pea (*P. arvensis*), which some consider varieties of one species, Mr. SUTTON made about 40 crosses with various forms, but in only four cases was it possible to grow the hybrids to F₃, or further, in two of which one of the parents was a variety of *P. sativum*, and in two varieties of *P. arvense*. In all the others sterility manifested itself, and the varieties were lost; but in the four crosses mentioned more or less perfect

fertility seems to have been achieved. The crosses were made with the sole idea of discovering the relationship the Palestine Pea had to commercial Peas. Five crosses were made with round-seeded, white-flowering varieties (*P. sativum*), and sterility prevented them being grown to F_2 ; similar results attending eight crosses made with wrinkled-seeded, white-flowered Peas. Six crosses with round-seeded, white-flowered, umbellate Peas (*P. sativum umbellatum*) gave only one that has continued fertile. Five crosses made with the degenerate types which constantly occur among cultivated varieties of *P. sativum*, gave only one which has continued fertile. Sixteen crosses with bicolor-flowered types (*P. sativum*) resulted in only two which have continued fertile. The F_1 hybrids were, as a rule, taller than the Palestine Pea, and had leaflets more or less serrated; the flowers were bicoloured. In F_2 plants, with white flowers and entire leaflets occurred, but none was found resembling the Palestine Pea, but with white flowers. It would thus appear that the Pea occurring wild in Palestine is not the plant from which the cultivated forms have been derived. Mr. SUTTON exhibited seeds of the wild form and of the cultivated ones with which it was crossed. It was unanimously resolved, on the motion of Mr. Holmes, seconded by Mr. Bennett-Poë, to recommend the award of a Certificate of Appreciation to Mr. SUTTON for his work in connection with these Peas.

Interesting Orchids.—Mr. J. O'BRIEN showed some interesting Orchids on behalf of the Rev. Mr. FLETCHER, including *Bulbophyllum Medusæ*, *Catasetum Gnomus* of Reichenbach, and a species of *Epidendrum* which Mr. ROLFE later identified as *E. Harrisoniæ*, Hook (*Bot. Mag.* t. 8392), a native of Brazil, and a somewhat variable plant.

Primula farinosa.—Mr. GORDON remarked that he had noticed a form of *Primula farinosa* in the Alps with a distinct white centre to the flower, and with the tips of the petals pink. He dug the plant up, but the new flowers came more and more like the type, until the last ones were entirely like it.

Malformation of *Cattleya labiata*.—Mr. G. WILSON showed flowers of *Cattleya labiata* showing false peloria, produced on a plant which each year produces malformed flowers, though not always malformed in the same fashion as in the present case.

Ceropegias.—Mr. LEDGER exhibited a flowering spray of *Ceropegia Rothii* × *Gürke*, new hybrid. Raised by Dr. Paul Roth, of Bernburg, from seed obtained in 1908 by crossing *C. Sandersonii*, Hook, with pollen of *C. radicans*, Schlecht, two South African species. A twining succulent, with fleshy leaves, intermediate between both parents. The flowers resemble those of the seed parent in colour, but the umbrella-like apex in that species is here modified to erect, replicate lobes, cohering at the top, somewhat as in *C. hybrida*, N. E. Br. (in *Gardeners' Chronicle*, December 8, 1906), a flower of which was also shown. Mr. LEDGER stated that, in describing the last-named plant, Mr. N. E. Brown drew attention to the peculiar structure of the Asclepiads, unique among Dicotyledons in having the pollen agglutinated into a waxy mass, and so placed that fertilisation would seem to be only possible through insect agency, and that to do so artificially would, if at all possible, prove a very delicate and difficult operation. Dr. Roth has, however, successfully accomplished, in this instance, the first artificial hybridisation to be recorded in the genus *Ceropegia*. The plant is described in *Monatsschrift für Kakteenkunde*, for January, 1911, pages 8-9. Mr. LEDGER also showed a flowering spray of *C. Rendallii*, N. E. Br., a slender-growing, tuberous-rooted species. The corolla lobes of the delicate and beautiful flowers are united into an umbrella-like canopy, of a bright-green colour, supported on five short stalks over the mouth of the tube, which is white in the upper part and grey-green in the inflated base. This species belongs to the section which includes *Sandersonii*, *Monteiroæ*, and the not yet introduced *fimbriata*. *C. Rendallii* was first sent to Kew early in the year 1894, by the late Dr. P. Rendall, of Barberton, after whom it was named. (*Kew Bulletin*, No. 87, March, 1894, 100.) Long lost to cultivation, a tuber (without name) was sent in 1908 by Mr. George Thorn-

croft, of Barberton, to the late Mr. W. E. Gumbleton, who presented it to Mr. Ledger, and from which all the plants at present grown are derived. Mr. Ledger has raised a hybrid from *C. Barklyi*, Hook. f., fertilised, in 1909, by pollen of this species.

MANCHESTER AND NORTH OF ENGLAND ORCHID.

NOVEMBER 2.—*Committee present*: Rev. J. Crombleholme (in the Chair); and Messrs. R. Ashworth, J. Bamber, W. R. Lee, C. Parker, G. H. Peace, H. Thorp, Z. A. Ward, J. C. Cowan, J. Cypher, W. Holmes, A. J. Keeling, D. McLeod, W. Stevens, and H. Arthur, secretary.

AWARDS.

FIRST-CLASS CERTIFICATES.

Cattleya labiata alba var. "*Richard Le Doux*," from R. LE DOUX, Esq.

Oncidium ornithorynchum album, from G. H. PEACE, Esq., and

Cattleya labiata var. "*W. R. Lee*," from W. R. LEE, Esq.

AWARDS OF MERIT.

Cattleya labiata, var. "*Helene*," and *Lælia Bella* (*majalis* × *purpurata*), a very fine flower, intermediate between the two parents, both from W. R. LEE, Esq. *Cattleya Armstrongæ*, "*Ward's*" var., *C. Armstrongæ* var. "*Mrs. Ward*," *C. Williamsii* (*Gaskelliana alba* × *Harrisonæ*), *Cypripedium Perfection*, "*Ward's*" var., and *C. Actæus*, "*Ward's*" var., all from Z. A. WARD, Esq. *Cattleya Folia*, var. "*Prince John*," from J. MCCARTNEY, Esq., a fine flower, with intensely-coloured lip. *Cypripedium Pyrrha*, "*Thompson's*" var., *C. Grittleton* (*Stevensii* × *Curtisii exquisitum*), *C. Spicerianum* × *Thompsonii*, unnamed, and *Odontoglossum hololeuca*, "*Walton Grange*" var., these four shown by Wm. THOMPSON, Esq.

VENTNOR AND UNDERCLIFF HORTICULTURAL AND CHRYSANTHEMUM.

NOVEMBER 7, 8.—The annual show of the above society took place on these dates in the Ventnor Town Hall.

In the plant classes, the most successful exhibitor was J. C. TOMPKINS, Esq. (gr. Mr. G. Plumley), who won the 1st prizes for (a) two plants of large-flowering Japanese varieties; (b) one specimen plant of a Japanese variety; and (c) one plant of an incurved variety. In the open classes for cut blooms, Mr. R. MURRAY was awarded the 1st prize for 24 cut blooms of Japanese varieties; 2nd, Col. STEVENSON (gr. Mr. W. Woods). For 12 cut blooms of this type Mr. R. MURRAY was placed 1st, and this gentleman was also successful in the classes for (a) 12 cut blooms arranged with foliage, (b) 12 incurved varieties, and for (c) a collection of single blooms, Mr. W. GEE being awarded the 2nd prize in the class for single blooms. Col. STEVENSON excelled in the class for six blooms of Japanese varieties; 2nd, Mr. R. MURRAY. In the classes for a decorated table and an epergne of Chrysanthemums, Miss A. E. LESTER was awarded the 1st prizes, whilst Mr. W. GEE showed the best hand bouquet. Mr. J. C. TOMPKINS was awarded the 1st prize for a group arranged by professional gardeners, whilst Mrs. HAHNEMANN was successful in the class for a group shown by an amateur. In the open classes for miscellaneous plants, Miss MITCHELL was awarded the 1st prize for six table plants.

STIRLING CHRYSANTHEMUM.

NOVEMBER 8, 9.—This society held its 22nd annual show in the Albert Hall, Stirling, on the above dates. A large increase was made in the fruit section, the display in the Grape classes being especially fine. The large blooms of Chrysanthemums were another special feature.

The principal class for cut blooms called for six vases, three blooms in each, in eight varieties. Mr. GEO. STEWART, Tulliallan, secured the premier position, thus winning the President's Cup. 2nd, Mr. JAS. SMALL, Norwood, Alloa.

There were numerous exhibits of single Chrysanthemums, the variety Mary Richardson being

the most prominent. In this section Mr. Wm. WATT, Bridge of Allan, showed in fine form.

Specimen Chrysanthemum plants were good. Mr. HENRY GRAY, Park Terrace, Stirling, led in the class for four plants of Japanese varieties, and Mr. R. JENNER, Newhouse, occupied the premier position for plants of single-flowered varieties. There were the usual classes for Primulas, Roman Hyacinths, table plants, Ferns and other foliage plants.

Excellent Grapes were shown by Mr. JAS. SMALL, Norwood, and Mr. MITCHELL, Airthrey Castle, showed good "Muscat" Grapes and Pears.

Vegetables made a meritorious display. Mr. SHAW, Kippen, staged the winning exhibit in the class for a collection of vegetables. 2nd, Mr. JOHN OGILVIE, Larbert. 3rd, Mr. GEO. COLTART, Alloa. Mr. GEO. WATSON, Kippen, had an uninterrupted run of success in the amateur section.

Honorary exhibits were shown by Mr. JOHN CRAIG, Mr. McOMISH, and Mrs. TASKER, all of Stirling; while Mr. JAMES THOMSON, St. Ninians, had a stand of early-flowering Chrysanthemums. Messrs. GEORGE BUNYARD & Co., Royal Nurseries, Maidstone, sent an exhibit of Apples which added greatly to the attractiveness of the exhibition. As a result of the disastrous gale on Sunday, November 5, the glass-houses of Messrs. DRUMMOND, of Stirling, were blown down, preventing them from exhibiting, as intended, over 60 varieties of early-flowering Chrysanthemums.

DERBYSHIRE GARDENERS' ASSOCIATION.

NOVEMBER 10, 11.—The annual exhibition of the Derbyshire Gardeners' Association was held on Friday and Saturday at the Albert Hall, Derby on these dates, and although there was a fine show, the attendance was not satisfactory.

Special mention may be made of a collection of Begonias of the Gloire de Lorraine type, including Turnford Hall, which filled a space the whole width of the hall; the exhibitor was Capt. DRURY-LOWE, Locke Park.

The Rev. HENRY BUCKSTONE (gr. Mr. Sharnbrook) staged a table of Cyclamens; amongst them was the new fringed salmon variety Mrs. Buckstone. He also showed Begonia Idealea.

The 1st prize for a group of Chrysanthemums arranged for effect, was exhibited by C. W. CATT, Esq., Duffield (gr. Mr. J. H. Coley).

Cut blooms were well represented. For 18 Japanese varieties, Mr. COLEY led with Master James, Mrs. Marsham, Sir F. Crisp, Lady Crisp, Evangeline, Lady Talbot, Leigh Park Wonder, Purity, W. Jinks, H. Perkins, Reginald Vallis, and Mrs. C. Beckett. Capt. DRURY-LOWE (gr. Mr. Sherwin) was placed 2nd. Mr. WOOD excelled in the class for 12 Japanese varieties; 2nd, Mr. F. MEAKIN.

For six vases of Japanese varieties Mr. J. WOOD won the 1st prize and Mr. F. MEAKIN the 2nd prize. For 12 incurved blooms, Mr. WOOD again was successful and Mr. MEAKIN 2nd.

In the class for six vases of single Chrysanthemums, Mr. J. COLEY won the 1st prize and Mr. SHERWIN the 2nd prize.

The prize for the table decoration of Chrysanthemums was won by Mrs. GARNETT, Hatton; while Mrs. NORMAN, Derby, was successful in the classes for a bouquet and a wreath of Chrysanthemums.

On Saturday morning the local school children were admitted to the show, when Mr. Sharnbrook gave a lecture on "School Gardening."

CHESTER PAXTON.

NOVEMBER 14, 15.—This society, as usual, arranged an autumn exhibition in the Town Hall.

CUT BLOOMS.—In the class for 18 Japanese Chrysanthemums in six varieties, arranged in vases, Sir GILBERT GREENALL, Bart. (gr. Mr. C. Goves), won the 1st prize with an excellent exhibit, having fine blooms of such sorts as Frances Jolliffe, Hon. Mrs. Lopes and President Viger; 2nd, R. BROCKLEBANK Esq. (gr. Mr. Thos. Winkworth). Sir GILBERT GREENALL also excelled in the class for 12 Japanese blooms shown in two vases. Mr. J. FLEET showed the best five blooms in one vase, and Mr. G. MORGAN the best three. For five incurved blooms

Sir GILBERT GREENALL was again to the fore, having splendid blooms of Calypso; and he also showed best in the class for 12 Japanese blooms arranged on boards. Mr. A. WALKER won in the class for six vases of naturally grown flowers; whilst in the classes for six and three vases respectively Messrs. A. D. P. CAMPBELL were the 1st prize winners. For a group of single Chrysanthemums, the Rev. Canon W. YERBURGH (gr. Mr. A. Walker) led with a pleasing collection, and the best representative group of the flower was shown by T. GIBBONS FROST, Esq. (gr. Mr. T. Gilbert). Mrs. THOMPSON (gr. Mr. J. Hill) won in the class for single Chrysanthemums with charming plants.

FRUIT.—The best two bunches of black Grapes were shown by Sir GEO. MEYBRICK, Bart. (gr. Mr. W. Pilgrim), and the best two bunches of white Grapes by E. LEIGH, Esq. (gr. Mr. H. Bateson). Col. THOS. GEE (gr. Mr. P. Greene), Talycafn, won the 1st prize for six dishes of dessert Apples with excellent fruits; 2nd, Mr. E. PORRITT, Christleton Grange. Mr. GREENE was again to the fore in the class for 12 varieties of kitchen Apples. Mr. PORRITT led for 24 varieties of Apples and Pears, with a fine collection, the best being (Apples) Peasgood's Nonesuch, Newton Wonder, Bismarck, Warner's King and Bowhill Pippin; (Pears) Pitmaston Duchess, Charles Ernest and Beurré Diel; 2nd, C. ROBERTS, Esq. (gr. Mr. H. Dutton), Upton. Prominent exhibitors in the single dish classes for Apples were Messrs. PILGRIM, J. WEAVER, P. GREENE, J. SHAW, G. FAULKNER and E. PORRITT.

Mr. J. FLEET staged the best six dishes of dessert Pears.

Amongst the non-competitive the Duke of WESTMINSTER (gr. Mr. N. F. Barnes) contributed a magnificent collection of Apples and Pears.

Messrs. CLIBRANS, Altrincham, set up a charming bank of Begonias in many varieties, all the plants being well-flowered.

Messrs. DICKSONS, Chester, furnished the end of the room with a pleasing display of Chrysanthemums. In each case the Society's Gold Medal was awarded.

Messrs. McHATTIE & Co. had a display of Chrysanthemums, fruit, &c., for which a large Silver Medal was awarded.

Mr. W. RICHARDSON staged a group of Cypripediums, Mr. C. J. HOUGHTON trained Chrysanthemums, and Mr. J. FRANCIS a collection of Cacti.

WOOLTON CHRYSANTHEMUM.

NOVEMBER 15.—The number of entries at this annual show exceeded those of last year by some 50, and the exhibits were generally of average quality, so that the results were highly satisfactory. This exhibition is noted for fine displays of single Chrysanthemums, as one of the most important prizes, the "Tate" Challenge Trophy, is offered for these flowers; P. W. BARR, Esq., last year's winner, was again successful, thus winning the award outright.

For 24 Japanese blooms, Sir W. H. TATE, Bart. (gr. Mr. G. Haigh), led with a good, even stand, followed by W. TOD, Esq. (gr. Mr. G. Eaton), and Lt.-Col. GASKELL, J.P. (gr. Mr. J. Stoney), in this order.

The finest exhibit of 18 blooms was shown by Mrs. CLARK (gr. Mr. J. Clarke); whilst in the class for 12 blooms, P. W. BARR, Esq. (gr. Mr. T. Keightley), was successful. Mrs. CLARK won the 1st prize for 18 incurved blooms; whilst for 12 blooms of this type, A. S. MATHER, Esq. (gr. Mr. H. Howard), was successful. The best nine vases of singles, nine flowers in each vase, were shown by P. W. BARR, Esq. (gr. Mr. T. Keightley), his best varieties being Meta, G. W. Forbes, Altrincham Crimson, and A. K. Askill. W. TOD, Esq. (gr. Mr. G. Eaton), and A. T. MATHER, Esq., were awarded the 2nd and 3rd prizes respectively. Mr. J. MADDOCKS excelled in the classes for bouquets and sprays of flowers, in a keen competition.

H. G. SCHINTZ, Esq. (gr. Mr. R. Hitchman), won four 1st prizes in the pot plant classes, with large specimens, carrying excellent blooms. W. CUNNINGHAM, Esq. (gr. Mr. W. Wilson), secured three 1st prizes with well-trained specimens.

In the classes for other plants, Sir W. H. TATE, Bart., had the best Palm; W. TOD, Esq., (1) the best specimen Fern, (2) the best speci-

men of any other foliage plant, and (3) the best Cypripedium. Col. J. P. REYNOLDS (gr. Mr. G. Lowe) led for Begonias, and A. T. MATHER, Esq., for any other flowering plant, with a good Eucharis.

J. W. HUGHES, Esq. (gr. Mr. J. McColl), was successful in the class for black Grapes, and in several of the classes for Apples and Pears. W. CUNNINGHAM, Esq., was awarded the 1st prizes for white Grapes and stewing Pears. Other successful exhibitors of fruit were Sir W. H. TATE, Bart., and J. B. HINSHAW, Esq. (gr. Mr. H. Hudson).

The classes for vegetables were strongly contested. H. G. SCHINTZ, Esq., showed the choicest collection.

NEWCASTLE-ON-TYNE CHRYSANTHEMUM.

NOVEMBER 15, 16.—This annual exhibition was this year of greater importance than usual, as it was held in conjunction with a Fruit Show and Congress arranged by the North of England Horticultural Society. The combined shows were accommodated in the large Corn Market and Town Hall, Newcastle-on-Tyne, and resulted in one of the finest autumn exhibitions held in the provinces. Papers were given both in the afternoon and evening of each day in the Mining Institute. The syllabus included such subjects as fruit growing, horticultural education, summer flowering Chrysanthemums, and fruit bottling.

The Chrysanthemum show was the finest ever seen in the North of England, and all classes were well contested.

In the class for 12 vases of the Japanese type in 12 varieties, Captain J. F. LAYCOCK, Wiseton, Bawtry, Notts (gr. Mr. G. Musk), was awarded the 1st prize, which included a silver cup; this being the third year in succession he has won the cup now becomes his absolute property. The blooms included Mrs. R. H. Marsham, Mrs. F. C. Stoop, Master David, Rose Pockett, F. S. Vallis, Reginald Vallis, Master James, Mrs. W. Knox, Eclipse, Sir Frank Crisp, J. Lock, and the three of most blooms in the show of Mrs. A. T. Miller. 2nd, The Countess of RAVENSWORTH, Cresswell Hall, Morpeth (gr. Mr. R. Addeson).

In the class for six vases of the Japanese type, Capt. LAYCOCK was placed 1st with finely-finished flowers of Mrs. F. W. Vallis, Master James, Melchet Beauty, and Mrs. A. T. Miller; 2nd, C. LACY THOMPSON, Esq., Brampton (gr. Mr. A. W. Appleton).

For four vases of the Japanese type, C. J. LAYCOCK, Esq., secured the 1st award; 2nd, R. D. MARSHALL, Esq.

For three blooms of white Japanese varieties, Captain LAYCOCK showed the winning exhibit; 2nd, Hon. Mrs. A. ROBERTSON, Norham-on-Tweed (gr. Mr. G. Little).

For a group of Chrysanthemums and other flowering and foliage plants, A. E. BAINBRIDGE, Esq., Lynwood, Jesmond (gr. Mr. T. Bell), was placed 1st; 2nd, T. KENDALL, Esq., Preston Hall, N. Shields (gr. Mr. J. Hitherington).

Captain LAYCOCK was awarded the 1st prize in the class for three blooms of a yellow Japanese variety; 2nd, R. D. MARSHALL, Esq.; whilst for three of any other variety, excepting white or yellow, Hon. Mrs. ROBERTSON was successful.

In the classes for Incurved Chrysanthemums, Capt. LAYCOCK staged the winning exhibit in each. The variety Buttercup and the Japanese variety Mrs. A. T. Miller above mentioned was awarded the North of England Horticultural Society's Silver-gilt Medal. The single-flowered classes were well contested, and some fine varieties were included.

In the classes confined to growers in Northumberland and Durham, the best four vases of the Japanese type, dissimilar, were shown by A. E. BAINBRIDGE, Esq.; 2nd, Mrs. TRANTER, The Grange, Wickham.

For two vases the Countess of RAVENSWORTH was successful; J. B. SIMPSON, Esq., Wylam (gr. Mr. Kerr), being placed 2nd.

The Rt. Hon. W. RUNCIMAN, Esq. (gr. Mr. J. Askew), showed the winning exhibit in the class for four vases of Incurved varieties; 2nd, Mr. W. THOMPSON.

The classes for bush plants were well contested, and were a striking feature of the show. Exhibits of vegetables were of a high standard of excellence, and mostly grown by the local pitmen.

TRADE EXHIBITS.

The North of England Horticultural Society made the following awards:—

Gold Medals to Messrs. CLIBRANS, Manchester, for vegetables and winter-flowering Begonias of the Mrs. J. Heal section, and Messrs. KENT & BYDON, Darlington, for flowers, including Chrysanthemums, Lilliums, and Carnations; also hardy fruits.

Silver-gilt Medals were awarded to Messrs. FINNEYS, Newcastle-on-Tyne, for vegetables; Messrs. W. LAWRENSON, Yarm and Newcastle, for fruit, Heaths, and other winter-flowering plants; and Messrs. MICHIE & Co., Alnwick, for a collection of 120 dishes of Apples grown in the three northern counties.

Silver Medals to Messrs. FELL & Co., Hexham, for Apples, foliage and flowering plants; Mr. H. EVANS, Newcastle, for dwarf decorative Chrysanthemums grown in small pots; FOUR OAKS Co., Sutton Coldfield, for spraying apparatus and garden tools; Messrs. RENSCHAW, Sunderland, for Bamboo and Reed covering; W. J. WATSON, LTD., for vegetables and flowering plants; and Messrs. J. ROBSON & SONS, Hexham, for fruit and hardy shrubs.

Bronze Medals were awarded to Messrs. DICKSONS, Chester, for Chrysanthemums, and Messrs. PORTEOUS & THOMPSON for Apples.

NORTHERN COUNTIES FRUIT CONGRESS COMPETITIVE CLASSES.

In the class for 12 dishes of hardy fruits grown by an amateur employing a regular gardener, the 1st prize was won by Mrs. CLAYTON, The Chesters (gr. Mr. J. Cocker). This competitor showed Apples, including Charles Ross, Blenheim Pippin, Lane's Prince Albert, Lord Derby, King of Tompkins County, Emperor Alexander, Peasgood's Nonesuch, and fine Pears Beurré Bosc and Beurré Diel. 2nd, Dr. STEWART, Hexham (gr. Mr. H. Lloyd). 3rd, E. A. HARRISON, Esq., Hexham (gr. Mr. J. M. Robson).

In the class for 12 dishes of Apples, Councillor W. ALEXANDER, Long Close, Hexham, was successful, showing Bramley's Seedling, Newton Wonder, Golden Spire, Worcester Pearmain, King of the Pippins, Lord Derby, Lane's Prince Albert, Royal Jubilee, Alfriston, Warner's King, Bismarck, and Cox's Orange Pippin. 2nd, Lord RAVENSWORTH (gr. Mr. E. Tindale), whose best dishes were Cellini Pippin, Mère de Ménage, and King of Tompkins County.

In the class for nine dishes, the 1st prize was won by Councillor ALEXANDER, Hexham, who showed Lord Derby, Warner's King, Ecklinville Seedling, Bramley's Seedling, Newton Wonder, Bismarck, Worcester Pearmain, King of Pippins, and Cox's Orange Pippin. 2nd, A. B. COLLINGWOOD, Esq., Lilburn Town (gr. Mr. Lovatt).

Councillor ALEXANDER, Hexham, won in the classes for cooking Apples and for a dish of Newton Wonder; 2nd, Mr. G. PATTISON.

Councillor ALEXANDER was placed 1st in a strong competition for three dishes of cooking Apples; 2nd, W. J. SANDERSON, Esq., Warkworth (gr. Mr. W. Sage).

In the class for three dishes of dessert Apples, Sir H. D. BLACKETT, Bart., Matfen Hall, Corbridge (gr. Mr. W. Gentles), was successful with Cox's Orange Pippin, Lamb Abbey Pearmain, and Allington Pippin.

There were 20 competitors in the class for Bramley's Seedling, in which Mr. T. SIMPSON, Hepscoth, excelled.

For three dishes of Pears, Mr. DIXON, Wylam, excelled with Durondeau, Beurré Diel and Doyenne du Comice; 2nd, JAS. KNOTT, Esq., Close House, Wylam (gr. Mr. J. Snell).

The Earl of DURHAM, Lambton Castle (gr. Mr. Smith), was successful in the class for a dish of Pears, showing Beurré Diel.

In the society's open class for two dishes of Apples, Captain J. F. LAYCOCK, D.S.O., Wiseton, Notts. (gr. Mr. G. H. Musk), was successful; 2nd, Lord RAVENSWORTH (gr. Mr. Tindale); whilst for two dishes of Pears, Mr. E. TINDALE won the 1st prize; 2nd, Mr. H. SMITH.

A group of 50 dishes of the leading varieties of Apples were shown from the Northumberland County Council plots by Mr. CHISHOLM, Lecturer under the Northumberland County Council. (Silver Medal.)

A fruiting plant of Banana was exhibited by the Right Hon. C. TREVELYN, Bart., Wallington (gr. Mr. E. Keith). (Silver Medal.)

BOLTON CHRYSANTHEMUM.

NOVEMBER 17, 18.—The autumn show of this society was held in the Albert Hall on these dates. The hall was overcrowded, many of the exhibits being set up in the annexe and long passages.

The most important class was for a circular group of miscellaneous plants arranged for effect in the centre of the hall. The entries numbered four, all of which were of high quality. The 1st prize was awarded to JOHN HAREWOOD, Esq. (gr. Mr. W. Burgess), for a charming display, in the centre being a fine Palm, whilst single-stemmed Crotons were well furnished with foliage. Cattleyas, Oncidiums, Cyclamens, Sonerilias, and other flowering plants provided bright colours; J. W. MAKANT, Esq. (gr. Mr. H. Shone), was placed 2nd, showing an effective exhibit, with a liberal display of Orchids; and 3rd, E. T. CROOK, Esq. (gr. Mr. J. Wainwright).

In the class for a group of undisbudded Chrysanthemums, there were three contestants. G. T. PECK, Esq. (gr. Mr. B. Hardy), excelled in this class, his exhibit being characterised by brightness and good staging; Mr. W. BURGESS was a close 2nd, and 3rd, Miss A. N. PHILIPS, Prestwich (gr. Mr. D. Wilson).

Mr. WILSON was the only exhibitor for the large-flowered group, having good blooms well arranged.

J. MCCARTNEY, Esq. (gr. Mr. J. Holmes), secured the leading award for a table of Orchids artistically arranged with good types of Cattleyas, Cypripediums, Oncidiums and other flowers.

In the three classes for Roman Hyacinths, Mr. D. WILSON secured two 1st prizes, and Mr. B. HARDY one 1st prize, all the plants being well grown. W. EDGE, Esq. (gr. Mr. M. Taylor), was successful with Primulas. Mr. JAS. ENTWISTLE secured the 1st award with a choice vase of Carnations in a class for these flowers.

Cut blooms were, as usual at this show, exhibited in good form, fine, massive blooms of good colour being staged in the premier class for 12 Japanese and 12 incurved blooms, in which Sir GILBERT GREENALL, Bart., Warrington (gr. Mr. C. Goves), excelled; his incurved varieties were specially well staged.

NATIONAL CHRYSANTHEMUM.

NOVEMBER 20.—The Executive Committee of this Society met at Carr's Restaurant, Strand, on this date. Mr. T. Bevan occupied the chair.

The Secretary was authorised to make the necessary arrangements for entering into a contract with the Crystal Palace Co. for holding the shows of the Society there next year. The interim financial statement was submitted, showing a substantial balance.

The Chairman of the Floral Committee, Mr. Crane, reported that that afternoon's meeting had been a record one. One hundred and six novelties had been presented for award, of which 14 had been awarded certificates, 16 were commended, and one received an award for its colour.

The Rochford and District Chrysanthemum Society was admitted in affiliation, and 10 Fellows and 23 members elected.

NATIONAL VEGETABLE.

NOVEMBER 21.—The third annual general meeting of this Society was held at the Royal Horticultural Hall, Vincent Square, Westminster, on Tuesday last. Mr. Alexander Dean presided. The annual report and balance-sheet showed that the Society is in a sound financial position. Owing to the poor attendance at the annual exhibition last year, it was decided to hold next year's show at Watford, where there is a large class interested in gardening and farming. The exhibition is fixed for October 2, and it is expected that the schedule will be ready for issuing in a few weeks time. The following officers were elected:—The Duke of Portland was re-appointed president; and the vice-presidents re-elected. Mr. G. Wythes having resigned the office of treasurer, Mr. H. J. Wright was elected in his place. Mr. E. G. Quick was re-elected hon. secretary, Mr. A. Dean chairman of committee, Mr. O. Thomas vice-chairman, and a small sub-committee was appointed to prepare the schedule, to which offers of prize are invited.

SCOTTISH HORTICULTURAL.

NOVEMBER 16, 17, 18.—The 26th annual Chrysanthemum exhibition of this association was held in the Waverley Market, Edinburgh, on the foregoing dates. The last day (Saturday) was fine; but with this exception, the weather conditions, though mild for the season, were most disagreeable. The first day was stormy, with strong blasts of rain and sleet; and on the second day, the rain descended in an incessant downpour. Notwithstanding this, the attendance was extremely satisfactory; the receipts at the door, exclusive of tickets, were £30 in excess of those of the four-day show of 1910, and £14 in excess of those of the three-day show of 1909. The total number of visitors was 21,173, 10,285 of whom were present on the last day.

In comparison with the figures of former years, the entries did not vary much from the average for the past five years. The general quality of the exhibits was of a very high standard. In the big bloom classes, it was the general opinion that finer flowers have never been staged, and that their equal has seldom been seen. Some of the blooms in the 1st prize exhibits in Classes 1 and 2 were magnificent.

In the premier class for cut blooms, consisting of 15 vases of Japanese Chrysanthemums in 15 varieties, three blooms in each vase, there were six entries. The awards for this class are the City of Edinburgh and Queen Victoria Memorial prizes, presented by the Magistrates and Town Council. The 1st prize was won by Captain STIRLING, of Keir, Dunblane (gr. Mr. Thos. Lunt); the prize consisting of the City of Edinburgh Cup (to be won three times) and £12. This is the second time that the cup has been won by the same competitor. The 2nd prize was awarded to JOHN JAMESON, Esq., J.P., D.L., St. Marnocks, Co. Dublin (gr. Mr. James McKellar); the 3rd to Sir JAMES SIVEWRIGHT, K.C.M.G., Tulliallan Castle, Kincardine-on-Forth (gr. Mr. George Stewart); and the 4th to DAVID THOMSON, Esq., Greenfield, Alloa (gr. Mr. L. McLean). The varieties in Captain STIRLING's exhibit, with the points awarded, were as follows:—

Variety shown.	Maximum Points.	Points Awarded.
Hon. Mrs. Lopez ...	12	10½
Purity ...	12	11
Lady E. Letchworth ...	12	10
White Venosa ...	12	9½
George Hemming ...	12	10
Edith Jamieson ...	12	10
Mrs. F. W. Vallis ...	12	10½
D. B. Crane ...	12	10½
Mrs. L. Thorn ...	12	10½
Mrs. Pearson ...	12	10
Mrs. A. T. Miller ...	12	11
Bessie Godfrey ...	12	10½
F. S. Vallis ...	12	10½
R. Vallis ...	12	10
White Queen ...	12	11½
	180	156

Mr. JAMESON's blooms, with the points awarded, were:—F. S. Vallis (8), Master David (10), Lady Talbot (10), Mrs. Chas. Penford (8½), Frances Jolliffe (10½), J. Lock (7½), Rose Pockett (10), W. Mease (10), Mrs. L. Thorn (9½), Lady Conyers (10½), Mrs. W. Knox (9), Miss E. Green (8½), Hon. Mrs. Lopes (9), Edith Jameson (9), and D. B. Crane (10½).

The Scottish Challenge Cup, competition for which is confined to Scottish gardeners and amateurs, together with £6 in money, was offered for eight vases of Japanese Chrysanthemums in eight varieties, three blooms in each vase. It was won this year for the first time by WM. RAMSAY, Esq., Bowland, Stow (gr. Mr. Robt. Honeyman), with an extremely well-grown collection, the total points awarded falling short of the maximum only by seven. The varieties were Lady Talbot, Mrs. A. T. Miller, Hon. Mrs. Lopes, Mary Poulton, Mrs. F. W. Vallis, Mrs. L. Thorn, Algernon Davis, and Purity. The bloom of Mary Poulton was awarded the Silver Medal offered for the best bloom in the show. JOHN GRAEME THOMSON, Esq., of Norwood, Alloa (gr. Mr. James Small), was 2nd in this class with 78 points. 3rd, JAMES E. B. BAILLIE, Esq., of Dochfour, Inverness (gr. Mr. R. Mackenzie), with 77½ points. Mr. RAMSAY also won the 1st prize in the class

for six vases of Japanese Chrysanthemums in six varieties, three blooms in each vase, with an aggregate of 43 points; Mr. GRAEME THOMSON was placed 2nd with 42½ points; and W. T. MACLELLAN, Esq., Auchanault, Helensburgh (gr. Mr. H. MacSkimming), was 3rd with 40 points.

In the class for 12 blooms of Japanese Chrysanthemums, in 12 varieties, shown on boards, Captain STIRLING was placed 1st, Mr. GRAEME THOMSON 2nd, and Mr. J. E. B. BAILLIE 3rd.

For two vases of Japanese Chrysanthemums, one variety, three blooms in each vase, the 1st prize-winner was JOHN JAMESON, Esq.; 2nd, Col. MORE NISBETT, The Drum, Midlothian (gr. Mr. R. Whannell); 3rd, Col. E. R. STEWART RICHARDSON, of Ballathie, Perthshire (gr. Mr. J. E. Davies).

Capt. STIRLING excelled in the class for four vases of Japanese Chrysanthemums, in 12 distinct varieties, three blooms in each vase, the 2nd prize being awarded to Mr. J. E. B. BAILLIE.

The best four vases of Japanese Chrysanthemums, in four varieties, three blooms in each vase, were shown by W. H. DOBIE, Esq., Dollarbeg, Dollar (gr. Mr. J. Waldie); 2nd, Mrs. R. PROCTOR, Claremont, Alloa (gr. Mr. A. Gauld).

Mr. DOBIE also excelled in the class for two vases of Japanese Chrysanthemums, in six distinct varieties, three blooms in each vase; 2nd, J. H. YOUNGER, Esq., Bughrigg, Coldstream (gr. Mr. J. Loan).

In the class for two vases of Chrysanthemums in three varieties, quality and decorative effect to be considered of first importance by the judges, the 1st prize was awarded to the Earl of WEMYSS, Gosford, East Lothian (gr. Mr. W. Galloway); 2nd, Mrs. W. L. BOASE, Binrock, Dundee (gr. Mr. J. Beats).

The best single vase of Chrysanthemums, dis-budded, and arranged for effect, was shown by Lord ELPHINSTONE, Carberry Tower, Musselburgh (gr. Mr. D. Kidd); 2nd, the Earl of HOME.

C. W. COWAN, Esq., Dalhousie Castle, Bonnyrigg (gr. Mr. W. G. Pirie), was placed 1st for six vases of single Chrysanthemums, in six varieties, not more than 12 sprays in each vase, the Earl of WEMYSS being placed 2nd, and Sir WILFRED LAWSON, Bart., Brayton, Carlisle (gr. Mr. A. Knight), 3rd.

Mr. COWAN was also successful in the class for three vases of single Chrysanthemums in three varieties, and again the Earl of WEMYSS was 2nd.

For two vases of winter-flowering Carnations the 1st prize was won by Lord STRATHEDEN AND CAMPBELL, Hartrigg House, Jedburgh (gr. Mr. A. Williams); 2nd, J. H. HOULDSWORTH, Esq., Castlebank, Lanark (gr. Mr. A. McKinnen).

In a class, open only to market-growers, for six vases of Chrysanthemums in six varieties, three single and three double varieties, and not more than 12 sprays or disbudded blooms, there was only one competitor, Mr. J. BRUCE, Davidson's Mains, Midlothian, and he was awarded the 1st prize.

The Silver Medal offered for the best new Chrysanthemum not yet in commerce was awarded to Messrs. W. WELLS & Co., Merstham, for Pockett's "White Australia."

Miss NEWLANDS, Leith, was the only competitor in the class for a bride's and two bridesmaids' bouquets, and she was awarded the 1st prize. T. G. BISHOP, Esq., Dalmore, Helensburgh (gr. J. Hood) showed the best bouquet of Chrysanthemums, hand-bouquet of the same flower, and basket of hardy foliage and berries. Sir W. LAWSON won 1st prizes for (a) a bouquet of Carnations, and (b) a basket of flowers (excluding Chrysanthemums).

In the class for a decorated dinner table (Orchids excluded) A. SINCLAIR HENDERSON, Esq., was awarded the 1st prize. The decoration consisted of pale pink-coloured Carnations, with foliage.

In the classes for Chrysanthemum plants the principal prize-winners were Lady STEEL, Boroughfield, Edinburgh (gr. Mr. W. Michie), and D. R. W. HINE, Esq., Hollywood, Edinburgh (gr. Mr. W. Pulman). The Earl of HOME, K.T., and Sir JOHN GILMOUR, Bart., showed the best Palms. Sir WM. YOUNGER, Auchan Castle, Moffat (gr. Mr. J. Macgregor) was 1st for Dracenas; Mrs. AIKMAN, West Colinton House (gr. Mr. R. Dickson) for Primula sinensis; the Hon. Mrs. BAILLIE HAMILTON, Langton, Duns (gr. Mr. G. D. Kerr), for Primula obconica; Mrs. MACKINNON for six table plants, excluding Ferns; ALEX. COWAN, Esq., Valleyfield, Penicuik (gr. Mr. J. Turnbull) for six dwarf hardy

Ferns; Mr. A. JOHNSTONE, Hay Lodge, Edinburgh, for six Ferns suitable for the table; Mrs. WAUCHOPE, of Niddrie, Craigmillar (gr. Mr. J. Alexander) for six plants of *Salvia splendens*; Provost DUNCANSON, Fenton House, Alloa (gr. Mr. C. Palmer), for six pots of Roman Hyacinths; the Earl of HOME, K.T., for six pans of Lily of the Valley; Mrs. BAILLIE HAMILTON, for six Cyclamens; Major THORBURN, Craigerne, Peebles (gr. Mr. J. McNeill), for six specimen Ferns; Sir W. LAWSON, for six decorative foliage plants; Mrs. ALEX. ROSE, Richmond House, Dowanhill, Glasgow (gr. Mr. Jas. Templeton), for four decorative foliage plants; STEPHEN MITCHELL, Esq., Kippen (gr. Mr. C. Shaw), for four winter-flowering Begonias; and the Earl of HOME, K.T., for four pots of Nerines.

FRUIT.—In the class for a collection of eight dishes of Fruit, of eight distinct kinds, Lord ELPHINSTONE was awarded the 1st prize; 2nd, the Earl of WEMYSS. C. W. COWAN, Esq., was placed 1st, and Lord ELPHINSTONE 2nd, for four bunches of Grapes, of distinct varieties. Col. STEWART MACKENZIE OF SEAFORTH, Brahan

The best collection of six varieties of culinary Apples was shown by Col. GORDON, and the best six varieties of dessert Apples, four of each sort, by the Marquis of LANSDOWNE, K.G., Meikleour House, Perthshire (gr. Mr. J. Chisholm).

VEGETABLES.—For a collection of vegetables in nine distinct kinds, the 1st prize was won by the Earl of LAUDERDALE, Thirlestane Castle, Lauder (gr. Mr. R. Stuart). In the single dish classes, the principal prize-winners were:—R. M. PILKINGTON, Esq., St. Fort House, Fife (gr. Mr. Jas. J. Staward); W. H. DOBIE, Esq.; Sir DUNCAN E. HAY, Bart., Kerfield, Peebles (gr. Mr. S. Murray); the Earl of HOME; J. MCINTOSH, Esq., Lamancha House, Peebles (gr. Mr. J. Johnston); R. WRIGHT, Esq., Costerton, Blackshields (gr. Mr. J. Scott); J. NEILSON, Esq., Mollance, Castle Douglas (gr. Mr. J. M. Stewart); Mrs. BREMNER, Edinburgh (gr. Mr. J. Macdonald); STEPHEN MITCHELL, Esq.; and Messrs. WM. CRAIG, Swinton, Berwickshire; C. PAGE, Liberton; A. BRYDON, Innerleithen; A. BELL, Douglas, Lanarkshire; J. PATERSON,

Duns, for Primulas; and Mr. D. McLEOD, Chorlton-cum-Hardy, for Orchids.

Bronze Medals were awarded to Messrs. DOBBIE & Co., Edinburgh, for Chrysanthemums; and JOHN FORBES, LTD., Hawick, for various plants.

ROYAL METEOROLOGICAL.

NOVEMBER 15.—The opening meeting of this Society, for the present session, was held on this date, at the Institution of Civil Engineers, Dr. H. N. Dickson, president, in the chair.

Mr. C. Harding read a paper on the abnormal weather of the past summer. He presented statistics showing the distribution of temperature, rainfall and sunshine week by week in the various districts of the British Isles, and also made a comparison of the results with the Greenwich records back to 1841. From the facts thus brought together, Mr. Harding showed that, so far as temperature is concerned, the summer of 1911 was unique. The maximum temperature of 100° at Greenwich, on August 9,

FIG. 157.—PREMIER EXHIBIT OF FIFTEEN VARIETIES OF JAPANESE CHRYSANTHEMUMS, EXHIBITED BY CAPTAIN STIRLING (GR. MR. THOS. LUNT) AT THE EDINBURGH SHOW, AND AWARDED THE CUP OFFERED BY THE CITY OF EDINBURGH.

Castle, Canonbridge (gr. Mr. Wm. Campbell), excelled in the classes for two bunches of Grapes, one black and one white variety; and for two bunches of Muscat of Alexandria. W. MACKAY, Esq., showed the best two bunches of Black Alicante; Major THORBURN, the best two bunches of Gros Colman and single bunch of Lady Hutt; Lord ELPHINSTONE, the best two bunches of Lady Downes; and J. E. LAIDLAY, Esq., Dirleton (gr. Mr. Jas. Law), the best single bunch of Appley Towers.

For 18 dishes of Apples grown in Scotland (not fewer than 12 varieties), the 1st prize was won by Col. GORDON, Threave House, Castle Douglas (gr. Mr. J. Duff); 2nd, Mr. R. G. SINCLAIR, Congalton, Drem.

For 18 varieties of Apples, ripe or unripe, Col. GORDON was again 1st, and the AMERICAN AMBASSADOR, Wrest Park, Bedfordshire (gr. Mr. G. McKinlay), 2nd. The principal prize-winners in the classes for Pears were the Earl of WEMYSS, Mr. SINCLAIR, A. M. S. FLETCHER, Esq., Saltoun Hall, East Lothian (gr. Mr. R. Pow); Rev. G. H. DAVENPORT, Foxley Hall, Hereford (gr. Mr. R. Currie).

Rutherford, Roxburghshire; G. SCOTT, Pencaitland, East Lothian; and D. PITT, Eccles, Kelso.

J. NEILSON, Esq., was 1st for five specimens of Cranston's Excelsior Onion grown in Scotland; and Mr. W. DOUGLAS, Easter Duddingston, Edinburgh, won the Silver Medal offered for the best 12 bunches of Leeks (14 to the bunch), as grown for market. This latter class was confined to Edinburgh market-growers.

NON-COMPETITIVE EXHIBITS.

Gold Medals were awarded to Messrs. STORRIE & STORRIE, Glencarse Nurseries, Perthshire, for flowers and fruit; SUTTON & SONS, Reading, for vegetables; W. WELLS & Co., Merstham, Surrey, for Chrysanthemums; and WM. BROWN & Co., Edinburgh, for fruit.

Silver-gilt Medals were awarded to Messrs. DICKSON & Co., Edinburgh, for Chrysanthemums and other flowers; YOUNG & Co., Hatherley, Cheltenham, for perpetual-flowering Carnations; and WM. CUTBUSH & SON, Highgate, London, for perpetual-flowering Carnations.

Silver Medals were awarded to Dr. MACWATT,

is the highest temperature recorded in the British Isles since the establishment of comparable observations. The mean temperature for the summer was also higher than for any similar period during the last 70 years. The maximum temperature of 96° in July has only been slightly exceeded on two previous occasions, and the September temperature of 94° has not previously been equalled during that month. So many hot days during the summer have never before been recorded. Mr. Harding further showed that the rainfall for the three summer months has only been smaller in three previous years during the period of 70 years, and also that the duration of bright sunshine was greater than in any previous summer since the introduction of sunshine recorders in 1881. As a consequence of the exceptional weather, the harvest was everywhere commenced at an earlier date than usual, and was quickly concluded, under the most favourable conditions. The effects of the drought, other than in relation to the water supply and vegetation, were very far reaching. Sports of all description were but little interfered with by the weather.

Obituary.

THOMAS PURVES.—The death of Mr. Thomas Purves, a native of Scotland, occurred on the 4th ult. at his home at Auburn, Victoria, Australia. Deceased was manager of the firm of Law, Somner and Co. for 13 years, and afterwards for 35 years of the firm of Adamson's, now Messrs. F. H. Brunning, Ltd.

* * * The Editors will be glad to receive, for consideration, large photographs of horticultural subjects, suitable for reproduction in this Journal.

ASTERS: Roma. Your seedling Asters are diseased, and should be watered with a solution of permanganate of potash at a strength of 1 ounce in 5 gallons of water. The fungus which is attacking the plants is present in the soil, which should be thoroughly soaked with one pint of formalin in 20 gallons of water, at least one fortnight before the seed is sown.

BEGONIA AND TOMATO: H. W. No disease is present on the foliage of your Begonias. The appearance of the plant suggests eelworm at the roots. For this disease there is no cure. Your best plan is to obtain fresh stock next season, also selecting the potting materials from a different source. The Tomatoes are affected with the fungus *Cladosporium fulvum*. Remove all dead and diseased leaves, and spray the plants with the Bordeaux mixture at half the usual strength. If flowers or fruits are present, it will be better to spray with liver of sulphur, using 1 ounce in 4 gallons of water.

CALLA DISEASED: A. M. S. A fungus is present at the root of your Calla, and was probably introduced in the leaf-soil. It will be well to water the soil at intervals of three days with sulphate of potash, using 1 ounce in 1 gallon of water.

CAMPANULA MEDIA CALYCANTHEMA: T. C., Notts. This is a biennial, and it is not uncommon for an occasional plant to miss flowering at its appointed season and grow on, increasing in strength for another year. All biennials are liable to do this in extraordinary seasons.

CARNATIONS DISEASED: Malmaison. There is no disease present in your plants. The trouble is caused by some wrong cultural treatment.

ERECTION OF A GLASSHOUSE: L. W. E. The glasshouse you contemplate erecting would cost about £55. This would include the providing and fixing of 37 pairs of rafters at 18 inches apart, the necessary glass of 21-ounce gauge; bedding same in best putty and securing on top with brass brads; painting the woodwork with two coats of paint before erection and one coat afterwards; fixing and tarring gutters; providing the necessary nails, screws and water joints for vents, latches for doors, gearing, and brass brads for securing glass in position when bedded in putty. This sum also includes the payments for bricks, lime, sand and labour and two divisions to the house, including division doors. Seventy-five yards (225 feet) of 4-inch piping (two pipes on either side of the house, one above the other) would cost £8 8s. 9d.; four H pipes, with two valves in each to regulate the circulation of hot water in flow and return pipes, would cost £7 10s., the joints being made of rope yarn and cement at a cost of, say, £1 5s.; a 4B Junior Robin Hood boiler, capable of heating 300 feet of 4-inch piping, £8 10s., totalling £54 19s. 9d. A No. 405 cast-iron White Rose sectional boiler, capable of heating 350 feet of 4-inch piping, would cost £8 7s. 6d. Both these types of boilers are very efficient and economical. The cost of a lean-to structure of the same length would be about one-third less than the span. You cannot do better than to bed the glass in putty and secure it on top with brads as indicated above.

GARDENERS' NOTICE: A Constant Reader. It is usual for a head gardener to receive or give a month's notice on terminating an engagement; in the case of under-gardeners, a week's notice only is necessary.

GRAPES DISEASED: Mespilus. The Grapes you send are attacked by Botrytis disease. This fungus only attacks plants when they are covered with condensed moisture. Ventilate the house early in the morning and maintain drier conditions in the vinery.

NAMES OF FRUITS: Lazenby. Warner's King.—H. A. R. 1, Scarlet Pearmain; 2, New Hawthornden; 3, Minchull Crab; 4, Annie Elizabeth; 5, Lady Henniker; 6, Dumelow's Seedling (Wellington).—W. H. H. Pears decayed; 3, Northern Greening; 4, Beauty of Kent; 5, Mank's Codlin.—Wick. Brown Codlin.—G. J. H. 1, Chelmsford Wonder; 2, Hollandbury; 3 and 5, Lord Lennox; 4, Cockle Pippin; 6, King of the Pippins.—Collier. Beurre Sterckmans.—S. Best. Cox's Orange Pippin.—Barnclith. 1, Hawthornden; 2, London Pippin; 3, Worcester Pearmain; 4, Ribston Pippin; 5, Keswick Codlin; 6, Cellini Pippin.

NAMES OF PLANTS: W. E. Maxillaria picta.—M. O. 1, Brassia maculata; 2, Sigmatostalix radicans; 3, Odontoglossum Wallisii; 4, Cattleya intermedia; 5, Pleione Wallichiana; 6, Polystachya pubescens.—Anxious. 1, Cestrum (Habrothamnus) Newellii; 2, Celsia cretica; 3, Gesnera (Nægelia), a garden form of N. zebrina; 4, Ruellia Portellæ.—R. H. C. Elæagnus pungens medio-aurea.

ORIGIN OF THE EARLY-FLOWERING STRAINS OF SWEET PEAS: Market. The three strains of early-flowering Sweet Peas are the Telemly (or Arkwright's), Zvolanek's, and Englemann's. In the *Sweet Pea Annual* for 1907, Rev. Edwin Arkwright, Telemly, Algiers, gives the following account of the origin of his strain:—"I have now, for several years, had Sweet Peas in bloom in my garden at Telemly, on the hill of Mustapha, above Algiers, from Christmas till May. The first of these early Sweet Peas was a sport from Blanche Ferry, an old-fashioned pink and white variety, hailing, I believe, from America. This particular Sweet Pea—Blanche Ferry—was always early at Algiers, that is to say, it flowered at the end of March; but about seven years ago a sport showed itself in my garden as early as February, and was promptly isolated from all others. The next year I had some plants flowering in January, and among them one red one, a cross, apparently, from Mars, on which a blossom or two had come out in May of the previous year. From these parents I have now 10 or 12 of the usual colours, ranging from white to purple, and including duplicates—or shall I say imitations—of Hon. Mrs. E. Kenyon, Jeannie Gordon, Lady Grisell Hamilton, Mars, Black Knight, &c., which begin to flower about Christmas-time, and last for five months." Mr. A. C. Zvolanek, of Bound Brook, New Jersey, is the originator of the Zvolanek strain, and the following account of it is given in the recent *Bulletin* of the Cornell University Department of Agriculture:—"It appears to be the result of a cross between an early-flowering plant, found among Lottie Eckford, and Blanche Ferry. The cross gave Christmas Pink, although, probably, not as we have it to-day, for, undoubtedly, it has been selected and improved. The cross was made some time previous to 1895, for Mr. Zvolanek says that he was able to send the first dozen blooms to market on January 1 of that year. The variety was introduced in 1899. The next winter-flowering variety was Miss Florence E. Denzer, a cross between Christmas Pink and Emily Henderson. Since the latter was a white sport from Blanche Ferry, it is evident how closely this winter type is related to this standard American variety. By 1900, Mr. Zvolanek called attention to the fact that he had five varieties of the winter-flowering class. These pioneers were used to cross with the best out-door varieties. The results number over a hundred varieties, from which 30 have been considered of commercial importance, and have been introduced." Mr. C. Engelmann, of Saffron

Walden, Essex, gives the following account of his strain in the *Sweet Pea Annual* for 1907:—"It is nearly four years since some plants of Captain of the Blues sported with me, and gave winter-flowering varieties of quite distinct habit. Ordinary stocks sown in autumn will not bloom under glass until the following April, but the new-comers commence to bloom from six to ten weeks after seed sowing, and continue to form branches and produce flowers all through the winter. I have now winter-flowering representatives of such varieties as Dorothy Eckford, Lady Grisell Hamilton, and Miss Willmott, as well as a number of crosses between these and the ordinary type and Mont Blanc, so that almost all Sweet Pea colours are represented. In 1906 I sowed my winter-flowering varieties at the end of August and beginning of September, and the resulting plants commenced to flower in October, and were splendidly in bloom at the end of November and early in December, and they should continue to flower until the ordinary Sweet Peas come into flower."

PROTECTING BULBS FROM MICE: S. A. Place a circle of red lead on the surface of the ground after the bulbs have been planted. Another good plan is to break up some old bulbs of Fritillarias (Crown Imperial) and dibble small pieces around the groups of bulbs; mice object to the smell of the Crown Imperial. The red lead will also protect the bulbs from damage by birds.

PRUNING APPLES: H. S. C. If you mean that the main shoots of the young trees were not cut back sufficiently last year, so that they have formed fruit-buds on or near the ends, the most desirable course to pursue depends upon circumstances. If the main shoots are sturdy, and have sent out good extensions above the fruit-buds, they may be cut back above these buds, severely or otherwise, according to their vigour. If these are slender, or have not grown out well above the fruit-buds, cut back to dormant wood-buds below the fruit-buds. One or more of these dormant buds will be almost certain to produce a shoot.

ROMAN HYACINTHS: W. P. The roots of the bulbs have been destroyed by mites. Your best plan is to mix flowers of sulphur with the soil in which the bulbs are planted.

ROSES: A. C. If the plants are not growing well, the proper treatment will be to afford them better or more suitable soil after transplantation, which may be carried out at once. Read the frequent notes on Rose culture which appear under the heading "Rosary" and procure a copy of *Roses*, by H. R. Darlington (Present-Day Gardening series), price 2s. 9d., from our Publishing Department.

VINE BORDER: W. P. The directions for making a vine border were given in the issue for September 30, p. 250, but the quantity of old mortar and bones should be 1 cwt. of each to every five loads of loam.

WEED ON LAWN: W. J. W. The plant is *Prunella vulgaris* (Selfheal). Next spring top-dress the turf with a mixture of fine soil and some nitrogenous manure. Afterwards, at intervals, sprinkle a little sulphate of ammonia on the lawn. These dressings will cause the grass to grow so luxuriantly as to crowd out the weeds.

WEeping OAK: S. J. T. The pendulous variety of the common Oak (*Quercus pedunculata* var. *pendula*) is occasionally offered for sale by nurserymen, but good specimens of this tree are by no means common. There is an elegant example in the collection of Oaks at Kew Gardens. It is of little use sowing the acorns; it is possible that a young tree of more or less pendulous habit might be obtained, but this is very uncertain. The propagation of the weeping tree is effected by grafting on standards of the common Oak.

BACK TO THE HILLS.

I.—THE LEGNA.

THE district ranging south from the Maloja to the Italian lakes, and eastward to Garda, contains the Alps called those of Bergamo and Brescia. To these hills are endemic, Saxifraga Vandellii, Campanula Raineri, Primula glaucescens, and Androsace Charpentieri. Nor is a rich show lacking on these mountains of brilliant but less especial treasures. Let us ascend a peak which towers above the Lake of Como and consists entirely of limestone.

The Legna rises behind Veralla, and all the first four hours of the climb are over a purgatorial track of cobble-stones. The Italian foothills of the Alps are hot and wooded. We pass through little perched village after village, huddling among groves of Chestnut; the steep copsy slopes are a-wave with the scented lilac tails of Gymnadenia, and the Orange Lily glimmers now and then like a flame amid the brushwood. After Igone, however, the path mounts rapidly towards the still invisible mountain, and in the west begins to unfold the panorama of the Monte Rosa chain. In the twilight of the copse are relics of Viola biflora, and the Anemones Hepatica and ranunculoides; Viola pinnata occurs in more open places by the path, and in the hayfields Anthericum liliastrium is passing out of bloom.

The Legna looms into sight at last, beyond what looks a little plain. Not at all: our way soars up abruptly to the right, and comes out at last on the brink of a fearful precipice. In place of a plain, there lies below us an abysmal profundity: round by a vast amphitheatre of cliffs runs the track that leads at last to the crest of the Legna. These rocks are rich, however, in treasures. Buphthalmum speciosissimum flaps

and flourishes from the crevices; Cytisus depends; Saxifraga Hostii hangs in mats of silver starfish. In cultivation I do not believe this plant is common. It is a true species, possibly, but may be described as a much-glorified Aizoon. Its spikes are tall and very thinly clad; its flowers are big and white, though not with that celestial whiteness that you get among the cousinhood of Saxifraga lingulata. It is, in cultivation, as easy and vigorous a thriver as most of its indispensable section.

In one more moment begins the reign of Campanula Raineri. Thenceforth, to within measurable distance of the summit, Archduke Rainer's Bell possesses all the crevices of the cliffs. This is an essentially and vehemently saxatile plant, it appears ramifying insatiably up and down the flaws and chinks of limestone precipices and boulders. When I was on the Legna, its immense and stemless cups of blue had not even begun to think about appearing: I have a suspicion, though, that neither at home, nor in nature, is it always very generous in their production. I may, however, have been completely misled in this by the apparent frailty of the tiny grey growths that C. Raineri throws up here, there, and everywhere, as the cleavages of the cliffs permit. As you continue along the track, all the rocks are full of it. Phyteuma comosum, however, which one might have expected to abound, seeing that it begins at the level of the lake itself, is nowhere now to be seen. But from this point onwards to the hut, universal among the more open spaces of the scrub is Primula glaucescens. I found the flowers lingering only at the upmost level in the bushes near the hut itself: a storm had damaged even these. Yet, from all my experience, I think I may fairly say that P. glaucescens, easy and thrifty as it is, has not the full resplendent beauty of its cousins, P. Clusiana and P. spectabilis. Its flowers are in shape a trifle ragged, in texture a trifle thin, in colour a trifle washy. But this, of course, only by comparison with the solid, glowing glory of P. spectabilis, and the fringed splendour of P. Clusiana.

Another thing that disappoints one here is Gentiana verna, which begins to occur as you climb towards the hut. It is so very scattered and sparse in flower, so screwed and starry and ungenerous in outline. But, indeed, G. verna is a variable plant, and by no means always can you count on having the clumped, dense-flowered, broad-starred form that covers Mont Cenis, and is found again on Monte Baldo and on the Schlern. Often and often in the Alps does one come on whole tracts of country where the prevailing G. verna is as mean and poor as the worst Oberland forms of G. acaulis. The Gentian abounds near the hut, and so does Ranunculus alpestris; but the climb continues high and far towards the mountain, over tumbles of scree, and up at last over shelves of cliff and slopes of shingle. In fine, pebbly banks glows an abundance of Thlaspi rotundifolium, in a well-habited form: wedged into crannies glows a lovely little Primula, which, by every rule, ought certainly to be P. cenensis rather than the P. hirsuta that it more resembles. Buphthalmum and Phyteuma comosum and Potentilla nitida flaunt on the cliffs; and up in the gullies and silted hollows Allium pedemontanum is pushing by the million. And then, at last, high up on a vast precipice, one has one's first sight of Saxifraga Vandellii.

Saxifraga Vandellii inhabits only the tightest crevices of the hardest, sheerest, and most awful limestone cliffs in the range. Here it forms dense, spiny domes, often a foot across, or more, from which hang out the clustered flower-heads of pure white. It is a wonderful plant to see: a most terrible plant to collect. And it has given

the lie to all my notions of it by proving to be as intensely calcareous in its likings as any other of its section. It seems, however, to appreciate the full glare of the sun on those gaunt white walls, in a manner which would certainly not be followed by either Burseriana or diapiensoides. It is the special sovereign of the Bergamask Alps, and, after this, there is but little to tell of what I saw on the Legna, unless it be of Monte Rosa at sundown, lying far away up in the sky, a many-pointed island of pale sapphire, floating above range upon range of level grey cloud, beneath which, down in the depths, lie all the mountains of earth, in fold over fold of darkness. At rare intervals, out of the undiscoverable blueness below, the sound of an ancient bell would rise into the velvet silence.

MONTE BALDO.

The famous mountain where everything grows is, in reality, a vast long rampart thrown up between the whole length of Garda, and the valley of the Adige, looking from some points rather like the work of some giant spade. But from the walls of Verona, seen end on, it is the central pillar of heaven. Monte Baldo is not easy of access; accommodation is weak upon its slopes. From Malcesine, on the lake, the Monte Altissimo may be ascended, on the southern face of which dwell ancient wide masses of Saxifraga tombeanensis; but between Altissimo and the rest of the ridge intervenes a very deep gulf called the Bocca di Navene, which makes it quite impossible to explore the whole mountain from any one point. The best thing to do, perhaps, is to go up from Verona to Caprino on the Adige side, and thence drive to Ferrara di Baldo, a tiny hamlet on the very slope of Baldo, with a town-hall big enough for Brighton.

Round Ferrara are copses full of Anemone ranunculoides in especial form, and the Orange Lily glows among the hay like Poppies in an English cornfield, and everywhere among the stones and open screes are pushing the glowing butterflies of Cyclamen europæum. Straight up the enormous grassy wall of the mountain then goes the track. At first there is brushwood, with here and there a little bush of Daphne alpina on some worn limestone boulder, and Pæonies flaunting great shell-pink blossoms in the shadow of the cliffs, among Rosa alpina. Crossing a little water-course we now emerge on to the long, bare slope of Baldo, a pitiless, interminable toil. The grass is thick with all the expected flowers, with here and there a strayed colony of Primula spectabilis passing into seed. Gradually one labours towards the ridge above, which at every step seems higher and further. Gentians begin to gleam in the grass, Aster alpinus, and Linum austriacum; but I missed Campanula alpina, if it be indeed said truly to make a very rare occurrence here in the Val Fredda above Ferrara. At last, however, the ridge draws nearer; Senecio spathulatus stands boldly, not to say coarsely, up among the grasses, with flannel-grey leaves, and clustered heads of yellow; richly-coloured Orchises emerge, and then the ground is blotched with waxy-pink patches among the Gentians, of Daphne Cneorum—a sight, indeed, for sore eyes that have so long been vexed by the poor flowers and dim drowsiness of Daphne striata, so universal in these southern ranges. D. Cneorum, on the contrary, ranks next to the unrivalled D. rupestris, and indeed its generous habit and ample blossom make it even more important to the ordinary gardener (if he can grow it). Its rich heads of fleshy-pink, pure and warm, lie like fragrant little trusses of Bouvardia here amid the short, brown turf of the alpine ridges. But who shall dare attempt the collecting of D. Cneorum?

We are on the ridge: we are over on the other side. Six thousand feet down lies Garda, like a floor of solid turquoise, and here the turf is

green and rich, spattered densely with *Geum montanum*, and the *Gentiana verna* and *G. Clusii*. Half-a-mile or more of this, and then, a little higher, among the rest, begins *Ranunculus alpestris*; a little further *R. anemonoides* Kernerianus joins in, *Primula spectabilis* follows immediately, *P. Auricula* hangs from little ledges of cliff, and then among these all, and the glowing azure trumpets of *Gentiana Clusii*, the whole grassy ridge of Baldo, for many a mile, is a silver lawn of *Geranium argenteum*, densely bedewed with its enormous, pale-pink flowers.

Ranunculus Kernerianus is a very rare and special form, appressed to earth, frail and exquisite, with big Marguerite-like flowers of a rather musty, mauve-white. It covers the high turf of Baldo, much more precious, and hardly less beautiful, than the unsurpassable *R. alpestris*. The *Primula*, too, is a revelation of loveliness, though it has not here the extra-

comosum darkly flaunts, and *Primula Auricula* and *P. spectabilis* peer out, with *Ranunculus alpestris* and *Saxifraga aizoon*, from between the flowery tussocks of *Rhodotharionus*. *Thlaspi rotundifolium* haunts the shingle-slides, and on the stony ridge itself the *Rhodothamnus* is at its loveliest, with *Saxifraga cæsia*, *Gentiana Clusii* and, on the bare eminences themselves, fine tufts of *Petrocallis pyrenaica*. Can this, then, be the "*Pulmonaria lichenis facie*" which Clusius reports from Baldo? If not, what is? What plant is like a lichen—and also like a *Pulmonaria*? What—what combines the two qualities—what but *Eritrichium*? But when was this ever seen on limestone? I saw no trace of it, and expected none. And I also failed to find any sign of *Saxifraga tombeanensis*. As for the view, on one side of Baldo lies Garda and the Adamello, and on the other, up north, all the Dolomites; but the vast, lonely

FIG. 158.—YELDHALL MANOR, TWYFORD.

ordinary matted profusion and lushness of splendour that it shows on Rocca Longa. Here it forms single crowns only, and sometimes perks from rocks and gets elongate, till older botanists mistook it here for *P. carniolica*. But its flowers are always a joy—so ample of outline, so well-liking in their solid texture, so refulgent in their brilliant, white-eyed rosininess. "*Spectabilis*" indeed! As for the *Geranium*, delicately charming though it be in all our gardens, with its contrasts of silver and pink, yet one has no idea of its full beauty till one has seen it on Baldo, densely neat and tight and dwarf, with outstanding wide rosy stars upon its close, fine tufts of silver-grey, as compressed, almost, as those of *Potentilla nitida*. In gardens its foliage always grows taller, and sprays out, though the size, brilliancy, and profusion of its blossom are in no way really diminished.

Along this multi-coloured lawn one roams the ridge of Baldo, until the track to the Hut of the Telegrafo leads along under the Eastern Cliffs. For Baldo, earth-trench though it may look from afar, is in reality profuse in most prodigious precipices, and each of the eight or ten peaks that compose its ridge is set about with grim combs and cliffs, and shingle-slopes of white limestone. In the sheer walls *Potentilla nitida* hangs in sheets, a galaxy of warm-pink Dog Roses on a firmament of silver, *Phyteuma*

ridges of Baldo—at all events its peaks—are very rarely free, for long, from a veil of cloud. *Reginald Farrer.*

(To be continued.)

NEW OR NOTEWORTHY PLANTS.

ERICA TETRALIX × VAGANS.

UNDER the name *E. cinerea* × *vagans* this interesting hybrid Heath was described last year in the *Journal of Botany* by Mr. F. H. Davey. A single plant having been found by the renowned horticulturist Mr. P. D. Williams, of Lanarth, Cornwall, on the occasion of the International Phytogeographical excursion, Dr. Schroeter, Dr. Graebner, and the writer were shown the original plant in situ. This confirmed my first impression of the Heath, which Mr. Williams had kindly brought to show us at the Lizard, that one of the parents was *Tetralix* not *cinerea*, since the glandular hairs on it must have been derived from the former species, with which it grew. It is greatly to be hoped that Mr. Williams will be able to propagate this new hybrid, which should bear his name × *Erica Williamsii*. Both the foreign scientists agreed to the determination. *G. Claridge Druce.*

YELDHALL MANOR, TWYFORD.

YELDHALL MANOR, the residence of P. F. Tuckett, Esq., is situated about three miles from Twyford, and two miles from the popular riverside village of Wargrave. There is a gradual rise from the river Thames to the Manor, and immediately behind the house is Bowsey Hill, the summit of which is said to be the highest point in Berkshire. Thence is obtained a fine view of the surrounding country, and particularly in the direction of Reading. Since Mr. Tuckett took up his residence at Yeldhall some 16 years ago, many improvements have been made in the gardens and pleasure grounds, in which some of the features are Roses, flowering trees and shrubs, Conifers, and a wild garden. Alterations and improvements are still in course of progress, including the making of a woodland walk. In front of the residence (see fig. 158) are two terraces, and on either side of the steps leading from one terrace to the other are large plants of *Choisya ternata*, the Mexican Orange Flower. At one end are a conservatory and Rose temple. The former structure contains several very interesting plants, and at the time of my visit *Eriobotrya japonica* was carrying numbers of its pale-orange-coloured fruits; plants of *Phyllocactus* were in flower, also *Dimorphotheca aurantiaca*, *Schizanthus*, and *Viscaria* (*Lychnis*) *cardinalis*. The *Viscaria* is grown from seed sown in September, the plants being accommodated in a cold frame till they commence to flower, when, for several weeks, they provide a bright display. *Alonsoas* are also cultivated in considerable numbers. The Rose temple is covered with all the best varieties of Rambler and *Wichuraiana* Roses. Crimson Rambler and *Thalia* were exceptionally fine when I saw them. Near by this temple are two trees of the weeping *Prunus* (*Cerasus*) *sinensis pendula*.

A winding pathway leads to the wild garden, which is still in the making. Beside large quantities of bulbs, Irises, Cyclamens, Gunneras, and Rambling Roses have been associated with the natural vegetation, which includes many handsome trees. The Irises include those of the German, English, Spanish, and Kämpferi types, the last-named forming a charming feature in themselves. There is a large pond in this portion of the grounds, half of which is used for bathing, the remainder being planted with Water Lilies, yellow Irises lining the banks. A background of *Rhododendrons* forms a pleasing setting to the water plants. Among the other improvements made by Mr. Tuckett is a carriage drive nearly one mile in length, and planted on either side with bold groups of shrubs, such as *Rhododendrons*, *Deutzias*, *Spiræas*, also various Conifers. The coloured foliage of a group of scarlet Oaks is conspicuous in autumn in this part of the grounds. On the north side of the mansion is a maze, some 2½ acres in extent, which was planted 15 years ago.

On the east side of the house is a rosary and the kitchen garden. In fig. 160 is shown the gardener's cottage and a specimen of the free-flowering *Pyrus floribunda*. Not far distant from this spot are two examples of the quaint *Sequoia gigantea pendula*, fine plants of the Strawberry Tree, *Arbutus Unedo*, and clumps of the Portugal Laurel, these shrubs being some 30 feet high.

Berberis, especially *B. Darwinii*, with its orange-yellow sprays, and the popular *B. stenophylla*, are largely planted in the shrubberies, while the bronze foliage of *Prunus Pissardii* shows up well amongst the green shrubs. There are also many Conifers, including *Thuja Lobbii*, *Sequoia gigantea* (*Wellingtonia*), *Pinus excelsa* (*Bhotan Pine*), *Cedrus atlantica glauca*, and *Cupressus Lawsoniana*. William Allen Richardson Roses are trained to stout poles at intervals along the winding paths: this variety being a favourite at Yeldhall. The Rose garden

contains upwards of 400 plants of the best varieties. This portion of the grounds is encircled with a dwarf hedge of the Common Yew on one side, and monthly Roses on the other.

In the kitchen garden the Loganberry grows luxuriantly, and produces large crops of its luscious berries. A range of glasshouses contains a small collection of Orchids, including finely-developed plants of *Ada aurantiaca*, *Cypripediums*, and *Calanthes*. One division is devoted to the cultivation of plants for furnishing the conservatory and greenhouse.

Mr. and Mrs. Tuckett take a keen personal interest in their beautiful gardens, and Mr. George, the gardener, has every reason to be proud of the excellent condition of all the departments under his charge. W. B.

THE PAST SEASON IN THE SOUTH-WEST.

IN the spring *Leptospermum bullatum* was smothered in buds, and a fine sight was anticipated when the blossoms expanded. Owing, however, to the extreme drought not a single flower opened, but all withered and turned brown in the bud state. The bush is now completely brown, and will probably not recover. Another shrub that, as regards its flowering, suffered badly from the drought was *Tricuspidaria dependens*. It is held to be a very shy bloomer, but this year the bush carried over 50 flowers. Not one of them, however, was typical, the little, shrivelled white petals being only about $\frac{1}{4}$ inch in length instead of over an inch, and from a flowering point of view the shrub was a failure. The

cardinalis elegans, *formosissimus*, Peach Blossom, Rose Queen, Queen Wilhelmina, Ackermannii, Red Prince, and Crimson Queen all flowering profusely. *Gladiolus Saundersii*, generally so excellent for cutting, was a failure, the flowers withering almost as soon as they opened. The little *Gladiolus vinulus*, which precedes The Bride by about 10 days, was very pretty with its pure white flowers having rich carmine markings on the lower petals.

Convolvulus mauritanicus was a charming sight drooping over a rock covered with a profusion of soft, lavender-blue blossoms, and the rare *Convolvulus tuguriorum* from new Zealand bore many pure-white flowers about 2 inches across, and ascended a wall to a height of 12 feet. The heart-shaped leaves measure from

FIG. 159.—VIEW FROM ONE OF THE TERRACES AT YELDHALL MANOR.

HARDY FLOWER BORDER.

YUCCA RECURVA GLAUCA.

A PLANT of this *Yucca* in these gardens is remarkably late in flowering. At the date of writing this note (November 6) it has seven fine flower-spikes, chiefly in the bud state. The largest inflorescence is just unfolding its basal flowers. In another week, should mild weather prevail, the plant will be in its full beauty. We have many of these handsome plants in various parts of the pleasure grounds, and I have particularly noticed that the finest plants are those exposed to the south and south-west, where they get the salt-laden air from the tidal waters. Arthur K. Turner, Orwell Park Gardens, Ipswich.

better known *Tricuspidaria lanceolata* (*Crinodendron Hookeri*) did not appear to suffer from the dryness, and bore typical flowers. *Ostrowskia magnifica* was very fine, though rather under 5 feet in height against 7 feet in Yorkshire. Many of the flowers, however, did not open fully, probably owing to the drought, but the plant set seed which was collected. *Aristea Ecklonii* bore its little starry, blue flowers under a south wall, but for beauty it cannot compare with its relative *Witsenia corymbosa*, which is not yet in bloom, though it is carrying many unexpanded flower-clusters. The Dropmore *Anchusa* was a splendid sight, a group 7 feet in height and 6 feet through being a mass of bright blue. The early *Gladioli* were very fine, and evidently appreciated the hot weather, Blushing Bride, Saumarez, Lucretia,

$\frac{1}{2}$ inch to 1 inch in diameter, and are borne on very fine, drooping side-shoots that fall down from the main growths and completely hide the wall with a veil of green. *Watsonia Ardernei* flowered well this year, sending up a dozen flower-spikes, but neither *W. coccinea* nor *W. rosea* bloomed. *Tacsonia mixta* (*quitensis*), which has made enormous growth, commenced to flower at the end of June; the flowers are of a soft, flesh-pink colour and about 4 inches across. It has overtopped a 12-foot wall and is now running on 2 feet 6 inches of wire netting strained above the top. A self-sown seedling of *Solanum aviculare*, which appeared last spring, has developed prodigiously, and is now 10 feet high and almost as much through. It is carrying numerous clusters of violet-purple, golden-eyed flowers, and hundreds of bunches of fruit. *Clethra arborea* was a

splendid sight in August, bearing over 150 branching flower-sprays set with white Lily-of-the-Valley-like blossoms. It is as yet under 6 feet in height. *Philadelphus mexicanus* is quite the prettiest of the so-called *Syringas*. It is a tender shrub, and rarely met with. The cup-shaped flowers are white, and are rather over an inch across. *Mimulus cardinalis* suffered much from the drought, and instead of being nearly 3 feet, was only a foot in height. The plants of *Gerbera Jamesonii*, though looking very healthy, have not flowered this year. For many seasons *Cyrtanthus McKennii* flowered in this garden, but then unaccountably died out. It has now been replaced by the yellow-flowered *C. lutescens*, which has borne blooms this year. *Incarvillea Delavayi* blossomed freely, but *I. grandiflora* has perished.

are bright blue in colour and half an inch in diameter. It has been in bloom from the end of July to the present time, and is very attractive. Next to it is a strong plant of *Arctotis aureola*, which has to be cut back periodically to give it room. For the past two years, *Zephyranthes Atamasco* has not borne a single flower, but this season it has bloomed profusely, as has the smaller *Z. candida*. Early in September *Nerine Fothergillii* major threw up 12 fine flower-spikes and *N. Bowdenii* is showing seven, but *N. flexuosa alba* has not bloomed. The great clumps of *Agapanthus* have been a splendid sight, both the evergreen blue and white and the deciduous white having flowered to perfection. *Dierama pulcherrimum*, with its fairy flower-wands, has been very beautiful, the pure-white variety being one of the loveliest flowers in existence. The type,

for at Kew, where they succeed to perfection, they get no sun until after five o'clock. *Cypripedium spectabile*, mentioned in the last article as being healthy, flowered finely, and *Calochortus venustus* Vesta bore numbers of its beautifully-coloured blossoms. *Rehmannia angulata*, from last year's self-sown seedlings, bloomed well, and the pretty little shrub *Helianthemum algarvense* carried numbers of its yellow, maroon-blotched flowers. *Androsace lanuginosa*, covering a space of 4 feet square, blossomed fairly well, but not as profusely as in former seasons, and *Cypella Herberti* had but few flowers. *Lonicera Hildebrandtiana*, on a north-west wall, as usual bloomed abundantly, its great flowers, 6 inches in length and 5 inches across the mouth, being deliciously scented. *Hedychium Gardnerianum* threw up a dozen fine flower-spikes of delicately-perfumed

FIG. 160.—YELDHALL MANOR: *PYRUS FLORIBUNDA* FLOWERING ON THE LAWN.
(See p. 383.)

Crassula coccinea, on an elevated site, made a splendid show with a couple of dozen of its flat, crimson flower-heads, and the scarlet-flowered *Bouvardia triphylla* was bright for some weeks, and made an exceedingly brilliant spot in the border; the semi-double *B. Alfred Neuner* also flowered well. The New Zealand *Arthropodium cirrhatum*, which has been flowerless for three years, bloomed finely this summer. It is almost impossible to save it from the attacks of slugs and snails, which revel in its succulent foliage and, unless destroyed, soon ruin its appearance. A pretty plant, that was given to me two years ago, is *Ceratostigma Polhillii*. It is not mentioned in any horticultural dictionary. It has formed a little shrub about a foot high and 2 feet through, with very slender branches and lanceolate leaves stained with crimson, an inch in length. The starry, five-petalled flowers

with its somewhat magenta-coloured blossoms, is not grown, only the white and pale-flesh varieties being cultivated. Several florists' varieties of *Abutilon* have flowered well in some gardens, and *A. vexillarium* was bright through the month of July, with its crimson and yellow brown-stamened blossoms, whilst early in June *A. vitifolium* bore its large lavender and white flowers in abundance. After it has reached a height of about 20 feet, it usually dies. *Calceolaria integrifolia*, a very common plant here, was a sheet of yellow in July, and is still bearing a fair quantity of flowers. The New Zealand Forget-me-not, *Myosotidium nobile*, has flowered, but not so well as usual, as it delights in moisture, and this dry summer has been against it. *Celmisia coriacea* has flowered well, but quite a dozen of these plants have been lost here, probably owing to their being in too sunny a spot,

pale-yellow blossoms. In August, *Mandevilla suaveolens* was covered with white flower-clusters, the individual blooms were nearly 3 inches across, and as many as seven carried in a single cluster. *Trachelospermum jasminoides* has also blossomed well against a wall where *Cassia corymbosa* will produce its yellow flower-heads until Christmas. *Leonotis Leonurus* has been a splendid sight, a shrub trained against a wall 7 feet high and as much across having been covered with countless large, orange-scarlet whorls of flower. *Gladiolus primulinus*, from the Victoria Falls, where it is ever drenched by falling spray, perfected, with the help of continuous waterings, a 3-foot-high spike of yellow flowers. The three *Æthionemas*, *persicum*, *pulchellum*, and *grandiflorum*, have been masses of soft, pink flowers, and the white *Sisyrinchium iridifolium* and the blue *S. chilense* and *bellum* have bloomed

finely, while *Iris gracilipes* flowered very freely and has increased greatly in size. In a neighbouring garden, *Bignonia speciosa*, from Uruguay, has produced its long, trumpet-shaped, wide-mouthed, lavender-coloured flowers against a south wall, and the rare, Mexican *Inga pulcherrima* has borne its scarlet flowers resembling a short blossom of a *Callistemon*. Wyndham Fitzherbert.

PHOSPHATIC MANURES.

SOME REASONS FOR APPLYING EARLY.

ALTHOUGH the past season has not been a very exhausting one for the soil, especially as regards phosphates, yet in highly-cultivated gardens there will be need to replenish the stock. Many will be now preparing for the autumn and winter, and the question when to apply manures other than farmyard manure will arise. As a general rule most of the nitrogen will be given in the spring or early summer on account of the ease with which it is washed out of the soil. To a lesser degree the same applies to potash, as for garden purposes the purified potassic manures, such as sulphate and chloride of potash, are usually made use of, together with wood ashes. These do not contain magnesium compounds or salt which are to render them injurious, and may therefore be applied just previous to planting. With phosphates the case is somewhat different, excepting perhaps with the water soluble phosphate in superphosphate and dissolved bones. To begin with, provided there is a sufficiency of calcium carbonate in the soil, practically all the phosphate will remain in the first 9 inches of soil for an indefinite period. Again, except in the case of superphosphate, the phosphate has to be mechanically mixed with the soil before it can be of use to the plant. This takes some time, even with the thorough methods of garden cultivation. Perhaps an even more important reason why the effect of a phosphatic manure is not shown in the first season is to be found in the mode of circulation of the phosphoric acid. Phosphate, which has been applied to the soil in an unavailable form, has two chief means of being dissolved, namely by the excretions from the rootlets of the plants, believed to be chiefly carbon dioxide, and by carbon dioxide, liberated by the decay of organic materials, and dissolved in the soil water. That which is rendered soluble by the roots themselves is doubtless of immediate use to the plant, but it must be remembered that, unless applied early, the phosphate has not had time to become mixed with the soil, and also that the roots come in contact with a comparatively small area of the soil particles. In the case of the phosphates dissolved by the soil water a small portion may be of use to the plant, but far the greater part is seized upon by the immense numbers of bacteria in the soil and built up into their own bodies. The phosphate is thus distributed very completely through the soil, but is unavailable to the plant until the bacteria have died and decomposed. When this has taken place very small particles are distributed throughout the soil and can then be easily dissolved by root excretions.

The question is sometimes asked, shall I add superphosphate to the stable or farmyard manure in order that the sulphuric acid may fix the ammonia produced by the decomposition of the organic matter? To this we answer No. Firstly, because it has been amply demonstrated that unless the proportion of phosphate is very large, say, 2-4 lb. per day per animal, the fixing effect on the ammonia is very small. Secondly, all organic manures are swarming with bacteria, which are engaged in decomposing them and producing carbon dioxide as one of their by-products. Hence the phosphate is dissolved, but this is of no use to the plant, as by the time the manure reaches the soil all the phosphate will be

locked up in the bacteria, and they will not have had the opportunity of dispersing among the soil particles.

In applying organic manures and phosphates, what process is therefore to be adopted? At present many will be dressing the garden with stable or farmyard manure, and when this has been spread on the soil it is advantageous to sow the phosphate, such as basic slag, basic superphosphate, bone ash, bone meal (steamed), so that, by digging in, the two will be well mixed. The rotting of the one will tend to dissolve the other, and the soluble parts will be taken up by bacteria and distributed through the soil ready for the spring and summer following. Some have gone so far as to say that the best effects of phosphates are not seen until the second season. To a very large extent fineness of division is the chief factor in rendering a manure available, but American experiments have proved that even the "floated" phosphate, made by grinding steamed bones or mineral phosphate very finely, comes only slowly into use. The name "floated or floats" arises from the fact that the impalpable powder will float when thrown on water. The coming season bids fair to be an expensive one for bones, and the same may be said for basic superphosphate. Therefore for present use a good grade basic slag is as cheap as anything and has the additional advantage of tending to counteract the acidity, due to want of lime, which is so common in garden soils. J. W. Tayleur, *The Woodlands, Theale, Berks.*

ISOPYRUM GRANDIFLORUM.

(See Supplementary Illustration.)

THE genus *Isopyrum* includes about 31 known species, fully one-third being indigenous to China, and inhabiting the mountainous and more or less Alpine regions of the north and west of the country. Of these species the most widely distributed, and probably the most beautiful, is *I. grandiflorum*, Fisch (see Supplementary Illustration). In Western and Northern Yunnan it is very local in its distribution, and, even where found, not over abundant. But in suitable habitats and in a fairly moist season I do not know any rock plant which excels it.

On a few spots on the eastern flank of the Lichiang Range, at an elevation of about 14,000 feet, many of the most precipitous limestone cliffs, otherwise barren of vegetation, are adorned with *I. grandiflorum*, and once seen in its full beauty in such a situation, with its delicately-cut glaucous foliage and gracefully pendulous lavender-blue flowers backed by the rugged grey of the limestone, it is not readily forgotten.

The plants are deeply rooted in the fissures of the rocks, and branching over the surface form compact and symmetrically-shaped cushions of 1 foot to 2 feet or more in diameter. Many of those I saw, whilst collecting for Messrs. Bees, carried close upon 100 blooms, each 1 inch to 1½ inch in diameter when fully expanded. The specimen shown in the supplement is an abnormal one, but it bears 94 flowers. In most instances, however, the largest and most floriferous specimens were far out of reach, fixed in the crevices of perpendicular or overhanging cliffs, and on the flanks of inaccessible and slippery chimneys. It was only with the greatest difficulty and not a little danger that I secured the photograph.

The species seems to delight in a northern exposure and comparative shade, and it can easily put up with an abundance of wind and moisture. The plant is of very slow growth, and it is therefore a most difficult matter to estimate what might be the age of the largest specimens. The foliage is finely dissected, and has a beautiful glaucous blue tint, such as is found in some of the highest Alpine forms of *Corydalis*. The flowers are generally solitary, 1 inch to 1½ inch in diameter, of a soft shade of lavender-blue,

with bright, orange-coloured stamens; they are borne on very slender pedicels of 2 inches to 3 inches in length, sufficient to carry them well beyond the compact surface of foliage. The flowers are produced in June and July. George Forrest.

SCOTLAND.

EDINBURGH OPEN SPACES.

A GOOD work is being done in Edinburgh by the committee of the Outlook Tower, which has in hand the work of securing and laying out gardens in the smaller open spaces in the old town of Edinburgh. In three years the committee has been able to lay out no fewer than nine gardens in the short distance between the Grassmarket and the Canongate.

NEWTON STEWART FLOWER SHOW.

THE Union of the Horticultural and Agricultural Societies which held their shows in Newton Stewart, Galloway, not having proved satisfactory, the report of a special committee appointed to consider the question advocated the dissolution of the union. It seems that a balance left from a bazaar in aid of the funds has been expended, and that there is a present debit balance of about £30, the society having lost about £80 in all. The proposal to adopt the report was carried unanimously, but it is anticipated that the horticulturists of the district will re-establish their show, which was for a long time the leading show in the south-west of Scotland.

THE ABERDEEN COLLEGE GARDENS.

THE experimental gardens of the Aberdeen and North of Scotland College of Agriculture have this season served as object lessons for school teachers, many of whom have had hitherto but few opportunities of becoming acquainted with gardening practice. The teachers receive lessons in horticulture, and the gardens also serve the purpose of showing by experiment the effects of such factors as deep and shallow sowing, the depth at which to plant bulbs and tubers, and other points of value. Instructions in pruning and in the cultivation of garden crops is also conveyed by means of practice, as well as by verbal teaching. The gardens are under the charge of Mr. R. M. Clark, who is well qualified for their supervision. A considerable space has been occupied by lots to show the effects of deep or shallow sowing, large versus small seeds, the best distances for planting and sowing, the different yields of certain stocks of vegetables, &c.; in brief, the consideration of as many as possible of the problems which confront the gardener. In addition to vegetables, flowers are also cultivated, and a considerable collection of Roses affords an opportunity of showing how these can be best cultivated and pruned, while annuals and perennials of various kinds are included in the experiments which are being made in this skilfully-ordered garden, which is certain to have a beneficial influence on horticulture in the North of Scotland. Correspondent.

TREES AND SHRUBS.

VERONICA VEITCHII.

THIS shrubby hybrid, which has, on several occasions, been exhibited at the Horticultural Hall by Messrs. R. Veitch & Son, Exeter, is quite the finest blue-flowered *Veronica* I have seen. Hitherto I had always considered that the pink-flowered sorts were finer than the blues, but now the advantage has been reversed. Unfortunately, these beautiful shrubs cannot be grown in the neighbourhood of London, or they would quickly become popular, and receive deserved recognition. In the western portions of the kingdom, where such shrubs luxuriate, the plant will undoubtedly find many admirers. B.

CARBON-DIOXIDE AS A PLANT-FOOD.

MR. ANDERSEN's article (see p. 349), describing his preparations for growing plants in a greenhouse, in air enriched with carbon-dioxide, is of importance, because such experiments have never before been carried out with proper ventilation, in a current of air, as he proposes to do them.

While waiting for his results, it may interest your readers to hear how far this matter has been carried already by the researches of scientific investigators.

Putting aside the earliest discordant results, we need only relate the experiments of Horace Brown and of Demoussy.

Horace Brown* worked in a double glasshouse at Kew, and kept one-half of it enriched with carbon-dioxide, so that it contained by day $3\frac{1}{2}$ times as much as the outside air, while the other half was enriched to 200 times the normal (i.e., 6 per cent.). The houses had to be kept closed by day to prevent the escape of the carbon-dioxide, and they were only opened for ventilation at night. To prevent excessive heating by the sun, the glass was whitewashed, which must have diminished also the illumination.

Selected plants were grown for about two months, May-July. In these conditions Cucurbita, Impatiens, Nicotiana, Begonia, Fuchsia, &c., all showed the same result. Instead of growing more, they grew less than control plants cultivated under ordinary conditions, and not one of the individuals ever bore a flower. Horace Brown concluded that plants are so closely "tuned" to flourish in the existing concentration of carbon-dioxide in the air (0.03 per cent.), that a small increase is enough to completely upset their balance and produce injurious results.

Demoussy, a little later, published several short accounts of his own experiments.† He attributed Horace Brown's results to acid impurities in the carbon-dioxide used, and found also the same effects when he used carbon-dioxide prepared by the action of hydrochloric acid on chalk. When he used really pure carbon-dioxide, as obtained by fermentation of manure, by heating sodium bicarbonate, or from water saturated with this gas, he got positive results of increased growth. He did not work on so large a scale as Horace Brown, but kept his plants under large bell jars or frames. Here, again, the plant had to be kept shut in by day to conserve the carbon-dioxide, and consequently they could not be exposed to direct sun. In his final experiments he raised the content of carbon-dioxide to about five times the normal, during the day, and opened the vessel for ventilation every night. After two months of this treatment he found an average increase of fresh plant-weight, about 60 per cent. greater than in control plants in ordinary air. It is interesting to note that different species gave very different results. Geranium plants were 2.6 times, Tobacco 2.0 times, Coleus 1.5 times as heavy as the controls, while Fuchsia showed no increased growth at all from this treatment. Generally the treated plants flowered sooner and more freely.

By working with a current of air passing continually through his greenhouse, Mr. Andersen's results will be more satisfactory than Demoussy's, but it seems likely that he also will find that some plants respond to this treatment by increased growth, and others, on the contrary, do not.

We may briefly outline the principles which prepare us for striking variation in the response shown by different plants. When a plant grows to a greater size or yields a larger crop, as a result of increasing the percentage of carbon-dioxide in the air surrounding it, there are at least three separate physiological processes involved. These are related to one another as successive stages of cause and effect.

The first stage is that more carbon-dioxide diffuses into the leaf, and hence the green cells have

more of this gas available for making sugar and starch by photo-synthesis in the light. The second is that more sugar can therefore be conducted by translocation down the leaf-stalk to the growing parts of the plant. The last stage is that, as a result of increased food supply, there takes place increased formation of new vegetative parts or more abundant formation of fruit, tubers or similar organs which store food-material.

There is, however, another set of considerations which complicates the whole matter, neglect of which has often led investigators astray. Suppose that the plants in question are growing where the light is feeble or the temperature low, then they may not be able to respond to the increased carbon-dioxide, because they are already doing as much assimilation as that amount of light or that degree of heat will allow. When light or temperature is low, one of these factors may be acting as a "limiting factor" to the amount of assimilation, and no increase of carbon-dioxide will cause an increase of assimilation, because the plant has as much already as it can utilise. Raise the light or the temperature, and then the plant assimilation will increase until it becomes "limited" by the low carbon-dioxide supply provided by the atmosphere: now it will readily respond to increased supplies of carbon-dioxide by increased assimilation. This interaction of limiting factors is not a special relation for assimilation, but is true also of growth and other physiological processes. The growth-rate of a plant at any given moment may be limited either by the temperature, or the water supply, or the internal supply of building material (sugar proteid, &c.). To quicken the growth-rate one must improve the particular condition which is actually limiting; improving the other conditions will have no effect.

The general outcome of these principles indicates that improving a factor in plant existence may have a positive effect, or no effect at all, entirely according to circumstances, and, indeed, according to circumstances which would generally be thought quite outside the problem.

A negative result such as that exhibited by the Fuchsia in Demoussy's experiments might be due to the fact that in this plant the assimilation and translocation are normally very efficient, so that it grows as fast as the temperature will permit, i.e., its growth is normally limited by temperature. If so, the only way to increase the growth is to raise the temperature; increasing the food supply will not do it.

Were a new experiment carried out at a very moderate temperature, possibly Geranium and Tobacco, which respond so well in Demoussy's conditions, would have their activity limited by cold also, and then they would no longer give positive effects with increased carbon-dioxide.

It would be very valuable if Mr. Andersen could arrange to carry out his experiment partly in this form; at least he should record the temperature which some previous observers have not done. F. F. Blackman, Botany School, Cambridge.

LAW NOTE.

NEW POISONS ACT REGULATIONS.

FOR some time past nurserymen desiring to sell poisonous substances to be used in agriculture or horticulture, either for the destruction of insects, fungi, or bacteria, or as sheep dips or weed killers, have been subjected to a good many irritating prosecutions at the hands of the Pharmaceutical Society. Although chemists and pharmacists are competitors of nurserymen in connection with the sale of these articles, the powers of prosecution for infringement of the Poisons Acts and Regulations are at present still vested in the Pharmaceutical Society.

The position of nurserymen who carry on their business in the form of a limited company has been especially unsatisfactory. Naturally a limited company, having no bodily existence, is bound to carry on its business by the agency of its directors and assistants; but the point has been raised by the Pharmaceutical Society that it is not sufficient for the limited company itself to hold a licence to sell a poisonous substance, and that, in order to escape the conviction of its assistants, the company must also obtain an addi-

tional licence for each assistant who performs the physical act of handing over the counter the sealed packet of insect destroyer or weed killer. Under the regulations which have hitherto been in force, no such licences could be obtained without advertising in at least two newspapers notice of intention to apply for same.

On the other hand, it has not been sufficient for the limited company to obtain licences for its assistants only, as the further point has been taken that, even if an assistant sells, he does not "keep open shop," and that in order to get over that difficulty both employer and assistant must have separate licences, even if a limited company could hold a licence at all, which was denied.

The position of a nurseryman carrying on the sale of these substances otherwise than as a limited company has been almost equally difficult. An employer holding a licence has been sometimes laid up or called away temporarily on urgent business, and in more than one case the assistant, selling the goods on his behalf in the interval, has been prosecuted by the Pharmaceutical Society and fined.

The position had begun to grow intolerable, but two difficulties stood in the way of nurserymen in seeking to obtain redress.

In the first place it was open to doubt whether or not the Pharmaceutical Society was correct in the construction which it sought to place upon the law on the subject, and before the authorities could be pressed to take the matter up it was therefore necessary to obtain a definite decision from the High Court. A test case was therefore fought, which resulted in the technical arguments of the Pharmaceutical Society prevailing, and thus gave clear proof of the difficulty of the nurserymen's position.

The second obstacle, however, appeared to be somewhat more formidable. Even if the time of Parliament were not too fully occupied during the next year or two with other matters, it was not likely that a further Act could be obtained from the legislature so soon after the passing of the Poisons and Pharmacy Act, 1908. The nurserymen, therefore, decided to follow the line of least resistance, and to endeavour to secure the desired reforms by urging the Privy Council to advise His Majesty to exercise the power of making further regulations under the Act in question. The result has proved eminently satisfactory, and is set forth in the additional regulations to which the assent of His Majesty, acting by and with the advice of his Privy Council, was given on November 10, 1911.

The principal reforms thus secured are as follow:—

1. Nurserymen and others (whether trading as limited companies or as private concerns) who may apply for licences to be granted to their assistants are relieved of the considerable expense of advertising, in at least two newspapers, notice of their intention to make such application.

2. The maximum fee to be charged on the first issue of an assistant's licence is reduced to 5s., the annual fee for subsequent renewal being 1s. 6d.

3. The new regulations recognise the propriety of granting a licence to a limited company. Although a limited company will still require to obtain licences for its assistants, this should put an end to the contention which has been raised that a licence cannot be granted to a limited company to "sell and keep open shop," and can only be issued to one of the directors in person.

4. It would of course be both unfair and untrue to suggest that the reforms now obtained indicate any leaning by the Privy Council towards horticulturists in their dispute with the Pharmaceutical Society. At the same time, it is permissible to point out that the new regulations could never have been obtained if the Privy Council had felt any fear of the "bogey," which is constantly being held up before provincial councillors by the Pharmaceutical Society, to the effect that the sale by nurserymen of poisonous compounds is liable to increase the average number of deaths either from suicide or misadventure. It is of course obvious that if a person takes a poisonous substance, either deliberately or accidentally, the trade of the licence holder from whom he originally obtained the substance is of comparatively little moment, the practical result being the same, whether the compound has been purchased from a licensed chemist or a licensed nurseryman.

* *Proc. Roy. Soc.*, vol. lxx., 1902.

† *Comptes rendus Acad. Sci. de France*, vols. 196-199.

Other points which will require to be borne in mind by those desirous of availing themselves of the new regulations are as follow:—

(a) The regulations will come into force on January 1, 1912.

(b) If an employer's licence is revoked or suspended the licences of his assistants are ipso facto similarly affected.

(c) The person on whose behalf any sale is made is to be deemed "the seller," so that employers (as in the case of holders of most other licences) are still held liable to see that their assistants do not contravene the law.

(d) Special forms of application, which are appended to the regulations, must be used in the case of applications for licences to limited companies, firms, or assistants.

(e) Notice of intention to apply for an assistant's licence must still be given beforehand to the police.

Fears had been expressed that it would not be possible to obtain the Royal Assent to the regula-

THE ROSARY.

CULTURAL HINTS FOR DECEMBER.

THE ground is now very wet, and it will be wise to delay any further planting if it continues sodden. Let me say that the transplanting of established Roses does not receive sufficient attention. The Rose is a somewhat gross feeder, and the soil sooner or later becomes exhausted; consequently, much good might be done by moving old plants and giving them fresh soil. When dealing with very large specimens, the shoots should be reduced, leaving only the best and youngest branches. In lifting old Rose trees, few fibrous roots are seen, and the few coarser ones cannot support a great quantity of top growth after transplantation; therefore, my practice is to thin out some of the shoots before planting. On

Roses undoubtedly enjoy a generous treatment; but, like other plants, they can be surfeited with manure. One needs to examine the ground well, and ascertain the condition previous crops have left it in. In some cases it would be better to release some of the humus by the application of lime, allowing the soil to lie fallow for a while. Stable manure is good upon very stiff soils, and well-rotted dung from the stock yard upon lighter soils. Pig and cow manures are especially useful for ordinary soils. Not a few of our successful growers obtain their best flowers by the aid of night-soil. Nor is this so offensive as might be imagined when properly prepared and applied. Let the night-soil be put upon a heap of loam, and covered with a little fresh earth. After a few weeks the whole should be turned over and well intermixed. It is then ready for use, and had better be placed below the surface of the soil.

FIG. 161.—BRASSO-CATTLEYA DIGBYANO-MOSSIE "HOLFORD'S VARIETY" (B. DIGBYANA X C. MOSSIE REINECKIANA).

(Received R.H.S. First-class Certificate on November 21 last. See p. 381 ante.)

tions until after His Majesty's return from India, and nurserymen and horticultural sundriesmen will doubtless feel considerable gratification that, amidst all the multifarious duties claiming attention on the eve of the Royal departure from this country, time should have been found to deal with the matter.

The successful result of the agitation for reform should certainly serve to encourage nurserymen in pressing for the removal of the many hardships affecting their trade. Having regard to the fact that they were opposed by so powerful a body as the Pharmaceutical Society, it should also serve to impress upon horticulturists how largely they may make their influence felt by means of combination and mutual support. The object lesson should prove especially useful at the present time when greater dangers (such as the agitation to tax land values and to throw millions of extra taxation, including the whole of the food duties, upon the land) are threatening those who have invested their savings in purchasing the soil from which their livelihood is derived. H. M. V.

no account allow these old plants to lie about after they are lifted, so that their roots are exposed to the drying air. In many cases the owner may object to moving some old favourite Rose, or it may be inconvenient to do. In such cases the plants may be much helped at this season if a good portion of the old soil is taken away from the roots and this replaced by fresh loam and suitable manure. New roots will develop in the fresh soil during the following summer, and the plant be greatly benefited.

MANURES.

Whilst the planting season was in full swing, I was frequently asked what manures would be most suitable for Roses. But so much depends upon the nature of the soil, that one hesitates to advise except generally. As a matter of fact Roses like almost any kind of manure. What the grower should aim at is to furnish in the manure what the soil is deficient in.

In the case of a hot, dry soil, I would give preference to cow manure over pig dung, the last being rather more drying.

But Roses do not require manure at the time of planting to the extent imagined by many. If the ground is dug deeply, and the bottom spit enriched, so as to provide food to the roots when they reach that point, it would be better, in many cases, to have the remainder little more than rich, loamy soil until the roots have got into it well, as they may be fed by surface dressings during their season of growth. Too often Rose beds are overdone with manure, or it is dumped into the hole and not sufficiently mixed with the soil.

Hedge Briars may still be planted. The late growth of climbers of such types as Wichuraiana, Ayrshire, and Climbing Polyantha Roses having provided many cuttings in the best possible condition for rooting; these should be inserted at once. *Practice.*

The Week's Work.

FRUITS UNDER GLASS.

By E. BECKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Hertfordshire.

FIGS.—The remarks in the Calendar for October 28 on the cleansing and pruning of Early Fig trees apply equally to the trees intended for successional fruiting. The Fig is very subject to infestations of mealy bug, and, unless vigorous measures are adopted, this pest will prove a continuous source of trouble. At Aldenham we have been experimenting recently with cyanide of potassium for the fumigation of fruit houses, and, so far as can be ascertained at present, I believe that repeated fumigations of this substance will prove effectual in destroying all mealy bug. Any root-pruning that is necessary should be undertaken as soon as convenient after this date. Where the borders are comparatively large, root-pruning often results in increased yield, and especially in the case of trees with a somewhat restricted top growth. Narrow borders give the best results, and it is a suitable time to undertake any alterations that are contemplated in the rooting medium. The border should be well drained, so that plenty of water may be applied during the growing season without a danger of the ground becoming waterlogged. In order to prevent the roots from spreading too far from home, a rough brick wall should be constructed below the soil some 3 feet or 4 feet distant from the trunk of the tree, varying the width of the border according to the amount of trellis work that the shoots are required to furnish. The borders should be top-dressed with good loam broken apart and mixed with a sprinkling of wood ashes, lime rubble, and bone-meal, or finely crushed bones.

THE ORCHARD HOUSE.—Immediately the opportunity presents itself the orchard house should receive a thorough cleansing. Afterwards attend to any necessary work connected with the trees, such as root pruning or lifting them. Plum trees, especially, often need to be root-pruned, which need may be seen in the strong shoots that develop in a single season, exhausting the energies of the plants to the detriment of fruiting. Permanently planted trees that show signs of exhaustion will be benefited by fresh soil. Take out a trench and remove some of the old compost, at the same time cutting back any gross growing roots that are met with. A portion of the surface soil should also be removed, and replenished with rich, fresh material. If ripe fruits are required by the end of May or early in June, some of the more promising pot trees of varieties suitable for early fruiting that are well furnished with fruit buds should be started gradually in a cool house. Afford water with care for the first few weeks, as the roots are in a dormant condition. Place the trees where they may obtain plenty of light, standing them on a firm bottom to prevent worms from entering the pot through the drainage holes.

THE VINERY.—Vines that were raised from "eyes" inserted last spring may, provided they are properly ripened, be pruned, cutting them back to two good buds. Dress the cut surface with styptic to prevent bleeding. Allow the plants to rest, keeping them moderately dry at the roots.

STRAWBERRIES.—A batch of Strawberries may be placed on a shelf in an early forcing house where a temperature of from 45° to 50° is maintained at night time.

LOAM AND OTHER ROOTING MATERIALS.—Get together a good supply of loam and other material for potting purposes, and the formation of Melon beds, which will have to be made early in the New Year. Store the soil in a cool, dry place. If the presence of wireworms be suspected in the turves, the latter should be charred as recommended in a previous calendar. Wood ashes are very valuable for many purposes, and should be placed under cover to prevent the manurial properties from being washed out by the rains. Loam that is not rich in fibre should be mixed with long strawy manure.

PLANTS UNDER GLASS.

By JAMES HUDSON, Gardener to LEOPOLD DE ROTHSCHILD, Esq., Gunnersbury House, Acton, Middlesex.

LILY-OF-THE-VALLEY.—Retarded crowns (Berlin) of Lily-of-the-Valley may be had in flower by Christmas, if forcing is commenced now. Let the forcing be gentle at first, raising the temperature when the spikes begin to show colour, and lowering it again gradually as the blossoms expand, until a greenhouse temperature is reached. Aim at obtaining well-developed foliage, which is essential to the best results.

HIPPEASTRUM (AMARYLLIS).—It is a comparatively easy matter to have plants of Hippeastrums in flower early in the winter. The essentials are well-ripened bulbs and healthy roots, the latter being the most important point. If plants have not been forced so early in previous seasons, make a selection of the best-ripened and largest specimens, and those which generally give promise of producing large flower-spikes. It will be advisable to mark these in some manner, so that they may be selected again next season for the earliest flowering. When this system is adopted, the bulbs start into growth quite easily, and, after a time, it will be found possible to have them in flower as early, or even earlier, than the present date. Remove the old soil from the roots previous to repotting them, and where there are signs of extra vigour in the bulbs, give these a larger pot, but not otherwise. For a potting compost, employ a mixture of turfy loam and lime rubble, which are the best materials to use early in the season. Our plants at Gunnersbury, which were plunged into cold frames as advised in the Calendar for June 10, have made excellent growth, and are, in every respect, satisfactory, and free from insect pests. As they are not required to flower early, they will not be started before the middle of January. Young bulbs that were raised from seed sown during the summer of 1910 have also made a satisfactory growth. These, from the commencement of summer up to the present time, have been accommodated in a north frame, provided with hot-water pipes. Not until the past few weeks has the frame been heated, as my object has been to get the bulbs thoroughly ripened, with a view to flowering the stronger ones next April. The bulbs were planted out, as I recommended in these columns last summer, to favour a strong growth, so that they might be had in flower as early as possible from the seedling stage. Up to the present time, the plants have not been rested. Seedling Hippeastrums raised this season from seed sown as soon as it was ripe should be kept growing actively all through the winter. Individual plants that have grown satisfactorily should now be in thumb-pots, and should be placed close to the roof-glass in an ordinary stove-house. In cultivating Hippeastrums, it is always better to use small pots rather than large ones; many will flower quite well in 4½-inch (48) pots; but, as a rule, 6-inch pots are the most suitable, allowing the very largest bulbs 7-inch pots. It is the practice of many to plunge the pots in some material, but this is not necessary. We do not plunge our plants before they flower, and they are shifted from house to house as circumstances require; but they are plunged out-of-doors during the summer, when they have finished their growth.

NARCISSI.—Bulbs of early varieties of Narcissus that were potted up some time previously, as recommended by me, should now be well rooted and ready for starting into growth, to provide a supply of early flowers. Under favourable circumstances, these should be in bloom by the end of the year. Remove all this early stock from the bed of ashes in which it is plunged, if this has not been done already, and, when the first batch is in heat, place the pots as near to the roof-glass as possible, maintaining a moist atmosphere. If a slight bottom heat, such as is afforded by a bed of tree leaves, is given, it will be an advantage. These remarks apply to trumpet Daffodils. Daffodils of the Paper White and Early Roman types may be had in flower now with very little forcing.

ROMAN HYACINTHS.—From this date onwards, successional batches of Roman Hyacinths will provide a supply of flowers suitable for a variety of purposes. Bulbs that were potted

last should be removed from their covering ashes before the leaves and spikes become drawn. If severe frost sets in, the frames must be covered with mats, for it is not advisable to allow the plants to become frozen.

TULIPS.—Tulips of the Duc van Thol section are very suitable for associating with Roman Hyacinths when in flower; endeavour to keep the growth as dwarf as possible for this purpose. If the bulbs are started into growth now, they should be in flower by the end of December, without resorting to hard forcing. Vermilion Brilliant is a very suitable variety to provide a succession of flowers to Duc van Thol. The variety forces well, and the flowers provide desirable colouring during the dull season.

THE ORCHID HOUSES.

By H. G. ALEXANDER, Orchid Grower to Lt.-Col. Sir G. L. HOLFORD, K.C.V.O., C.I.E., Westonbirt, Gloucestershire.

PHALÆNOPSIS.—There are few Orchids more difficult to manage during winter than the Phalænopsis. The succulent and sensitive nature of the leaves, and absence of pseudo-bulbs for storing up nourishment, renders watchfulness on the part of the grower very necessary. The treatment required during this season will depend, to a great extent, upon how the plants have been cultivated during the summer and autumn. If the leaves have been properly consolidated by due exposure to light and air, the plants should be, in a manner, hardened, and better able to withstand dryness at the roots, a drier atmosphere, and a lower temperature, than specimens having soft, unripened foliage. Well-matured plants should pass the winter quite safely in a minimum temperature of about 55°, and will take no harm if the temperature should drop a few degrees lower on very cold nights. The plants are best suspended about a yard from the roof-glass, affording them the sunniest and lightest position possible. Whilst every care is necessary in affording moisture at the roots, sufficient water must be given to keep the leaves plump and firm, for plants that are allowed to suffer from excessive dryness during winter will often, when the sap becomes active in the spring, cast many of their leaves; but guard against an excess of moisture when the roots are inactive, for this will favour damping and spot diseases. It is impossible to give any precise directions with regard to these matters, but it is always better to err on the side of dryness at the roots, compensating with plenty of moisture in the atmosphere, for, if the early morning temperature is rather lower than desirable, there is always less danger when the roots are on the dry side. Newly-imported plants, or any that have not finished their growth, should be kept growing gently through the winter. They are best grouped together in the warmest house, where they will be constantly under the observation of the cultivator.

DECIDUOUS CALANTHES.—Amongst all the winter-flowering Orchids, none is more useful than the deciduous Calanthes, of which there are now many handsome kinds. The plants commence to bloom in November, and provide a display of flowers throughout the winter months. After the flowers are past, the pseudo-bulbs require a season of rest. They are best left in their pots, placing the latter on their sides in a light and dry place, where the temperature never falls below 55°. Some growers advocate shaking the plants out of their pots, and storing them thickly in boxes, covering the roots with dry sand; but, except for exigencies of space, this practice is not advisable, for the bulbs start more freely into growth when not disturbed.

VANDA TERES.—The beautiful Vanda teres requires a different treatment from others of its family. The plants have now completed their season's growth, which may be seen by the sealing over of the points of the roots. This Orchid requires a long season of rest, and, during its period of inactivity, water should be afforded in quantity sufficient only to prevent much shrivelling of the leaves. The temperature of an intermediate house, such as the majority of Cattleyas occupy, will suit this species whilst at rest better than a warmer house. Vanda Hookeriana and its hybrids should be afforded a similar treatment when signs of rest are apparent.

THE HARDY FRUIT GARDEN.

By W. HEDLEY WARREN, Aston Clinton Gardens, Buckinghamshire.

FIGS ON WALLS.—Figs will succeed in any moderately light garden soil, provided the substratum is not wet or cold; therefore, a border for Figs should be drained perfectly. The principal cause of failure in growing Figs out-of-doors in this country arises from not choosing a suitable situation, such, for instance, as a south wall. Restriction of the roots is an essential point in their successful cultivation, for with a free root run the trees grow too luxuriantly, and fail to produce or mature satisfactory crops of fruit. The object of root restriction is to induce the trees to make short-jointed wood that may become fully matured before winter. If the roots cannot be otherwise kept within bounds root pruning must be resorted to. In planting—unless the soil is of a very poor nature—no manure should be employed: it is far better to give the trees a good mulching of cow manure after the planting is completed. The distance apart at which the trees should be planted, against a wall 10 feet or 12 feet high, is from 16 feet to 18 feet. The best form of training for wall Fig trees is the fan shape. In pruning and training aim at securing a regular supply of young wood in every part of the tree. The branches should be trained sufficiently far apart to allow the sunshine and air to reach every part of the tree; the branches of those kinds that produce very large leaves should be at least 12 inches or 14 inches apart. During the early part of the summer, when the young shoots have completed or almost finished their growth, they should be stopped to assist the young fruits to swell. Lateral shoots generally bear plenty of fruit during the latter part of the summer or early autumn, but they will not ripen in this country during the same season. Fruits of this crop that have grown to half their proper size or even such as are as large as a Marrow Fat Pea seldom survive the severity of English winters, and it is the common practice to remove these at the end of the autumn. This is the correct thing to do, and in many instances their earlier removal would be of benefit to the embryo fruit usually found at their side, or near by, but which are small enough to escape injury, provided the trees are sufficiently protected during the winter. During the summer season the borders must be kept well supplied with water, and the regulation of the shoots attended to. Before frosts appear the trees should be protected, but use no more covering than is absolutely necessary, or the trees may receive a check when it is removed in the spring. Where procurable, dry bracken Fern forms an excellent material for the purpose, for whilst affording adequate protection to the branches it does not exclude the air. The winter pruning of the trees may be undertaken just before the sap commences to rise, retaining as many fruiting branches as are necessary to furnish the wall. All shoots that are not required should be cut clean away, except where a supply of wood may be wanted for any particular purpose. In such cases a few branches may be shortened to one or more buds. All shoots that are retained for bearing fruit the following summer must remain intact. After pruning, and before the branches are again tied or nailed into their respective positions, the trees may be dressed or washed with an insecticide if this is necessary.

THE KITCHEN GARDEN.

By JOHN DUNN, Kitchen Garden Foreman, Royal Gardens, Windsor.

MUSHROOMS.—Where a regular supply of Mushrooms is required throughout the winter and spring, it is necessary to make up a fresh bed every three or four weeks from the present time until the end of March. It is important that the manure be thoroughly prepared before it is taken into the Mushroom house. When the droppings are being collected, they should be placed together as quickly as possible, and turned every other day for 10 days, after which they should be ready for removal to the Mushroom house, where they must be allowed to remain in a heap for a few days before the bed is made up. By that time the temperature of the manure should have risen to 75° or 80°. It should then be rammed tightly together, and, when all danger from overheating is past, the spawn should be inserted about 1 inch below the surface, and

10 inches apart. A layer 2 inches deep of new loam is not too much soil to spread over the bed, and it should be beaten lightly, using the back of a spade. Examine the beds from which supplies are being gathered at least once a week, so that water may be afforded when necessary. But overhead waterings should be avoided whenever possible whilst the bed is in bearing. I have often noticed that many young Mushroom beds are damaged by too much moisture. If a cool, moist atmosphere is maintained, this will lessen the need for overhead waterings. Instead of applying fire-heat, close any ventilators which may cause a draught, and keep out all the cold air possible. Damp the floor and walls of the house when the atmosphere seems at all dry. The temperature of the house need not be more than 50° in winter, and may be allowed to drop to 45° in very cold weather, when the amount of moisture afforded should be reduced.

TOMATOS.—Tomato plants intended for furnishing a supply of fruits in winter need to be watered very carefully, but do not allow the soil to become too dry, or many of the fruits may split after water is afforded. The temperature of the house should not be higher than 60°, and the atmosphere should be kept moderately dry. A little more freedom of growth may be allowed during winter, to keep the plants healthy. Young plants intended for fruiting early in April should be ready for transferring into 6-inch pots, in which they may remain until January, when, if all goes well, they should be ready for placing in their fruiting pots. The pots should be washed and crocked carefully. The potting compost may be composed of two-thirds turfy loam, and one-third leaf-mould, with sufficient rough sand to keep it porous. Pot moderately firmly. It is important that the plants be kept to within a few inches of the roof-glass, which should never be allowed to become dirty. If the soil is moderately moist at the time of potting, water will not be necessary until fresh roots reach the sides of the pots. The aim of the grower should be to keep the plants as sturdy as possible. The temperature of the pit should be about 55° at night; but in very cold weather a few degrees lower will not matter. Some material should be placed over the roof in cold weather for a protection, to lessen the need for excessive fire-heat.

CAULIFLOWERS.—Cauliflower plants growing in cold pits should be afforded plenty of fresh air whenever the weather is favourable; whilst on mild days the lights may be removed entirely in the mornings, to be replaced in the evenings. The plants should be placed within 1 foot of the roof-glass, with the object of keeping them as hard and stocky as possible. It is not too late to pot young plants for a succession. They may be potted in 4-inch pots, using good, rich soil. The lights should be kept closed for a few days to allow the plants to make fresh roots as soon as possible. The plants must be watered carefully during the winter.

THE FLOWER GARDEN.

By R. P. BROTHERSTON, Gardener to the Earl of Haddington, K.T., Tynninghame, East Lothian.

PROTECTING TENDER PLANTS.—It is now quite time that some means should be in readiness of efficiently protecting such shrubs or other plants that are not sufficiently hardy to stand the rigours of a severe winter. Two years ago some shrubs in the garden here which had survived the winters for 30 years were severely damaged, and a few were killed. It was curious to note that the damage was not universal, for some specimens of the affected species escaped without injury, even on the same spot; this was especially noticeable in the case of *Olearia macrodonta*, *O. Haastii*, and certain Bamboos; also *Cornus capitata*, the finest specimen of which was killed. Not one of the Sweet Bays was killed, but some of the plants suffered severely. The following year *Arbutus Unedo* (Croomii) was the only plant that succumbed, and quite a number of plants, by no means indisputably hardy, were unscathed. Soil forms one of the best protective materials; it should be heaped around the stem to a depth of about 6 inches in the case of Roses, *Romneya Coulteri*, varieties of *Hypericum* and any other plants which have several shoots springing from the ground. It may also be employed in the case of clumps of *Montbretia*, and any bulbous plants which cannot be considered

to be quite hardy. Rough straw ropes form a good protection for such plants as *Nandina domestica*, *Cæsalpinia japonica*, *Daphniphyllum glaucescens* and *Ligustrum sinense*, and they may be wound around the stems of taller specimens. Wall shrubs may be protected with branches of Spruce, or a better method is to employ straw, kept in position by means of branches of deciduous trees, especially for such plants as Myrtles and Fuchsias. It cannot, however, be denied that a very severe frost is apt to penetrate the most carefully-applied protection.

SURFACE DRESSING.—Surface dressings of sifted soil compost or decayed rubbish (the latter only if free from the seeds of weeds) should be applied to many kinds of flowering plants which exhibit a tendency, when left in the ground for a lengthened period, to come to the surface. A better method still is to lift and re-plant them, but the time necessary for this latter operation is sometimes lacking. Lily-of-the-Valley and Daffodils should be given a dressing an inch thick, or, if the Daffodils are growing in grass, 2 or 3 inches, according to the nature of the soil. Groups of Phloxes will need 3 to 4 inches; the ground between the clumps should be filled in to make an even layer 1 inch thick at each clump. This treatment is especially suitable to borders outside the flower-garden. Lawn grass in poor condition should be treated with very fine soil, soot or compost. It is sometimes considered essential to break the surface with a rake previous to making the application, but equally good results are obtained by scattering the dressing over the ground, and leaving the rain and other agencies gradually to work it in.

THE FRENCH GARDEN.

By PAUL AQUATIAS.

SPRING CROPS.—The Lettuces, owing to the cold and wet weather, have not been given any ventilation. The keen winds have somewhat retarded the growth of the plants, but the cold has favoured a hardier and sturdier growth, rendering the plants less liable to attack of mildew, which generally appears about this time. The Cos Lettuces "Paris Grey" intended for forcing on hotbeds are ready for transplanting a second time. The beds are prepared for three rows of cloches, as was done for the first planting in October. The plants are carefully lifted, and the cotyledons and any decayed leaves removed. They are set 14 per cloche instead of 30 as at the first planting. It has not yet been necessary to cover the cloches with mats as there has not been hard frost. Should very cold weather set in, however, every precaution must be taken. Lettuces sown about the middle of November are just coming through the soil. They should be thinned out at an early stage in order to prevent damping off, as they will not be pricked off until early in February.

BLACK SOIL.—The compost produced by the decay of the hotbeds, which were made the previous spring, is one of the greatest assets under this system of intensive culture. It favours the growth of fibrous roots which are so beneficial to a quick-growing and healthy vegetation; in the early spring and autumn its dark colour attracts the heat of the sun, frosts have very little effect owing to its porosity, and it is workable in any weather. If added to light ground it serves to retain moisture in the soil, while in heavy land it promotes a more open texture. The produce obtained from it is clean and wholesome, and this is a point worth the attention of those who may object to vegetables grown directly in the manure. Our black soil which is intended for hotbeds next season is now placed in five ridges, 3 feet wide at the base, 3 feet high, and 65 feet long, perpendicular to the future position of the beds. The surplus, equivalent to one-third of the whole quantity, will be carted away to some part where it will be needed. Some of the soil will be used for filling the frames intended for cold work, and the remainder will be placed in a heap for use at future sowings and transplantings.

GENERAL WORK.—Every advantage should be taken of favourable weather to prepare the ground for planting the open-air crops. It should be given a heavy dressing of manure and dug deeply. Any necessary alterations and levelling must be completed without delay, as after Christmas most of the time will be occupied by the making of hotbeds and the planting of the numerous crops.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, as well as specimens of plants for naming, should be addressed to the EDITORS, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Local News.—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Illustrations.—The Editors will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c., but they cannot be responsible for loss or injury.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.

APPOINTMENTS FOR DECEMBER.

SATURDAY, DECEMBER 2—
Soc. Française d'Hort. de Londres meet.

MONDAY, DECEMBER 4—
Nat. Chrys. Soc. Conference at Carr's Restaurant.

TUESDAY, DECEMBER 5—
Roy. Hort. Soc. Coms. meet. (Lecture at 3 p.m., by Dr. Breland-Farmer, on "Mistle Organs of Plants.")
Hort. Club meet. Perpetual-flowering Carnation Soc. Exh. at Botanic Gdns., Regent's Park (2 days). Scottish Hort. Assoc. meet.

THURSDAY, DECEMBER 7—Linnean Soc. meet.

MONDAY, DECEMBER 11—
United Hort. Benefit and Prov. Soc. Com. meet. Kent Commercial Fr. Sh. at Ashford (2 days).

MONDAY, DECEMBER 18—
Nat. Chrys. Soc. Executive Com. meet.

TUESDAY, DECEMBER 19—
Roy. Hort. Soc. Com. meet (no general exhibition).

THURSDAY, DECEMBER 21—Linnean Soc. meet.

MONDAY, DECEMBER 25—Christmas Day.

TUESDAY, DECEMBER 26—Bank Holiday.

THURSDAY, DECEMBER 28—
Soc. Nationale d'Hort. de France (Paris) General Meet.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last Fifty Years at Greenwich—41°1'.

ACTUAL TEMPERATURES:—

LONDON.—Wednesday, November 29 (6 p.m.): Max. 50°; Min. 44°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—Thursday, November 30 (10 a.m.): Bar. 30°1'; Temp. 48°; Weather—Dull.

PROVINCES.—Wednesday, November 29: Max 51° Ireland, S.W.; Min. 39° England E.

SALES FOR THE ENSUING WEEK.

MONDAY AND WEDNESDAY—
English and Dutch Roses, Shrubs, Azaleas and Dutch Bulbs, at Stevens's Auction Rooms, 88, King Street, Covent Garden, London, at 12.30.

MONDAY, WEDNESDAY, THURSDAY AND FRIDAY—
Dutch Bulbs, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 11.

WEDNESDAY—
Trade sale of miscellaneous Bulbs and Roots, at 12; Roses and Herbaceous Plants, at 1; 4,336 cases Japanese Lilliums, at 2.30; Palms and Plants at 5; at 67 & 68, Cheapside, E.C., by Protheroe & Morris.

FRIDAY—
Choice Established Orchids in variety, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 12.45.

Increased Yields from First Generation Hybrids.

The increased vigour exhibited by hybrids is a fact which is all but universally known, and hence it is not surprising, now that so much attention is being paid to genetics, that a systematic attempt should be made to take advantage of the fact for commercial purposes. Indeed, with the evidence of experiments with hybrids before us, it is somewhat remarkable that such attempts have not been made on a large scale heretofore. Thus, so long ago as 1878, Dr. W. T. Beal found that, by crossing two varieties of Maize

(Corn), the vigour of the hybrid expressed itself in an increased yield of "seed" amounting to 31 per cent. Dr. Beal's results were confirmed from time to time by other experimenters working independently. The most recent experiments of this kind are by Mr. G. N. Collins, of the Bureau of Plant Industry, United States (see *Year Book of Department of Agriculture*, 1910). As the result of extensive trials, Mr. Collins concludes that breeding first-generation hybrids of Maize for seed purposes is commercially practicable. He estimates the increased cost of producing seed from cross-fertilised plants at about 2 per cent. of the normal cost.

Inasmuch as the reproductive vigour of Maize hybrids is confined to, or, at all events, is most marked in the first generation, it is necessary to build up the seed each year: hence the extra cost.

In the Maize plant the procedure to be adopted is rendered extremely simple by the fact that male and female flowers are borne on different parts of the plants. Hence, all that is necessary is to cover with stout paper bags the male inflorescence of the plants chosen as male parents. The pollen which collects in the bags is then dusted on the tassels (stigmas) of the plants chosen as seed-bearers. Self-fertilisation, which in Maize is always attended with reduced fertility—even among hybrids—is prevented by removing the male inflorescences before they shed their pollen—from the plants destined for seed-bearing.

How far the exploitation of the enhanced fertility of first-generation hybrids is likely to obtain among other plants is an open question.

In the first place, it may be remarked that, though increased vigour is a very general, if not universal, phenomenon among first-generation hybrids, it has yet to be proved that enhanced fertility is an equally general phenomenon, even among varietal crosses. In the second place, it remains to be proved that enhanced fertility of the first generation is—as appears to be the case in Maize—lost in the next generation. In the third place, it must be borne in mind that many plants are not so easily manipulated as is the Maize, and therefore the question of the extra cost of cross-bred seed as compared with ordinary seed has to be considered. Nevertheless, we are inclined to think that the practice may be extended. We possess at the present moment unpublished researches, which show that first-generation hybrids between varieties of culinary Peas (*Pisum sativum*) are not only more vigorous growers, but also heavier yielders than are either of the parental varieties. In the case of the Pea, the labour involved in raising stocks of hybrid seed year after year is enormously greater than in the Maize. Each seed-bearing flower must be emasculated and artificially pollinated, and hence the number of flowers which would have to be treated to secure a large supply of seed is indeed great. On the other hand, the operation of emasculation is of the simplest, and could be taught to any person with delicate fingers, in a few minutes, so that, with practice, one worker

—and for such work women are better adapted than men—could emasculate, and pollinate, many hundreds of flowers in the course of a day. Another plant with respect to which the first generation hybrid method is eminently successful is the Potato. Here again we have strong experimental evidence, which professional breeders could, no doubt, corroborate, of the high yield of first generation varietal hybrids. Unfortunately, however, the raising of Potatoes from seed instead of from sets is not a "commercial proposition." Hence it is much to be desired that exact investigation should be made as to the rate of falling off in yield in subsequent generations. The much discussed "running out" of varieties of Potato is often appealed to as evidence that the vigour gained as the result of the original cross is, as a matter of fact, gradually lost. Whether this is so or not, it is important, both from a scientific and a commercial point of view, to know if the loss of vigour and fertility in self-fertilised or vegetatively propagated plants follows any general law of decreasing returns, or whether the rate of loss of vigour—if such occurs—varies according to the varieties employed in the original cross.

As to the scientific aspect of these matters, there is nothing to say, for nothing is known. It is greatly to be desired that students of genetics should occupy themselves with the significance of the obscure phenomenon of self-sterility and the apparently cognate phenomenon of enhanced vigour of hybrids. Professor Bateson has already drawn attention to the need for investigation in this branch of genetics, and for our part we know of no subject on which growers, professional hybridists, and scientific men could so well co-operate as on the elucidation of what is at once one of Nature's profound mysteries, and a problem fraught with far-reaching consequences to horticulturists and agriculturists.

James Douglas.

The news of the sudden death of this well-known and highly-respected gardener and florist will be received with profound regret. Douglas was the last of the old school of florists, and his death has severed a link with the past that can never be repaired. Our own columns have frequently borne witness to his enthusiasm for such flowers as Carnations, Auriculas, Polyanthus, and Tulips; indeed, Mr. Douglas was one of our oldest contributors. Only a week ago he wrote to us with respect to arrangements for contributing articles on his favourite flowers during the present season, and the first of what promised to be an invaluable series reached the office after his death. James Douglas had a pleasant way of working into his cultural articles a great deal of florists' lore which was not merely interesting, but helpful to an understanding of the true properties of the flowers which he was describing. His writings were of permanent value, because they were based on his own experience as a cultivator. No man

Supplement to the "Gardeners' Chronicle."

ISOPYRUM GRANDIFLORUM; FLOWERS LAVENDER-BLUE.

FROM A PHOTOGRAPH TAKEN BY MR. FORREST ON A LIMESTONE CLIFF ON THE
LICHANG RANGE, CHINA.

excelled Douglas as a plant grower, and it will be remembered that he exhibited with extraordinary success at most of the great shows before leaving Great Gearies garden, Ilford, to start business as a nurseryman at Bookham. His collections of Auriculas shown at the R.H.S. meetings in recent years have excelled anything of the kind ever seen, and the Council has shown its sense of the general appreciation of them by awarding Mr. Douglas the gold medal on several occasions. His personal qualities were as high as his professional attainments, and his name was, and will remain, always associated with all that was best in the horticultural world. Amongst his public services may be reckoned thirty-two years work on the Committee of the Gardeners' Royal Benevolent Institution, and he was not only a permanent member of the Floral Committee of the Royal Horticultural Society, but for some years represented professional gardeners on the Council of that Society. He gave continuous help to the National Auricula and Primula Society and other special Societies. Douglas was awarded the Veitch Memorial Medal, and in 1899 the Victoria Medal of Honour. No man deserved these distinctions more than he, for his life and work afforded an exemplary example for the younger gardeners of the present day to emulate.

ROYAL HORTICULTURAL SOCIETY.—The next meeting of the Committees of this Society will take place on Tuesday, the 5th inst. In the afternoon Dr. J. BRETLAND-FARMER, F.R.S., will deliver a lecture on "Motile Organs of Plants."

HORTICULTURAL CLUB.—The next house dinner of the Club will take place on Tuesday, December 5, at the Hotel Windsor, Victoria Street, S.W., at 6 p.m., when Mr. ARTHUR W. SUTTON, J.P., V.M.H., will give a lecture entitled "Four Hundred Miles on Horseback East and West of the Jordan." The lecture will be illustrated by 100 painted views of the Lebanon, Gilead, Basham, Moab and Southern Palestine.

THE WINTER CARNATION SHOW.—Mr. LAURENCE J. COOK, hon. treasurer of the Perpetual-flowering Carnation Society, wishes us to remind our readers that the Society's show will be held at Regent's Park on the 5th and 6th inst., during the Smithfield Cattle Show week, when special trains will be run to London from the provinces at reduced fares.

ALTERATIONS AT GRIMSTHORPE CASTLE.—The Earl of ANCASTER is carrying out extensive alterations and improvements at Grimsthorpe Castle, his Lincolnshire seat. These include a new heating installation on the hot-water low-pressure system, which is being carried out by Messrs. FOSTER & PEARSON, LTD. The same firm is also installing a system of domestic hot-water supply.

FORESTRY DEGREE AT ABERDEEN UNIVERSITY.—At a recent meeting of Aberdeen University Court, a resolution was passed approving of the institution of a degree in forestry. The course for qualifying for the degree will consist of two sections, the first including botany, zoology, natural philosophy, and chemistry, while the final examination and the major part of the course will consist of the subject of forestry in its various departments. A three years course is contemplated.

LINNEAN SOCIETY.—The next general meeting will be held on the 7th inst., at 8 p.m. Papers:—1. Prof. PERCY GROOM—The Inter-nodes of Calamites; 3. Mr. H. N. DIXON—On some Mosses of New Zealand. Exhibitions:—1. Dr. GEORGE HENDERSON—Lantern slides taken during an expedition through Kashmir, Little Thibet and Turkestan; 2. The same—Variation in the foliage of Alnus; 3. Mr. W. C. WORSDELL—Some Abnormal Toadstools, and their Morphology.

NORTHERN FRUIT CONGRESS.—At the exhibition, held at Newcastle on the 15th ult., in connection with the North of England Horticultural Society's Fruit Congress, Messrs. MACK & MILN, Darlington, were awarded a large Silver Medal for a collection of Apples.

SWEET PEA DISEASES.—The authorities of the University of Pennsylvania have decided to conduct an investigation into the diseases which affect Sweet Peas, and, if possible, to find remedies for them. The results will be watched with interest by Sweet Pea growers in this country, who would especially welcome a solution of the mysterious "yellow streak" complaint.

WESTON - SUPER - MARE CHRYSANTHEMUM SHOW.—We learn from the secretary, Mr. J. LEE, that our correspondent took too optimistic a view of the success of the recent show. However successful the show may have been as an exhibition, the society is still left with a deficit on the year's working, besides that incurred during last season.

BATTERSEA PARK.—For some time past the Parks and Open Spaces Committee of the London County Council have had under consideration the desirability of converting the botanical garden at Battersea Park into an Old English garden. Having regard to the comparatively limited extent to which the garden is at present used, the Committee think that it would be advantageous to make the ground more attractive for the general public, while still offering facilities for the study of special plants as at present. The cost of carrying out the most suitable scheme in its entirety is estimated not to exceed £265, and it is proposed that the initial works of drainage, water supply and the formation of paths and pond should be put in hand during the coming winter at a cost of about £100.

LINDLEY MEDAL AWARDED TO MR. JAMES HUDSON.—At the meeting of the Council of the Royal Horticultural Society held on the 21st ult., the secretary drew attention to the splendid exhibit of Fig trees made by Mr. JAS. HUDSON on the 7th ult., on the occasion of his lecture on the cultivation of the Fig. It was proposed by the President, seconded by Sir ALBERT ROLLIT, and carried unanimously, that a Lindley Medal for Cultivation be awarded to Mr. HUDSON.

SALTS OF AMMONIA AS FERTILISERS.—It is generally accepted that most cultivated plants absorb nitrogen in a combined form, preferably as nitrates. Nitrates are considered to be immediately available, whereas other forms of combined nitrogen have first to be transformed into nitrates by the soil bacteria. Lately, greater attention has been given to salts of ammonia as fertilisers. The increased fertility of soils following partial sterilisation has been shown by RUSSELL and HUTCHINSON to be due to the acceleration of the production of ammonia in the soil rather than to the formation of nitrates; this is also in harmony with recent statements as to the value of ammonia compounds as plant-food. Experiments made by W. P. KELLEY, of the Hawaii Agricultural Experiment Sta-

tion, have given the interesting result that, in the case of Rice, ammonium sulphate is of great value as a manure, whereas nitrate of soda produces little or no effect. The conditions in Rice soils are peculiar; the Rice is grown in standing water, and consequently in a saturated soil, conditions very unfavourable for nitrification. It is shown actually that denitrification takes place instead, with the result that, in some instances, nitrites are formed from added nitrates with consequent ill-effect to the Rice. There is evidence that in some plants ammonia is more easily assimilated by plants than are nitrates, and it is not unreasonable to suppose that this holds good in the case of the Rice plant.

LATE-FLOWERING SHRUBS.—Mr. P. HANSCHITZ draws attention in *Die Gartenwelt* (xv. 44, p. 608) to three useful late-flowering shrubs, *Artemisia lactiflora*, *Gaura Lindheimeri*, and *Salvia angustifolia*. *Artemisia lactiflora*, a Chinese species, bears white, fragrant blossoms from the latter half of August till the advent of frost. *Gaura Lindheimeri* flowers throughout the summer and autumn. It forms a dense bush, with the inflorescences raised well above the leaves. The reddish-white flowers are enclosed in a red calyx, and are useful for cutting purposes. Like the *Artemisia*, *G. Lindheimeri* may be propagated by cuttings, or it may be raised from seed. *Salvia angustifolia*, though a Mexican species, is hardy, and flowers late. The flowers are bright blue, and the plant is a vigorous grower, reaching a height of 4 to 5 feet. *S. angustifolia* prefers a sunny position, and may be propagated by division or by cuttings.

A TREE-LIKE SEDGE.—Dr. ENGLER describes and figures a tree-like Sedge, *Schoenodendron Buecheri*, in the *Abhandlungen der K. Preuss. Akademie der Wissenschaften* for 1911. This plant is tree-like in its branching, not in dimensions, being only about 18 inches high. It recalls the Brazilian *Vellozias*, as shown in MARTIUS's views of Brazilian vegetation, and repeated in LINDLEY's *Vegetable Kingdom*. *Schoenodendron* is a native of the Cameroon region, West Africa, and is the only known member of the Cyperaceæ having a distinct branched development. Several other members of the same family have a short undivided or forked trunk. Among them *Cephalocarpus*, with which ENGLER compares his plant anatomically. It is not commonly known that our native *Carex paniculata* develops a trunk, often several feet in height, nor does Dr. ENGLER mention this fact in his discussion of the subject.

PAPER MAKING AND CROP PLANTS.—The *Year Book* of the Department of Agriculture for 1910 (U.S.A.) contains an interesting account of experiments which are being made by Mr. CHARLES J. BRAND, of the Bureau of Plant Industry, with a view to determine whether the at present unused residues of various crop-plants can be profitably employed in paper making. It is pointed out by Mr. BRAND that good reason exists for the belief that, owing to the depletion of forests, wood pulp supplies for paper making are likely to fall off very considerably in the near future. Thus, 40,000 cords less Spruce were used in 1909 than in 1907, and the cost was considerably greater. On the other hand, over 100,000,000 acres are under Corn (Maize) in U.S.A., and the Corn stalks left after the crop is taken are not at present utilised. Experiments show that paper can be made from this residue, but it remains to be seen whether the price the paper makers can offer the farmers will be such as to make it worth the while of the latter to prepare and sell the Corn-stalk residues.

THE UNEMPLOYED AND THE LONDON PARKS.

—The Parks Committee of the L.C.C. have, in response to a request, prepared a list of works, consisting chiefly of digging, levelling and re-turfing playing and other grounds, which they consider to be suitable for unemployed men during the coming winter. As, however, such works could not be regarded as being required or likely to be undertaken either at all or in the immediate future, the Committee do not feel justified in asking the Council to make any re-coupment in respect thereof to the funds of the Central Unemployed Body for London.

PLANTS OF NEW SOUTH WALES.—The third part of Mr. J. H. MAIDEN'S *Illustrations of New South Wales Plants*, not previously depicted, has appeared. This part is devoted to the genera *Callistemon* and *Swainsonia*, both of horticultural interest. Some of the species of the former genus were dealt with in part ii., and the rest will appear in part iv. Several of the species of *Callistemon* are among the most conspicuous features in Australian vegetation, but they are rarely cultivated in this country now. They are popularly known as Bottle-brushes. Respecting *Swainsonia*, Mr. MAIDEN states that *S. Greyana* and *S. galegifolia* are notoriously injurious to animals, and are known locally under the names of Darling Pea, Indigo, &c. Other species are eaten in mixed pasturage by sheep, apparently with impunity, but there is much uncertainty as to which are noxious or relatively innocuous. It is probable that it is the seed that is poisonous, as in other members of the family, and not the herbage.

A NEW DISEASE OF MELONS AND CUCUMBERS.

—In the current number of the Journal of the Board of Agriculture an account is given of a fungous disease of Melons and Cucumbers which has not been known to be present in Britain until this year. The fungus causing the disease is known as *Colletotrichum oligochætum*, and, though not previously reported in this country, it has been prevalent in France and Italy for some time. All parts of Cucumber plants are liable to attack, and, when the soil is infected, seedlings soon succumb. Spots are formed on the leaves of older plants, but the areas affected in this way do not fall away completely as they do in the case of the Cucumber disease caused by *Hormodendron hordei*. Large sunken patches are formed on the fruits, which soon die. The spores of the fungus arise in small pustules on the parts attacked and readily spread the disease to healthy plants. It has been found that spraying the plants either with liver of sulphur—1 ounce dissolved in 3 or 4 gallons of water—or with self-boiled lime-sulphur mixture checks the progress of the disease. Emphasis is laid on the necessity of removing affected plants as soon as possible, in order to prevent infection of the soil. Growers who have already experienced severe losses on account of attacks of the leaf-blotch disease (*Cercospora melonis*) and of *Hormodendron hordei* will doubtless be on their guard against this new pest. Fortunately, the leaf-blotch disease appears to have lost some of its former virulence.

PUBLICATIONS RECEIVED.—*Transactions of the Edinburgh Field Naturalists' and Microscopical Society*. Vol. vi., part iv. (London: Wm. Blackwood & Sons.) Price to non-members, 4s.—*An Encyclopædia of Gardening*, by W. P. Wright. (London: J. M. Dent & Sons.) Price 1s.—*Histoire des Legumes*, par M. Georges Gibault. (Paris: Librairie Horticole).—*The Profitable Culture of Vegetables*, by Thos. Smith. (London: Longmans, Green & Co.) Price 6s.—*The Melbourne Argus Booklet of the Australasian Mails for 1912*. The London offices of *The Argus*, 80, Fleet Street; free, or 1d. for postage.

DWARF CHRYSANTHEMUMS.

VISITORS at the recent exhibition of the National Chrysanthemum Society were loud in their praises of a group of dwarf Chrysanthemums shown by Messrs. Butler Bros., of Bexley Heath. Every plant was a perfect little specimen, not more than a foot or 18 inches in height, but furnished with half-a-dozen or more good blooms. Nothing could be more suitable for the decoration of greenhouse and conservatory stages in November and December than these pretty plants, whilst they are admirable subjects for use in a dwelling room. Another excellent exhibit of dwarf Chrysanthemums was shown by Messrs. James Veitch & Sons, Ltd., at the Royal Horticultural Society's meeting on November 7. In figs. 162 and 163 are reproduced plants from Messrs. Butler's and Messrs. Veitch's groups respectively. The culture of the plants is very simple. The cuttings may be rooted in a cold frame, and the plants should be given a cool treatment from the com-

Caprice du Printemps section, the type of which is pink, but there are varieties known as Yellow or Golden Cap, Red Cap, White Cap, Purple Cap, and Greening's Caprice. The selection shown by Messrs. Butler at the Crystal Palace included Caprice du Printemps, Kathleen Thompson (bronze), Tapis d'Or, Mrs. Roots (white), Felton's Favourite (white), Dazzler (red), La Pactole (bronze), Yellow Caprice du Printemps, October Yellow, October Bronze, Mrs. Greening (pink), and Mrs. Coates (single pink).

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

THE LATE JAMES BUDD.—Mr. Orpet's reference (see p. 372) to the late James Budd, a former Hampshire gardener, has been productive of a somewhat pathetic incident. It had but recently become known to me that Mr. Budd, when leaving Lockerley Hall, South Hants., after a

FIG. 162.—A GOOD SPECIMEN OF DWARF CHRYSANTHEMUM; THE VARIETY IS YELLOW CAP. HEIGHT 18 INCHES.

mencement. The cuttings should be inserted in March, and after they have made growths 2 inches long, they should be pinched back to the first pair of leaves. Two, or at the most three shoots develop, and after a time these should be pinched again to two leaves, and each subsequent growth treated in a similar manner until the end of July. After this stage they should be potted on in the usual way, but they will not need pots larger than 5 inches in diameter, the final potting being done about the middle of July. Afterwards the pots should be plunged out-of-doors in a bed of ashes. The repeated pinchings should result in from 12 to 15 shoots forming, and all but a single flower bud should be removed from each growth. The plants may be allowed to remain out-of-doors until the flower buds show signs of bursting, when they may be placed in the glasshouses, where they will last for more than 2 months in flower. The most suitable varieties for the purpose are those of the

long service of 45 years at that fine place, came to reside in the Richmond Park Road, Kingston, with some of his children. I had the pleasure of visiting Lockerley Hall, and of writing a description of the gardens for one of the Southampton papers, some 42 years ago, and that was my first and I think my last association with Mr. Budd. But on reading Mr. Orpet's reference to him, I took a copy of the *Gardeners' Chronicle* with me, intending to make a call upon him, and was intensely saddened to learn that death, following rapidly on a severe bronchial attack, had carried him off so long since as January last. He was buried in the grave which holds his wife at Lockerley, near Romsey. When Mr. Budd was in the early vigour of manhood he was one of the great gardeners of South Hampshire, and Lockerley Hall ranked high as a fine garden. Cranbury Park, near Winchester, Hursley Park, Mottisfont Abbey, Melchet Court, Broadlands, Romsey, Paultons Park, in the New Forest, and Cadland, opposite Netley Hospital, were all great gardens, and were controlled by very able men, not one of whom appears now to be living.

Doubtless others as able have succeeded them, for British gardens never lack men to carry on the work their progenitors so well began. We see in London, no doubt, very much of what makes it the "hub" of horticulture, but we must not minimise the great—nay, grand—work that is being done in the thousands of great gardens all over the kingdom by men who are the finest asset horticulture possesses. *A. D.*

GLASNEVIN BOTANIC GARDENS.—In the interesting contribution by Mons. Corrèvon, in your issue of October 18, one is pleased to find him speak highly of the botanic gardens at Glasnevin. It is a mistake, however, to attribute to the character of the soil any factor favourable to plant development. As a matter of fact, the soil, instead of being deep and rich, consists for the most part of a mixture of boulder clay and river gravel. So many promising trees have been prematurely done to death from this cause that it has been found necessary in recent plantings to remove this "soil" and fill up the pits with a more suitable medium. With the limited funds available this must prove a severe tax and interfere very considerably with the development of the garden on modern lines. The exposure of the site is another factor highly deterrent to tree and shrub growth, for there is practically no shelter from the western gales, which are very prevalent in Ireland. M. Corrèvon has doubtless been led to this inference from the evidence of good culture, and concluded that all was right below ground. *W. B. Bruce, Dublin.*

JUDGING AT THE FRUIT SHOW.—*Fairplay* (see pp. 310, 379) need not imagine that I am personally pained by his criticism of the judges at the October R.H.S. fruit show. After many years of experience, one gets accustomed to the growls of disappointed competitors, and they cease to worry. But his criticisms did severely reflect on the honour and integrity of the whole body of judges at the fruit show, and it is such uncalled-for reflections that I resent. I have had a long life's experience of judges, having in that period had hundreds of colleagues, but have never found one animated by any personal prejudice. Like myself, they have made awards only to those exhibits they considered to be the best, and I am absolutely certain that was the case at the fruit show. It is mean to infer that, because judges may look round the show while it is being arranged, they do so for improper purposes. Does *Fairplay* know that at the Rose, Sweet Pea and Dahlia's Society's exhibitions judges are taken largely from the competitors themselves, it being their custom to judge in classes in which they are not competing? It is so much better to have faith in the honour and integrity of our fellow-men than to be suspicious as to their actions. *A Judge.*

CELERY DISEASE.—Since writing my previous notes regarding the disease which so badly affects Celery in a great many districts, I have sent some diseased leaves to the Director of the Royal Horticultural Society's laboratory at Wisley, who has written to say the proper name of this disease is *Septoria Apii*, not *Cercospora*. He has also kindly sent me a booklet written by himself on this disease. Having carefully read this, I find the cause mainly suggested for the introduction of the disease is growing plants from seed saved from affected plants. This was my theory, which is strengthened by the statement "that wild Celery seems not to be attacked by this disease," the cultivated plants being contaminated through themselves by means of summer spores and also by sowing seed containing spores. I do not think Mr. Jaques's contention that the sort of dung one uses has anything to do with inducing the disease, as I have taken the trouble to write and find out what class of manure my neighbours use; they deny using pig manure. Strange to say, while holding this view strongly, I have for the first time been compelled to use this very manure; this I think, however, merely a coincidence. It would be interesting to know if seedsmen would guarantee the seeds as saved from clean stock. One point has impressed itself on my mind, that is the necessity of spraying. Those of us who have been bitten can take proper precautions in future. It would greatly facilitate matters if we had a non-poisonous spraying compound on the market, as one has to be careful about destroying the leaves when sprayed with sulphate of copper. *D. Calthorpe, The Gardens, Ballyheigue Castle, Co. Kerry.*

GIVE THE JOURNEYMAN A CHANCE!—I think *A Royal Journeyman* (see p. 359) is expecting too much when he suggests that head gardeners and foremen should allow journeymen to assist in the pruning of "Vines, Peach and other indoor fruit-trees" at this time of year. Speaking from my own experience, head gardeners, as a rule, prefer to prune such trees themselves, sometimes without the assistance even of the foreman. The work is considered much too important to be entrusted to the ordinary journeyman gardener to do. Even the foreman is not permitted to do such work unless he has proved his ability to prune with skill and care, and to consider not the present only, but the future welfare, development and symmetry of the plants entrusted to him. Journeymen have, as a rule, ample opportunity to gain a knowledge of the methods of pruning indoor trees, since the head gardener, while doing such work, frequently explains the procedure to the journeyman who is working under glass, and who will subsequently have to train the pruned trees under the direction of the head gardener or foreman. A really intelligent gardener should find it quite simple to understand the operation of pruning so as to obtain a well-balanced tree, furnished with fruit-bearing shoots from base to summit of the trellis or wall. I have myself always found pleasure in enlightening young

FIG. 163.—CHRYSANthemum WHITE CAPRICE DU PRINTEMPS GROWING IN A 4½-INCH POT.

gardeners on the cultural points of any work on which they were engaged, and have frequently encouraged a spirit of enquiry, assuring them that any questions they cared to ask me on gardening matters would always be welcome. The journeyman should constantly bear in mind that he is qualifying for a foreman's place, just as the foreman is qualifying for that of a head gardener. I fully agree with *A Royal Journeyman* when he says that "practice is better than theory," but I would remind him that there is something better than either alone, which is a combination of the two. He should remember that head gardeners cannot be expected—even by a "Royal" journeyman!—to risk the symmetry and general welfare of his vines and Peaches by entrusting the delicate operation of pruning them to a novice, however intelligent and aspiring that novice may be. *H. W. Ward.*

—My own experience while serving as a journeyman was that, if the head gardener or foreman found a man was keen and interested in his profession, every possible chance was given him to improve himself both in theory and practice. I am speaking generally of work in all departments. At the same time, I had to work hard. Lights tasks were not selected for any particular man. There are, unfortunately, many young men who fancy themselves "above" doing certain work, preferring to wait until the garden boy or a labourer is at liberty, or else

leaving the work undone. Should these young men ever fill the position of head gardener they will find few operations at which they will not have to "lend a hand." I will not close this note without a word of praise to the many hard-working and thoughtful young men one meets with in the profession. These men, who devote their minds to their work and are ever ready to do what is required of them to the best of their abilities, will meet with help and encouragement from the men under whom they are working. It is for want of confidence in the men that certain operations are not given them to perform. The head gardener would often be only too pleased for the men, or man, as the case may be, to undertake duties requiring skill and intelligence, providing he had full confidence that the work would be done in a satisfactory manner. Many gardeners have suffered through neglect on the part of those working under them, hence there is some hesitation on their part before giving young journeymen important tasks. *C. Ruse, Lambay Island, Rush, Co. Dublin.*

ONE REASON WHY JOURNEYMEN GARDENERS APPEAR TO BE DETERIORATING.—There are many and varied reasons why the present-day under gardeners are not so good as their predecessors. I am of an opinion that, in a great measure, the individual journeyman is really not to blame. The present-day gardens, although more up-to-date in the construction of glass-houses, are generally deficient in labour, which means that a man has more work to do than he can properly manage, the consequence being that he cannot devote the time he has at his disposal to cultivate the plants or fruit up to the correct standard. Hence he gets the reputation of being not much good at his work. I feel sure that when head gardeners realise what a mistake is made by giving a man too big a charge, then, and not until then, will a journeyman be able to show the proficiency expected of him. *Journeyman.*

HELENIUM AUTUMNALE RIVERTON GEM (see p. 373, fig. 155).—*Helenium Riverton Beauty* is a beautiful Composite, and so is *Riverton Gem*. Indeed, I prefer the last-named. A plant of *Riverton Gem* in my garden, which slopes to the south, was exposed to the full sunshine this summer, but it retained its foliage well, and flowered profusely. The first blossoms opened in the last week of July, and soon after the plant was a mass of bloom, in which condition it remained till the end of September, while there was a sprinkling of flowers for a month later. A notable feature is the way in which the warm, terra-cotta tint of the blossoms deepens after expansion, changing ultimately before the flowers fade to a deep, "Wallflower" hue. Among the many yellow-flowered Composites that are in bloom at about the same season as this *Helenium* its colour is quite distinct. *W. T.*

MECONOPSIS INTEGRIFOLIA.—I obtained a packet of seed from Lissadell in August, 1910. It germinated well, and must have produced over 100 plants, for, after disposing of many, I still have six or seven dozen left, and am now anxious as to how they will pass through the winter in the open. As the leaves are deciduous in winter, they should not require the protection that *M. paniculata* so evidently needs, but I have enough plants of this also to try experiments in various situations. *G. G. Baker, Cresswell, Barndale, Alnwick.*

CASSIA CORYMBOSA OUT-OF-DOORS.—This beautiful plant thrives and flowers well out-of-doors here. A tree planted against a south wall in my garden 12 years ago flowers every year. This season it commenced to flower in July, and for three months was covered with its lovely orange-yellow blossoms, and a few often last till Christmas. The plant measures 7 feet 6 inches in height, and as much in width. Freesias also flower very freely in a sheltered border, and this year the ordinary pink Oleander flowered for the first time out-of-doors; these plants have no protection in the winter. Ivy-leaved Pelargoniums grew and flowered freely on a west wall for four or five years; but after they reached the roof they were killed by about 7° of frost. Pelargoniums have only been killed twice by frost in 12 years in this garden. I am enclosing seed pods of the *Cassia*. *Mary Evans (Mrs.).*

L.C.C. PARK EMPLOYEES.—The resolution carried by the L.C.C. regarding the promotion of the employees in the parks staff must eventually have an effect on the type of gardeners employed in the parks. At present the lads are recruited from the neighbourhood of London, and although they may not be wanting in good qualities, they lack the aptitude which is a marked characteristic of lads who are bred and born in an environment in harmony with their vocation, such as lads in the country possess; especially is this so in regard to gardening and gardeners. It would be advantageous both to the lads and the public service if the improvers were to serve a period of three years or so in gardens or nurseries in country districts. To those aiming at becoming permanent employees on any staff, where there are such prospects of promotion as exist in the L.C.C. service, the training they would receive in nurseries or private gardens of repute would be of the greatest service, especially if facilities were afforded for the re-entrance into the service. In the interest of the State, it is essential to have stability in employment, but what is going to be the result if the future gardeners employed in the public parks are mainly composed of town-bred individuals? *F. W.*

NUT TREE IN FLOWER.—On the 23rd ult. I saw six or eight Cob-nut trees with red, female flowers open, say, 10 on a tree; no catkins were open. The trees have grass over their roots. Have any of your readers noticed Nut flowering so early in other years? I think it is usually half-way through January before these flowers open. *Cecil H. Hooper, Wye, Kent.*

FRUITING OF THE MYRTLE.—I enclose some pieces of Myrtle cut from a plant 10 feet high and 10 feet wide, growing on a south wall in these gardens. The top of the plant is a mass of berries as the pieces enclosed show. *F. G. Brewer, Bryntirion Gardens, Bont-Ddu, Dolgelly, N. Wales.* [We have never seen the Myrtle more plentifully fruited than on these shoots.—*Eds.*]

A NEW FRUIT MANUAL.—*Yorkshire Gardener* (see p. 341) touches the weak spot in any proposal to issue a new and up-to-date edition of Hogg's *Fruit Manual* when he refers to the great cost. If the book be issued on the lines suggested by some correspondents, it would be so dear that only rich people could afford to purchase it. Those who have the latest edition of the book need only a supplement, giving all the varieties of fruit introduced since the last edition was issued. Even this would necessitate a good-sized volume. To reproduce, in any new edition, varieties of fruits that have passed entirely out of cultivation and are, for all ordinary purposes, useless, would be folly. Mr. E. A. Bunyard asks for a book such as could hardly be published at less cost than from 3 to 4 guineas, because, to make it complete, such a book should be profusely illustrated. The ordinary gardener requires a comprehensive book, costing about 5s. *D.*

—It would be a pity to omit any varieties from any revision of this work, but could it not be brought out on the same lines as *Kerner's Natural History* at 2s. 6d. every fortnight? A greater number of copies would be sold, as it would be within the reach of all who wished to purchase a copy. *George N. Tebbutt.*

"MANUAL OF BRITISH FRUITS."—Could not a new edition of the *Fruit Manual* be issued in parts: (1) Apples and Pears; (2) Grapes and Figs; (3) Stove Fruits; (4) small fruits, Nuts, &c.? In any case, it should be on the lines of Hogg's *Manual*. I have lately unearthed my copy of *British Apples*, and found it very interesting. As many of your readers will remember, it was compiled by the late Mr. A. F. Barron, after the Apple Congress of 1883: he was a very high authority on fruits in general. The suggestions of Mr. E. Bunyard, on p. 341, as to the distinctive ideals in fruits and foliage, remind me of *Apples of New York*, a work published some few years ago by the local authorities of that State, mainly for educational purposes. It is in two volumes, and contains a good deal of useful information. The coloured plates form an important feature, though to

British eyes they seem a little too vivid in colour. A son of mine went to the States a few years ago with a number of teacher confrères to inspect some of the country schools. One of the local education authorities in New York, finding that he was interested in school gardens and fruit trees, sent him a copy of the work. *H. J. C.*

NEWCASTLE FLOWER SHOW.—As a member of the society which is responsible for the Newcastle Flower Show I desire to bring forward a matter which concerns not only the society itself but also the public at large. The actual name of the society is the Northumberland, Durham and Newcastle-on-Tyne Botanical and Horticultural Society. It is not the oldest society in the north of England, but it is certainly one of the oldest. Now, does it live up to its name? What does it do to justify such a title? Nothing at present, except hold a flower show once a year. And the serious aspect of the matter is that the society is £400 in debt. What is to be done, for we cannot stand by and see this old society go down? I would suggest (1) that a public meeting be called as soon as possible; that all horticultural societies in the two north-eastern counties be asked to send delegates. (2) That new blood be infused into the committee; there is no lack of keen horticulturists in the district. (3) That the society co-operate with the North of England Horticultural Society. This latter society has been brought into existence with the goodwill and support of the Royal Horticultural Society which co-operates with it in the north of England. (4) That it be clearly understood that the society live up to its name, and lead the two north-eastern counties in all that appertains to horticulture (educational, scientific, commercial, and general). (5) Personally, I would suggest that, as soon as the deficit is wiped off, a large spring show be held each May in Newcastle, and that all the profits be given to the hospitals. Speaking for the N.E.H.S., we will gladly do all we can to restore this old society to its former position and back it up in its work. *J. Bernard Hall.*

NOTES FROM BELVEDERE.—The following letter was received some weeks ago by the owner of Belvedere, St. Lawrence, Isle of Wight, from the head gardener, and, referring as it does to many plants that are rarely grown in the open in England, it will prove interesting to readers:—"Bignonia Tweediana has made very rapid growth this season, and has reached a good distance up the roof in front of the gazebo. *Solanum aviculare* is 12 feet in height, and completely covered with large clusters of berries and purple flowers, which it has produced continually since May. It is a very desirable and handsome shrub. *Bignonia grandiflora* is another fine sight with hundreds of its large, scarlet, bell-shaped blooms from the base to the top, and as it has climbed well up the house, they are visible from a considerable distance. *Mandevilla suaveolens* has also been a beautiful sight for about six weeks, entirely covered with its large, sweetly-scented blossoms of purest white. *Bouvardia triphylla* is still a mass of scarlet bloom which almost entirely covers the foliage. It has been in flower for about 10 weeks, and there is a row of very sturdy plants from 3 feet to 4 feet in height. *Romneya Coulteri* has also been very free-flowering, and the young suckers when transplanted grow even more rampantly than the older specimens. They evidently like this limestone soil, with plenty of manure added each year, and occasional copious waterings. The two clumps of *Phormium Tenax* have grown to a great size. I have made another clump of the rose-coloured *Gyneryum* in a very conspicuous position in the grass in the lower garden, and it and the old one are now both of a very large size, with scores of plumes starting to ascend. All the *Crinums* have grown to an immense size, and are flowering very grandly, as also all the species of *Eucomis*. *Erythrina cristagalli* is very prominent at the present time with its large spikes of scarlet flowers. *Cyclamen hederifolium* (*Neapolitanum*) is a complete carpet with its numerous charming blooms. *Curcuma angustifolia* is also in fine flower, as is also *Rosa bracteata*. *Amaryllis Belladonna* is a superb mass of flower-spikes, which are fully 3 feet high. *Hovenia dulcis* has grown into a very large shrub, or, I may say, small tree. I had hoped to see flowers this season, as the last year's shoots escaped being cut back last winter, but have been disappointed. *Fendlera rupicola* and *Tri-*

cuspidaria lanceolata have made fine growth, and the latter is loaded with its bell-shaped, cherry-red flower-buds in all stages of development, some nearly fully expanded. *Lobelia cardinalis giganteus* is a grand sight. The clump which I put in the Lily tank about three years ago is very massive, and fully 5 feet high. All the autumn, winter, and spring-flowering bulbs have had a most thorough ripening this summer, and as I make a very special point of leaving all the foliage on until it is fully ripened, there should be a grand display of the whole collection at the proper season. *Leonotis Leonurus* is forming a full complement of flower-whorls as is *Sparmannia africana*. *Clerodendron foetidum* and *C. trichotomum* are in splendid flower, as are *Cassia corymbosa*, *C. floribunda*, and *Abutilons* *Golden Fleece* and *Thompsonii*. *Capparis inermis* has been blooming for a considerable time. *Correa viridis* was conspicuous on an arch in the open border and climbing up the house. It is just now coming well into flower. *Cestrum elegans* and *Manettia bicolor* are also making a fine display of bloom. *Sutherlandia frutescens*, *Salpiglossis sinuata*, a great number of *Fuchsias* of many sorts, including the very desirable *syringæflora* from Mexico and *Boliviana hybrida*, are all masses of blossom, and have been so for a very long time. *Calandrinia grandiflora*, from Chili, has also been bearing its rosy flowers about 2 inches across very freely. *Clematis tangutica* has also flowered well for some time." Notes on this interesting garden have appeared in the *Gardeners' Chronicle* from time to time. *Wyndham Fitzherbert.*

PRIMULA FARINOSA.—In your report of the Scientific Committee of the R.H.S. of November 7, on p. 381, it is stated that Mr. Gordon observed plants of *Primula farinosa* in the Alps "with a distinct white centre," all subsequent flowers approaching more or less directly to the typical form. With such evidence at hand, I should regard the early flowers noted as in the nature of a "sport," that may, or may not, reappear another year after the manner of sports. Should the variation reappear, I would suggest that all other flowers be at once discouraged, and that those with the white centre be fertilised with their own pollen. If this be done, a certain proportion of the progeny will, in all probability, be similarly characterised, but, if not, it would be worth continuing a year or two longer to raise seedlings in the hope of reproducing the interesting variation referred to. *Primula farinosa* is easily raised from seeds, and it is to be hoped that Mr. Gordon has already secured seeds of his plant, since the tendency to sporting in these plants is not an everyday occurrence. *E. H. Jenkins.*

A GARDENERS' CONFERENCE.—The need for an association or union of professional gardeners is stronger now than it ever was. Attempts have been made to establish such a union, but from causes that are too difficult to focus they have missed their object, and we are still "seeking a way, yet wandering from the way." There was some prospect that the British Gardeners' Association, in the early stages of its career, might come in time to achieve this purpose. With the late Dr. Masters as sponsor and a representative set of men as the executive, it looked like winning its way and gathering into its fold all the good men of the profession. It has failed to do this, notwithstanding its membership of some 2,000, its journal, and its well-intentioned efforts. One hears on all sides that gardeners must combine to get strength, yet the great majority decline to support the B.G.A. I am convinced that the B.G.A. went astray when it renounced the articles of its first plea and prospectus. It has been on the wobble ever since, and wobblers in a cause have no chance. My present object is not to belittle the present executive of the B.G.A., but rather to excuse it. Fear led to doubt, which was succeeded by vacillation, and this is the way to dissolution. It is largely due to the attitude of employers, who see what they take to be danger in a combination which declares its intention to be the betterment of the conditions of employment of the professional gardener. I am afraid we cannot blame the employers. No man will pay more than the market rate for any commodity or service, and he looks with suspicion upon any combine which has for its object the raising of prices, even although the rise in price may be accompanied

by a rise in quality. That, in the case of gardeners one is the complement of the other, must be evident to the man who can think. It is not easy to make both sides understand this, but it has to be done. Can we manage to induce gardeners to meet and confer next year at the time of the International Horticultural Exhibition, with a view to forming a national institute or union or federation or association (the name does not matter, "the play is the thing")? I will not attempt to indicate what the line of procedure might be; I only feel that the present need is to set gardeners thinking what could be done by following the example of all great bodies of workers. If a meeting could be arranged for the purpose of deciding what course would be best—a meeting of a dozen or twenty or fifty representative men—some time before the end of the present year, a programme or policy might be formulated. The difficulty is to get at the right kind of man. Gardening is a worthy calling, a fact which the crowd fails to realise. It is our own fault if we neglect to lay claim to the respect which is the due of every body of men who have qualified for a position of trust and requiring skill of no mean order. Horticulture is an art which owes much of its present high position among the great industries to British workers, and it is meet that those who practise it should see that they get their due. W. W.

SOCIETIES.

ROYAL HORTICULTURAL. Scientific Committee.

NOVEMBER 21.—*Present*: Mr. E. A. Bowles, M.A., F.L.S., F.E.S. (in the Chair); and Dr. J. A. Voelcker, Rev. Canon Fowler, Messrs. J. O'Brien, A. Worsley, W. Hales, J. T. Bennett-Poe, W. C. Worsdell, E. M. Holmes, W. Cuthbertson, and F. J. Chittenden (hon. sec.).

Raspberry beetles.—The Rev. Canon FOWLER showed specimens of the Raspberry beetle, *Byturus tomentosus*, which feeds in the flowers of Raspberry, Blackberry, Loganberry, and Strawberry, remarking that in all probability the pest pupates in the soil, and not so much in old stems, &c. He considered that if some measure of reaching the pest in the soil could be devised it would prove very beneficial, but after some discussion the Committee thought that none of the methods at present economically available would be entirely suitable in the present instance. It was remarked that some success had been attained in dealing with this pest by shaking the canes over tarred boards and by spraying with lead arsenate during the time the plants were in bloom.

Uncommon fruits.—A. BAYLDON, Esq., sent from Dawlish, Devon, a bunch of about 16 fruits (on one branch) of *Mandevilla suaveolens*, and a pair which measured 20 inches in length; a bunch of seed pods of *Wistaria japonica* from a standard on its own roots which bore several dozen fruits (*W. multijuga* was also fruiting in the same garden, and had produced racemes 30 inches to 36 inches in length); a spray of many fruits of *Cornus capitata* (*Benthamia fragifera*) from a very old tree 26 feet in height. The seeds of *Cornus capitata* are picked from the fallen fruit by the blackbirds and dropped about the grounds. R. SHAFTO ADAIR, Esq., of Clauville, Minehead, Somerset, sent two excellent fruits of the common Pomegranate, perfectly ripe, and open to show the seeds, picked from a plant growing on a south wall.

Mr. A. S. HORNE, B.Sc., of the Wisley Laboratory, exhibited specimens in illustration of the following notes:—

Streak disease in Potato.—In 1910 a sample of seed Potatoes of the Duke of York variety was obtained from a dealer in the North of England. When the tubers were examined about 20 per cent. of them were found to be affected with

streak disease. Several diseased tubers, however, were not included in the estimate. These were rotten in the middle, and the flesh was more or less excavated, the cavity or cavities being enclosed by diseased tissue. It was supposed at the time that this condition was due to some other cause. During November, 1911, however, a complete series of stages has been obtained between streaked and rotten tubers of the same variety of Potato. The following stages in the development of streak disease in the Duke of York variety were sent for inspection:

1. Potatoes marked internally with streaks as described in the *Journal of Agricultural Science*, iii., September, 1910.

2. Potatoes with internal brown rot. Upon closely inspecting the flesh the rotten area is seen to be made up of a number of concentric curved brown lines; the rotten appearance is due to the fact that the lines are very numerous, and almost in contact with one another. The lines show up well when a slice of the Potato is soaked in potash.

3. Potatoes with cavities in the flesh which are bounded by a brown zone of diseased tissue.

4. Potatoes similarly diseased, but having external injuries.

The diseased Potatoes were raised in Scotland with the co-operation of Mr. W. G. MCGOWAN in connection with Potato investigations, of which an account has not yet been published. The seed Potatoes of the Duke of York variety were obtained from a locality in which streak disease is at present unknown, and were free from disease when planted.

LEE, BLACKHEATH, AND LEWISHAM HORTICULTURAL.

NOVEMBER 24.—At the meeting of this society, held on this date at the Church Street Schools, Mr. F. Phillips gave a lecture on "Hardy Fruits and their Culture." The meeting was well attended. Mr. Freeman Fox occupied the chair. In dealing with Red, White and Black Currants and Plums, Mr. Phillips recommended the pinching of the tips of the young shoots in summer, this causing fruit-buds to develop at the base. He advised a dressing of lime once a year for Plum trees, his practice being to give this in the winter months. This also applied to all other stone fruits, whether grown indoors or in the open. In the summer-pruning of Apples and Pears he did not advise cutting the growths short; his method was to just break the tips of the growth off when a length of 6 or 8 inches had been formed. In preparing fruit plantations, Mr. Phillips said too much attention could not be paid to the provision of efficient drainage, as a healthy root system was the chief essential in successful fruit culture. He said he made a practice of placing tiles or bricks at the bottom of the holes where strong-rooted trees were planted, thus checking the roots from growing downwards and encouraging the growth of the more fibrous roots near to the surface.

THE MARKET GARDENERS', NURSERYMEN, AND FARMERS' ASSOCIATION.

The annual general meeting of this association was held last week, Mr. Wm. Poupart, President, in the Chair. The chairman having reported on the work of the association during the past year, and the hon. treasurer having presented the yearly balance sheet showing the sound financial position, the officers were elected for the ensuing year as follow:—

President, Mr. Wm. Poupart; vice-president, Mr. W. G. Lobjoit; hon. treasurer, Mr. G. Monro; auditors, Mr. W. Maxwell and Mr. F. W. Clifford. Messrs. Geo. Miller, John Poupart, R. R. Robbins, John Cull, and J. Lewis Mann were elected members of the general committee.

Matters of interest to the trade which had already been before the general committee, including the basis of rating of glasshouses, the adoption of a uniform system of weights and measures, the Market Gardeners' Compensation Act, and the damage caused to land and crops by aviators, were discussed, and resolutions thereon adopted.

EASTBOURNE HORTICULTURAL.

NOVEMBER 8 and 9.—The annual Chrysanthemum show of this society was held in the Floral Hall of the Devonshire Park on these dates, there being a record number of competitors.

In the section devoted to cut flowers, Mr. W. EVANS, Haywards Heath, was successful in the class for 24 Japanese varieties, and also in a smaller class for 12 varieties of the Japanese type, the Earl of ASHBURNHAM, Battle (gr. Mr. G. Grigg), securing the 2nd position in both classes. Captain T. F. SWINFORD, Eastbourne (gr. Mr. C. Sheppard), excelled in the class for six blooms of a white or yellow variety; 2nd, Miss RAMMELL, Boston House (gr. Mr. W. H. Skinner), who excelled in the classes for six blooms of any one colour other than white or yellow, and for six blooms of the Japanese type. The best group of Chrysanthemums was shown by G. MATTHEY, Esq., Rosemount, Eastbourne (gr. Mr. G. H. Lyddiard).

Gold Medals were awarded to Messrs. H. G. WHITE & Co., Eastbourne; Mr. JAMES BOX, Lindfield; and the Duke of DEVONSHIRE, Compton Place, Eastbourne (gr. Mr. Thompson), for non-competitive exhibits.

WINCHESTER CHRYSANTHEMUM.

NOVEMBER 14, 15.—This annual show was held in the Guildhall, Winchester, on these dates, and although the exhibits were not quite so numerous as last year, there was a good display. Chrysanthemum plants suitable for decorative purposes are a feature at Winchester, and attention is paid to the high quality rather than the number of the flowers. Japanese and Incurved blooms are always good at this show, the late date suiting those of the latter type. Small-flowered varieties grown without being disbudded make a fine display, and the competition in the classes for these is exceedingly keen. Fruit and vegetables were well represented.

PLANTS.

Groups of Chrysanthemums were not numerous, but those that were staged were satisfactory. M. HODGSON, Esq., Winchester (gr. Mr. A. J. Marsh), was awarded the 1st prize for rather tall plants carrying good blooms and foliage neatly arranged. H. JOHNSON, Esq., Northgate Place, Winchester (gr. Mr. Pearce), was placed 2nd, his plants being dwarf, much more freely-flowered, and consequently the individual blooms were smaller.

In the class for nine dwarf plants, each specimen to have not fewer than five blooms, four competed. J. A. FORT, Esq., The College, Winchester (gr. Mr. G. Cousens), won the 1st prize with plants carrying excellent blooms and good foliage. F. S. VALLIS, Bessie Godfrey, W. Mease and Mrs. Judson were noteworthy varieties; 2nd, Col. DICKENS, Edge Hill, Winchester (gr. Mr. G. Adams). For nine plants of any white or yellow varieties, F. A. FORT, Esq., again led with finely-flowered plants of such sorts as *Emblème Poitevine*, Mrs. Judson, F. S. VALLIS and Mme. R. Oberthur; 2nd, Capt. CLAYTON MITCHELL, West Highlands, Winchester (gr. Mr. C. White). M. HODGSON, Esq., had the most profusely-flowered plants of decorative sorts in *Caprice du Printemps*, Kathleen Thompson and Mme. R. Oberthur.

CUT BLOOMS.

The most important class was for 24 blooms of Japanese varieties in not fewer than 18 varieties. The premier exhibition was from the gardens of Mrs. G. CLARKE, Frensham Place, Farnham (gr. Mr. C. Moore), the varieties including Leslie Morrison, Duchess of Sutherland, Bessie Godfrey, Frances Jolliffe, the Hon. Mrs. Lopes, Evangeline, Mary Farnworth and Master David; 2nd, M. HODGSON, Esq. Mrs. G. CLARKE was again successful for a dozen varieties of the Japanese type with well-grown specimens; 2nd, Admiral the Hon. W. G. STOPFORD, Ashe House, Overton (gr. Mr. F. Neville). In the class for three blooms each, of six varieties of the Japanese type, M. HODGSON, Esq., secured the premier place with fine, shapely blossoms; 2nd, Mrs. G. CLARKE.

Prizes were offered for five flowers of any white variety. Mr. HODGSON was again placed 1st in this class, showing superior flowers of *Evangeline*; 2nd, J. RIDLEY SHIELD, Esq., Cardew, Alresford (gr. Mr. F. Rome).

Incurved varieties were a distinct feature of the show. In the class for 24 blooms, in not fewer than 18 varieties, M. HODGSON, Esq., was awarded the 1st prize, showing large, shapely examples of Mrs. J. Wynne, Clara Wells, Edwin Thorp, Pantia Balli, Mrs. R. H. Hall, Godfrey's Eclipse, Mrs. G. Denyer, Romance, Frank Trestian and Emblème Poitevine. Mrs. G. CLARKE was placed 2nd with smaller blooms. M. HODGSON, Esq., obtained the leading award for 12 varieties, showing shapely examples of popular varieties, 2nd, W. GARTON, Esq., Sarisbury Court, Southampton (gr. Mr. D. Edwards).

Single-flowered varieties were well shown. M. HODGSON, Esq., showed the best of six exhibits in the class for six bunches not disbudded, large blooms being displayed of the pure white Mensa and the pink W. Buckingham; 2nd, G. H. KITCHEN, Esq., Compton, Winchester (gr. Mr. G. Grant). Exhibits in a class for decorative varieties, also not disbudded, in six bunches, were contributed by nine exhibitors, Mr. A. E. TAYLOR, Hillside Terrace, Winchester, showing the winning exhibit with good blooms loosely and effectively arranged, including such varieties as Glitter (pure white), John Shrimpton (red), Soleil d'Octobre (pale yellow), and Ivory (dull white); T. C. WILSON, Esq., The Thickets, Bishop's Waltham (gr. Mr. G. Barnes), securing the 2nd place with fine blooms.

The fruit section was interesting. For two bunches of Black Grapes, W. H. MYERS, Esq., Swanmore Park, Bishop's Waltham (gr. Mr. G. Ellwood), was placed 1st with Alnwick Seedling. ELLEN Lady SWAYTHLING, South Stoneham House, Southampton (gr. Mr. T. Hall), led in the class for dual bunches of any White Grape, showing Mrs. Pearson. There were 14 entries in the class for four dishes of dessert Apples, Mrs. KNOX, Holt Hatch, Alton, winning the 1st prize with well-coloured examples of Cox's Orange Pippin, Ribston Pippin, Blenheim Orange and Alington Pippin. In the class for four culinary varieties, J. LIDDELL, Esq., Sherfield Manor, Basingstoke (gr. Mr. W. Larmouth), was awarded the 1st prize.

Vegetables were a strong feature of the show. W. H. MYERS, Esq., won easily in Messrs. Too-good & Sons' and Messrs. Sutton & Sons' classes for six varieties.

Amongst non-competitive exhibits, Messrs. E. HILLIER & SON, Winchester, staged Carnations in pots, and other flowering subjects effectively arranged with Palms, also a collection of highly-coloured Apples (Gold Medal). W. H. MYERS, Esq., showed four dozen dishes of highly-coloured Apples (Silver Medal). Mr. S. FAY showed Carnations (Silver Medal). Mr. F. BEALING, The Nurseries, Bassett, Southampton, exhibited single Chrysanthemums (Silver Medal).

LANCASTER CHRYSANTHEMUM.

NOVEMBER 15.—The sixth annual exhibition of the Lancaster and District Horticultural Association was held at the Alexandra Hall, Lancaster, on this date. The entries, about 100 more than last year, numbered 311, which established a record. Interest centred in the non-competitive groups, which, though their number showed no increase, were characteristic of the best traditions of Chrysanthemum culture in the district. The President, Lord ASHTON, exhibited a group that was remarkable for the variety, colour and finish of the blooms. The latter included specimens of Henry Perkins, Mrs. Knox, J. W. Molyneux, Master David, Master James, F. S. Vallis, Mrs. H. Lopes, and other well-known varieties. The gardener is Mr. W. Black. H. L. STOREY, Esq., showed a collection of Codæums (Crotons), Dracænas, Begonias, and Balsams, displayed in parterre design by the head gardener, Mr. Roberts, while the LANCASTER CORPORATION was represented by a very creditable show of Chrysanthemums, Salvias, and other plants, arranged by Mr. J. DEARDEN, gardener at Williamson Park. Mr. W. MITCHELL, of Belle Vue, exhibited an interesting group of seedling Chrysanthemums. In the competitive classes the challenge cup presented by Lord Ashton was won for the third time in succession by Mr. J. W. PICKARD, who with Mr. HELME, M.P., Mr. E. STOREY, and Mr. W. BRIGGS were the winners in this class, while in the other plant classes prominent exhibitors were Mr. E.

G. CLARK and Mrs. GARNETT, Shefferlands. The cut bloom classes contained the largest number of entries. Miss PETTY, Ulverston, won the "Lady Storey" rose bowl for 12 varieties of Japanese blooms, and shared the honours in several other classes with Mrs. PORRITT, Mr. T. N. THORNTON, and several local growers.

WOMEN'S AGRICULTURAL AND HORTICULTURAL INTERNATIONAL UNION.

NOVEMBER 15.—The annual general meeting of the members of this society was held on this date, in the Indian Museum, Park Lane. Lady Willington presided, and delivered the opening address, in which she set forth the objects of the Union. Reports were read from the general secretary, Mrs. T. Chamberlain, the educational secretary and the treasurer, as to the work carried out during the past year. Two important changes are contemplated during the coming year—the removal of the central offices to a more convenient site in Westminster, and the holding of the principal exhibition next year on October 12, at the Royal Horticultural Hall, Westminster, instead of at Regent's Park.

Mrs. Gould Dale (Ontario) gave an address on "Horse Breaking and Training," and Professor Bottomley gave a lecture on "Hybridisation."

LINNEAN SOCIETY.

NOVEMBER 16.—Dr. Reginald R. Gates, M.A., Ph.D., gave the main outlines of his paper, communicated by Dr. Marie Stopes, on "Certain aspects of the Mutation Problem in *Oenothera*." He stated that:—

Work with the *Oenotheras* has developed in several directions, all bearing on the general question of the place to be assigned to mutation as an evolutionary factor. A concerted attack upon the behaviour of the *Oenotheras* in heredity and variation from several points of view, gives a broader basis for the interpretation of the evolutionary significance of these phenomena than has hitherto been possible in most other genera.

The cytological evidence has shown that in most of the mutants from *Oenothera Lamarckiana* the chromosome number is unchanged, but in the mutant *O. gigas* it is doubled. Hence mutants originate in various ways. Evidence goes to show that the chromosome doubling in *O. gigas* probably occurred either in the fertilised egg, or in a megaspore mother-cell which afterwards developed apogamously.

On the other hand, in certain cases the mutational change probably occurred during the reduction divisions. Thus, *O. rubricalyx* is a mutant from *O. rubrinervis*, which produces an extreme amount of pigment; and when crossed with the parent type the new character behaves as a Mendelian dominant, and in such a way as to show that the original mutant individual was heterozygous and probably originated from a cross between a germ-cell in which the new dominant character appeared, and one in which it was lacking.

From this and much other evidence, mutation in *Oenothera* appears to be due to a general condition of germinal instability, which in turn is probably connected with crossing in the ancestry. This, however, by no means deprives it of evolutionary significance, for all open-pollinated species of plants are hybrids in the sense that various races have participated in their immediate ancestry.

Certain results were also communicated, of *O. grandiflora* × *O. rubricalyx*, *O. Lamarckiana* × *O. grandiflora*, and other crosses which produce twin types.

Mr. G. Claridge Druce, in his exhibition entitled "Some Floristic Results of the International Phytogeographic Excursion through the British Isles" during the past summer, gave an account of the places visited during the five weeks spent on the tour, and touched on the species and varieties discovered.

Mr. Arthur W. Hill showed drawings of a viviparous specimen of *Juncus bufonius*, in which the seedlings were seen emerging from the parent capsule.

Mr. N. C. Macnamara contributed some remarks on "Mutations in Foxglove Plants," which was communicated by Prof. A. Dendy, and read by the General Secretary.

MANCHESTER AND NORTH OF ENGLAND ORCHID.

NOVEMBER 16.—Committee present: Rev. J. Crombleholme (in the Chair); and Messrs. R. Ashworth, J. Bamber, W. R. Lee, C. Parker, H. Thorp, Z. A. Ward, J. C. Cowan, J. Cypher, J. Evans, W. Holmes, A. J. Keeling, and H. Arthur (secretary).

W. R. LEE, Esq., Heywood (gr. Mr. Woodhouse), exhibited a group of plants to which a Silver-gilt Medal was awarded, containing very choice forms of *Odontoglossums*, *Cattleyas*, and *Cypripediums*. Many of the plants received Awards.

Z. A. WARD, Esq. (gr. Mr. Weatherby), also exhibited an excellent group, and was awarded a Silver-gilt Medal, an especial feature being numerous varieties of *Cypripedium insigne*.

O. O. WRIGLEY, Esq., Bury (gr. Mr. Rogers), again staged a magnificent exhibit of more than 250 plants, *Cypripediums*, comprising all the yellow varieties known in cultivation.

J. MCCARTNEY, Esq., Bolton (gr. Mr. Holmes), was awarded a Silver Medal for a group, which included *Cattleya labiata* Mrs. J. McCartney and C. Bowringiana "McCartney's" var.

Rev. J. CROMBLEHOLME, Clayton-le-Moors (gr. Mr. Marshall), staged a very pretty group of *Cypripediums*, tastefully arranged with small Ferns and Palms. A Silver Medal was awarded.

Col. J. RUTHERFORD, M.P., Blackburn (gr. Mr. Lupton), was awarded a Bronze Medal for a group of *Cypripediums*.

G. H. PEACE, Esq., Monton Grange (gr. C. Mace), was also awarded a Bronze Medal for a group of *Cypripediums*.

J. J. HOLDEN, Esq., Southport (gr. Mr. Johnson), staged a fine plant of *Odontoglossum ardentissimum* var. *Johnsonii*, carrying two spikes of flowers $3\frac{1}{2}$ inches across, and other choice Orchids.

Messrs. J. CYPHER & SONS, Cheltenham, were awarded a Silver Medal for a general collection of Orchids.

Messrs. STUART LOW & Co., Bush-hill Park, staged a miscellaneous group, to which a Silver Medal was awarded, *Cattleyas* and *Cypripediums* being well represented.

Messrs. HASSALL & Co., Southgate, were awarded a Silver Medal for a meritorious group of *Cattleyas*, *C. labiata* and hybrids of the Iris section, with a few choice *Cypripediums*.

Mr. JOHN ROBSON, Altrincham, staged a few yellow varieties of *Cypripedium insigne* and a choice hybrid (*Leeanum Clinkaberryanum* × *Memnon giganteum*).

Mr. W. SHACKLETON, Great Horton, Bradford, staged *Cypripediums* *Niobe superbum*, *Memnon*, *Queen Alexandra*, and an unnamed seedling.

Mr. H. ARTHUR, Blackburn, staged *Oncidium Forbesii*, var. "nigrum" (a very dark form), *Cymbidium erythrostylum*, and *Cypripedium Baron Schröder*.

AWARDS.

FIRST-CLASS CERTIFICATES.

Cattleya Fabia var. "Imperator," a fine flower with golden lines in the lip; *C. labiata* var. "Virgo Purissima," a large white flower with pale yellow markings in the throat; *Odontoglossum Chione*, the chocolate-coloured segments tipped with white, the lip broad and flat; all these shown by W. R. LEE, Esq.

O. ardentissimum var. "Johnsonii," a specimen carrying two spikes of magnificent flowers each $3\frac{1}{2}$ inches across, from J. J. HOLDEN, Esq.

Cypripedium Overtonii (*Fulshawense* × *Leeanum Corona*), a large, well-balanced flower, from R. L. OVERTON, Esq.

AWARDS OF MERIT.

Cattleya Portia var. "Imperator," a large, round flower of good even colour, and 4 inches across; *C. labiata* "Genevieve," a white flower with faint markings in the lip; *C. Iris* var. "Corianda" (bicolor *Grossii* × *Dowiana*); *C. × Myrrha* "Lee's" var.; *Lalio-Cattleya Clive* "Plumpton Hall" var.; *Odontoglossum Antiope*; *O. Hermione*, very distinct and of good form; *Cypripedium Arthurianum* var. "Sanderæ" (*Arthurianum* × *insigne Sanderæ*), a flower showing the parentage on both sides; *C. Charlesianum* var. "Prometheus," all these from W. R. LEE, Esq. *C. Pearl Beauty* (*Milo* × *Nitens Charlesworthii*), from

R. LE DOUX, Esq. *Cattleya labiata alba* "Holden's" var., a distinct, but rather small flower; *C. Holdeniae* (Schrödera alba x Warneri alba), having a showy lip tipped with pink, the throat is yellow; *C. Princess Mary* (Warneri alba x Dowiana alba), good variety, showing Dowiana markings in the lip, but rather light in colour; all these shown by J. J. HOLDEN, Esq. *Cypripedium Mancunium* (Harrisianum superbum x Leeannum), from Rev. J. CROMBLEHOLME. *C. Actæus* "Cringewood" var., from Z. A. WARD, Esq. *Cattleya Fabia* var. "gigantea," from STUART LOW & Co.; and *C. labiata*, from Messrs. HASSALL & Co.

BLACKBURN CHRYSANTHEMUM.

NOVEMBER 17, 18.—The annual exhibition of this society was held in the Town Hall, and was equal to the average show of this town. For a table of Orchids, foliage plants and Ferns, arranged for effect, W. DUCKWORTH, Esq. (gr. Mr. H. H. Tindall), Ribby Hall, Kirkham, was awarded the 1st prize for a choice assortment of Cattleyas, Odontoglossums and other Orchids, surmounted by a mass of golden *Oncidium varicosum*, the arrangement being greatly admired. The 2nd prize exhibit, shown by Col. J. RUTHERFORD, M.P. (gr. Mr. J. Lupton), was of similar outline, and contained some fine spikes of *Odontoglossums*. In the class for a table of *Cypripediums* Mr. CHAS. PARKER, Preston, led, Mr. J. WALMSLEY, Helmshore, being placed 2nd with a better arrangement, but lacking the quality of the first exhibit. For three *Cypripediums*, T. MITCHELL ECCLES, Esq. (gr. Mr. J. Pimlott), secured the 1st prize, showing *C. insignis* Harefield Hall var., and *C. i. Sanderæ*, whilst for three hybrid Orchids HARRY BELL, Esq., J.P. (gr. Mr. S. Hardy), Preston, won with choice examples. Mr. J. PIMLOTT led in the class for four Orchids, having good Cattleyas and *Cypripediums*. Mr. H. ARTHUR was successful in the class for three Orchids; while for one *Cypripedium* Mr. C. PARKER won the 1st prize. Mr. H. H. TINDALL won in the class for one Orchid with *Cypripedium Spicerianum*. In the class for a table of Begonias Mr. H. SHUTT was the only exhibitor, and he was awarded the 1st prize. J. WILCOCK, Esq., J.P. (gr. Mr. H. Bradburn), showed the best exhibit in the class for six table plants in a keen contest. Mrs. ASTLEY (gr. Mr. K. McCulloch), with well-grown plants, led in the class for six Primulas. Mr. H. BRADBURN was the only exhibitor in the class for a group of Chrysanthemums, but he staged his exhibit in a creditable manner, flowers of the Japanese type, of which it was largely composed, being especially fine. For a group of singles, J. THOMPSON, Esq., J.P. (gr. Mr. C. Samways), secured the leading award with well-grown blooms; T. MITCHELL FORBES, Esq., J.P. (gr. Mr. Pimlott), was placed 2nd.

The best group of miscellaneous plants was shown by Mr. J. PIMLOTT.

Mr. H. BRADBURN won the 1st prize in the classes for (a) six single Chrysanthemums; (b) four pot plants; and (c) one Japanese variety. Mr. J. PIMLOTT had the best incurved varieties, and Mr. C. SAMWAYS the best single variety.

Cyclamen, Hippeastrums, Solanums, Bouvardias and Amaryllis were shown well.

In the classes for cut flowers, Mr. H. BRADBURN won the 1st prize for 24 Japanese varieties, staging moderately-sized fresh blooms; 2nd, H. SWALLEY (gr. Mr. J. Mundell).

For 12 Japanese and 12 incurved varieties Captain FIELDEN (gr. Mr. H. Boyd) was awarded the 1st prize, followed by Mr. J. PIMLOTT and Mr. H. JONES.

For 12 Japanese varieties Mr. J. PIMLOTT was successful, Mr. H. JONES leading in the class for 12 incurved blooms.

Mr. H. JONES secured the N.C.S. Certificate for the best Japanese blooms in the show with Frances Jolliffe, and for the best incurved bloom with Buttercup.

FRUIT AND VEGETABLES.—For eight varieties of vegetables, Mrs. STONES (gr. Mr. J. Barker) excelled with a generally meritorious display. Mr. C. SAMWAYS won the 1st prize in the class for two bunches of black Grapes, with good bunches of Black Alicante E. LORD, Esq. (gr. Mr. J. Wright), won in the class for white Grapes with well-coloured bunches of Muscat of Alexandria. This exhibitor also showed the best single bunch of a

black or white Grape. Mr. THOMAS SMITH excelled in the class for Tomatos. Mr. H. BRADBURN had the leading dessert and culinary Apples, and Mr. H. SHUTT the choicest dessert Pears. Mrs. J. PIMLOTT won the 1st prize offered for a basket of Chrysanthemums.

NATIONAL DAHLIA.

NOVEMBER 28.—The annual general meeting of this Society was held on this date at the Hotel Windsor, Victoria Street; Mr. George Gordon, V.M.H., presided. A letter was read from Mr. Edward Mawley resigning his office as President. Many regrets were expressed at Mr. Mawley's decision, and a warm tribute paid to the great services he has rendered the Society. The Committee's report was presented, of which the following are extracts:—

EXTRACTS FROM THE REPORT.

A conference was held on March 17, when papers on "Single Dahlias: Their Cultivation and Use," by Mr. Joseph Cheal, and "Decorative Dahlias, with Special Reference to Their Early and Abundant Production of Bloom," by Mr. George Gordon, were read and discussed.

Two exhibitions were held, one at the Crystal Palace, and the other at the Royal Botanic Gardens, Regent's Park. The dry season had considerable influence upon the early production of bloom, and, in these circumstances, the exhibitors were not so numerous as in the preceding year.

An extensive series of trials was carried out by Messrs. H. Cannell & Sons, Swanley. The trials brought into prominence the best varieties for garden decoration, and the report of the committee of inspection will be published in due course.

In order to assist the Society in its work, members of the trade have most generously decided to forego their prizes in the nurserymen's classes for the present year. By this means the Society has been able to carry out its work, and now has a balance on the credit side.

More than 20 new members have joined the Society during the year, and the majority have taken part in the exhibitions.

Your Committee have offered a gold, a silver-gilt, and a silver medal to be awarded for Dahlias at the Royal International Horticultural Exhibition, 1912. They recommend that only one show shall be held by the Society in the coming year.

An alteration of by-laws authorising the annual meeting to be held on any convenient date in November was carried.

Mr. George Gordon was elected president, Mr. John Green hon. treasurer, and Mr. E. F. Hawes hon. secretary. Mr. Hawes was asked to accept an honorarium of £8. All eligible members of the Committee were re-elected.

Mr. Joseph Cheal, V.M.H., was elected Chairman of the Committee.

At a subsequent meeting of the General Committee Messrs. F. W. Seale and E. F. Such were elected to the Executive Committee to fill the vacancies caused by the retirement of Messrs. E. Cadman and J. Cheal.

GARDENING APPOINTMENTS.

[Correspondents are requested to write the names of persons and places as legibly as possible. No charge is made for these announcements, but if a small contribution is sent, to be placed in our collecting box for the Gardeners' Orphan Fund, it will be thankfully received, and an acknowledgment made in these columns.]

Mr. A. MANSER, for 3½ years Foreman at Greenhill Park, New Barnet, Hertfordshire, as Gardener to Mrs. WESTERN, Orchard Court, Stevenage.

Mr. ARTHUR GREENTREE, for the past 6 years Foreman at Ingestre Gardens, Stafford, as Gardener to Captain Higson, Oakmere Hall, Hartford, Cheshire.

Mr. J. M. RICHARDS, for the past 5 years Foreman in the gardens at Gregynog, Newtown, and previously for 2 years Foreman at Hendrefoilan, Swansea, as Gardener to Lieut.-Col. FAIRFAX RHODES, Brockampton Park, Andoversford, Gloucestershire.

CATALOGUES RECEIVED.

HOGG & WOOD, Coldstream, Scotland—Trees, Shrubs, Clematis, Roses, and Rhododendrons.
ALAN BALCH, Girvan—Scotch-grown Tomato Seed.

FOREIGN.

VILMORIN-ANDRIEUX ET C^{ie}, 4, Quai de la Mégisserie, Paris—Seeds of Trees and Hardy Shrubs.
M. HERB, Via Trivio, 24-36, Naples, Italy—Seed List.

MARKETS.

COVENT GARDEN, November 29.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—Eds.]

REMARKS.—Trade and prices remain the same as last week. Edward J. Newborn, Covent Garden and St. Pancras, November 29, 1911.

Obituary.

JAMES DOUGLAS, V.M.H.—The news of the sudden death of Mr. James Douglas, on the 27th ult., will cause a feeling of intense regret over the whole world of British gardening. It seems but a few days since I last saw him in his usual health. He was no ordinary gardener, but an outstanding representative of his profession. In his private life he was quiet and unobtrusive,

invariably in the front rank of exhibitors. Not content with showing specimen plants, he took up the work of hybridising Orchids, and this, I believe, he continued to the last, but during later years more as a hobby than for profit. At one time he used to exhibit specimens of exotic Ferns, and I also well remember his splendid examples of forced plants of *Deutzia gracilis*. It is some years since he commenced to raise varieties of *Hippeastrums*, and in this work he showed his great skill as a gardener, as he did also (if my memory serves me right) in the culture of *Incurved Chrysanthemums*. It is, however, as a florist that James Douglas will be best remembered, for of florists' flowers he had a wide knowledge. When he removed in 1892 from Great Gearies, where he was head gardener to Mr. Whitburn, to open a nursery at Great Bookham, the newer race of hybrid *Nymphæas* engaged his attention, but I do not know that he raised any novelties. During later years his energies were more concentrated upon the culture of hardy border and *Souvenir de la Malmaison* Carnations. He introduced many standard varieties of the former flowers, as the Award book of the Floral

THE LATE JAMES DOUGLAS, V.M.H.

REMARKS.—Oversea consignments of Apples this week amounted to 36,000 barrels and boxes, and of Pears 4,000 cases, consisting of the following varieties: (dessert) Doyenné du Comice, Glou Morceau, Easter Beurre, Winter Nelis; (culinary) Keiffer and Catillac. The following varieties of home-grown Apples are still obtainable in fairly large quantities: (dessert) Cox's Orange Pippin, Blenheim Pippin and Allington Pippin; (culinary) Bramley's Seedling, and Lane's Prince Albert. Grapes from all sources continue a very heavy supply, and can only be cleared at low rates. The following fruits are arriving from Madeira: Avocado Pears, Mangoes and Custard Apples. Channel Island and English-grown Tomatoes are now almost finished, but large supplies of Tomatoes are arriving from Tenerife weekly, the fruits being in a very saleable condition. French Beans from all sources are very plentiful and of excellent quality. Seedless Oranges of very fine quality are arriving from Dominica, at present in limited quantities only. Cobnuts remain a good supply and show a slight increase in prices; the same applies to Italian and French Chestnuts. The supply of French Walnuts is about equal to the demand. The vegetable trade is quiet, but prices are fairly well maintained considering the quantity of produce in the market. E. H. R., Covent Garden, November 29, 1911.

always ready to render aid and to give advice to any inquirer. Many gardeners will miss him and the friendly smile which was characteristic of the man. My earliest knowledge of Mr. Douglas was as an exhibitor of high-class dessert fruit, and he especially excelled in the culture of forced Grapes. I remember his fine exhibits of Grapes at the shows at South Kensington and Regent's Park. He aimed at getting perfect finish of berry, and this quality often won the 1st prize for him in competition with exhibitors of larger bunches. I well remember his splendid exhibit of three bunches of the variety Foster's Seedling, with which he won the 1st prize in the White Grape class at one of the Royal Horticultural Society's Shows in May. I think it may be said that he first made a name for himself as a fruit grower. But he was also a clever cultivator of Orchids at a time when large, specimen plants were popular. These he exhibited for very many years at the Metropolitan exhibitions, and he was

Committee of the R.H.S. bears evidence, whilst he also distributed the excellent varieties raised by the late Martin R. Smith. His aim was to obtain refinement in the flowers, combined with a good habit of growth and freedom in flowering. Both the Picotee and the Pink also claimed his attention, and of these he raised several improved varieties. In the cultivation of the Auricula, both the show and Alpine types, he was pre-eminent. His successes at the spring shows of the Royal Horticultural Society and the National Auricula Society were most noteworthy, his exhibits receiving the highest awards at the former shows, and he was seldom beaten in the competitive classes of the Auricula Society. No one has raised more choice or distinct Auriculas in recent years than James Douglas. Noteworthy amongst these is a cross between the show and the Alpine Auricula. Only this last spring some of his novelties received Awards of Merit from the Floral

Committee of the R.H.S. Both the Primrose and the Polyanthus came in for a good share of his attention. Some years back he was one of the best growers and exhibitors of Hyacinths, his plants being models of good culture. So also did he excel with Tulips. He was, I believe, a raiser of seedling Narcissi, of which bulbs he cultivated a choice selection at Great Bookham. He was an expert on the Pansy, and his great knowledge of the flower was apparent when I have acted as judge with him at the northern Pansy exhibitions. He was also keenly interested in Roses. In fact, it would be a difficult matter to point out any florists' flower that has not, at some period of his career, been the subject of his careful attention. He was called upon to act as a judge at most of the more important exhibitions in the country, and in this capacity I have been his colleague upon many occasions. The exhibit of Pansies by a pitman in the north would receive as much attention from him as a large exhibit of Carnations shown by some prominent grower. At the Newcastle-on-Tyne Show he had officiated as judge for a quarter of a century. For some years Mr. Douglas was a member of the Council of the Royal Horticultural Society, and on his retirement it was my privilege to be elected in his stead. He was also an active member of the Committee of the Gardeners' Royal Benevolent Institution. Besides being a prolific contributor to the horticultural Press, he was an active worker in other walks of life. One of his sons lost his life in the Boer War, and another son has been connected with the florist's business at Bookham. The funeral took place at Leatherhead on Wednesday, the 29th ult. *James Hudson.*

It was whilst engaged for many years as gardener to Mr. and Mrs. Whitburn, at Great Gearies, Ilford, that Mr. Douglas showed his consummate skill as a cultivator. He seemed to be successful with every kind of plant he took up, for, whether plant, flower or fruit, everything he cultivated was always of the best. For many years he was examiner with the Rev. Professor Henslow of the candidates of the Royal Horticultural Society's general examination, and only recently he resigned that office. At Great Bookham Mr. Douglas was able to show his great ability in the culture of Auriculas and Carnations, and no one excelled him as a cultivator of these old florists' flowers. His nursery also contained a fine collection of Narcissi, and the bulbs succeeded well in the somewhat retentive soil of Bookham. But with Auriculas and Carnations he was indeed a master, and visitors to the Vincent Square meetings are familiar with the magnificent exhibits of these flowers staged by him. Mr. Douglas was not only a skilful cultivator, but also a great raiser of new varieties. His love for the Carnation was well known, and the new sorts he raised were all of the true florists' type. Both the National Auricula and the National Carnation Societies have lost one of their most powerful supporters and exhibitors in the death of this distinguished man. *Alex. Dean.*

The following details of Mr. Douglas' life are kindly furnished us by a member of the bereaved family. He was born at Ednan, a little village near to Kelso, in 1837, and commenced his gardening career at Mr. Andrew Tait's nursery, at Kelso, as an apprentice, though it was his parent's wish that he should enter the ministry. In 1860 Mr. Douglas was appointed head gardener to Mr. Whitburn at Great Gearies, Ilford. About the year 1889, the late Mr. Martin Smith invited Mr. Douglas to accompany him to M. Benary's nursery, at Erfurt, Germany, with a view to procuring the best of what Benary had in selfs and fancy Carnations. These Douglas selected, and they formed the basis of Mr. Smith's noted collection at Hayes. The first seedling varieties introduced to commerce afterwards were self-coloured flowers (1893), Abigail, Niphetos, Lady Gwendoline, and others. But decided developments had occurred before the late Martin Smith began his work. The first of the yellow-ground Picotees had been introduced in 1858, Prince of Orange being the earliest named variety. The late Charles Turner raised seedlings from this flower, and, out of his selections, Mr. Douglas succeeded in raising the first true Picotee-edged variety, which was named Agnes Chambers. Another variety was named Mrs. Robert Sydenham. Not until

Elaine (a border self) was shown, in July, 1888, did Mr. Douglas obtain a Certificate from the Floral Committee of the Royal Horticultural Society for any of his novelties in Carnations. Souvenir de la Malmaison, as well as border varieties, received attention at his hands. For 21 years Mr. Douglas was honorary secretary and treasurer of the National Auricula Society and the National Carnation and Picotee Society. The first suggestion of a Carnation society for the south appears to have arisen in the minds of Mr. E. S. Dodwell and Mr. Douglas, after a visit these gentlemen paid to a show in the Botanical Gardens, Manchester, on August 10, 1875, in consequence of the uncertainty as to the action of the R.H.S., which had previously held a London Carnation show. A meeting was held on January 31, 1876, and at this meeting the National Carnation Society was established. Mr. Douglas was one of the members of the now-defunct Pelargonium Society. His first literary contribution was on the subject of the Cineraria, published in the *Cottage Gardener*. On the death of Robert Fish, Mr. Douglas wrote the "Doings of the Past and Present Week" for the *Journal of Horticulture* for some considerable time. Mr. Douglas was the author of *Hardy Florists' Flowers: Their Cultivation and Management* (1880). On his retirement from the Council of the R.H.S., he was awarded the Victoria Medal of Honour. He was also a member of the executive committee of the Gardeners' Royal Benevolent Institution. His chief recreations were his books and the study of old china. Of the latter he possessed a rich collection. His library is singularly complete in floricultural works. It includes a complete series of the *Botanical Magazine*, *Edwards' Botanical Register*, the *Floricultural Cabinet*, the *Transactions* of the Royal Horticultural Society, and, till recently, Gerard's, Parkinson's, and other *Herbals*. Only last year Mr. Douglas contributed to a volume entitled *Carnations in the Present-Day Gardening* series.

ANDRÉ ARRANGER.—The many friends of Monsieur Charles Arranger, secretary of the *Jardin* and *Petit Jardin Illustré*, will learn with regret the death, on the 23rd ult., of his son André, at the age of 19. M. André Arranger was a pupil of the National School of Horticulture at Versailles.

THE WEATHER.

THE WEATHER IN WEST HERTS.

Week ending November 29.

A cold and dry week.—Throughout the last 10 days there has occurred only one unseasonably warm day and but two warm nights. On the coldest day of the past week the temperature in the thermometer screen did not at any time rise above 34°, which is a very low maximum reading for November, and on four nights the exposed thermometer registered from 9 to 12° of frost. The ground temperatures have fallen, and yesterday the reading at 2 feet deep was 2° colder, and at 1 foot deep 4° colder than is seasonable. Rain, snow or sleet fell on four days, but the total measurement amounted to less than one quarter of an inch. No measurable quantity of rain-water has come through either of the percolation gauges during the past five days. The sun shone on an average for 1 hour 35 minutes a day, which is about the usual duration for the end of November. The winds were as a rule light, and for the first five days came almost exclusively from some point of the compass between north and east. There was about a seasonable amount of moisture in the air at 3 p.m. *E.M., Berkhamsted, November 29, 1911.*

ANSWERS TO CORRESPONDENTS.

ABIES NOBILIS: *F. G. Brewer.* The tree, of which you send a specimen, is *Abies nobilis*. The cracked condition of the trunk which you describe has been reported from other parts of the country during the present autumn, and has been put down to the unusual heat of the late summer. In some cases the cracks extend into the wood. The only thing you can do is to paint the crack with a little tar, in order to prevent fungus-spores from entering. You cannot do any harm by giving the ground about the tree a good watering, as you say that it is still very dry. A mulch of leaves may do good. This tree is, however, in some parts of the country, very subject to attacks from aphids, which cause gall-like swellings on the branches, and it is probable that your tree is affected in this way. This would explain the reason for the leaves falling. Spraying with

a paraffin wash during May and June is to be recommended.

APPLE BRANCH: *G. R.* The Mussel Scale (*Mytilaspis pomorum*) is present on the shoots in large numbers. The trees should be syringed in autumn and winter with kerosene emulsion, or, better still, with the "Woburn" wash. This is made as follows:—Take sulphate of iron (copperas) or sulphate of copper (blue vitriol), 1½ lb.; quicklime, 6 ounces; paraffin, 5 pints; caustic soda, 2 lbs.; and water, 9½ gallons. Dissolve the sulphate of iron or copper in the water by suspending it in a bag of sacking overnight; at the same time put the lime in a jar with enough water to not quite cover it. Next day, when the sulphate is dissolved and the lime slaked, add a little more water to the latter to make it into a milk, and pour it into the sulphate solution. Then the paraffin should be added, and the mixture churned with a garden syringe. One or two strokes of the syringe are sufficient to produce a perfect emulsion. Then add the soda, and mix the whole well together. If the soda is in the powdered form it may be added while solid to the water, if in large lumps, dissolve it separately in a portion of the water reserved for that purpose. In applying this wash it is important that it should be done in the form of a fine spray, so that it does not drench the ground or crops underneath, for it would thus cause damage.

FUMIGATING WITH SODIUM CYANIDE: *Anxious.* We are indebted to Mr. F. C. Edwards, nurseryman, Leeds, whose special apparatus for cyaniding was illustrated in *Gardeners' Chronicle*, March 31, 1906, for the following details:—It is perfectly safe to employ the cyanide in a greenhouse when the plants are in a dormant condition, but at other times it must be used with caution. Speaking generally, it is inadvisable to fumigate plants that are making growth or fruit trees whilst the fruits are setting. Hydrocyanic acid gas, in common with other fumigants, if used at full strength, injures young growths of Vines, Roses, Cucumbers, and Tomatoes. It does not, if used judiciously, injure Palms, Dracenas, Codiaëums (Crotons), and most plants with non-succulent leaves. When fumigating, the foliage should be dry, the temperature below 60 F. and the light subdued. The quantity of cyanide necessary to free a house from insect pests depends on the nature of the insects, the plants, and the size of the house. One-eighth of an ounce of sodium cyanide, with a quarter of an ounce of sulphuric acid previously diluted with half an ounce of water to every thousand feet of space, is sufficient to kill the different kinds of aphides, green fly, white fly, &c., but this strength has little effect on mealy bug, red spider, and scale insects. It is advisable to err at first on the side of weakness, carefully noting any slight injury to foliage. Having ascertained the maximum strength which the plants will stand, the house should be fumigated once weekly for three weeks. This will destroy all insect pests. With regard to the cost, it is claimed that the use of cyanide reduces the account for fumigation to about one-eighth.

GARDENING AS A PROFESSION: *L. C. P.* We frequently hear of cases similar to your own, where, from reasons of ill-health, young men wish to leave businesses which impose much confinement indoors upon the assistants. At the same time it is certain that those are most likely to succeed in horticulture who acquire a thorough knowledge of the principles of gardening at a comparatively early age. Whether you could get over the difficulties that lack of training imposes upon you, would, of course, depend mainly upon yourself, and circumstances, in some degree. The best chance of getting employment would be in some market nursery or other where you might expect a little wage for doing various kinds of work usually carried out by labourers, but which would bring you into association with the gardening practices of the place. You might apply to nurserymen or market gardeners that you know, or insert an advertisement in a gardening journal. Then, if you get employment, you must make the best of your opportunities, and later determine what special branch you will make your own.

HOME-GROWN AND IMPORTED APPLES: *Interested.* There are no data for estimating the home crop of Apples. The yield varies immensely in different years, and some trees are too young and others too old to bear any considerable quantity, while others are cider Apples, which do not count. It was only as recently as 1907 that the acreage of Apples was officially returned separately from that of other fruits, and this covered only trees on agricultural holdings in Great Britain in 1910. The acreage was 172,031. The imported Apples in 1860 amounted to 706,000 cwts., and in 1910, 3,242,205 cwts.

HORTICULTURAL TUITION: *G. H. H. W.* The curiosity you complain of is no doubt irritating when attempts are made to satisfy it in the manner you describe. If the gardener or other gentleman intends to coach others for certain examinations, he might at least be expected to draw up his own syllabus without first obtaining syllabuses from other lecturers through ordinary correspondence, and by leading the owners to suppose that they are sending the copies to prospective pupils. Irritating though the circumstances may be, you must try and get what satisfaction you can from the thought that after all the other man's desire for your prospectus is a tribute to your own reputation as a teacher.

INSECTS IN SOIL: *G. W.* The soil was dried up and no insects could be detected. But there were excrescences on the roots of the Begonia, suggesting the presence of eel-worms, which are not visible to the naked eye.

JAPANESE GARDEN: *D. H.* In constructing a Japanese garden, avoid all semblance of formality, or of repetition. Do not, in any sense, attempt to balance one part with another. As the ground at your command amounts to about 560 square yards, you should divide it from the centre into four sections by drawing two lines across that point at right angles. Then endeavour to make each section quite distinct one from the other, yet harmonising as a whole. Keep the centre free from any shrubs or ornament of any kind. In one section arrange for a pool of water, which need not be deeper than 2 feet in any part, with a narrow, informal streamlet issuing from it. A few Water Lilies of the smaller kinds might be grown in the pool, whilst along the bank a few water-side plants, such as *Myosotis palustris*, *Mimulus luteus*, *Senecio Clivorum*, and *Primula japonica*, may be planted. In the stream plant a few water-loving plants, such as *Cyperus longus*, *Zizania latifolia*, *Glyceria aquatica variegata*, and *Caltha polypetala*. Arrange for at least one stone bridge over the streamlet. Let this be approached from either side by irregular stepping-stones of about 4 inches in thickness; the best stones for the purpose are such as are taken direct from a quarry, without having had any tooling. A Japanese stone lantern might be placed at or towards one corner, possibly the one farthest removed from the entrance to the Rose garden, as shown on your plan. Stepping-stones up to and passing this lantern might be arranged so as to terminate at the extreme boundary. About one-fourth of the remaining area might be laid down as grass. The soil that is excavated in forming the pool and streamlet should be utilised in the formation of at least one mound, where it would have the best effect, or where such a mound would assist in hiding any unsightly view. Upon a mound of this description a few well-known Japanese Conifers might be planted, but not crowded together. One of the best Pines for the purpose is *Pinus densiflora*; the *Retinosporas* are also suitable; and one plant of *Trachycarpus excelsus* may be placed in a prominent position. Include, if possible, at least one plant of *Sciadopitys verticillata* (the Umbrella Pine of Japan), say, of about 2 feet in height at the time of planting. This Pine requires peat and an abundance of moisture. A *Wistaria* trained informally up a dead tree stem, or to form a rustic arbour, would give further variety. *Clematis Jackmannii* should also be planted and trained up another tree stump. A few Bamboos might be grouped on one side, but these should not be planted before next May. *Arun dinaria nitida*, *Phyllostachys nigra*, and *P. aurea* would be suitable. A few Japanese Maples will give colour effect in spring and

autumn. A good evergreen to include is *Fatsia japonica*. Japanese Liliiums should be freely planted.

LANTERN SLIDES: *G. F. M.* If you write to Mr. W. J. Vasey, Broad Street, Abingdon-on-Thames, or to Mr. John Gregory, 60, Canterbury Road, Croydon, most likely they will supply you with what you require.

LEGAL: *S. 211.* (1) An employer cannot be compelled to state his reasons for giving notice to leave, and, assuming that the notice is in order, you have no claim for wages beyond the date when the notice expires and cannot claim your expenses back to the place from which you originally came. (2) If the plants which you brought with you are still in pots you can take them away with you when you leave, but if you have planted them in the soil you cannot remove them without your employer's permission, in the absence of any custom to the contrary.

NAMES OF FRUITS: *A. V. W. B.* Gooseberry Apple.—*A. H. James.* Annie Elizabeth.—*H. V. W.* A fine fruit of Ribston Pippin.—*R. Jones.* Williams's Victoria.—*H. G. P.* 1, Beurré d'Anjou; 2, Soldat Labourer; 3, Comte d'Lamy; 4, Marie Louise d'Uccle; 5, Northern Spy; 6, Brabant Bellefleur.

NAMES OF PLANTS: *H. S., Twyford* The specimens were insufficient for naming; it is impossible to name single leaves or barren twigs.—*A. E. Stevens.* Common Spruce, *Picea excelsa*. It is not of great value as an ornamental tree.—*J. J.* We do not recognise the variety.—*W. E.* *Arbutus Unedo* var. *rubra*, also called *A. U. Croomii*.—*J. C.* 1, *Jasminum humile*; 2, *Escallonia* sp. (send when in flower); 3, *E. macrantha*; 4, *Baccharis patagonica*; 5, *Escallonia rubra*; 6, *Akebia quinata*.—*A. C.* American Milk-weed, *Asclepias Cornutii*.—*Orchid.* 1, *Cœlogyne flaccida*; 2, *C. corrugata*; 3, *Brassia maculata*; 4, *Lælia longipes*; 5, *Oncidium tetrapetalum*; 6, *Eria convallarioides*.—*Kenley.* *Cypripedium insigne*. The inflorescence carrying two flowers is evidence of good cultivation.—*W. H. S.* *Rhynchosylis violacea*; generally called *Saccolabium violaceum* or *S. giganteum* in gardens.—*G. S. P. H.* 1, *Strobilanthes Dyerianus*; 2, *Lycaste Smeeana*, which is said to be a natural hybrid, but which, in effect, is a very low form of *Lycaste Skinneri*; 3, *Maxillaria picta*.

PAMPAS GRASS: *W. B.* It is quite safe to move your plant of *Cortaderia argentea*; the first week in April will be a good time to carry out the work. It may either be replanted wholly or divided if required to increase the stock. In transplanting preserve as much soil as possible about the roots, and plant in well worked soil enriched with suitable materials.

POTATOS: *F. E. G.* You can hardly expect to get "floury" Potatos from land which is rather heavy and cold and, as a rule, lies wet. You will do well to trench the soil now two spits deep, loosening the bottom and applying some good, rough manure at the same time. When planting in spring do not put the tubers deep into the soil; rather lay them on the top, and with the hoe pull the earth up over them until the desired depth or covering is obtained. As you have not obtained satisfaction with varieties like "Up-to-Date," we advise you to try other types. Langworthy and Golden Wonder usually yield tubers of excellent cooking quality, but the crop will not be half so heavy as "Up-to-Date" or "Factor." There is a late round Potato named "The Provost" which you might also try. It yields heavy crops of good tubers and is quite opposite to the "Up-to-Date" type. On your land it might be excellent.

SWEET PEAS: *W. F.* You have taken the first essential step towards having good Sweet Peas next season by cultivating your ground so thoroughly as 2 feet 6 inches deep. You must sow the seeds in boxes or pots in January or early in February in a frame or cool greenhouse. They should remain there until early in April, when you must plant them out. Good single plants should be planted 18 inches apart in lines. By pinching the centres out of the young plants when about 3 inches tall they will break at the base, and three to five strong growths will start away. These will climb up your sticks or wire and fill up the row well

and yield large flowers with long stems in abundance. After the first flower-buds begin to show colour, regular weekly or fortnightly waterings with liquid manure should be given; this will vary with weather and other conditions. Growths which are inclined to ramble must be tied in with raffia, and no flowers must be allowed to form seed-pods, otherwise they will become small and short-stemmed and ultimately the plants will cease to flower at all.

VINE BORDER: *W. J.* You did not state the age of your vines, or whether they have been giving satisfactory results. The manure you mention would have been better applied to the border after the vines had started into active growth. Remove all the loose surface soil from the border, and then fork the latter to the depth of 2 or 3 inches with a digging fork, afterwards applying, as a top-dressing, a compost consisting of three loads of rich loamy soil, one load of horse-droppings, or well-decomposed stable manure, one load of lime rubble or old plaster, and 1 cwt. of some artificial manure, such as Thomson's Vine and Plant Manure or Cross's Vine Fertiliser, the whole being well mixed before being spread evenly over the border. On top of this place a layer 3 inches deep of short stable manure, and then give the border a good watering. When starting the vines, surface dress the border with one of the fertilisers indicated above at the rate of $\frac{1}{4}$ lb. to the square yard, and afford water through a rose, so as to wash the substance of the fertiliser down to the roots. Give three subsequent dressings of the fertiliser at the rate of $\frac{1}{4}$ lb. to the square yard, one after thinning of the berries, the second after stoning, and the final one as soon as the Grapes commence to colour. If the vines are growing in an outside border top-dressed with the compost and short manure as described above, cover it with 24 inches thick of fermenting materials, consisting of three parts of tree leaves, preferably of Oak or Chestnut, and one part of stable manure, including the droppings. These materials should be thrown together in a conical heap a fortnight previous to being spread on the border, and turned over twice during the interval to sweeten. The fermenting materials should be renewed two or three times between the time the vines are started and March next. There need be no apprehension of the heat from the fermenting materials injuring the roots; quite an opposite effect will be produced. It will induce the vine roots to push up into the top-dressing, with the most satisfactory results, giving renewed vigour to the vines, and adding to the weight and quantity of the crop. When the covering of dung and leaves is removed, half in April and the remaining portion a month or two later, in order to allow the solar heat to reach the border, the top-dressing, including the 3 inches thick of short manure, will be found to be a network of healthy roots. Any one of the three following books will afford you the information you require:—*Manure for Fruit and Other Trees*, by A. B. Griffiths, P.L.D., price 7s. 6d.; *Manure for Garden and Farm Crops*, by W. Dyke, 1s. 9d.; *Manure and the Principles of Manuring*, by G. C. M. Aikman, 6s. 10d. These books may be obtained for these prices, which includes the postage, from our Publishing Department.

VINES: *Mespilus.* We do not think that the presence of the Ferns has anything whatever to do with the disease affecting the vines. The Botrytis disease is not usually termed "rust." "Rusty" Grapes are Grapes which have been rubbed, and as the result of the rubbing have not only lost the "bloom" which should characterise them, but present a rusty appearance, which is not attractive.

VITIS INCONSTANS FRUITING: *F. S.* The Virginian Creeper has fruited freely out-of-doors this summer, so that your plant is not an exception.

A LONDON DAFFODIL SHOW.

THE Royal Horticultural Society has circulated, through its Daffodil Committee, a schedule of the prizes to be offered at the Daffodil show which it is proposed to hold at Vincent Square on Tuesday and Wednesday, the 16th and 17th of April, 1912. The Society's classification of Daffodils, 1910,* is to be followed throughout the schedule.

The classes are divided into four sections. In the first three it would appear that any Daffodils may be shown, subject only to this condition, that they must be legibly and correctly named; while the fourth section is, with the exception of a class for Daffodils introduced into commerce during or since 1907, restricted to seedling Daffodils not yet in commerce. Throughout this section only one flower of each variety is admitted, but in the first three sections the rule in force at the Birmingham show has been adopted, and

three stems of each variety are in most cases required. On the whole, this plan is probably a good one, but it is to be regretted that classes for decorative arrangement of some of the commoner varieties are not included, as such classes might have broken the monotony of the exhibits and provided scope for the exercise of taste and ingenuity in decorative arrangement among the exhibitors. Section I. is the open section, and begins with a class for a collection of 48 varieties, "fairly representing the different divisions." After this come four classes of 12 varieties each, corresponding to the first four divisions of the classification, i.e., trumpets, incomparabilis, Barri, and Leedsii, then nine varieties of Division IX. (the Poeticus section), nine varieties selected from Divisions V., VI., and VII. (hybrids of Triandrus, Cyclamineus, and Jonquilla), nine Polyanthus (Division VIII.), and six double Daffodils.

Sections II. and III. are confined to amateurs, and the classes are substantially similar to those in the open classes, save that the number of varieties asked for is smaller. The only restriction imposed is that the exhibitors in any one of these sections must confine himself to that section and may not compete in any other of the first three sections, e.g., an amateur electing to compete in Section III. may not compete in Sections I. or II., and so on. It may perhaps be assumed that the intention is that the larger growers among amateurs should show in Section II. and the smaller growers in Section III., but there is nothing to provide for this, there is no restriction as to the price of the bulbs flowers of which may be shown in the smaller classes, nor is there anything to prevent the largest growers from selecting the third section and putting up the newest and most expensive varieties in the small classes, and so swamping the small exhibitor altogether. This is precisely the mistake made by the National Rose Society in its early days, when a good deal of discontent among the smaller growers was caused by regulations which permitted the largest growers, if so disposed, to show in the smallest classes.

It is rather curious that only in the third section, probably intended for the smaller growers, do we find any use made of the sub-divisions in the classification. In this section, after a group of 12 varieties we find three classes for trumpets apportioned to the three sub-divisions, a, b, and c; that is, yellow trumpets, white trumpets, and bicolors respectively; two classes for the incomparabilis division with yellow and with white perianths respectively, two classes in the same way for the Barri section, and one each for the Leedsii, Triandrus, Polyanthus, Poeticus, and doubles, three varieties being asked for in each case, and three stems of each, save in the class for Triandrus Daffodils, where one stem only is required.

From the standpoint of exhibitions, one of the best things in the 1910 classification was the collection into a separate division (No. XI.) of the beautiful miniature Daffodils—N. bulbocodium, Triandrus, Cyclamineus, and the like—which are so use-

ful in the rock-garden, and it is somewhat to be regretted that in the drafting of this schedule no place was found for a class for these little gems. However, it is unfair to expect to get all we want at the start, and perhaps this and other things may come later on.

In addition to money prizes amounting altogether to about £60, four cups and some 28 medals are offered as prizes, but the schedule contains a rather curious note to the effect that the R.H.S. will be responsible for the provision of the cups and medals offered, but not for the money prizes, which are to be subscribed "by certain Daffodil lovers" and placed in the hands of Messrs. E. A. Bowles, C. H. Curtis, and W. T. Ware. Those who have long wished for a Daffodil show in the Metropolis owe a debt of gratitude to these gentlemen for the task they have undertaken, for without their disinterested assistance the arrangements for a show could never have been made. Nevertheless, the position is scarcely satisfactory. Subscribers to the fund will have few of the advantages which usually fall to the members of a society under whose auspices a flower show is held. They will have no voice in the election of the officers who control the show or with regard to the arrangements, nor settlement of the competitions, and but little interest in its success or failure, the benefit or onus of which will fall to the R.H.S. The subscription would appear to have a certain eleemosynary character, which is scarcely consistent with the dignity of a society like the R.H.S. If the Society, by means of one of its committees, or otherwise, thinks fit to undertake the show at all, it can scarcely, without loss of prestige, decline responsibility for its own show. The position is unfortunate, but well-wishers both of the Society and of the Daffodil may hope for better things in the future.

Something perhaps may be said of the date proposed for the show. It is, no doubt, a date on which the Society has often held Daffodil shows in previous years, but in those cases it has looked chiefly to the trade and others who grow Daffodils on a large scale. Now, however, it is inviting a different class as well—the smaller growers—without whose presence in considerable numbers the show must be a failure. For this class the date will be full early, and a week, or even more, later would, in a normal year, probably be more suitable. In the neighbourhood of London it is seldom that varieties of the Poeticus or Poetaz divisions open out of doors so early as April 16, and this is true even of such early-flowering sorts as Chaucer or ornatus among the poets or Aspasia in the Poetaz division. This is just one of the points on which the expression of opinion from members of a society assembled in general meeting might have been valuable.

Notwithstanding the foregoing criticisms, some of which are of minor importance, the schedule presented may be pronounced, on the whole, a good one, and it is a cause for much satisfaction that we are at last to have—in the coming spring—a Metropolitan show of Daffodils. The

* Price 1s. from the Secretary of the R.H.S.

limitation of the number both of varieties and flowers in the different classes—a point for which the late Mr. Bourne was always pressing—is altogether excellent. The drafting of the schedule has evidently been effected with both knowledge and care, and it will be a disappointment to many if it does not produce a show which shall be first-class, both in quality and importance. *Narcissus*.

NEW OR NOTEWORTHY PLANTS.

ULMUS PLOTII* DRUCE SP. NOV.

THIS tree was first distinguished by Dr. Robert Plot, in his classic *Natural History of Oxfordshire*, published in 1677, where he writes of it as hitherto not described, proceeding to give an account of it as "a narrow-leaved Elm, which also being smooth, justly deserves the name *Ulmus folio angusto glabro*, wherein it differs not only from the *Ulmus minor* of Parkinson and Gerard, but also from their *Ulmus folio glabro*, whose leaves they say are nothing so large as the Wych Hazel, but nearest in bigness, and exactly the figure of the common Elm; whereas ours are much less and of quite a different figure, being narrow and having a peculiar kind of pointed ending as exactly expressed in tab. 10, fig. 1. Of those there are plenty in the avenue to the house of the Honourable the Lady Cope, the relict of the most ingenious Sir Anthony Cope, of Hanwell, where there is a whole walk of them planted in order, besides others that grow wild in the coppices of the park."

Ulmus Plotii Druce is of a singularly graceful and beautiful habit. It still grows near Banbury, and is also found in the counties of Northampton—where I have recorded it as Lock's Elm (*U. sativa* var. *Lockii*)—Lincoln, Bedford, Cambridge, Huntingdon, and Essex, although the avenue at Hanwell is now composed of the English Elm. The characteristic figure of the leaf in Plot's *History*, however, shows without doubt that his tree is identical with the tree illustrated in figs. 165 and 166, and which I venture to designate by his name.

Miller, in his *Gardeners' Dictionary*, 1768, describes six species of Elm, of which only two could be held to cover this. One, *U. minor* (the smooth, narrow-leaved Elm, by some called the upright Elm), evidently refers to the Cornish Elm, a tree of strict habit; the other is *U. sativus*, an Elm, with oval, acute-pointed leaves, which are doubly sawed, and unequal at their base = *U. minor*, *folio angusto scabro* Gerard Emac, 1480. The small-leaved or English Elm, which he says "is not a native of England and is only found growing near London: or in plantations where the young trees were procured from the neighbourhood of London. . . . As this tree is well known, it requires no description." He also says that compared with *U. minor*, the latter has leaves narrower, more pointed and smoother, which is not the case with Plot's Elm. These statements of Miller's surely cannot be held to describe this beautiful tree, which Plot speaks of as being wild in the coppices in Oxfordshire, and distinctly says differs from the *U. minor* of Gerard. Of *U. minor* Gerard says "it is like the others, but much lesser and lower; the leaves are usually 2½ inches long, and an inch or an inch and a quarter broad. . . . and are harsh and rough on both sides." The leaves of Plot's Elm are not so long or broad, 2 inches by 1 inch being the usual size, are more acuminate, and they are not rough above. The tree, too, grows to a considerable height—sometimes over 80 feet—as will be seen by the specimen illustrated in fig. 165. It is a beautiful species, and well deserving a place in parks for its ornamental character. *G. Claridge Druce*.

* Arbor elevata, cortice glabro, ramis attenuatis, foliis parvis, angustis acuminatis, glabris,

THE MARKET FRUIT GARDEN.

EIGHTEEN rainy days in November followed 14 in October, and 5.89 inches followed 6.11 inches, making 12 inches for the two months, or only 0.18 inches less than the total for the nine months ended with September. These are the records of my station, and they are certainly striking as illustrations of drought and flood. No doubt similar comparisons could be furnished from many other localities. Fortunately, no rain of any consequence fell in my district in November after the 18th, the principal precipitation being snow on the 26th, which melted almost as fast as it fell, yielding 0.15 in. of water in the gauge.

Much difficulty was experienced in obtaining Gooseberry bushes of the variety May Duke, from a nursery in which American Gooseberry mildew was not, and never had been, in existence. This stipulation was made an inflexible condition of purchasing, and some bushes from a lot which an official inspector had declared free from the disease were rejected because the disease had been detected in two or three other lots of bushes in the nursery. It was found necessary ultimately to accept some bushes, rejected in the first instance, on the ground that they were not strong enough, as these were grown where the dreaded disease has never appeared. It seems that many nurserymen who

FIG. 165.—SPECIMEN OF *ULMUS PLOTII* (PLOT'S ELM), NEAR BANBURY, OXFORDSHIRE.

Only on one morning in the autumn has the land been hard with frost.

PROGRESS IN PLANTING.

After such a statement as that made above, it may seem strange to remark that the hindrances to fruit-planting have been few and brief. The explanation is that the prolonged drought had rendered the land dry to so great a depth that it speedily absorbed the water that fell upon the surface other than that which passed away in water-furrows, where these had been made. It is further to be observed that the greater portion of the rain fell between sunset and sunrise, and that there were many days of bright sunshine in October, and a considerable number in November. Consequently the land, except immediately following a heavy downfall of rain, was found to be in fair condition for planting, and this was particularly the case in the latter part of November, when only a little rain fell.

used to raise Gooseberry bushes have ceased to raise them, in consequence of the American mildew.

A PLAN FOR BLACK CURRANTS.

One result of the summer drought was that a plan of planting young Black Currants between bushes 6 feet apart, planted two years ago, had to be postponed for a year, as the young bushes raised for the purpose are not big enough. They are not more than half the size which has been attained from cuttings in previous seasons, and they will be bigger a year hence if cut back severely and left where they are than they would be at the same time if transplanted. It is usual not to plant out such bushes until they are two years old, but in previous seasons the best of my maidens have been as big as many a lot of two-year-old bushes, and they have grown remarkably well after being cut back before planting them. The idea of interplanting

referred to is that of allowing the original bushes to stand and fruit until the younger ones begin to crowd them, and then to cut the old bushes to the ground level, leaving the young ones to fruit until it is their turn to be cut down, namely, when the originals have grown up and branched out freely. There can hardly be any doubt that the plan would be a good one for a plantation of Black Currants by themselves; but where there is top fruit the trees may overshadow the bushes before there has been time for the full advantage of the plan to be realised.

My bushes were set 6 feet apart in order to allow of horse cultivation across as well as up and down the field between the trees and bushes. But I have come to the conclusion that this involves too much loss of space in the case of Black Currants, because the bushes become too much infested with mites by the time that they have branched out sufficiently to require so much room. After all, the only difference between horse cultivation in one and two directions is that more hand-hoeing is necessary in the former case than in the latter, and this is a trifle in comparison with the advantage of fully utilising the land. If I were planting Black Currants afresh I should set them 6 feet apart from row to row, as at present, but only 3 feet apart in the rows, with the object of cutting every alternate bush down to the ground level when they begin to interlace, and doing the same with the remaining bushes when the cut-backs have branched out sufficiently some years later. By this method anything like a bad infestation of mites would be prevented—at least, it would be so with Boskoop Giant, which is less liable to the pest than any other variety, with the possible exception of the ordinary French variety.

A COX'S ORANGE SEASON.

Apparently, a season of hot drought is precisely what suits Cox's Orange Pippin, as it is doubtful if as great a crop of that delicate variety of Apple as that of 1911 has ever before been produced in this country, or a crop of equal quality and freedom from blemish. Greatly liable to scab, as well as to canker, as Cox's Orange Pippin is, it is not surprising that a hot and dry season suits it. My own crop was entirely free from scab, though not free from bitter pit or fruit spot, whichever the complaint may be. This pitting, moreover, increased on keeping some of the fruit up to nearly the end of November. But the bulk of the crop consisted of very fine Apples, and a great many of these were carefully selected, packed tastefully in small boxes, and sold at prices ranging from 1s. 6d. to 3s. per dozen, while ordinary firsts made 3s. per peck, after the selected fruit had been taken from them. It is very pleasant to get high prices for something, and yet, in spite of one successful Cox's Orange Pippin season, few growers are likely to extend their acreage of this variety, because it pays only in districts or soils particularly well suited to it. In seasons of rarity this Apple has been sold at prices double those of the present season, apart from the selected fruit, and that was down to 1s. 6d. per dozen while the supply was at its greatest. Selected fruits must be large, well coloured, and free from blemish.

SHORT WEIGHT IN LONDON MANURE.

A very serious matter to fruit-growers and market-gardeners is what some of them declare to be the systematic charging for a greater weight of London manure than is supplied. I have had reason to suspect it, but Mr. Spencer Pickering, in a letter to the *Times* a short time ago, stated that he had proved it by having several trucks of the manure weighed at the delivery station, and finding the weights less than those invoiced. More recently the evidence of a market-gardener has been given in the

Fruit-Grower. He buys about 1,800 tons of London manure in a year, and as there was no weighbridge at his nearest railway station, he had one erected at his own place at a cost of £80. In the presence of a representative of the railway company he weighed the manure taken out of three trucks, and it was found that the actual weight was from 1 ton 5 cwt. 1 qr. to 1 ton 15 cwt. 2 qr. per truck less than that for which he was charged. The total deficiency in the three trucks was 4 tons 7 cwt. 1 qr. In other words 20 tons 1 cwt. 3 qr. were invoiced, and only 15 tons 14 cwt. 2 qr. received. The suggested explanation is that the railway man who weighed the manure was bribed by the seller to report the weight falsely. Other buyers have since come forward to say that they have been similarly cheated, and one of them states that he believes the fraud is effected by watering the manure profusely before the weighing, and that most of this water drains out of the truck in transport. Unfortunately, there is

FIG. 166.—ULMUS PLOTHII, NEAR FINESHADE, NORTHAMPTONSHIRE.

no truck or cart weighbridge at a country station as a rule, so that it is impracticable for farmers or market-gardeners in rural districts to test the weights received.

FRUIT-GROWERS AND THE INSURANCE BILL.

It is safe to say that no fruit-grower knows what his position in relation to the National Insurance Bill will be when that measure comes into force. Fruit-pickers who work by the piece will earn in a fine week wages much above the exemption level and below that level in a wet week, while, for other reasons than amounts earned, some will be liable to compulsory insurance and others will be exempt. The difficulties of an extensive grower who employs scores, or even hundreds of pickers in the Strawberry season may be more easily imagined than described. But the worst of it is that there is a clause in the Bill quite unamended, so far as I have noticed, requiring an employer to pay his share of insurance for an employee, even if that person be exempted. *A Southern Grower.*

BACK TO THE HILLS.

(Continued from p. 388.)

THE SCHLERN.

THE Schlern is that huge, table-shaped mass of limestone that rises a few miles north of Bozen. It is a genuine Dolomite, unlike most of the mountains that usurp the name. Standing well out from the range, it is rich in treasures. One climbs towards it from the deep valley of the Adige far below, over dark igneous rock, where ash-grey plants are seen, and strange *Sempervivums*, and *Epilobium rosmarinifolium*. Then, after two or three tedious hours, the upper level is reached, and suddenly the northern face of the Schlern leaps into view above the Pine trees. This is as dramatic a view as any in the Dolomites, as the Schlern mass concludes in two appalling isolated needles of stark rock. In those grim chines and vertical faces the adventurous may climb to see *Saxifraga Burseriana*, *S. squarrosa*, *Phyteuma comosum*, *Asplenium Seelosii* and *Campanula Morettiana*. These two last are especial treasures. They both cling to the tiniest crevices of the hardest rock. The *Asplenium* likes sunshine. The *Campanula* has an even more marked preference for cooler, northerly exposures; it is a lovely small plant, hairy-leaved, with big, dark-blue flowers, that were only a profuse promise when I climbed to see it.

The way to the Schlern winds round, along the upper level, and then again, up the steep gorge of the Frottsch, on to the secondary level, above which now towers abruptly the wall of the mountain. This alpine level, covering many square miles in one rolling down of meadow, is the largest of all European Alps—the Seiser Alp—a sea of *Gentians* and *Geums* and *Anemones* in its time. But now we are to breast the long, sharp slope of the Schlern. It is not, however, until we emerge upon the high, undulating plateau of the summit that we at last arrive at anything of very special interest. That turf, stretching indefinitely up and down the distances, is mainly composed of *Geums* and *Anemones*, *Myosotis alpestris*, *Douglasia Vitaliana*, *Primula longiflora*, *P. farinosa*, *Ranunculus rutefolius*, *Gentiana Clusii*, *G. angulosa*, *Edelweiss*, and *Potentilla nitida* in mats and carpets wherever the ground is more open and stony. The show is marvellous. *Primula minima* belongs to this mountain, too, and *Androsace Haussmannii* is to be found in its terrible walls.

Neither of these, however, did I find, but continued my way exploring along the track to the Grasleiten Hut. *Valeriana saluunca* rejoiced my eyes and nose in the steep earth-pans, and *Androsace helvetica* abundantly compensated me for my failure to see *A. Haussmannii*. One descends and descends into the Bärenloch, and then ascends once more to the Grasleiten Hut. In all the southern cliffs of the Schlern the masses of *Androsace* hang like green face-sponges, and even in the shingles are wide carpets of *Potentilla nitida*. *Thlaspi*, too, occurs in the stone-pats, with *Ranunculus Seguieri* beginning higher up on the gaunt Molignon Pass.

The Grasleiten Hut sits in a grim gorge of desolate cliffs. Behind and above it lies an enormous amphitheatre of perfectly naked shingle, descending on every side, from the terrible bare walls of the Fassa Dolomites. But all that stony track is aglow with the packed lilac loveliness of *Thlaspi*. *Papaver rhæticum* is pushing up its big lemon flowers, and I even happened at last on a strayed colony of *Androsace Haussmannii* that had seeded down from some inaccessible cliff. For inaccessible peaks and cliffs are the normal home of *Haussmann's Androsace*, and there it grows ill-temperedly in wizened little single crowns, depending from the solid rock. In the shingle, however, it had waxed fat, and made big tufts; its narrow, pubescent-grey leaves and its clusters of rose-pink buds give it a promise of extraordinary attractiveness,

which is not quite fulfilled by its rather diminutive white stars, when at last they appear.

The next day I ventured over snowfields to the Grasleiten Pass, and thence, again, over yet higher, further snowfields, to the Antermoja Pass. The snow concealed *Ranunculus parnassifolius*, and at that great height the flowers were few. Here, one is up in the very centre of the Fassa Dolomites, in a scene of barren grandeur, unimaginable and indescribable. It seems the kingdom of an everlasting silence. So one comes round over the shoulder of the pass, to find more *Thlaspi* glowing among the stones, and *Androsace Hausmannii*, looking sad and poorly in the rocks. Over snowfields and shingles the track (or its direction) descends and descends, until it reaches a vast valley of fine scree, all dark with lumps of vegetation, among which, however, the most interesting plants are *Gentiana brachyphylla* and *Saxifraga cæsia*, this latter species in a form which seems to me to be of special size. Away below this, again, one comes to the lovely lonely little Antermoja Laké, lying bright and still and green amid the tumbled desolation of grey limestone all round. Beyond it, far away over the ranges, high over the Val di Fassa, that lies between, there rises the superb and terrifying triangle of the Marmolata, seen sidelong—the huge snow-slope, and then the awful 6,000 feet of its southern wall.

From the lake one rounds a shoulder, and then drops down and down and down into the Duron Valley, over limestone still, passing scree-patches all aglow with *Thlaspi* and citron-pale *Papaver rhæticum*, and *Androsace Hausmannii* looking quite plebeian among the pebbles; until at last one comes suddenly round upon black igneous rock, to be immediately dazzled by the violet splendour of *Linaria alpina*. After which the path of the Duron Valley winds down and down and down in its turn, over meadows and through wood, until it sinks at last into the Val di Fassa at Campitello. *Reginald Farrer.*

(To be continued.)

THE MADRESFIELD AGRICULTURAL CLUB.

I THINK the title which would best describe the scope and work of a club such as the one which forms the subject of this article would be "Agrihorticultural Club," both elements playing an important part in its activities. Unfortunately, there is often a tendency to ignore the claims of horticulture in favour of those of its more utilitarian sister-craft; a tendency which is apparent in the policy of the present Government. The Board of Agriculture and Fisheries has truly as much to do with horticulture as it has with the industries which it ostensibly governs; but that is not saying much. And why should not "horticulture" be specially mentioned in the title of the Board, instead of being tacitly included under "agriculture"? The two industries, although closely allied, are clearly quite separate and distinct. Horticulture is becoming of greater importance year by year; more labour is employed in this service, more land placed under floral cultivation, more results obtained from even the same acreage by the application of the system of intensive culture.

There are, however, signs of agencies at work which, if rightly and wisely directed, should bring about a great improvement in the status and development of these industries. I allude, for instance, to the recently established Development Fund, a portion of which is to be devoted to numerous experiments of a scientific nature in horticulture and agriculture. The Royal Horticultural Society's experimental station in their gardens at Wisley was established with a similar object, though in relation only to horticulture.

Nature study, botany, gardening, &c., are taught in Government and council schools and colleges, both day and continuation, all over the country, so that opportunities are offered to all to learn at least something of these fascinating subjects. Indeed, to me, as a practical gardener, there appears even a danger of overdoing the scientific and theoretical side of horticulture; this is useless unless it is accompanied by really hard, persistent practical work. Horticulture would never have been brought to its present position had it not been for the unremitting industry and toil of thousands of working gardeners, many of whom had no advantage whatever in the way of scientific instruction or knowledge.

The club which forms the title of this article is run on very "practical" lines, though the claims of science are by no means ignored. The founder of the club, Earl Beauchamp, is also its president, and much of the success it has already attained is to be attributed to his initiative, and the keen interest he takes in its welfare. The president is supported by a committee of about 20 practical men—farmers, fruit growers, gardeners, and others resident in the neighbourhood.

The aims of the club are two-fold; firstly, to induce the workers on the land to take a creative and proprietary interest in their labour; and, secondly, to increase their efficiency. In point of fact, these two may be taken as cause and effect, for, with interest, there is more energy, more spirit, greater intelligence, than without it. In order to induce this interest, prizes are offered for competitions, covering nearly all the work done on an ordinary farm—hedging, ditching, ploughing, thatching, mowing, reaping, rick-building, hop-drying, hop-stringing, sheep management, poultry keeping, &c. There is also a veterinary section, dealing with the prevention and cure of the common diseases of farm stock.

An agricultural exhibition is held annually on the estate in connection with the club; this is always a red-letter day for the workers; prizes are distributed, and a feast is provided which no one is too proud to enjoy. There is also an annual flower show, which is held in the grounds of the court; prizes are offered for almost every sort of flower, fruit, and vegetable which a cottager could produce. The day of the flower show is the great day of the year; not only do the workmen compete, but prizes are also given for needlework, carving, &c., the results of long busy winter evenings of the wives and elder children. Then there are competitions for miscellaneous articles, such as butter, cakes, honey, and wasps' nests—this latter a most useful class, especially in such a summer as the last. The opportunity is taken to give demonstrations on various useful subjects, such, for instance, as the pruning of trees, in connection with which a special class is held by an expert in the art, which may be attended by any one in the district. At the end of the session (three or four weeks) a pruning exhibition is held in an orchard within reach of the club; a competent fruit grower is appointed as judge, and prizes are given for the best-pruned trees. Each competitor is distinguished by a letter attached to his coat, and corresponding to that on the trees which he has to prune. The trees are generally Apples (standard), Plums, and Gooseberries, or sometimes Pears, Cherries, and Currants, and they are chosen to present as far as possible the same features. The competition begins punctually at 10 a.m., without regard to weather, and each competitor is provided with steps, ladder, saw, and knife. The judge remains on the spot and watches the work throughout, and at 1 p.m. the competition ceases. The judging is done by points, which are noted down during the progress of the pruning, so that the winner is declared as

soon as the competition is closed. As a rule about 15 or 20 lads compete. Points are given for judgment as to which branches to cut, skilful and expeditious manipulation, and the appearance of the trees when finished. The pruning demonstration is really of great service to orchard owners, who may thus have their trees pruned free of all charge; the work is usually done very well, as the competitors are trained by the hardy fruit foreman at Madresfield Court. In case of any damage being done, the judge is empowered at once to stop any pruning if the competitor appears incompetent. The advantage to the men themselves is still more obvious; the knowledge thus gained will be of incalculable benefit to them, especially to those who will one day possess fruit trees of their own.

The theoretical side of horticulture and agriculture is chiefly developed by means of lectures and demonstrations which take place in winter at the club room; there are also nature study rambles in the summer. It may be mentioned here that this part of the work receives valuable assistance and encouragement from the Worcester County Council in the shape of an annual grant of £150.

The recreative aspect is by no means forgotten, and cricket in the summer, concerts, a few dances, and facilities for boxing practice in the winter, form pleasant diversions. The evening of the flower show is always wound up by a dance on the lawn, which attracts large numbers of country people, and which is always attended by the Earl and Countess Beauchamp.

I hope that I have succeeded in showing that this club renders a considerable amount of real and practical service to the villages in the neighbourhood, and so indirectly to the county in general. The club, moreover, publishes a quarterly journal, which records the transactions in an interesting way, and is edited by the estate agent, Mr. Wilson.

The secretary of the club is Mr. A. D. Melvin, address Abbotsford, Malvern Link, Worcestershire, and the secretary of the horticultural sub-committee is Mr. Crump, of Madresfield Court Gardens. In case anyone would like to hear more of the work of the club, either of these gentlemen, would, I am sure, be glad to give information on the subject. *Owen Thomas.*

AMERICAN NOTES.

RHUS TOXICODENDRON.

In my copy of the *Gardeners' Chronicle* just received, my friend Mr. Divers writes (p. 272) of *Rhus Toxicodendron*, and its seemingly non-poisonous character.

Very few seem to be injured by it when the plant is dormant, though this cannot be said to be the case always. For myself, I am very susceptible at all times to the poison of *Rhus* and of *Prunella obconica*.

Last summer, when the *Rhus* was just budding forth with blood-red shoots, four men were employed to root it up, for unless given something to climb upon, it becomes a pestiferous ground weed. These men were seemingly immune until hot weather, but when perspiration was free all were badly affected. The face swells to such an extent that the sufferer can scarcely see, and other portions of the body are also affected.

Our physician recommended as a remedy tincture of *Sanguinaria canadensis*, sopped on with a soft cloth. Each man was cured in four days by the use of this simple remedy. The Blood-root grows plentifully here with the *Rhus* in similar situations, and a pint of the tincture is ample to effect a cure of a serious case. Physicians also recommend the fluid extract of *Grindelia robusta* for cases of poison from *Rhus Toxicodendron* and *R. venenata*, the latter being the worse of the two species. *H. O. Orpet.*

THE REMOVAL OF TREE STUMPS.

THE removal of tree stumps is often necessary, as in the conversion of old pasture into arable land, and in clearing forest land. The various methods used generally entail considerable labour and expense. Recently, at Studley Horticultural College, Warwickshire, the writer saw the first demonstrations in this country

each being firmly pressed home by a wooden rod. A primer cartridge containing a detonator is then placed on the top of these, and the bore-hole is filled with clay and tightly rammed. The primer is either connected directly with a safety fuse, or to a high-tension battery, by a cable, and is afterwards fired. As dynamite strikes downwards as well as upwards, the effect of the explosion is that the roots and stump are

besides travelling and hotel expenses. Three men—an expert and two labourers—can bore holes and blast 30 sound stumps per day easily. If the stumps are hollow in the centre, two or three bore-holes are necessary for each stump, and in that case 20 only can be blasted during the day. Taking the wages of two labourers at 2s. 6d. each per day, the cost of boring and firing averages 2½d. per stump, exclusive of the expert's fee. The expert's fee increases the cost by about 2s. per stump.

The explosive used is Nobel's dynamite, in the form of cartridges, costing 9½d. per lb. The average quantity used for each stump is between 2 lbs. and 3 lbs. (about 20 to 30 cartridges), so that the cost of the explosive is not more than 2s. 6d. per stump. The detonators and fuses required only cost a few pence. Summing up, the cost per stump is:—

	s.	d.
Expert's fee	2	0
Cost of boring	0	2½
Cost of explosive	2	6
Detonators and fuse	0	9½
	5	6

Misfires and partial removal of stump may require fresh borings and further charges of explosive, so increasing the cost. By employing a skilled estate hand capable of using explosives instead of an expert, the expense, however, is greatly diminished.

By the old method of grubbing and jacking, stumps were removed at Studley some time ago at the high cost of about £2 5s. each butt, and even then success was only partial. In another case, on an estate in Norfolk, where an old pasture was converted into a plantation of mixed trees, trenching at the cost of £18 per acre had to be resorted to on account of the presence of roots and stumps of old trees. In this case it would have been much cheaper to have removed the stumps by blasting. The demonstrations at Studley showed that both sound and unsound stumps could be successfully blasted, and whole trees—an Apple and an Oak—were also uprooted by the same method with equal success, using only one bore-hole and about the same charge of explosive. The timber of the trees so treated, however, is very much split, so that blasting is only advisable when the timber is considered of little value.

The particular explosives used are unaffected by damp, and, in consequence, the method is applicable in both wet and dry situations. Firing the charges was done at the demonstrations mostly by ladies, and a photographer was able to get sufficiently near to obtain photographs of the effect of the explosion without danger. The principal recommendations of this method, therefore, are cheapness, effectiveness, and safety.

Stumps may also be removed without blasting by the following method, which is, however, only applicable when the soil is light and sandy. A trench is dug round the tree at a short distance, cutting through the roots, and the surface soil is removed. The tree is then pulled down by means of a strong rope attached to the top, and the stump, with some of the roots, is removed at the same time. Where this method is followed, the extra timber obtained is enough to pay for the cost of felling the tree, and the ground is cleared of stumps. A. P. Long, Cambridge.

ODONTOGLOSSUM CHIONE.

OUR illustration (fig. 167) represents the inflorescence of the beautiful *Odontoglossum Chione*, for which W. R. Lee, Esq., Plumpton Hall, Manchester (gr. Mr. Woodhouse), was awarded a First-class Certificate at the Royal Horticultural Society's meeting on the 21st ult. A similar award was given to *O. Thais*, also shown by Mr. Lee. Both were of unknown parentage, but the form of the lip and fine texture of the flower of *O. Chione* suggest that *O. Lambeauianum* (Rolfæ × *crispum*) was one of the parents. The prevailing colour is bright claret-purple, the front of the lip and the tips and margins of the sepals and petals being pure white, whilst the crest is yellow and red.

[Photograph by John Gregory.]

FIG. 167.—ODONTOGLOSSUM CHIONE.

(Received R.H.S. First-class Certificate on November 21.)

of the American method of blasting, which may be described as follows:

A hole is bored with a long auger or crowbar in a sloping direction from one side of the stump to its base, generally from 2½ feet to 3½ feet deep. The bore-hole is cleaned out, and a number of dynamite cartridges inserted,

all either ejected or loosened, so that they can be easily removed by hand.

The American method is less costly and more speedy than the methods hitherto used in England in removing stumps. If there is no man on the estate qualified to handle explosives, an expert must be employed at about £1 per day,

THE ROSARY.

ROSE MME. HECTOR LEUILLIOT.

THE accompanying photograph (see fig. 168) may be of interest in view of the recent discussion in the *Gardeners' Chronicle* of the merits of this beautiful Rose. Our plants of Mme. Hector Leuilliot grow splendidly, trained up rustic poles 8 feet high. We have three beds, each 6 feet in diameter, planted with the variety, there being three plants in each bed. They generally furnish a supply of blooms through the greater part of the season.

and mid-winter blooms cannot be had without considerable heat now that the growth has progressed sufficiently to show the flower-buds. If hurried, there will be a danger of a large number of the shoots coming blind.

Grafting should be done all through the month of December. I omitted to mention in my remarks last month that the Dwarf Polyantha varieties Jessie, Phyllis, Mrs. W. Cutbush, Orleans and others have some good shoots suitable for grafting now that the blooms are over. If secured before much frost occurs these shoots may be used for grafting. Our plan is to

Roses in pots from the first. They develop a larger mass of roots when planted out than when grown in pots.

Although Standard Briars may be planted early, it is wiser to delay the planting of dwarfs until the spring, the stocks being safest when bedded in the soil during winter. *Practice.*

FLORISTS' FLOWERS.

THE PHLOX.

THE border Phlox, *P. decussata*, is easily grown, and may be raised from seeds, cuttings, or by division, the last operation being done in the spring. The best plants that I have seen during recent years were at Miss Willmott's garden at Great Warley. There the soil is well prepared for them, and ample space is allowed for their development. But the finest examples of this handsome garden plant that I have seen were in the nurseries of John and James Fraser at Lea Bridge, nearly 50 years ago. These famous nurserymen objected to the clumsy method of division, as not likely to give the best results, and they propagated their plants with two objects: first, to produce saleable specimens that would give satisfaction to their customers; and, secondly, to make a display in their nursery such as would show the plants to the best advantage when planted out in the open garden.

Every plant they sold was propagated from a cutting, and care was taken in the selection of the shoots for the purpose. A great number of cuttings may be obtained from a single root-stock if it be lifted from the open garden at the present time and placed in the greenhouse or a heated pit. If a greenhouse is selected, the plant should be potted, but in the case of the heated pit it may be either planted out or placed in pots, as may be convenient. The object in either case is to obtain good, strong cuttings in March. I am now potting up a plant of each variety for the purpose. I do not grow many sorts, as I consider a dozen sufficient, and plant six plants of each. In this case 12 6-inch flower-pots are required, and the plants are potted firmly in good soil. I follow carefully the system adopted by Messrs. Fraser, and do not know that it is possible to improve upon it. When the growths are about 2 inches in length they should be taken off with a heel, and each one inserted separately in a small "60" flower-pot. They will soon form roots, and the more readily if a little bottom heat is provided. Each plant, when well established, should be repotted into a 5-inch pot, and these plants, if well grown and afforded occasional applications of weak liquid manure, will each give a handsome spike of flowers. Plants grown in this manner are excellent subjects for placing in a greenhouse or conservatory, and those who have not practised this system of culture should give it a trial. From the nurseryman's point of view, no better plants could possibly be sent out to customers; but I was thinking of gardeners and amateurs; as the trade are supposed to be able to look after themselves. It may not be convenient to amateurs to attend to Phloxes in pots during the summer, therefore it is as well to plant them out in the open garden in beds if possible, at about 12 inches apart. This distance will not be sufficient after they have grown for a season. The Phlox is a gross feeder, and the soil should be worked to the depth of 18 inches or 2 feet, and well enriched with manure. The plants must be replanted into beds or borders 2 feet 6 inches apart, and each plant may be allowed to carry from three to five stems. Specimens that were allowed to flower in pots should also be planted out as advised. The summer treatment of border Phloxes is of primary importance; few plants suffer so much in hot, dry weather, owing to their tendency to make a large mass of roots near the surface of the ground. Hoeing between the rows serves to conserve the moisture in the soil to a considerable extent; but this is not sufficient. The best plan is to mulch

FIG. 168.—ROSE MME. HECTOR LEUILLIOT IN SIR RUFUS ISAACS'S GARDEN, FOXHILL, READING.

The old wood is thinned out every year, as the plants make plenty of young shoots, which are trained in. Our soil is a very stiff, cold clay, being especially favourable to mildew, but seldom is this variety attacked by the disease. I think the flowers have been finer this year than ever, plenty of sunshine suiting the variety. *E. B., Foxhill Gardens, Reading.*

ROSES UNDER GLASS.

The earliest plants may now be afforded a slightly higher temperature, and another batch brought in for a succession. Those that are being forced should be breaking into active growth,

trim off a few of the coarser leaves, and graft in the form known as green or herbaceous grafting. Any small piece of wood will suffice, and the scion may be cut in the form of a small wedge. This is simply slipped into a corresponding slit, cut in the middle of the stock, and then stock and scion are bound together. It is quite distinct from side or crown grafting, can be done very quickly, and seldom fails. Plants raised in this manner will be ready to bed out next May, and will be a mass of blossom from the end of June until frost sets in. I would greatly prefer to plant all out and repot any that are wanted for the purpose to the usual plan of growing the

the roots with decayed manure, and then to water well. Two copious waterings in one week are better than driblets every day. I also prefer to use water that has stood in a tank for at least a day in the open air; in most gardens water comes direct from the main, and is very cold. Use a water-can with a rose. Raising Phloxes from seed is interesting work. If the seed is saved indiscriminately, from 40 to 50 per cent. of the seedlings may be as good as the parents, but few or none better or different in colour. Cross-fertilising is necessary to obtain good results. The seed should be sown in February in a little heat, and as soon as the seedlings are large enough to handle they should be placed singly in small pots. Repot the plants into larger receptacles in due course, and, with good treatment, the plants will each give a flowering spike the same season. They should be planted out early in May in good soil at a distance of 1 foot apart, as advised for plants raised from cuttings. Many beautiful varieties of Phlox have been raised during recent years both in this country and on the Continent, with most symmetrical spikes, and the form of the flowers is all that could be desired from a florist's point of view. The Phlox may well lay claim to the very highest position amongst flowers beloved of the old florists. The colours are so rich and varied, the corolla quite circular, and the perfume is delicious. It is a difficult matter to keep the list of the best varieties down to 12, therefore I have enumerated 18, with their colours:—Antonin Mercie, lilac or pale lavender; Baron von Dedem, orange-scarlet, or blood-red, as described by the raiser; Beranger, pale rose, changing to white; Coquelicot, orange-scarlet, still one of the best of its colour; Dr. Königshofer, orange-scarlet, with blood-red eye, superior to Coquelicot; Dove, white, with pink centre; Elisabeth Campbell, distinct salmon colour; Frau Antonin Buchner, perhaps the best white variety; General Van Heutsz, bright salmon-red; George A. Strohlein, orange-scarlet, with dark eye; Goliath, very tall grower, carmine, dark-red centre; Gruppenkönigin, very fine rose-pink; Le Madhi, the best of the bluish-purple varieties; Mme. Paul Dutrie, soft pink, suffused with white; Mrs. Oliver, salmon with white centre; Selma, pink, with a reddish-pink eye; Sheriff Ivory, salmon-tinted buff; Tapis Blanc, a fine dwarf white variety. *Jas. Douglas.*

MUTISIA.

A DECIDEDLY uncommon climbing plant flowered very freely in the autumn in the temperate house at Kew. It is *Mutisia Clematis* (see figure in *Gardeners' Chronicle*, June 26, 1909, p. 415), which is altogether a more vigorous grower than its better-known relative, *Mutisia decurrens*, from which it also differs widely in other particulars. In *M. Clematis*, the leaves are pinnate, and terminated by branching tendrils, which cling to any support within reach. The general aspect of the foliage is that of a leguminous plant, a resemblance which is increased by the leaflets being clothed underneath with fine, silky hairs. At Kew, the main branches of this *Mutisia* are trained to a wire stretched between two of the pillars supporting the structure at a considerable height above the ground, and from these the minor shoots hang down for a considerable distance. The flowers are very singular and totally dissimilar from the *Gazania*-like blossoms of *Mutisia decurrens*. Those of *M. Clematis* hang directly downwards, suspended by slender pedicels several inches in length. The basal portion of the flower consists of large bracts forming an involucre, from the mouth of which the bright-red petals protrude. The flower never expands to the same extent as *Mutisia decurrens*. Indeed, when developed to its utmost, it appears to be but par-

tially opened. Despite this fact, *Mutisia Clematis* is decidedly attractive when in bloom, and, withal, so distinct that it can be recommended as a climber for a large structure, or for out-of-door culture in the more favoured parts of the country. It does not appear to die off suddenly, as often happens in the case of *Mutisia decurrens*. By no means a new plant, for the *Dictionary of Gardening* gives the date of its introduction as 1859, *Mutisia Clematis* is still difficult to obtain from nurseries.

Mutisia decurrens, already mentioned, is, as far as my experience goes, the showiest member of the genus. It is of a climbing habit, but much less vigorous than *M. Clematis*. The stems are of a peculiar wiry nature, and the strap-shaped leaves have their midrib prolonged into a wiry tendril capable of taking hold of any support. This feature is particularly noticeable when the shoots are scrambling over a neighbouring shrub—a situation that, as a rule, it seems to prefer. The flower-heads are quite 4 inches in diameter, the ray florets being of a rich, brilliant-orange colour, and those of the disc yellow. This *Mutisia* is a native of the Chilian Andes, and was introduced by Richard Pearce, of tuberous *Begonia* fame, when travelling in South America for Messrs. Veitch. It will grow and flower well out-of-doors in many of the milder parts of this country; but even when apparently flourishing, it has an unaccountable habit of dying off suddenly.

Another species which has flowered in this country is *Mutisia ilicifolia*. The leaves of this plant are spiny, and the flowers are usually pink, with a yellow disc. The stems are thickly clothed with a cobweb-like tomentum. It is questionable if this species is now in cultivation. Many others are known to botanists, but the only two species that are likely to be obtained in a living state are *M. Clematis* and *M. decurrens*.

The climatic conditions of the Andean region of South America are so different from those experienced in this country as to account for the difficulty attending the culture of these *Mutisias*. They thrive best in the more humid atmosphere of the West of England and Ireland, and need a fairly cool medium in which to root.

The *Mutisias* belong to the vast family of *Compositæ*, and have as a near relative *Barnadesia rosea*, of which I remember seeing an excellent specimen at Trinity College Gardens, Dublin, during the time of the late Mr. Burbidge. *W.*

SCOTLAND.

A GARDENER'S LONG SERVICE.

MR. ANDREW DAVIDSON, who for the long period of 60 years has occupied the post of head gardener at Cairngall, Aberdeenshire, has just retired from service.

Born at Summerfield, Aberdeen, over 80 years ago, Mr. Davidson served his apprenticeship at Lochhead, Aberdeen, a part of which estate now forms the Westburn Public Park. After a short period as a journeyman in and around that city, Mr. Davidson obtained an appointment as under gardener at Ellon Castle, where he remained for two years. At the end of that time he accepted the post of head gardener at Cairngall. There he has since remained, a most capable, skilful and honoured servant. As a judge at local and other shows, Mr. Davidson's services were much in demand. He was also an enthusiastic Volunteer, having joined the corps known as the Buchan Rifles, in which he rose to the rank of quartermaster-sergeant, retiring after 34 years service. For 50 years he has acted as parish librarian. Mr. Davidson is still hale, both in mind and body.

A SEEDSMAN'S ESTATE.

AMONG the inventories of estates lodged during November with the Sheriff-Clerk of Perthshire is that of Mr. James Alexander, seedsman, Perth. It is stated as £2,709.

PERTHSHIRE FRUIT GROWERS AND THE INSURANCE BILL.

At a meeting of representatives of the various associations of fruit growers in Perthshire the question of the effect of the Insurance Bill, should it become law in its present form, was discussed a few days ago. Those present were from the Blairgowrie and Rattray Fruit Growers' Association, the Stormont Fruit Growers' Association, Alyth Fruit Growers' Association, Kirriemuir Fruit Growers' Association, and others from fruit-growing firms in Blairgowrie. Ex-Bailie Adamson, of the Blairgowrie and Rattray Association, presided. After full consideration, resolutions urging amendments were agreed to, and copies ordered to be sent to the local members of Parliament, with the request that they endeavour to secure the alterations. The resolutions include proposals that the tramp class largely employed at the fruit-picking season should be excluded; that fruit pickers not comprised in the tramp class should only come under the Act in cases where they are already insured. Another suggestion is that the weekly contribution should be 3d. for the employer and 3d. for the picker, irrespective of wages, the former being put at 3d. instead of 4d. on account of the intermittent character of the work, and to divide the sum better where there are different employers in course of the week; and that the fruit grower should retain 1d. per day per week from each picker until the total subscription be deducted. If the picker should remain with the grower two days in a week 2d. would be deducted; if the picker be employed with another grower that week for one day 1d. would be retained.

EDINBURGH SEED TRADE ASSISTANTS' DINNER.

THE annual dinner of the Edinburgh Seed Trade Assistants, this being the 17th of such events, was held on the evening of December 1, in the Royal British Hotel, Edinburgh. Mr. J. H. J. Young presided over the company, and there were upwards of a hundred members of the trade and their friends present. The toast of "The Seed Trade Assistants" was proposed by Mr. Robert Fife, of Messrs. Dobbie & Co. Mr. Fife referred to the importance of the industry, and said that he considered that its value to the public was hardly sufficiently understood. He also spoke of the changes which had taken place in it, and impressed upon the young men the necessity of putting all their energy into their occupation if they wished to be successful.

The other leading toast was that of the "Seed and Nursery Trade," the duty of proposing which devolved upon Mr. J. Alexander. He remarked that the seeds which gardeners could buy in Edinburgh 30 years ago could not compare with those now offered by the seedsmen of the city. The chairman, in replying, spoke highly of the generally honourable manner in which the seed trade was conducted.

CHRYSANTHEMUMS IN EDINBURGH AND GLASGOW PARKS.

THE opportunities afforded by the conservatory at the Saughton Park, Edinburgh, for the display of flowers are being fully taken advantage of by Mr. J. W. M'Hattie, and at present there is a most attractive show of Chrysanthemums in the large hall of the conservatory and its annexes.

In the Glasgow parks the usual displays have also been made, and the quality of the plants and blooms has been very fine. At Camphill, Tollcross, Glasgow Green, the Botanic Gardens, and other parks containing winter gardens there have been splendid displays, and Mr. James Whitton, the superintendent of the City Parks is to be congratulated. *Correspondent.*

The Week's Work.

THE ORCHID HOUSES.

By H. G. ALEXANDER, Orchid Grower to Lt.-Col. Sir G. L. HOLFORD, K.C.V.O., C.I.E., Westonbirt, Gloucestershire.

SCALE INSECTS.—The principal work needing attention at the present time is the washing and cleansing of the plants. The resting season offers a favourable opportunity to do this operation, and the grower is enabled to give more attention to the work than would be possible at other times during the year. The exhausting effects of various parasites upon the plants are not sufficiently considered by some cultivators. Few collections are free from white scale, a troublesome insect which establishes itself on the leaves, and under the outer sheaths of the growths of Cattleyas and other species. Wherever this scale establishes itself the result is yellow spots upon the foliage. The destruction and removal of this pest may be easily accomplished with the aid of one of the many safe insecticides now on the market, and, now that time can be spared, every plant should be examined, and the leaves and bulbs made scrupulously clean. Where the pest is very numerous the outer sheaths of the pseudo-bulbs should be stripped off, and, after the insecticide has been applied, a small, pointed stick should be used to remove the scales. This cleansing process, even when trusted to careful and reliable men, is difficult to carry out without causing some injury to the plants, but the least damage occurs when the operation is performed at a time when the growths are fully matured. The distichous-leaved Orchids are subject to attack by both white and brown scale insects, whilst Cymbidiums, Cœlogyness, and a few other Orchids are often infested. Large specimen plants with leaves crowded together, are the most difficult to cleanse.

THRIPS.—Thrips are often troublesome during the winter, and especially in the warmer houses, when a considerable amount of fire-heat has to be employed to maintain the requisite temperatures. This troublesome pest seems to hang about the plants, lodging in the centres of any young, tender growths, markings on the leaves denoting its presence. This pest should be kept in check by treating the plants with some safe vapourising compound at regular intervals. Before fumigating, close the house early, damp the bare spaces freely, and allow the temperature to rise, which will be an inducement for the insects to leave such hiding places as the vapour cannot readily enter. When using these strong nicotine preparations, remember that two mild applications, at an interval of about one hour, are quite as effective, and safer, than one of greater strength.

OTHER INSECTS.—Many other insects attack Orchids, including woodlice, snails, slugs, ants, and cockroaches and the following methods are useful for capturing and destroying these pests. Woodlice, which cause much damage to the tender, young roots, may be destroyed by placing Potatos cut in halves, about the plants and on the compost as traps, examining these at night and early in the morning, till the woodlice are all destroyed. The creatures are often disturbed by the watering, which causes them to come to the surface of the compost, when they may be easily captured. Snails and slugs may be trapped by Lettuce or Cabbage leaves, sliced Potatos or Carrots, and bran in small saucers, placing these about the houses amongst the plants. With the aid of a lamp the cultivator should search diligently for these pests at night. In the cool houses where slugs and snails are often most troublesome, the flower spikes of *Odontoglossums*, *Odontiodas*, and other Orchids of their type, may be protected as they are pushing forth by a band of cotton wool wound around the base of the flower stalk. The safest plan in the case of rare and valuable plants is to place them on inverted pots, stood in pans of water; even then a constant watch is necessary, as small slugs and snails often hide themselves in the potting materials. Cockroaches and crickets may be kept

under by using "Beetawline," which may be purchased from the sundriesmen. Ants may be destroyed after first attracting them to sponges wetted and filled with sugar, or by sprinkling the latter about their haunts, and when they are feeding spraying them with a strong solution of XL-All insecticide.

PLANTS UNDER GLASS.

By JAMES HUDSON, Gardener to LEOPOLD DE ROTHSCHILD, Esq., Gunnersbury House, Acton, Middlesex.

INDOOR TEMPERATURES.—We have already experienced wintry weather, and must guard against the temperatures in the glasshouses falling below the minimum, both during the day and at night time. It is a mistake to consider that in mild weather this matter is one of small importance; weather conditions must constantly be watched, and stoking be done carefully. Too much fire-heat should not be maintained during the dull and sunless period of the year; it weakens the vitality of the plants to a serious degree, and favours the spread of insect pests. In sunnier climates, such as Canada and the Northern United States, where the air is clearer, and the periods of bright sunshine longer than in any part of England, it is practicable to maintain higher temperatures in the glasshouses in winter, even although the atmosphere outside is colder than ours.

THE STOVE.—For purposes of heating, it is desirable to classify stove plants under two heads—a difference of 5° Fahr. being made between them, both day and night. An "intermediate" stove house is, of course, a great convenience, especially in the winter. Here the night-temperature may range from 55° to 60° at the time of making up the fires, and these should be started again very early in the morning. During the day, the temperature may be increased by 10°, and, whenever possible, the house should be ventilated. Atmospheric moisture should be regulated according to the amount of heat employed. It should be remembered that a very hot, dry atmosphere is favourable to such pests as White Scale, Thrips, and Red Spider. A house, such as the one described, is suitable for growing winter-flowering Begonias, and the forcing of bulbs and plants where a special forcing pit is not available. In the warmer stove, the temperature should be increased by 5° at night, and 10° during the day when the weather is bright and fine. This house would be suitable for such plants as Allamandas, Dipladenias, and Ixoras; Alocasias and other aroids will also thrive well in it. Codæums will grow well in either of the temperatures named, but are best kept in the warmer house. Space should be economised, and as much light as possible admitted by pruning some of the more luxuriant growths, from such subjects as Allamandas, Stephanotis, and Clerodendrons. Bougainvillea glabra may be wintered at the warmer end of the house, but the roots must be kept on the dry side. Caladiums should be wintered in the warm stove if possible and kept quite dry. In the case of all the plants, the watering should be regulated according to the nature of their requirements. Shrubby evergreens need a good deal of water, and often do not get sufficient. Ixoras, too, should not be allowed to droop or flag for want of moisture. Plants which are wholly or partially deciduous do not need much water whilst at rest.

THE GREENHOUSE.—I have recently given particulars regarding the temperatures in the greenhouses, advising that they should be kept as low as possible, and it may be taken as a safe rule that during frosty weather 5° above freezing point, in the morning, will be quite sufficient. In the case of houses which are exposed to the full blast of a north, north-east, or east wind, it is a good thing to cover up the windward side with the brown sheeting which is now so much used. This may be obtained in pieces of any size or shape, and will quickly repay the initial expense by the efficient protection afforded to the plants. It will last, with ordinary care, about three seasons. Hooks and eyes should be used in preference to nails for fixing the sheets, the nails being destructive to the sheeting and unsightly. Plants of permanent growth should not be allowed to become overcrowded; it is a good thing to make use of shelves wherever possible, and thus save room. Tender plants, such as

Cinerarias and Primulas, should not be placed too near to the hot-water pipes. A strict look-out should be kept for symptoms of damping in the foliage, which must be prevented at all costs.

THE KITCHEN GARDEN.

By JOHN DUNN, Kitchen Garden Foreman, Royal Gardens, Windsor.

CARROTS IN PITS.—If an early supply of young Carrots is desired, a sowing should be made as near the middle of December as possible. If unheated brick pits are available for the purpose, there need be little fear of the result. The pit should be thoroughly cleared out and a fresh bed of leaves introduced, so that a mild and lasting bottom heat may be obtained. The leaves should be at least 4 feet deep, in order to provide sufficient warmth for the Carrots all through the winter. They should be placed in the pit to ferment for a short time before they are made into a bed. When they have been turned and trodden tightly so that no sinking takes place, they should be covered with a layer of sifted soil to the depth of 8 inches, the top being within 1 foot of the glass. It is a mistake to make the soil too light or to leave it loose on the bed. If moderately dry, it may be beaten with the back of a wooden rake and made level with the same implement. The seeds should then be sown broadcast and covered lightly with fine, sifted soil, which should be moist, so that no water will be needed until the seeds germinate, when a gentle watering should be given through a fine-rose can. Rain water should, if possible, be used for the purpose. A covering of some kind should be provided for use in frosty weather. The young plants must not be exposed to cold draughts, and they should be thinned to 2 inches apart as soon as they are large enough to handle. For the first sowing select Parisian Forcing and afterwards Early Gem and Scarlet Horn. Radishes are sometimes sown amongst early Carrots, but this is not a good practice, as the Radishes often spoil the Carrots. It is better to grow the Radishes by themselves, treating them in the same way as the Carrots.

LETTUCES.—Lettuce plants in pits will require careful attention for the next two months. When the weather is fine, air should be given freely by tilting the lights; during very mild weather air may be admitted at the top of the frames all night. Stir the soil frequently with a small hoe and do all that is possible to keep the plants in a healthy condition. Excessive dampness is the chief thing to guard against with this crop during winter. Slugs may be kept in check by sprinkling dry lime frequently round the edges of the pits. If the stock of Lettuces intended for spring planting is below the requirements, a sowing of some suitable variety should be made at once in a cold frame where the soil can be raised to within 1 foot of the lights. If properly hardened, the plants from this sowing should be ready to plant in some sheltered position about the end of February. May King is one of the best Cabbage Lettuces for this purpose; it matures early, the heads being of a good size and fine in quality.

POTATOS IN PITS.—If very early Potatos are required, preparations for this crop should be made at once by selecting the "seed" tubers and placing them in shallow trays, where they will soon start into growth. They may be planted as soon as the young shoots are $\frac{1}{2}$ inch long. A hotbed should be made almost entirely of leaves, as they produce a mild and lasting heat, which is of great benefit to this crop during cold weather. The bed should be made up to within 2 feet of the roof-glass and should be covered with soil to the depth of 8 inches. Soil from an old Melon or Cucumber bed is suitable. Plant the tubers in rows formed 18 inches apart and allow 9 inches between the sets. When the haulm appears above the surface, air should be admitted in quantity sufficient to keep the plants from becoming drawn, but cold draughts must be prevented. If only an occasional dish is required, early Potatos may be grown in pots in any house where mild forcing is being carried on, such, for instance, as a Peach house. Fill pots 10 inches in diameter with turfy loam to within 4 inches of the rim, leaving the remainder of the space to be filled when it becomes necessary to earth up the plants. May Queen is a reliable variety for forcing, and three sets will be sufficient to place in each pot.

FRUITS UNDER GLASS.

By E. BECKETT, Gardener to the Hon. VICARY GIBBS,
Aldenham House, Hertfordshire.

VINE BORDERS.—Where it is intended to form fresh vine borders, the work should be commenced with as little delay as possible, selecting, for preference, frosty weather or when the ground is not very soft, so that the wheeling of the soil may be an easy operation. Old borders that are to be renewed should have the old soil and the drainage materials removed, so as to make a fresh start entirely. When the trench is excavated, it will be seen what the requirements as to drainage are, and this matter will depend upon the situation. Where the soil, and especially the subsoil, is of a tenacious character, the bottom of the border should be covered with a layer of concrete, on which to place the drainage materials. It is a matter of dispute as to whether both outside and inside borders are desirable, but whilst a combination of the two has its advantages, in cases where very early supplies are needed, and for Muscat Grapes, inside borders are best, because then the roots are more under control. Where a wide, single border exists the roots will receive all they require if fed with manures and mulches during the growing season, but in this case the roots must be prevented from growing beneath the foundations, and, whilst the border is being made, it affords an excellent opportunity for bricking up the foundations, if considered desirable for the purpose. Whether it is intended to plant vines newly raised from "eyes" or, on the contrary, dormant canes, it is desirable to make the bed now and allow the soil to settle before planting. When the drainage materials have been placed in position, whole turves placed grass-side downwards should be laid on the top to prevent the finer particles of soil filling the interstices. It is wise to form the border partly at first, adding to its width each year, rather than place a great bulk of soil at one time, only to become sour before the roots penetrate it. For young vines the bulk of the soil should consist of good, fibrous loam that has been stacked for a twelvemonth before use and which is free from wire worm. The use of animal manures should be avoided, especially those of a quick-acting nature. Crushed bones or a vine-border compound, mortar-rubbish, wood-ashes and soot should be mixed thoroughly with the loam. Make the border firm as the work proceeds, and complete the first section by a wall made with whole turves.

TOMATOS.—Tomatos in winter require very careful watering. Assist the roots occasionally with applications of weak liquid manure and at other times with a slight top-dressing composed of finely-sifted loam and artificial manure. Maintain a dry, buoyant atmosphere, admitting a little fresh air when the weather permits. The plants at this season require the maximum amount of light to prevent the foliage becoming enfeebled. An excess of either water or manure will favour fungous disease in the foliage, so that no attempt must be made to force the plants into bearing. Should the leaves show signs of infection, dust them with black flowers of sulphur. Maintain a night temperature of from 50° to 55°.

THE HARDY FRUIT GARDEN.

By W. HEDLEY WARREN, Aston Clinton Gardens,
Buckinghamshire.

CANKER.—Certain varieties of fruit trees are more susceptible to attacks of canker than others, therefore trouble from this disease may be largely avoided by making a careful selection of sorts, and planting the trees in suitable borders. Various causes contribute to canker, amongst them being damaged bark caused by bruising, injudicious pruning, and an unsuitable sub-soil. The trees should be dressed periodically with the substance recommended in a former Calendar (see p. 239). Directly the disease makes its appearance, the affected part should be cut clean away, the cut surface carefully pared, and afterwards dressed with a styptic, so that no moisture may lodge thereon. Some dress the wound, and, when it is perfectly dry, plaster the affected part with a mixture of moist cow dung and clay, to which a little soot has been added. This covering usually remains in position without

being in any way secured to the branch of the tree, and gives excellent results. When trees are badly affected through growing in an unsuitable soil, or when the sub-soil is at fault, it is useless to apply any remedy before the ground is properly drained, and new soil added. Young trees will often recover from canker when these faults are remedied. It sometimes happens that a large wound is made in the bark by accident, in which case, if the tree be healthy, the wound will heal naturally; but it is well to pare the damaged parts with a sharp knife, so that the surface is made as smooth as possible, afterwards dressing the wound as advised above. Trees affected with gumming may be treated in a similar manner.

GENERAL REMARKS.—Continue the pruning of orchard trees, as previously advised, during mild, open weather. When it becomes necessary to remove a large branch, the wound should be covered with paint or varnish to keep out the wet and prevent decay. Scrape and clean the stems of old trees, afterwards washing them with a mixture of soft soap and water, or lime-wash. See that newly-planted trees are properly secured to stakes, and the surface of the soil above the roots well mulched with a dressing of half-decayed manure. Every advantage should be taken during mild weather to get as much of the pruning and nailing of wall trees completed as possible, as very cold weather will bring all outdoor operations to a standstill, thus compelling any of this work still unfinished to be deferred till the spring, when so many other important operations require attention. Apricot and Peach borders should be well mulched with any suitable material that may be at hand. If the natural soil be light and porous, half-decayed manure is to be preferred to long, strawy dung, but this latter kind may be used if the soil is cold and heavy. Such a dressing will save the roots from injury during severe frosts, and the trees will, in consequence, be better able to meet the demands made upon them in the spring. During frosty weather new drains may be laid, fresh borders made, and any other ground work carried out. In wet weather, work may be found for the staff under cover in repointing, cleaning, and painting stakes, also getting ready shreds and tying materials; all these will be required later, and, perhaps, hurriedly. Decaying fruits should be removed from the fruit room.

THE FLOWER GARDEN.

By R. P. BROTHERSTON, Gardener to the Earl of
HADDINGTON, K.T., Tynninghame, East Lothian.

HEDGES.—Garden hedges usually receive plenty of attention in trimming and pruning, but they are sometimes neglected at the roots, which are allowed to grow unrestricted to the detriment of other crops growing close by. The roots should be restricted to a space about 2 feet or 3 feet wide on either side at the time of planting and kept within bounds every other year. There are large Yew hedges in these gardens that have only a width of 5 feet in which to root, and yet the hedge grows well. The present is a suitable time to root-prune hedge plants. Open a narrow trench that will allow a spade to be easily forced about 2 feet down, severing any roots that are growing beyond the limits. Time spent in root pruning will be saved when trimming the top growth, as this will be restricted. As a rule, a Box hedge needs little pruning, and then only at long intervals. Yew and Privet are the most encroaching of all hedge plants, and should other shrubs be left unpruned these, at least, should be restricted at the roots. Besides the shrubs named, Thuja Lobbi is excellent for tall fences, and requires less attention than most kinds of trees or shrubs. In the warmer districts, Viburnum Tinus Laurustinus, forms a very handsome and large hedge, needing to be knife pruned only in early summer. Cotoneaster Simmondsii is suitable, whilst Holly is always to be recommended, the Golden Holly, especially, having a very rich effect. There is a remarkably fine hedge of Ilex Hodginsii at Barn-ton in Midlothian. It must always be borne in mind that Hollies exhaust the soil, and when this has been done the plants become subject to canker and they even die. Surface-dressings are essential to preserve old Hedges of

Holly in health. A hedge of Sweet Briar at Tynninghame is delightful during the summer months for its perfume. But it requires a lot of attention, the growths needing trimming many times, and occasionally the plants have to be cut level with the soil to induce shoots to develop from the bottom. Lavender also is a troublesome subject as a hedge, and is useful only as a low dividing plant. Common Ivy trained up a light trellis such as wire netting is one of the very quickest plants to form a hedge. The Wichuraiana Roses have no doubt a future before them as hedge plants.

SPANISH IRIS.—Any bulbs of Spanish Irises not yet planted should be put into the ground without further delay. In some soils they live for a few years only, but they are so cheap that their loss is not to be deplored so much as expensive and rare bulbs. There is now a very large number of varieties, the following being a good selection for ordinary garden decoration and furnishing cut blooms:—Belle Chinoise, yellow; British Queen, white; Filifolia, blue, all these are early-flowering sorts; Midley, light blue; Leander, yellow; Hercules, bronze; and Bronze Queen. The bulbs need not be placed wider apart than 4 inches. The planting of Ixias, too, should be finished by now. The flowers are very varied in colour, and the spikes charmingly graceful. They should be given a warm position, planted rather shallow, and protected on the surface for the next ten weeks. Viridiflora is perhaps the most beautiful variety, but Rosea plena, Prince of Orange, Azorea, Crateroides Major, Lady Slade, præstans, and Hogarth, a very late variety, are also beautiful. They do well planted at the same distances apart as recommended for Spanish Irises. At present Muscari are being planted, and there is yet time to plant the pretty Scilla italica.

THE APIARY.

By CHLORIS.

BEES AND THE FERTILISATION OF FRUIT.

The small holder has failed in many instances to grasp the idea that bees are necessary where fruit trees are grown, for fruit trees are often unfruitful, though an abundance of bloom is produced, because many varieties of Apples especially are self-sterile, and are consequently termed "shy" bearers. By the introduction of bees "shy" bearers have been converted into heavy croppers; even one hive in an orchard has worked wonders. Some time ago an orchard had been producing inferior crops and was the despair of the owner; but on the advice of a friend three colonies of bees were established in its midst, and the results surpassed the market gardener's wildest dreams. The trees had even to be heavily thinned; nor was this extra crop the only gain, for there was honey and wax in excess to the value of £3 10s. Unfortunately, orchards are often planted in blocks of one variety; then the introduction of bees will not overcome the difficulty, for the pollen produced will not fertilise the variety, although it is brought from another tree. There are many instances, too, especially among Pears, where the pollen may produce an abundance of fruit, but the resulting fruit is much smaller than would be the case were the pollen obtained from another variety. If the truth of this be doubted, blooms of any particular variety can be covered with muslin; some of them can be fertilised with pollen from the same variety and others cross-pollinated, and the results carefully compared by weighing and measuring the fruits. The number of fruits resulting from the number of blooms pollinated will differ so widely as 3 or 4 per cent. in the self-pollination to 30 per cent. in the cross-pollination, in addition to being finer specimens. Then, too, it will be seen that even the pips of the former will be much smaller and less plump than the latter. It may be urged that other insects do this class of work. Quite true, but when fruit trees are in bloom there are few other insects on the wing except bees, for these latter will number 25 to 1 of all others. It must not be imagined that bees will make a crop certain when blooms are plentiful; not so, for a rainy season will cause failure, and it is often wet when fruit trees are in bloom; consequently, bees are confined in the hives. Pollen is seriously damaged with rain and made almost useless.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, as well as specimens of plants for naming, should be addressed to the EDITORS, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Local News.—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.

APPOINTMENTS FOR THE ENSUING WEEK.

SATURDAY, NOVEMBER 9—

British Gard. Assoc. (Birmingham and Midland Branch). Lecture on the "British Gardeners' Association and Its Objects," by Mr. W. W. Pettigrew.

MONDAY, DECEMBER 11—

United Hort. Benefit and Prov. Soc. Com. meet. Kent Commercial Fr. Sh. at Ashford (2 days).

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last Fifty Years at Greenwich—41.5°.

ACTUAL TEMPERATURES:—

LONDON.—Wednesday, December 6 (6 p.m.): Max. 46°; Min. 35°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—Thursday, December 7 (10 A.M.): Bar. 29.4°; Temp. 45°; Weather—Raining.

PROVINCES.—Wednesday, December 6: Max. 50° Cornwall; Min. 30° Cambridge.

SALES FOR THE ENSUING WEEK.

MONDAY—

Dutch Bulbs, Herbaceous Plants, &c., at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 11.

WEDNESDAY—

Dutch Bulbs, Perennials, &c., at 11; Roses in large variety, at 1; Palms and Plants, at 5; at 67 & 68, Cheapside, E.C., by Protheroe & Morris.

FRIDAY—

Choice Imported and Established Orchids in variety, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 12.45.

The Strength of Wheat Flour. At a meeting of the Bio-chemical Club, held recently in the School of Agriculture of the University of Cambridge, Professor T. B. Wood gave an account of a simple method which he has devised for determining the strength of Wheat flour.

The quality known as strength—that which gives to flour the power to form a good upstanding loaf—is of great commercial importance, and has been shown to be due to the association of mineral salts with the gluten of the flour. Hitherto the only satisfactory test of the strength or weakness of a given flour has been the baking test: and it is the practice—for example, in Canada, where one of the Wheat breeders' chief objects is to raise varieties of Wheat which are at once "strong" and heavy yielders—to make numerous and laborious baking tests, each of which requires a fair amount of flour not always to be obtained from the grain of single plants.

The value of the new test lies in the facts that it takes a very short time to carry out, and that it requires but a small quantity of flour.

Since the problem before the breeder is to combine the quality of strength with other desirable characters, the mode of inheritance of the former quality requires

to be known with certainty. Professor Biffen has produced evidence to show that when a weak Wheat (Rivet) is crossed with a strong Wheat (Red Fife), the characters segregate in the second generation in typical 3:1 Mendelian fashion.

This conclusion, which as indicated already is of great importance commercially both to this country and to Canada, is disputed by other observers. Hence it became necessary to work out in full detail the mode of inheritance of strength with a view to confirming or amending Biffen's results. By Professor Wood's method this is comparatively easily done. The new method is based on the observation that the watery extract made from a strong Wheat is opalescent, and remains opalescent after filtering, whilst that made from a weak Wheat is practically free from opalescence. Further, the addition of a weak solution of iodine renders the opalescent watery extract yet more turbid, whilst it is without effect on the clear solution obtained from the weak Wheat. So, in order to compare two Wheat plants with respect to strength, all that is necessary is to grind the grains, to extract each sample of flour with water, to add a given amount of iodine to each, and then to determine in either case through what thickness of fluid a light—for example, a small electric light—is just visible. The opalescence of the extract from the strong flour (to which iodine has been added) causes the light from the electric lamp to be invisible even when only a thin layer is interposed between the eye and the source of light; the greater clearness of the extract from the weak Wheat necessitates the interposition of a much thicker layer of the fluid in order to produce the like result. Thus strength and weakness may be expressed in terms of thickness of layer of extract required to just extinguish the light from a constant source.

The difference between strong and weak flour in this respect is so marked that there is no difficulty of classifying any unknown sample as strong or weak after submitting it to this simple test.

An interesting and practical vindication of Professor Biffen's contention that strength of wheat and high yielding capacity are characters which can be bred true and combined in a plant is provided by the result of the Dorchester grain show, held on October 7, where, according to *The Times*, the champion prize for wheat was won by Mr. H. J. Standfield, Barford Farm, Wimborne, with a sack of Burgoyne's Red Fife Wheat. This exhibit was from a crop which yielded 48 bushels per acre. *The Times*, in commenting on this Wheat, states that it was described by judges and others as the best Wheat ever seen at the show. Burgoyne's red Wheat is of the choicest quality, and combines the milling properties of Red Fife with the prolificness of the English standard varieties.

APPOINTMENT. — Mr. C. O. FARQUHARSON, B.Sc., of the University of Aberdeen, has been appointed by the Secretary of State for the Colonies, on the recommendation of Kew, mycologist in Southern Nigeria.

NATIONAL ROSE SOCIETY.—The thirty-fifth annual general meeting of the members of the National Rose Society will be held at the Westminster Palace Hotel on Thursday, the 14th inst., commencing at 3 p.m. A conversazione will be held from 4.30 to 6 p.m., and during the proceedings the President, Rev. J. H. PEMBERTON, will deliver an address on some subject of interest to Rosarians. Members are entitled to attend the conversazione free and to purchase tickets for friends at 2s. each. The Secretary, Mr. EDWARD MAWLEY, invites an early application for tickets in order that he may complete the arrangements.

THE SURVEYORS' INSTITUTION.—The next ordinary general meeting, being the first of the two afternoon meetings arranged for the convenience of country members, will be held in the Lecture Hall of the institution on the 11th inst., at 8 p.m., when a paper will be read by Mr. W. A. HAVILAND, entitled "The Burden of Upkeep on Rural Estates and its Relief under Section 69 of the Finance Act, 1910."

THE TEACHING OF BOTANY.—The London County Council's Education Committee is proposing to increase the staff at the botany depot at Avery Hill, in order to meet, as far as possible, the demands for botanical specimens made on behalf of about 600 additional departments of schools, which cannot at present be supplied with such specimens owing to the limited staff. The existing staff comprises nine officers, a superintendent, three senior collectors, three junior collectors, a temporary clerical assistant, and a boy, the expenditure in staff being £800 a year. This staff is barely sufficient to cope with the requisitions received from the 630 schools and educational institutions to which the scheme is at present applied. It is now proposed to increase the staff by an additional senior collector and three additional junior collectors at an estimated increased cost of £370, in order to allow of the extension on the present lines to about 300 additional schools. This will utilise to the full the capacity of the existing premises, and will not involve any increase in the accommodation or any structural alteration. There are at present large numbers of both provided and non-provided schools, especially in congested areas, where specimens are urgently required. Under the new arrangement, the cost of a fortnightly supply of botanical specimens would be £1 8s. 6d. per school per annum.

A PAINT-DESTROYING FUNGUS.—Specialisation is, at it were, a reply on the part of the organism to the challenge thrown down to it by the "struggle for existence." Nowhere is this specialization so strikingly illustrated than among the fungi and bacteria. Thus, yeast is probably the only organism which can support life in a 15-20 per cent. solution of alcohol; though it is stated that a bacterium lives happily on rum. Mr. MASSEE describes in the *Kew Bulletin* (No. 8, 1911) an equally remarkable organism which specialises in the destruction of paint. As a consequence of this habit, this fungus flourishes in hot houses, where it may do no inconsiderable damage. Experiments made by Mr. MASSEE show that when this paint-destroying fungus, which he names appropriately *Phoma pigmentivora*, is cultivated in linseed oil, it remains uncoloured, but when the spores are sown on a streak of wet paint, they germinate, and produce rosy blotches, which become deep purple in the course of a few weeks. The striking colour appears to be due to the production of an oxide of lead from the white lead (carbonate) used in the paint. By the addition of carbolic acid (2 per cent.) to paint, the spores of the fungus are prevented from germinating, and the work of painting the house is not rendered useless by this pest.

ICKWORTH PARK, SUFFOLK, THE RESIDENCE OF THE MARQUIS OF BRISTOL.

"BOTANICAL MAGAZINE."—The issue for November contains illustrations and descriptions of the following plants:—

CALADIUM PUBESCENS, tab. 8402.—The flowers of this interesting Aroid bear a certain resemblance to our native *Arum maculatum*, but the spathe is white within and greenish-white on the exterior. It was introduced by Mr. FORGET from Peru, who sent plants to Messrs. SANDER & SONS, St. Albans; the illustration in the *Botanical Magazine* was prepared from specimens presented to Kew Gardens by Messrs. SANDER. The species is remarkable for its pubescence, only one other *Caladium* being known to possess hairs. The plant flowers freely in a tropical, moist house under treatment usually afforded the members of this genus.

RHODODENDRON JAPONICUM (var. *pentamerum*), tab. 8403.—This beautiful *Rhododendron* is a native of the mountains of Central Japan, and is known in gardens as *R. Metternichii*. At Kew the plant forms a low, spreading bush, producing showy trusses of soft, rose-coloured flowers.

LEONOTIS DYSOPHYLLA, tab. 8404.—The Lion's Tail, *Leonotis Leonurus*, is a well-known plant in gardens, and closely resembles the species under notice, except in the colour of the flowers, those of *L. dysophylla* being orange-scarlet. Plants of *L. dysophylla*, raised in the Cambridge Botanic Garden from seeds sent by Mr. G. THORNCROFT, from Barberton, Transvaal, supplied the material for the illustration in the *Botanical Magazine*.

PHYLLODOCE AMABILIS, tab. 8405.—*Phyllodoce amabilis* is a low-growing, Ericaceous shrub, having clusters of flowers at the tips of the twigs. The corolla is white, tipped with pink, each segment possessing a rose-coloured line. The plant forms a suitable subject for the rock-garden, and specimens grow well on the rockery at Kew in a mixture of peat, leaf-soil and sand.

RUELLIA DEVOSIANA, tab. 8406.—This species has been confused with *R. Schaueriana*, from which it differs in the indumentum on the stem and leaves and the shape of the ovary. *R. Devosiana* forms a compact little shrub, suitable for growing as a basket shrub or as a trailer in a warm house. The white flowers have a lilac line along the centre of each petal, and are produced in the autumn.

The December issue of the same magazine gives illustrations and descriptions of the following plants:—

ACIPHYLLA LATIFOLIA, tab. 8407.—This umbelliferous plant is one of the most conspicuous features of the flora of the Auckland and Chatham Islands. The flowers are of a purplish colour. The plant is uni-sexual, and that introduced by Captain A. A. DORRIEN SMITH is a male specimen.

RHODODENDRON SPINULIFERUM, tab. 8408.—The red, tubular flowers of this dwarf *Rhododendron* are very pretty; the plate shows them in fours at the ends of the branches. The species is a native of China, where it was first discovered by FRANCHET, and the specimen which supplied the material for the *Botanical Magazine* figure flowered in Mr. M. L. DE VILMORIN's garden at Les Barres. Unfortunately, doubts are expressed as to its hardness in this country, except in the most favoured parts.

SYMBEGONIA FULVO-VILLOSA, tab. 8409.—The genus *Symbegonia* is endemic in New Guinea, and includes four species, all having uni-sexual flowers. The female flowers of *S. pulvo-villosa* are pale-yellow with their perianth-segments united. The plant is of a branching habit, not more than 1 foot in height, and most of the shoots die down in winter. Cuttings root readily.

PITCAIRNIA TABULÆFORMIS, tab. 8410.—This is an old garden plant, requiring a stove temperature. The leaves are 4 to 5 inches long with an undulate margin, and possessing a narrow white border. The inflorescence forms a dense, many-flowered raceme, the petals being a bright orange colour.

PRUNUS SARGENTII, tab. 8411.—This beautiful flowering tree closely approaches *P. serrulata*, better known in gardens as *P. Pseudo-cerasus*. *P. Sargentii* was raised in the Arnold Arboretum from seeds collected in Japan in 1890 by Dr. BIGELOW. The flowers are very handsome, being rose-coloured, whilst the foliage is said to assume a dark red colour in autumn.

NATURALISATION OF TREES.—Owing to a variety of causes trees generally do not readily naturalise. On the authority of CHEESEMAN'S *Manual* about 530 alien species of plants are more or less permanently established in New Zealand, and of these only three are really arboreal, namely, the Elderberry and two Willows, *Salix babylonica* and *S. fragilis*. But Dr. COCKAYNE records a remarkable instance of the naturalisation of an Australian Gum tree in New Zealand, and the conditions under which it has progressed. The record runs as follows:—A plant may remain quite isolated for years and be apparently incapable of spreading, but an unlooked-for change of conditions may give it just what it requires. At Waitati, on the land belonging to the Mental Hospital, stands a fine example of the Stringy Ash (*Eucalyptus numerosa**) more than 50 years of age. Originally the vegetation of the place was mixed forest, but this had been replaced by a close growth of Manuka Heath (*Leptospermum scoparium*). Some 10 years ago this was burned in the neighbourhood of the tree, and a young forest of Gums, several acres in extent, has sprung up; the new ground and the potash from the fire being eminently suitable for the germination of the Gum tree seeds. At the present time the Gum saplings grow extremely closely, and their height is from 40 feet to 50 feet. Some are half a foot in diameter, while others are extremely slender. Thousands of Manuka seedlings sprang up along with those of the Gum, and it must not be forgotten that Manuka, far more than most of the indigenous plants, can reproduce itself again and again after burning, and can exclude almost all other vegetation. But in this case the greater rapidity of growth gave the Gums the victory, and now only a little Manuka remains near the margin of this remarkable and quite natural forest growth.

ELECTRIC CULTURE.—A demonstration in connection with electro-chemical culture will be given on Saturday, the 9th inst., at 4 p.m., at the Royal Botanic Society's Gardens, Regent's Park. An electric apparatus will be in operation, showing the effect of electricity on the germination of seeds.

UNIVERSITY OF CAMBRIDGE: FOURTH ANNUAL REPORT OF THE FORESTRY COMMITTEE.—The report of the Forestry Committee contains, besides an account of the work done by students, the following items of general interest. Further experimental sowings of Elms have been made during the past summer; and seedlings of the "English" Elm (*Ulmus campestris*), which are unknown in England, have been raised in large quantities from seed borne by trees in the royal park at Aranjuez, in Spain, which are reported to have been introduced from England in the reign of Philip II. Experiments were made during last spring in crossing trees both in Devonshire and at Kew; and a consider-

able quantity of hybrid seed has resulted, the most of which will be sown next spring. A few hybrid seedlings of Elms have been obtained already. In last year's report, the reader referred to the need of museum and laboratory accommodation for teaching and research in forestry. An appeal has been made for the funds required for this purpose, and generous donations have been already given or promised. Among the subscribers are:—H. J. Elwes, Esq., F.R.S., £1,000; David Davies, Esq., M.P. (King's College), £500; Messrs. N. M. Rothschild and Co., £500; Lord Iveagh, £250; the Surveyors' Institution, £210; the Worshipful Company of Mercers, £200; Earl of Powis (St. John's College), £100; Sir Dorab Tata (Gonville and Caius College), £100; Dr. Herbert Watney (St. John's College), £100; M. P. Price, Esq. (Trinity College), £100; the Worshipful Company of Carpenters, £52 10s.; Lord Peckover (St. John's College), £50; Sir John Stirling Maxwell, Bart. (Trinity College), £50; Sir Eustace Gurney, £50; Cecil Hanbury, Esq. (Trinity College), £50; and M. R. Pryor, Esq. (Trinity College), £50; making, with other donations, a total exceeding £3,600.

A POTATO COMPETITION.—The seventh annual Potato-growing competition has just been held by the Hallam Fields Garden Association, at Ilkeston, a small, but successful society, with a membership of about 54, chiefly colliers. The competition consists of three tests, the first of which includes planting from "seed" tubers. Each competitor was given 1 lb. of seed Potatoes of the variety "Superlative;" these had to be planted and grown out-of-doors, the time limit being fixed between April 1 and September 30. Each competitor was allowed to cut his Potatoes into as many sets as he desired, the object being to produce the greatest weight of tubers from the pound of seed. The results throw some light upon the subject of the relative value of large and small sets. The first prize-winner cut his pound of seed into 110 sets, which produced 181 lbs.; while the second prize-winner had only 67 sets, yet his produce from little more than half the number of actual roots was only 8 lbs. behind. The opinion prevails among these garden-holders that when the tubers are cut into very small sets they are more liable to become affected by disease. The greatest yield from a single root was 11 lbs. of Potatoes, whilst the heaviest tuber weighed 1 lb. 9 ounces.

STATE AID FOR THE POULTRY INDUSTRY.—In August last the provisional committee of the National Poultry Institute made application to the Treasury from the Development Fund to the amounts of £8,500 for establishment and equipment, and of £2,000 annually for maintenance of a central institute for the provision of higher instruction and conduct of research and experimental work in poultry keeping, and on November 13, representatives of this committee gave evidence before the Commissioners in support of their application. At a recent meeting of the provisional committee, a letter was submitted to the effect that the Development Commissioners are prepared to recommend to the Treasury to make advances from the Development Fund to something like the amounts mentioned, conditionally (1) that a permanent form of incorporation is given to such institute; (2) that an adequate scheme is adopted providing for higher educational work, practical investigation; and the work of training experts; and (3) that half the capital and annual sum required is provided from other sources. It was resolved by the provisional committee that efforts be put forth immediately to carry out the recommendations of the Commissioners, to which end it will be necessary to secure at least £8,500 towards the cost of establishment and equipment, and of £2,000 in annual subscriptions.

* This specific name is probably a slip of the pen for *nervosa*, which Bentham cites as a synonym of the gigantic *E. obliqua*.

SANDGATE ARBOR DAY.—Arbor Day was celebrated at Sandgate for the first time on the 30th ult. The proceedings began with a meeting at Castle Glen, when Sir JOHN ALEXANDER COCKBURN, K.C.M.G., Lieut.-colonel PENFOLD, the MAYOR of Folkestone, and other visitors were received by the Committee of the Society. Tree-planting commenced at half-past two, and members of the authorities of the three towns took part in the proceedings. Sandgate is a town without a boundary, and is situated in the middle of the Parliamentary borough of Hythe. The area within the jurisdiction of the Urban District Council is only a part of that now in the postal district of Sandgate. It includes the Riviera, and extends eastward as far as Cliff House (the residence of Lord RADNOR) and westward to Hythe. Trees were planted in the Castle Road, the High Street, and on Castle Green, the trees selected being the Mountain Ash, Acacia, Lime, and Austrian Pine.

ICKWORTH PARK.

(See Supplementary Illustration.)

AN easy journey of three miles to the south-east of the ancient town of Bury St. Edmunds brings the visitor to the lodge gates of Ickworth Park, the Suffolk residence of the Marquis of Bristol. The carriage drive leads over gently rising ground through a portion of the magnificent park, which has a circumference of 16 miles, with ample greensward, wide-spreading Oak and Beech trees, and here and there an ancient Thorn, heavily laden with red fruits, to the "Porter's Lodge," which gives access to the mansion and gardens. As will be gathered from the view of the central portion which appears in the Supplementary Illustration, the mansion is built in the Ionic style, and is a copy of the Coliseum, the figures representing the various Olympic games. The building was commenced in 1795 and the original design included wings intended for the reception of rare paintings and sculptures. Various vicissitudes, culminating in a shipwreck, robbed Ickworth of all the art treasures save one, which now stands in the entrance hall, and so the wing intended for their reception was transformed from a temple of arts into an orangery. In front of the orangery there is a sunken tennis lawn with specimen *Cupressus sempervirens* at one end. Flower-beds divide it from the very broad walk which leads from the chief garden entrance to the outer terrace. This wide gravel promenade, which is built up on arches, gives a splendid view of the broad acres of Ickworth. In front, away as far as the eye can reach, stretch cool greensward and ancestral trees; to the left the ground slopes into a wide valley. On the distant hillside, skilfully placed groups of trees delight the eye at all seasons of the year, whilst the gentle-eyed fallow deer placidly grazing on the slopes complete the picture. The inner side of the terrace walk is bordered by a low, rounded Box hedge, over a quarter of a mile long. From the terrace steps to the mansion on each side of the walk there are tall hedges of Box and Yew, happily blended, from which diverge similar avenues with mown paths, leading to various enclosures, such as a formal Rose garden with Roses climbing on poles and with a fine weeping specimen of the variety *Gardenia* occupying the centre bed. On the right a side avenue leads to a quiet retreat surrounded with trees, and containing stones from the Giant's Causeway. Another vista reveals a fine Tulip tree, whilst a fourth discovers an informal garden containing Ferns and parallel fences clothed with *Rosa Feltenberg*, which blooms freely, even under the partial shade of the *Ilex*es and other trees. The west front of the mansion is embellished with many flower-beds, in which the favourite flowers of Lady Bristol, who takes a keen interest in horticultural

matters, are grown. Standard *Heliotropes* of the darker-coloured varieties diffuse a pleasant perfume, and a great variety of *Pelargoniums* with scented leaves is grown. In a recess outside the picture gallery, which contains priceless treasures, there was an exceedingly fine row of *Amaryllis Belladonna*.

Ickworth is full of pleasant surprises: after having seen the Rose garden, in its Box and Yew enclosure, we, not unnaturally, concluded that we had seen all the Roses, but on leaving the conservatory and its fine Palms, *Hedychiums* in bloom, pillars of scarlet *Pelargoniums*, and its roof clothed with *Roses* and *Browallia* (*Streptosolen*) *Jamesonii*, Mr. Herbert Coster, who for the last two decades has so admirably managed the gardens, led the way to yet another Rose garden. This most delightful spot is enclosed by red brick walls, to which many winters and summers have given a mellow tone. Here the Roses are grown in long Box-edged beds, and bear quantities of fragrant blooms. The walls are clothed with many interesting plants; close to the Rose-covered arbour there is a very old plant of the lemon-scented *Verbena* (*Lippia citriodora*); a Pear tree is grown for the sake of its blossom in the spring. In this sun-trap, the Fig, planted away from the walls, bears luscious fruits. Outside this charming garden there is an immense Oak tree partly overshadowing a circular flower-garden with gravel paths. Here, of course, a brilliant display is impossible, but the plants are all well cared for, and this spot makes a very pleasant retreat during the hot, sunny days.

THE ROMAN CYPRESSES.

It is interesting to speculate on the origin of the Italian influence in the mansion and grounds at Ickworth. As we have remarked, the house is a copy of the famous amphitheatre of Rome; the terraced walks, the formal alleys of Box and Yew are all of the Italian style, and there are literally hundreds of the true upright Roman Cypress in various parts of the grounds. This Italian manifestation is perhaps simply the result of the enthusiasm for things Italian which was the vogue of the early part of last century. That was the period of Italian gardens in our country, and many of the finest examples were laid out at that time. But the probable influence of the town of Bury St. Edmunds must not be overlooked. It will be remembered that not only is that ancient town (the capital of East Anglia) remembered in history as having been the seat of several Parliaments, and as the site of the murder of the Saxon King St. Edmunds by the Danes in the year 870, but that there is also in Bury St. Edmunds the ruins of the Benedictine Abbey founded by Canute. Competent authorities consider that the Roman villa Faustini was situated at Bury St. Edmunds, so it will be seen that there has for very many centuries been a strong Roman influence in this neighbourhood, and the Bristol estate offices are situated in the old abbey. The front wall supports an exceedingly fine *Tecoma grandiflora*—reputed to be 400 years old—whose flowers freely.

At Ickworth there seem to be Roman Cypresses (*Cupressus sempervirens*) everywhere, and very many of them are beautiful specimens. The Cypresses are planted in avenues, in groups, as single specimens (a few may be seen in the illustration), and in the shrubberies. The tallest is 47 feet high, and its girth 6 feet 11 inches at the ground line. Most of the trees, which have grown to be typical specimens—veritable green pillars—are bearing quantities of their large cones, and it is hoped that these will, this season, yield a crop of fertile seeds. The rich soil of Ickworth evidently suits the many specimen trees which have been planted on the lawns. Cedar and the Redwood (*Sequoia sempervirens*) grow exceedingly fast. A fine *Photinia serrulata*, fully 20 feet high, and well furnished with handsome leaves, must be a very striking example in the spring, when it sends out its purple young leaves, more beautiful than many flowers. That rare shrub in private gardens, *Phillyrea angustifolia*,

is here quite a tree, with a clean trunk and reaching 30 feet in height. There is also a fine *Libocedrus decurrens* 60 feet in height. Opposite the carriage entrance there are many magnificent Cedars—Cedars of Lebanon with flat, spreading branches; the sacred *Cedrus deodara*, with more delicate outline and pendulous branchlets; and the silvery *Cedrus atlantica*. These trees have been planted at goodly distances apart, and the grass beneath is cut sufficiently often to ensure tidiness without the trim formality of a lawn. Besides these grand Cedars, which are periodically cleared of their dead branches, there is a sprinkling of the genus *Pinus*, and a fine tree of *Taxodium distichum*. The admirer of precise shrubberies, where each shrub is permitted to occupy just so much room and no more, should not go to Ickworth, or his susceptibilities will be sorely wounded. When the shrubberies were planted there was no intention of growing specimens. The aim of the planter was evidently to obtain contrasts of form and foliage, of light and shade, and he has succeeded in an admirable manner. Space will not permit the mention of the many combinations which may be found in these shrubberies, where the Box bushes have grown up tall as trees, with trunks standing so closely together as to form an impenetrable barrier, and where the Sea Buckthorn (*Hippophaë rhamnoides*) becomes fully 20 feet high; but the unconventionality is charming. The grass verges of these extensive shrubberies contain quantities of spring-flowering bulbs, so that the interest is sustained between the fall of the leaf and the bursting of the buds.

THE KITCHEN GARDEN.

This important, and very necessary, portion of a well-found garden does not possess the attractiveness of the pleasure gardens, but, apart from the cultural interest of well-grown crops in a properly managed kitchen garden, such a garden as that at Ickworth, with its old red-brick walls, herbaceous borders gently sloping to a large pond where Water-lilies grow, and where, on the opposite side, the herd of Shetland ponies canter down to the water-side, has more than a passing interest. This 5½ acre garden contains several transverse walls which greatly increase its value. Many of the cross-paths are of grass, kept in far better condition than is the case with some lawns. Gooseberries are a favourite dessert fruit, so a large quarter is allotted to the bushes with their stout branches kept well apart amongst the several rows of fan-trained specimens, which produce large fruits of high quality. The late Grapes still hanging on the rods were large in bunch, and of the fine colour which betokens high quality. Another fruit house contained healthy Fig trees. No first-class establishment is complete without several Peach houses and vineries, and Ickworth is no exception to the rule, and here we also saw many rows of pot Strawberries, with large plump crowns ready for forcing. Outside one of the fruit houses we noticed a large wall plant of the Californian Allspice bearing numbers of oval fruits. In this pure air frame Violets grow to perfection.

The plant houses contain good, healthy batches of useful plants: Primulas, Cyclamen, Zonal *Pelargoniums*, &c., for winter flowering. Nerines were in full bloom, and many *Calanthes*, which are grown singly in 5-inch pots, were just pushing up very strong flower-spikes. The indispensable winter-flowering Carnation requires a house to itself, and there were also many healthy plants of *Begonia Gloire de Lorraine*.

Mr. Coster resides in a pleasant house conveniently attached to the garden, and a few years ago the Marquis of Bristol, recognising its advantage, built a bothy for the young men close to their work. This structure is built against the higher kitchen garden wall, and special care was taken to use weathered bricks so as to harmonise with the older portion. In this sunny house the young men find a comfortable home in their hours of study and leisure. A. C. Bartlett.

ROYAL INTERNATIONAL EXHIBITION.

In fig. 169 is illustrated a Rose bowl which Messrs. Clay & Son will present to the Royal International Horticultural Exhibition, 1912. It will be awarded for the best exhibit of Roses.

The following description is supplied by the manufacturers, Messrs. Elkington & Co.: The bowl is silver-gilt, with Roses and a floral band in hand-chased repoussé, in high relief, and gilt in natural colours. The bowl measures 13 inches across; its height, without pedestal, is 6½ inches; with pedestal, 10 inches; weight, 80 ounces. The inscription, which is engraved upon a silver-gilt plate attached to the pedestal, reads as follows: "Presented to the Royal International Horticultural Exhibition, May 22nd to 30th, 1912, by Messrs. Clay & Son, Stratford, London, E."

It is proposed to have a detailed inscription engraved within the bowl itself.

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

SHREDS VERSUS NAILS.—Mr. Hedley Warren, writing on nailing and regulating wall trees in the *Gardeners' Chronicle* for November 25, p. 374, stated that it is difficult to improve on the old method of shreds and nails. I find that the patent (Francis) wall nails are much better than shreds. The soft, pliable lead at the end of the nails does not harm the bark; there is no harbour for insect pests; they can be used over again time after time, and a man can get over much nailing quicker than he can with shreds. I am discarding all shreds in favour of them. *T. M. Nelson, The Hall Gardens, Rainhill, Lancs.*

CELERY DISEASE.—My plants have suffered from the disease for the past two seasons. I cannot help thinking that it is through using pig manure. Last season and this year I have had miserable crops, and, like many other gardeners, have only pig manure to use. This season I planted about one thousand plants in five varieties. All went well until August; then the disease started. I did not spray as I should have done, but I also planted a row of celery in the garden at my cottage, using no manure. These latter are as good and as free from disease as anyone could wish. If the disease is present in the seed, can any of your correspondents explain why I have disease in one garden and not the other? *P. Slaughter, Hurstmonceux Place Gardens, Hurstmonceux, Sussex.*

—Mr. D. Calthorpe's remarks (see p. 39) on the subject of Celery disease interested me, as I have been troubled with the disease both this year and last. I am entirely at a loss to account for its appearance, as no one else near here has been troubled with the complaint. I can only think that the disease was present in the seed, though this also seems hardly possible, as it was obtained from two different sources. The only manure used was horse-droppings, mixed with nitrate of soda. Neither soot nor lime has proved of any avail as a cure. I should be glad to know the opinions of any of your readers with regard to the value of spraying, and whether that is likely to affect the taste of the Celery? *W. Smith, Mayfield, Cann, Dorsetshire.*

THE NUT FLOWERING (see p. 400).—Twelve months ago I had occasion to remove a large Filbert tree early in December, and, on cutting it down, was astonished to see hundreds of female flowers fully expanded; there were no catkins approaching opening. I noted the example at the time for reference this year, but up to the present I have been unable to find any female flowers expanded. *T. Skilton, Lovelands, Walton-on-the-Hill.*

THE LATE JAMES DOUGLAS.—It was towards the end of 1863—not in 1860—that Mr. Douglas became gardener at Loxford Hall. Hardly anything had been done there in the way of gardening prior to his taking the post, and when he went to interview Mr. Whitbourne, he was only persuaded to accept the appointment by the ad-

vice of one of the servants. After events proved the wisdom of his decision; Mr. Whitbourne was a most considerate master, and provided ample means for Mr. Douglas to carry out his ideas. In the summer of 1866 he made his first exhibit—some fine Pineapples—for which he obtained prizes at the exhibition of the Royal Botanic Society and at the Crystal Palace; in December of the same year the Royal Horticultural Society awarded him two special certificates for Pineapples. The following year he showed Peaches, and was again successful; and in 1868 he exhibited Strawberries and Buckland Sweet Water Grapes. At Stratford he commenced exhibiting Chrysanthemums, both as cut blooms and plants in pots. Mr. Douglas's début as a writer was earlier than was indicated last week. The *Cineraria* article appeared on March 28, 1867, but his earliest contribution to literature is an extremely interesting review on "Orchard House Peaches," dated December 4, 1866. This was followed a fortnight later by a paper on Ferns, in the *Journal of Horticulture and Cottage Gardener*. A few years subsequently to this, Mr. Douglas received a tempting offer to transfer the scene of his activities to a large garden in the

EDUCATION IN HORTICULTURE.—May I take this opportunity of thanking the numerous gardeners for their kind letters and willingness to support some scheme of education in horticulture—the formation of an institute or a guild on national lines? In reply to W. W. and others expressing a desire for a meeting to discuss the project with a view to the inauguration of the society at the forthcoming International Horticultural Exhibition, 1912, I am commissioned to make use of the name of the secretary of the North of England Horticultural Society, and to ask all gardeners who would attend such a meeting to forward their names to him—the Rev. J. Bernard Hall, secretary North of England Horticultural Society, Rawdon, Leeds—before December 13, on which date a meeting of horticulturists is being held in Leeds, and the scheme can then be got on a stage further. *County Council Lecturer and Instructor in Horticulture, Durham.*

NON-WARRANTY CLAUSE.—In consequence of the House of Lords, on the hearing of the appeal in the action of Wallis, Son and Wells v. Pratt & Haynes, having decided that, on a sale of

ROYAL INTERNATIONAL EXHIBITION, 1912.

FIG. 169.—ROSE BOWL OFFERED BY MESSRS. CLAY AND SON FOR THE BEST EXHIBIT OF ROSES.

north; he refused, however, preferring to work near London, especially as he had at Loxford almost unlimited liberty of choice in his own sphere. There is a pretty superstition, mentioned in Mr. Dion Calthorpe's *Charm of Gardens* that flowers have an especial affection for certain people, and grow better for them than for others. This would seem to be borne out by the fact that all kinds of plants were amenable to Mr. Douglas's care and treatment. Even when he was quite a boy, to work amongst plants and tend them was his greatest happiness. While he was still an apprentice, he spent the winter evenings increasing his knowledge of horticultural science, and in summer he would roam about the countryside budding Roses on Wild Briars in the hedges, and working in his mother's garden. This latter he made the wonder and admiration of the whole village—a village, too, where gardening was extensively practised, and where every inhabitant was an amateur gardener of skill and taste. *B.*

seeds by description, if a seller decided to throw the risk of any honest mistake on the buyer, then he must use apt language, and the clearer he tried to make the language the better, and that they did not think Messrs. Pratt & Haynes had done so in the non-warranty clause they used, which is similar to that used by members of the nursery and seed trade, we, as solicitors for the Nursery and Seed Trade Association, Ltd., have had the non-warranty clause, of which we send you a copy, prepared by counsel engaged in the litigation referred to, and at a meeting of the committee of the Nursery and Seed Trade Association, Ltd., held on the 21st ult., to consider the same, the members passed a resolution that, having considered the clause as prepared by counsel, it should be recommended for adoption by all members and the trade generally, in lieu of the clause hitherto used, as being more definite. Counsel who settled the clause advised that it should be printed in conspicuous type and in

red ink. As a sale is effected when an order is taken and accepted verbally, or by correspondence, we advise that members of the trade should have it printed on all sale notes, invoices, and in catalogues, and on their letter paper, thereby giving full notice of the terms of sale, and preventing customers alleging they were not aware they were purchasing subject to the conditions. *Chas. Butcher & Sons, Solicitors to the Nursery and Seed Trade Association, Ltd.*

CONDITIONS OF SALE.

We believe that all seeds, bulbs, and roots sold by us are of the description and kind specified by us at the time of sale, but owing to the practical impossibility in many cases of being certain of this, we give no undertaking that such seeds, bulbs, or roots will correspond with the description under which they are sold, and we make all sales subject to this condition. We further give no warranty, express or implied, as to their growth, description, quality, or productiveness, and will not be in any way responsible for the crop. If the purchaser does not accept the goods sold to him on these terms, they are at once to be returned to us.

A GARDENERS' CONFERENCE (see p. 400).—There is much that is true in the letter from W. W., and I think it would be an advantage to the gardening community if the step he suggests is taken, i.e., the organising of a conference of gardeners on the occasion of the International Horticultural Exhibition. The need for an association or union of professional gardeners is stronger now than ever before, and in my opinion the time has also come to make a decided step forward in the way of education. In the words of the late Mr. Chas. Foster, quoted from his last letter to me, "the future gardener must look to his guns, or the better-educated college man will do the ordering of things." A national diploma in horticulture might be established, somewhat analogous to the national diploma in agriculture. Men who obtained this diploma would be recognised as experts, capable of taking up any of the more important horticultural appointments. The present instructors are constantly deploring the fact that greater educational facilities are not obtainable. They realise their deficiencies when they have to meet on equal terms men of college training. It should also be possible to establish certificates for gardeners which would enable them to rank as "gardeners." I do not here intend to make a plea for the establishment of a diploma, nor to lay down the qualifications necessary to secure it. I merely refer to the matter because I think the establishment of a national diploma in horticulture and gardening certificates should follow naturally on the establishment of a national institute of gardeners. I have in mind the National Institute of Architects, which has done so much for the profession it represents; it is the aim and ambition of all young architects to secure the title of F.R.I.B.A. Does W. W. consider such an ambition a worthy one? I think it is a side of the question deserving earnest consideration. *W. B. Little.*

W. W.'s notes regarding the need for an association of gardeners seems to condemn the B.G.A., on the ground that it has not attained its object. If a society of gardeners worthy of the name is to be formed, surely a greater measure of success would be achieved if those nurserymen and gardeners who are Fellows of the R.H.S. were to take the matter in hand. A society might thus be formed on a sound basis, the success of which would be assured. The R.H.S. exists for the promotion of the best interests of horticulture, and it follows that the advantage of those engaged in it ought to be the first consideration of those who belong to the Society. The B.G.A. was formed independently, and from the date of its inception a lack of cohesion has been noticeable among the members. Even if harmony had been preserved, what good can come of fostering a feeling amongst gardeners antagonistic to the interests of the premier Society? Had those who are influential in the B.G.A. sought to attain their objects through and with the assistance of the R.H.S., all engaged in the profession would have regarded it as a genuine effort coming from the right quarter. The support accorded it in these circumstances would, I venture to say, have been of such a nature that there would have been no lack of respect or recognition. *F. W.*

SOCIETIES.

ROYAL HORTICULTURAL.

DECEMBER 5.—The last of the Society's exhibitions for the calendar year was held on Tuesday last, thus bringing to a close a series of most successful meetings. The displays of flowers and fruits were not so numerous as at the last show, yet there was plenty to interest visitors, and far more variety than is usually seen at a December flower show. The exhibits of Orchids were, as usual, remarkably good and varied. The ORCHID COMMITTEE granted one First-class Certificate and two Awards of Merit. The chief exhibits before the FLORAL COMMITTEE were large groups of Begonias and Chrysanthemums. The fine American raised variety of Begonia named Glory of Cincinnati was shown exceptionally well by more than one exhibitor, whilst the beautiful hybrid winter-flowering Begonias were shown in splendid form by Messrs. VEITCH, CLIBRANS, and CUTBUSH. THE FLORAL COMMITTEE granted one First-class Certificate and five Awards of Merit. The FRUIT AND VEGETABLE COMMITTEE made no award to a novelty; but there were two excellent collections of hardy fruits, both of which received Silver-gilt Medals. At the three o'clock meeting of the Fellows a lecture on "Motile Organs of Plants" was delivered by J. Bretland Farmer, F.R.S.

Floral Committee.

Present: Messrs. W. Marshall and Henry B. May (Chairmen); and Messrs. Jno. Green W. J. Bean, G. Reuthe, J. H. Barr, R. C. Reginald Nevill, W. G. Baker, Chas. T. Drury, Jas. Hudson, C. R. Fielder, A. Kingsmill, J. F. McLeod, J. Jennings, N. F. Barnes, W. Bain, John Dickson, Charles Dixon, Herbert J. Cutbush, H. J. Jones, F. Page Roberts, Chas. E. Shea, Chas. E. Pearson, Walter T. Ware, E. H. Jenkins, R. Hooper Pearson, and R. C. Notcutt.

Messrs. W. CUTBUSH & SON, Highgate, again showed an assortment of greenhouse foliage, flowering and berried plants, as well as varieties of perpetual-flowering Carnations. The Carnations furnished a bright display of colour, and were shown in large sheaves in tall vases. We noticed a new red perpetual-blooming variety named Mrs. Lucy Mackinnon, the flower having a delightful fragrance like the Old Clove; Mrs. Drummond Aster, yellow ground with scarlet markings; Goldfinch, terra-cotta; Countess of Lathom, a free-flowering variety of rich crimson colour; and Miss Winnie Hey, a pretty yellow ground fancy with pink markings. (Silver-gilt Banksian Medal.)

Mr. H. BURNETT, Guernsey, again exhibited Carnations, the blooms, as usual, being of splendid quality. Besides a selection of the well-known sorts, there were excellent blooms of the novelties White Wonder and White Chief, both of American origin. (Silver Flora Medal.)

Messrs. H. B. MAY & SONS, The Nurseries, Edmonton, filled a large table with stove and greenhouse Ferns. There were well-grown plants of the rare *Ceterach aureum*, *Nothochlæna Marante*, *Nephrolepis Neubertii*, *N. Marshallii compacta*, *Platynerium grande*, *P. Stemmata*, *P. Cordreya*, *Davallia brasiliensis*, *D. fijiensis gracillima*, *Adiantum Veitchianum*, *A. flabellatum*, *Blechnum corcovadense crispum*, *Acrostichum scandens*, and *Phegopteris divergens*. (Silver-gilt Banksian Medal.)

Messrs. JAMES VEITCH & SONS, LTD., King's Road, Chelsea, again showed a selection of their beautiful hybrid Begonias, presenting large batches of Winter Cheer, Julius, Mrs. Bedford, and Ensign, all of which we have described on former occasions. Besides these the group was enlivened with fine plants of *Gesnera Aurora*, gold and vermilion, *Bouvardias* in variety, *Callicarpa purpurea* in fruit, and white and red-flowered *Lapagerias*. The exhibit was completed with a selection of Chrysanthemums in pots, which included Golden Age; Swinburne, white, tinged with light rose; Antique, a shade of rose; Elusive, amaranth, and Cinnamon. (Silver-gilt Banksian Medal.)

Rev. H. BUCKSTON, Sutton Hall, Etwell, Derby (gr. Mr. A. Sharnbrook), staged numerous plants of a white-flowered Cyclamen, set off by Ferns and other greenery. (Silver Flora Medal.)

A number of charming little plants of *Euphorbia* (*Poinsettia*) *pulcherrima* was shown

by W. D. JAMES, Esq., West Dean Park, Chichester (gr. Mr. W. H. Smith). Many of the plants were in small "60" pots, but every specimen had finely-developed bracts of the richest colouring. (Silver Banksian Medal.)

A very attractive group of Begonias of the Gloire de Lorraine type was shown by Mr. J. BRUCKHAUS, nurseryman, Twickenham. The majority of the plants were the new variety Glory of Cincinnati, with larger, brighter flowers than the Gloire de Lorraine. All the plants were splendidly grown, and presented pyramids of blossoms. (Silver Flora Medal.)

Mr. G. LANGE, nurseryman, Hampton, showed numerous well-grown plants of the new Begonia Glory of Cincinnati, which received an Award of Merit. (Silver Banksian Medal.)

Messrs. CLIBRANS, Altrincham, showed novelties in winter-flowering Begonias. Besides a very beautiful sort, which received an Award of Merit, there were Mr. T. H. Cook (rose-coloured), Beauty of Hale (rosy-pink), Emily Clibran (salmon-rose), and others.

Messrs. JOHN PEED & SON, West Norwood, showed Begonias of the Gloire de Lorraine type in batches of white and pink varieties, which included Turnford Hall, Roupell Gem, Mrs. Leopold de Rothschild, and the type.

A very large exhibit of Begonia Gloire de Lorraine and its varieties was shown by GURNEY FOWLER, Esq., Glebelands, South Woodford (gr. Mr. J. Davis). (Silver Banksian Medal.)

The pretty *Primula malacoides* was shown well by W. B. M. BIRD, Esq., Earham House, Colchester (gr. Mr. A. Gooding). Some of the inflorescences had as many as six whorls of the pretty pale-lilac-coloured blossoms.

Mr. VINCENT SLADE, Staplegrave Nurseries, Taunton, showed varieties of Zonal-leaved Pelargoniums. Naples (scarlet), Countess of Jersey (pale salmon), Berlin (scarlet), Lady Folkestone (blush pink), Lord Curzon (magenta), and Uranus (rosy cerise) are a selection.

Mr. W. H. PAGE, Tangley Nurseries, Hampton, showed a batch of his new scarlet Pelargonium His Majesty, the blooms being of exceptional size. There were also bunches of Fiscal Reformer (salmon rose) and Winter Cheer (cerise "shot" with scarlet), both novelties of this nurseryman's raising. (Bronze Banksian Medal.)

Messrs. H. CANNELL & SONS, Swanley, Kent, exhibited several pretty Chrysanthemums, including Darent Jewel, a new single variety with pale rose-pink florets; Cannell's White, one of the largest single varieties and very pretty; King of the Plumes, a yellow variety, the florets being crested like Endive leaves; and Mdle. Jeanne Mamelie, a large pink Japanese bloom after the type of Rayonnante, of promise as an exhibition variety. The bunches of Pelargonium flowers provided a bright batch of colouring. (Silver Banksian Medal.)

Messrs. W. WELLS & CO., LTD., Merstham, Surrey, showed a very beautiful exhibit of Chrysanthemums, mostly single and decorative varieties. The colours were exceptionally bright, and there were many beautiful white sorts, especially amongst the singles. A selection includes Ruby Beauty, Miss May Thorne (pink), Mrs. W. Higgs (blush), Polly Duncan (yellow), Crimson Jewel, Merstham Jewel (old rose), Mensa (white), and Peter Barnes (yellow). (Silver Flora Medal.)

Mr. PHILIP LADDS, nurseryman, Swanley, Kent, again showed varieties of Chrysanthemums such as are grown by market nurserymen. The blooms were highly decorative, and included such pretty sorts as Cannell's Crimson, Lady Furness, Merstham Jewel, Mensa, Constance, Edith Pagram, and Margaret Gray. Mr. LADDS also showed plants of a salmon-coloured form of the well-known Paul Crampel Pelargonium. (Silver Banksian Medal.)

Messrs. WHITELEGG & PAGE, nurserymen, Chislehurst, Kent, were awarded a Bronze Banksian Medal for an exhibit of Chrysanthemums.

A yellow-flowered Chrysanthemum of the "spidery" or "silk thread" type, named Miss Annie Howard Parrott, was shown by W. PARROTT, Esq., Barton Court, Kintbury, Hungerford (gr. Mr. W. R. Cox).

Messrs. GODFREY & SON, Exmouth, showed their new Anemone-flowered Chrysanthemum Godfrey's Perfection, the blooms being the same as those shown at the last meeting, when an Award of Merit was granted. The flowers were in splendid condition, although cut some 17 days.

Mr. L. R. RUSSELL, nurseryman, Richmond, again showed small decorative shrubs, many furnished with scarlet berries. The varied collection of Aucubas, Ivies, Euonymus, Skimmia, and Eleagnus was wonderfully pretty, nearly all the plants having variegated leafage. (Silver Flora Medal.)

Messrs. W. & J. BROWN, Peterborough, exhibited plants of *Plumbago rosea*.

Mr. G. REUTHE, Keston, Kent, again exhibited hybrid *Nerines* and *Alpines* in pots.

A small rockery furnished with *Alpines* was shown by the Misses HOPKINS, Mere Gardens, Shepperton-on-Thames.

AWARDS.

FIRST-CLASS CERTIFICATE.

Zephyranthes aurea.—This charming yellow-flowered *Zephyranthes* from Peru received an Award of Merit on June 9, 1908 (see *Gardeners' Chronicle*, June 13, 1908, p. 390). On Tuesday last the higher award of a First-class Certificate was given. Sir TREVOR LAWRENCE, Bart. (gr. Mr. Bain), exhibited a pan in which the species bore nine very beautiful golden-yellow flowers shaped like a *Vallota*.

AWARDS OF MERIT.

Begonia Altrincham Pink (see fig. 170).—This is one of the semi-tuberous hybrids, a rather tall grower as shown, with numerous double flowers of a rich rosy-carmine shade. It is the best double-flowered variety of this type of *Begonia* yet exhibited. Shown by Messrs. CLIBRANS, Altrincham.

Begonia Glory of Cincinnati.—This variety was raised in America. It resembles *Gloire de Lorraine* in its flowers, except that in this novelty they are much larger than is the case in *Gloire de Lorraine*. The leaves are roundish, and they possess much substance, giving the plant an air of distinctness. Shown by Mr. LANGE, Hampton.

Carnation Bath's Premier.—A pale-yellow, perpetual-flowering *Carnation* of excellent form. Shown by Messrs. BATH, Wisbech.

Chrysanthemum Isabel Gray.—A well-formed, single-flowered variety of a shade of mauve. Shown by Mr. P. LADDS, Nurseryman, Swanley.

C. "Mrs. David Lyme".—A pure-white Japanese variety that is sure to meet with appreciation. Shown by Messrs. WELLS, Merstham.

Orchid Committee.

Present: J. Gurney Fowler, Esq. (in the Chair), Sir Jeremiah Colman, Bart., and Messrs. Jas. O'Brien (hon. secretary), Harry J. Veitch, F. J. Hanbury, R. G. Thwaites, W. Waters Butler, T. Armstrong, C. H. Curtis, W. Cobb, J. Charlesworth, J. Cypher, J. E. Shill, W. H. Hatcher, H. G. Alexander, W. P. Bound, A. Dye, W. H. White, J. Wilson Potter, W. Bolton, Gurney Wilson, J. S. Moss, and R. Brooman-White.

J. GURNEY FOWLER, Esq., Glebelands, South Woodford (gr. Mr. J. Davis), was awarded a Silver Flora Medal for a very fine group of *Cypripediums*, the central plants being of *C. Leeannum* "J. Gurney Fowler," which still holds the record as a magnificent variety, its large, square, white dorsal sepals and general fine form rendering it unlike any other. Another very fine plant in the group was *Odontoglossum Smithii*, all of the plants of which are in Mr. FOWLER's collection. Others noted were *Cypripedium Ville de Paris* in fine form, rare varieties of *Cypripedium insigne*, including *Fowlerianum*; *C. Tityus superbum*, and *C. triumphans* of very rich colour; *C. Bingleyense*, *C. Fowlerianum*, and other showy hybrids.

FRANCIS WELLESLEY, Esq., Westfield, Woking (gr. Mr. Hopkins), showed *Laelio-Cattleya Epicasta* "The Premier," a perfectly-formed flower with blush-white sepals and petals and ruby-violet lip; *Cattleya St. George*, a pretty flower of very effective colour, like *C. Hardyana Massaiana*; *Brasso-Cattleya Mme. Hye* "Westonbirt variety"; and *Cypripedium Mrs. Francis Wellesley*.

Lieut.-Col. Sir GEORGE L. HOLFORD, K.C.V.O. (gr. Mr. H. G. Alexander), sent the new *Cypripedium Nydia* (*Niobe* "Westonbirt variety" × *Charlesianum*), with very fine rose-coloured dorsal sepal with white margin, and the handsome *C. Draco* (see Awards).

Sir JEREMIAH COLMAN, Bart., V.M.H. (gr. Mr.

Collier), showed *Cypripedium insigne* "Gatton Park variety," an improvement on *Harefield Hall* in size and shape.

F. BOSTOCK, Esq., Springfield, Northampton, showed two very good forms of *Cypripedium Actæus*.

Mrs. NORMAN COOKSON, Oakwood, Wylam (gr. Mr. H. J. Chapman), showed *Odontoglossum crispum Chapmaniæ*, a finely-blotched variety; *Cypripedium Leeannum Gratrixæ*, and the bright-rose *Calanthe Chapmanii rosea*.

E. H. DAVIDSON, Esq., Twyford (gr. Mr. Cooper), showed *Cattleya armainvillieriensis alba*.

MESSRS. ARMSTONG & BROWN, Orchidhurst, Tunbridge Wells, were awarded a Silver Flora Medal for a fine group, principally good *Cypripediums* and other hybrids. A new yellow form of *C. nitens* was a very distinct flower; *C. Arthurianum* "Orchidhurst variety," a distinct form

crest. A fine selection of *Cypripediums* was shown, including *C. Niobe* and *C. Thalia* varieties, forms of *C. insigne* and *C. Leeannum*, and at one end a batch of hybrids, the best of which was *Laelio-Cattleya Urania* of unrecorded parentage, of finer colour than *L.-C. Dominiana*.

Messrs. CHARLESWORTH & Co., in their pretty group for which a Silver Flora Medal was awarded, had the novelty of the meeting in their brilliantly-coloured *Sophro-Cattleya Lotte Müller* (see Awards). *Odontoglossum Goodsonii* was well shown, *Sophro-Laelio-Cattleya Pandora* and other crosses of *Sophrontitis grandiflora*; some very fine blue *Vanda cœrulea*, *V. Amesiana*; the brightly-coloured *Epidendrum vitellinum autumnale* and a general collection of good things.

Messrs. JAS. CYPHER & SONS, Cheltenham, secured a Silver Flora Medal for a fine group of *Cypripediums*, in which were many remarkable varieties of *C. insigne* and *C. Leeannum*. Also *C.*

FIG. 170.—WINTER-FLOWERING BEGONIA "ALTRINCHAM PINK."

(See R.H.S. Awards.)

with the colouring of *C. Baron Schröder*, another new hybrid, between *C. Bassano* and *C. Fairrieanum*, beside it being still darker and finer. Forms of *C. Leeannum*, *C. insigne*, *C. Zeus*, &c., were well shown, and among others noted were a new hybrid between *Cattleya Maronii* and *C. aurea*, a good flower of an Indian-yellow tint, the lip veined with rose; a distinct cross between *Cattleya Trianae* and *C. Aelandiæ*, of good shape and substance; another between *C. guttata* and *C. aurea*, which promises well; a blood-red *Odontioda* between *C. Noezliana* and *O. Rolfæ*; various other good unnamed hybrids, and a finely-spotted seedling *Odontoglossum crispum*.

Messrs. JAS. VEITCH & SONS, Chelsea, were awarded a Silver Flora Medal for a fine group, in the centre of which was the handsome *Odontoglossum Aurora* (*Rossii rubescens* × *Lambeauiannum*), a grand flower resembling *O. Smithii* with lilac-coloured sepals and petals blotched with claret, and a large rose-purple lip with yellow

Amy Moore, *C. Mme. Jules Hye*, *C. Milo* "Westonbirt variety," *C. Tityus superbum*, *C. Fascinator*, *C. Fulshawense*, *C. Priam magnificum*, and *C. Thalia* varieties. The plants were finely grown and well staged with hybrid *Cattleyas*, *Dendrobium Phalaenopsis*, and others.

Messrs. J. & A. A. McBEAN, Cooksbridge, were awarded a Silver Flora Medal for a very bright and well-arranged group of hybrid *Cattleyas*, *Laelio-Cattleyas*, &c. Specially fine were two forms of *Cattleya Luegæ*, some richly-coloured *C. Fabia* and *Sophro-Laelio-Cattleya Marathon* var. *Helen*, a charming copper-red flower with ruby-crimson lip veined with gold. A selection of *Cypripediums* and *Odontoglossums* were also included.

Messrs. STUART LOW & Co., Bush Hill Park, were awarded a Silver Banksian Medal for an effective group, at the back of which were some well-flowered specimens of a very large type of

Oncidium varicosum. With them were some dark forms of *Cattleya labiata* and one good white-petalled variety; several *C. Hardyana*, *Sophrone*, *Cattleya Saxa*, *Cynoches chlorochilon*, *Lycaste*, *Mrs. Rogers* and other *Lycastes*, *Eria stellata*, *Cymbidium Traceyanum*, good *Vanda cœrulea*, *Dendrobium Phalaenopsis*, *Houlletia Brocklehurstiana*, and a good selection of *Cypripediums*, &c.

Messrs. SANDER & SONS, St. Albans, were awarded a Silver Flora Medal for a fine group rich in hybrid *Cypripediums*, the best of the many forms of *C. Leeannum* being the variety *Gratrixia* with its broad, white dorsal sepal. *C. Durbar* was a very good dark novelty with a resemblance to a fine *C. nitens*, *C. Troilus* "Sander's variety," of very delicate colour, *C. Rossettii* (greenish-yellow and white), *C. Niobe superbum*, *C. Fulshawense* and others well flowered. Colour was given by some handsome *Cattleyas* and *Lælio-Cattleyas*; *C. Dowiana Rosita*, *C. Fabia Vigeriana*, *C. Cooksonia amabilis* and others being noted.

Messrs. W. BAYLOR HARTLAND & SONS, Cork, were awarded a Silver Banksian Medal for a good display of *Cypripedium insigne* Harefield Hall, *C. i. Sanderæ* and other *Cypripediums*, together with *Lælio-Cattleyas* and two good *Odontoglossum crispum*.

Messrs. MANSELL & HATCHER, Rawdon, Yorks., were awarded a Bronze Banksian Medal for an effective group, in which *Cypripedium Leeannum giganteum* "G. S. Ball's variety" had fine flowers, and others were equally good. *C. Actæus* varieties, *C. Thalia* Mrs. Francis Wellesley, and others were staged, and also noted were a spike of a very fine pure-white *Dendrobium Phalaenopsis* and another of the true *Calanthe vestita rubro-oculata gigantea*.

Mr. E. V. Low, Vale Bridge, Haywards Heath, secured a Bronze Banksian Medal for a group in which a specimen of *Cypripedium Minos Youngii* had five flowers. *C. Leeannum Corona*, *C. L. Clinkaberryannum* and other forms of *C. Leeannum*, *C. triumphans*, *C. Tityus*, *C. Gaston Bultel*, *C. Baron Schröder* (nine flowers), and other showy things were well displayed.

Miss WALTERS ANSON, The Studio, Broadway, Streatham, had a very fine display of beautifully-executed coloured drawings of Orchids.

Messrs. HASSALL & Co., Southgate, staged a small group, in which were noted two pretty and dissimilar forms of *Cattleya Aliciæ*, the rose-coloured *C. St. Gilles*, *Lælio-Cattleya Rubens* and other hybrids.

AWARDS.

FIRST-CLASS CERTIFICATE.

Sophrone-Cattleya Lotte Müller (C. Peetersii × S.-C. Nydia), from Messrs. CHARLESWORTH & Co., Haywards Heath.—One of the best and brightest-coloured hybrids of medium growth. The flowers are formed after the manner of *Cattleya labiata*, though smaller in size. The sepals and petals are broad and of varying tints of bright rose and ruby red, the midribs being silver-white at the base. Lip well expanded and crimped at the margin ruby-crimson with a velvety surface and gold veining at the base. One of the most attractive novelties shown this year.

AWARDS OF MERIT.

Cypripedium Draco "Westonbirt variety" (insigne Harefield Hall × Euryades), from Lieut. Col. GEORGE L. HOLFORD, K.C.V.O., Westonbirt (gr. Mr. H. G. Alexander).—A grand flower, broad in all its parts, the main characteristics being of *C. insigne* Harefield Hall, but with the dark colouring, fine substance and round form as in *C. Earl of Tankerville*. The broad dorsal sepal is white above and greenish-yellow below spotted with dark purple, which changes to rose in the white zone. Petals and lip yellow tinged and veined with purple-brown.

Trichopilia Gouldii (suavis × fragrans), from Messrs. CHARLESWORTH & Co.—A pretty and fragrant hybrid between two widely-separated sections of the genus. The flowers in shape partake most of *T. (Pilumna) fragrans*. Sepals and petals silver-white spotted in the middle with rose. Lip white spotted with rose.

Fruit and Vegetable Committee.

Present: G. Bunyard, Esq. (in the Chair); and Messrs. J. Cheal, W. Bates, F. Perkins, A. Dean, E. Beckett, A. R. Allan, W. Pope, G. Woodward, J. Willard, G. Reynolds, W. Poupart, and W. Humphreys.

E. R. JAMES, Esq., Wroxton, Banbury, submitted fruits of a pretty dessert Apple somewhat resembling Cox's Orange Pippin. The exhibitor was asked to send specimens in February.

The Earl of STANHOPE, Chevening, Sevenoaks (gr. Mr. J. C. Sutton), showed a collection of Apples. The fruits were not of large size, but they were generally well finished. The best of the cooking varieties were Bramley's Seedling, Belle de Pontoise, Newton Wonder, Bismarck, Waltham Abbey Seedling, Belle du Bois, Lane's Prince Albert, Hambling's Seedling, Lord Derby, and Small's Admirable. Of dessert sorts the best were Blenheim Pippin, King of Tompkins County, Cox's Orange Pippin, May Queen, American Mother, and Allington Pippin. (Silver-gilt Banksian Medal.)

Messrs. H. CANNELL & SONS, Swanley, Kent, staged a remarkably fine collection of Apples and Pears, embracing 96 dishes. The fruits generally were very highly coloured. Of cooking varieties King Edward VII., Alfriston, Bismarck, Bedfordshire Foundling, Reinette de Canada, Lord Derby, Peasgood's Nonesuch, Gloria Mundi, Twenty-Ounce Pippin, Striped Beefing, and Tower of Glamis were exceptionally good. The best dessert sorts were The Rival, Maltster, King of the Pippins, Fearn's Pippin, Cornish Aromatic, Autumn Pearmain, Allington Pippin, Barnack Beauty, Cox's Orange Pippin, Charles Ross, Mother Apple, Sturmer Pippin, Adams's Pearmain, Vicar of Beighton and Ribston Pippin. Pears included Catillac, Verulam, and Uvedale's St. Germain. (Silver-gilt Banksian Medal.)

Mrs. MILLAR, Moylaen, Marlow, and Miss HILDA SEWELL, South Kensington, both exhibited jellies, jams, marmalades, chutney, and other conserves.

NATIONAL CHRYSANTHEMUM.

NOVEMBER 29.—The annual dinner of this Society was held at the Holborn Restaurant on this date. The President of the Society, Sir Albert Kaye Rollit, LL.D., D.C.L., occupied the Chair, and there were 100 members and friends present.

After the presentation of cups and medals won at the Society's shows, the President proposed the toast of "The National Chrysanthemum Society." He referred to the work of the Society, which, he stated, had been established more than 50 years. He said that the last Show exceeded all previous exhibitions so far as a spectacular display was concerned. At recent shows marked prominence had been given to the development of single-flowered varieties and dwarf plants of a purely decorative character.

Mr. T. Bevan, Chairman of the Executive Committee, replied.

Other toasts were "The Donors of the Special Prizes," proposed by Mr. W. Howe and responded to by Mr. J. R. Jackson; "The Exhibitors and Affiliated Societies," proposed by Mr. E. F. Hawes; "The Ladies and Visitors," by Mr. J. H. Witty; "The Press," by Mr. J. W. Moorman; and "The Chairman," by Mr. J. McKerchar.

Sir Albert Rollit was presented with a printed copy of the resolution passed by the Executive Committee on November 20, "that the Executive Committee on behalf of the members desires to place on record its sincere appreciation of the very valuable services rendered to the Society by Sir Albert Kaye Rollit, LL.D., D.C.L., since his appointment as President in February, 1908. The Committee particularly appreciate the President's special personal efforts towards increasing the membership of the Society, being certain that, in addition to the direct results of the President's action, a distinct advantage has accrued to the Society from the publication given to the Society's name and work."

CHRYSANTHEMUM CONFERENCE.

DECEMBER 4.—There was an excellent attendance at the conference held by the Society at Carr's Restaurant on the 4th inst., when, owing to the indisposition of the President, the chair was occupied by Mr. Thos. Bevan.

The first paper was by Mr. F. W. Ladds, his subject being "The Culture of Disbudded and Spray Blooms." We print the following extracts:—

Great care should be exercised in the selection of plants for stock. Much the best plan is to

select cuttings from plants which have produced the best blooms, marking them for the purpose when in flower.

It is desirable to select the best stools; shake most of the soil from the roots and place them on a hard-bottomed border, just covering them with some fine loam. Great care should be taken in affording water, as an over supply will lead to failure. If the stools are left in the pots, a top-dressing will be advisable, as the top soil will be sour from last autumn's manuring.

It is difficult to name the best date for taking cuttings, but, generally speaking, the later the variety the earlier should the cuttings be inserted. For instance, Panckouke, Framfield Pink (with others of its family), and those of the "Thompson" type are all the better for being rooted early.

To strike a large number of cuttings, I have found the following method to be the cheapest and most successful:—In an ordinary 12-feet greenhouse with a centre path, pat the soil of the border rather hard. Place a piece of 1 inch by 3 inch batten on edge at the back and front of the border, and fix it in position by 9-inch stumps driven into the ground on either side. In this bed place a 2-inch layer of good loam, containing no manure, but to which has been added about two shovelfuls of coarse sand to each barrow-load of soil. Pat down firmly and dibble the cuttings in, inserting about 100 to the square foot.

The length of the cuttings should be about 3 inches. When taking the cuttings, be sure to leave an "eye" on the old stool to break again later on, in case of failure with the first batch. Make the cuttings firm in the ground, inserting them about 1 inch deep, taking care that the base is in contact with the soil. The cuttings should be taken off, made, and inserted within, say, two hours, so that no sign of flagging is visible. Afford only sufficient water to keep the soil moist, but sprinklings overhead will help to prevent the foliage from flagging. Tissue paper or newspaper may be used for shading if necessary.

If the potting is done as soon as the cuttings have made roots about 1 inch long, they may easily be taken from the beds with hardly any damage to the roots; thus they will receive only the slightest check. The size of the pots will largely depend on how the plants are to be treated later on. With some varieties, it is as well to pot into 3-inch pots (60's), shifting into 48's, and finally into 24's or 16's. Other varieties may be potted directly into 48's, placing two, three, or four plants in a single pot. In the first system, the plants should be potted into 48's as soon as they are fairly well rooted in 60's. For the first potting, the plants are best accommodated in frames, as the lights can be removed to give them the benefit of sunshine, air, and rain. If the plants are kept in an ordinary greenhouse, they are apt to grow weak and soft. The best time for the final potting into 24's and 16's is from May 7 onwards, every endeavour being made to get all potting finished by the end of June. It is preferable to use 24's, as in the case of 16's the pot is so large that, should the late autumn be wet and cold, the soil does not dry quickly, and is liable to become sour. There are exceptions to this: for instance, in the case of four plants of the variety Tuxedo use the larger size.

For the first potting, good loam is essential, mixing one part of decayed horse manure to 15 parts of the loam. For the second and final potting, that is, from the 48's to 24's or 16's (it is impossible to devote more time and money to potting when growing in a wholesale way for market), use a good loam, not too heavy, with the following additions:—In November turn the loam, and, in layers, add 8 per cent. of decayed horse manure, and, in alternate layers, add 1 per cent. boncreal, ground bones being the best. When turning the soil again in May, add 1 per cent. of soot, and $\frac{1}{2}$ per cent. to 1 per cent. of Peruvian guano. By preparing the soil in this way, very little artificial manure will be necessary during the summer months. The soot seems beneficial in several ways, chiefly by keeping away worms, slugs, and other pests. The pots should be well drained and a quantity of soil placed in the bottom and rammed down. The ball of the plant should then be placed in the middle of the pot, more soil added, and rammed down regularly, so that the soil is compact throughout.

As regards stopping the shoots, it will be sufficient, perhaps, to state the usual methods: (1) Stop once in late May when in the flowering pot, and allow as many breaks to grow as will furnish a crop. Then take the next bud. (2) Stop once in the 48 pot, and once in the flowering pot, and take next bud. (3) Stop once in the 48 pot, and allow the growth to break naturally in the flowering pot. Remove surplus shoots, and take the next bud. (4) Stop in 48's, natural break in the flowering pot, then leave only one break on a stem. Some varieties are better taken this way for disbudded blooms than stopping once and taking next bud. The grower must ascertain by experiment, first, which method, and, secondly, which date is best for the particular variety.

In the stopping of a large batch of one variety at the same date, the blooms will probably all have to be cut for market in one week; but, by dividing the batch into three parts, and stopping on three different days, with a range of a fortnight, the crop may be made to extend over three weeks instead of one.

The disbudding should be done as soon as the buds are large enough to handle. In some instances it is advisable to leave the top shoot next to the bud until the latter shows signs of swelling. This applies to buds other than terminal buds.

Very little food is necessary during the mid-summer months if the potting soil is good. In fact, it can almost be made a rule not to feed until the disbudding is finished. Then feed a little at a time and often, up to within 14 days from cutting the bloom. If the plants require a slight stimulant before the bud is formed, a weak solution of Peruvian guano, or a little soot-water with guano, may be applied by the water-can. In top-dressing with concentrated manures mix the manure with about twice its quantity of fine soil. There are several special manures for Chrysanthemums. Personally, I favour Peruvian guano and Bull's Food for Plants.

A weak solution of Tobacco water sprayed on the plants at frequent intervals during the summer will keep down insect pests. The cheapest method of making Tobacco water is to buy cheap Tobacco paper or cloth, or if possible the rope that is taken from the bales of imported Tobacco. Boil these in water and dilute the liquid to the strength thought necessary. Tobacco-water made in this manner is a certain preventive of maggot. Sulphur is a good remedy for mildew, also liver of sulphur. Take a piece of the latter about as large as a Cob Nut and dissolve it in one gallon of water. Spray the leaves all over, taking care to wet the under sides as well as the top.

In the case of lifted Chrysanthemums, the cuttings are struck in February and March, and we usually insert 200 in an egg-case 4 inches deep. When rooted, the plants are put in a cold house or frame, and stopping takes place when they are 6 inches high. In April they are put outside, a canvas covering being handy for use in frosty weather. The ground is prepared for planting and the rows set out 21 inches apart one way and 18 inches the other. The planting takes place on the first showery day in May, in just the same manner that the market-gardener plants his Cabbages. Weeding the fields is necessary during the summer. The plants should be stopped about the first week in July, or when they have made sufficient growth. The lifting in autumn must be done before frost occurs. At Swanley we generally start lifting at about October 1 and finish by October 18.

Framfield Pink is undoubtedly the finest Chrysanthemum from the market-growers's point of view. The only exceptions that can be taken to it are that in some districts, being a late variety, it will not flower, also it does not always lift well. Other than these faults, it is an ideal Chrysanthemum. It has good foliage and good stems, which are stiff enough to hold its flowers erect, and yet not so hard as to prevent the blooms from drawing water. The neck between the top leaf and the flower is not unsightly through being too long, nor is it too short so that the leaves are intermingled with the florets of the bloom. The petals or florets are of good form and substance. They are stiff or springy enough to maintain their proper position in the flower, even though the side of the flower may have become flattened after a long journey by road or rail by reason of close packing in a box. Again, it seldom shatters, even if carelessly handled, and will withstand a great deal of rough usage. It is

good alike grown for sprays or disbudded blooms.

So much for Framfield Pink. Now, if a grower wishes to assure himself that a new variety, or a variety that he has not already grown, is of any use to him as a commercial Chrysanthemum, let him compare that variety with Framfield Pink on the several points that I have enumerated. If it passes the examination and is equal to, better than, or even nearly as good as Framfield Pink, that grower can congratulate himself on having found a good Chrysanthemum. There is one little detail that I have not mentioned up to the present, and that is "colour." This is a consideration in a market Chrysanthemum, and I do not feel capable of laying down any hard-and-fast rule regarding "colour." The foremost thing to bear in mind is that it is best to grow those shades of colour that are most fashionable.

THE DISCUSSION.

Messrs. W. Wells, Norman Davis, Wood, Crane, Stevenson, and Godfrey took part in the discussion which followed the reading of the paper. The general opinion was that potash was of considerable value in increasing the resistance of the plants against fungous diseases, and also that plants grown in the neighbourhood of large towns were seldom, if ever, attacked by Chrysanthemum rust.

MR. CRAGG'S PAPER.

Mr. P. A. Cragg's paper dealt with "Soil Preparation and the Use of Some Chemical Foods." Mr. Cragg stated that in his firm's system of soil preparation they first secured an analysis from a competent horticultural chemist of the soil with which they had to deal. The whole soil to be dealt with was first mixed as a bulk, and the addition of the necessary fertilising agents was made just previous to the soil being required for potting, a sufficient amount of each ingredient being used to bring the soil up to an even balance of fertility. The materials used were basic slag, ground grey lime, bonemeal, ground hoof, phosphates in various degrees of solubility, soot, and old Mushroom manure. They had proved that the addition of potash in the soil resulted in less mildew in Tomatos, supporting the statement of Mr. A. D. Hall, that potash increased the plants' powers of resistance to fungous diseases. To 100 tons of soil was added $1\frac{1}{2}$ ton of lime 77 per cent. purity, $\frac{1}{2}$ ton basic slag, $\frac{3}{4}$ ton of ground bones, 12 cwt. of ground hoof, and 10 bags of soot. The lime was applied in the autumn to the pasture before the turf was dug for stacking.

Messrs. Cragg's method of dealing with this matter of soil is a novel one, and commenced with the enrichment of the pasture itself. The soil which they possess in the nursery is a light brick earth, and, taking note of the fact that nitrogen can be obtained from the atmosphere by leguminous plants this portion of land was sown with deep-rooting Grasses and Clovers, the soil having been previously prepared for their reception by a good dressing of lime, basic slag, and potash.

If the foliage of the Chrysanthemum developed a pale-green colour, a watering with sulphate of iron in the proportion of $\frac{1}{2}$ ounce to 1 gallon of water soon restored the plants to their natural healthy appearance.

Messrs. Davis, Godber, and Godfrey contributed remarks on the subject.

ULSTER HORTICULTURAL.

NOVEMBER 14, 15.—The annual show of this society took place in St. George's Market, Belfast, on these dates.

The 1st prize in the class for a group of Chrysanthemums decorated with foliage plants was won by CHARLES DUFFIN, Esq., Danesfort (gr. Mr. J. M'Cormick); 2nd, Mrs. FORSTER GREEN, Derryvolgie House (gr. Mr. A. Smiley). For a group of single Chrysanthemums and plants Mrs. FORSTER GREEN was placed 1st, and J. RODGERS, Esq., Edna-a-Green (gr. Mr. M'Ilveen), 2nd. Mrs. FORSTER GREEN was again successful in the class for 12 plants suitable for table decoration. Messrs. HUGH DICKSON, Royal Nurseries, were awarded the 1st prize for a group of stove and greenhouse or forced plants, arranged for effect; also in the class for a group of conifers and hardy ornamental plants, Messrs. F. E. SMITH & Co. taking the 2nd prize. FRANK WORKMAN, Esq., The Moat (gr. Mr. T. Culbert),

excelled in the class for a group of stove and greenhouse or forced plants, arranged for effect, and also in that for best six Ferns, dissimilar. The best two Palms or Cycads were shown by Mr. DUFFIN. The best pink Begonias of the Gloire de Lorraine type by Mr. G. J. PRESTON, Lord O'NEILL being successful in the similar class for white varieties.

In the classes for six specimens of Primula obconica and six zonal-leaved Pelargoniums Mrs. MONTGOMERY and H. BROWN, Esq., Helen's Bay (gr. Mr. J. Taylor), were awarded the 1st prizes respectively.

CUT BLOOMS.—For 15 vases of Japanese blooms, three blooms of each variety, J. JAMESON, Esq., secured the 1st award; 2nd, Countess of CALEDON (gr. Mr. J. Harding). Mr. JAMESON was also successful in the classes for (1) one vase containing five blooms of any variety, pink; (2) one vase of a yellow variety; (3) one vase any bronze variety; and (4) 48 Japanese blooms, shown in boxes, in 36 varieties. The Countess of CALEDON was awarded the 1st prize for 10 vases of Japanese blooms, three blooms of each variety; 2nd, Mr. DUFFIN. The Countess of CALEDON was also successful in the class for one vase of a white variety. For 20 vases of single Chrysanthemums, distinct varieties, EDWIN HUGHES, Esq., Craigavad (gr. Mr. T. Magill), secured the 1st award, Colonel SHARMAN-CRAWFORD, Crawfordsburn (gr. Mr. J. Whytock), being 2nd. For 10 vases of single Chrysanthemums, distinct varieties, HERBERT BROWN, Esq., was placed in the 1st position, and this competitor also excelled in the classes for one vase of yellow single Chrysanthemums. Mr. EDWIN HUGHES, winner in the similar class for (1) a white variety, (2) a pink variety, (3) a bronze variety, and (4) one vase of single Chrysanthemums arranged for effect. In the class for four vases of winter-flowering Carnations, distinct varieties, H. E. RICHARDSON, secured the 1st position, J. ACHESON, Esq., Dunavon, Portadown (gr. Mr. W. J. Cox), being awarded the 2nd prize.

FRUIT CLASSES.—For a table of dessert fruit, 12 distinct varieties, Lord O'NEILL secured the 1st prize. He also won the 1st prizes in the classes for two bunches of Muscat of Alexandria Grapes, two bunches of Lady Downes Grapes, two bunches of Gros Colman Grapes, and for Blenheim Pippin Apples. FRANK WORKMAN, Esq., Strandtown (gr. Mr. T. Culbert), excelled in the classes for six bunches of Grapes; 2nd, GEORGE J. PRESTON, Esq., Dunmore (gr. Mr. J. M'Bride). Mr. WORKMAN was again successful for two bunches of Black Grapes not scheduled. G. J. PRESTON, Esq., secured the 1st prize in the similar class for two bunches of a white variety. Colonel SHARMAN CRAWFORD excelled in the class for two bunches of Black Alicante. For a collection of 24 dishes of Apples, 8 dessert and 16 culinary varieties, J. JAMESON, Esq., Portmarnock, was successful, whilst for 12 dishes of Apples A. G. BOWERS, Esq., Co. Kilkenny, secured the 1st award.

In the section devoted to vegetables Lord O'NEILL secured the 1st award for a collection of 12 kinds; 2nd, Mr. H. BROWN; and for six kinds Mr. J. STEWART was successful. Mr. BROWN excelled in the class for six Onions, and he was awarded the 1st prize in the class for six Leeks.

DARLINGTON HORTICULTURAL.

NOVEMBER 22.—The Chrysanthemum show of the above society was held in the Drill Hall, Darlington, on this date. The quality of the exhibits reached a high standard of excellence, fruit being exceptionally fine.

In the open class for 24 Japanese Chrysanthemums, the 1st prize, which included a Silver Challenge Cup, given by the Member for the Borough, H. L. Pike Pease, Esq., was awarded to J. BRENNAND, Esq., Baldersby Park, Thirsk (gr. Mr. J. E. Hathaway). This is the third time Mr. BRENNAND has won the cup in four years, and it now becomes his own property. 2nd, W. C. GRAY, Esq., Thorpe Perrow, Bedale (gr. Mr. W. Pattison), and 3rd, the Marquis of RIPON, Studley Royal (gr. Mr. G. E. Thomas).

Mr. BRENNAND was also placed in the premier position for 24 Incurved varieties and for 12 Incurved varieties.

Sir JONATHAN BACKHOUSE, Bart., Uplands, Darlington (gr. Mr. J. Lester), excelled in the class for 12 Japanese varieties; 2nd, Mr. HORSNELL, Grimston Manor Gardens.

In the class for six vases with three blooms each, Mr. J. LESTER was awarded the 1st prize.

The best six vases of single varieties was shown by A. C. STAMER, Esq., The Knoll, Darlington.

Mr. G. E. THOMAS showed the best basket of Chrysanthemums; Mr. H. H. HILLIAR the best centre piece decoration of Chrysanthemum blooms arranged as for a dinner table; whilst Miss L. BORD excelled for a hand bouquet.

A fine exhibit of Carnations was staged from the gardens of the Rt. Hon. J. A. PEASE, M.P., Headlam Hall, Gainford (gr. Mr. T. McKeown), and was awarded the 1st prize in the class for these flowers.

In the fruit section Lady COWELL, Clifton Castle, Bedale (gr. Mr. J. E. Gardiner), excelled in the class for two bunches of black Grapes; Mr. BRENNAND, Baldersby Park, winning the 2nd prize. The same gentlemen were similarly placed for two bunches of white Grapes.

For a collection of vegetables, Mr. T. SEYMOUR, Yarm, excelled, and Mr. G. DANBY, Yarm, followed.

Non-competitive exhibits were staged by Messrs. KENT & BRYDON, The Nurseries, Darlington, and Messrs. MACK & MILN, Catterick, Scorton, and Darlington.

ABERDEEN CHRYSANTHEMUM.

NOVEMBER 24, 25.—This annual exhibition and floral fete was held under the auspices of the Aberdeen Chrysanthemum Society in the Music Hall Buildings, Aberdeen, on these dates. The effects of the remarkably fine summer were seen in practically all the sections of the show, but especially in the fruit classes.

In the class for a group of Chrysanthemums and other plants, arranged in a semi-circular form on a space 10 feet by 5 feet, A. R. GRAY, Esq., Garthdee House, Aberdeenshire (gr. Mr. R. Begg), was awarded the Silver Cup, his group comprising well-grown blooms, while the decorative varieties were much admired. A. SMITH, Esq., Craigielea, Aberdeen (gr. Mr. J. Mathieson), was placed 2nd. This exhibit was exceedingly good.

In the classes devoted to Chrysanthemums, A. R. GRAY, Esq., was awarded the Silver Cup for the best group, and nine 1st and 2nd prizes. Mrs. COOK, Ashley House, Aberdeen (gr. Mr. Murray), also showed some fine exhibits.

Lord PROVOST MAITLAND, Rubislaw Den House, Aberdeen (gr. Mr. A. Duncan), and JAMES JAMIESON, Esq., Tillycarthie, Udney, Aberdeenshire, were the most successful exhibitors of Ferns. Chinese Primulas (single varieties) were shown well by A. R. GRAY, Esq., Garthdee, whilst H. BAIRD, Esq., Durris House, Kincardineshire (gr. Mr. Andrew Reid), excelled with Orchids. Lord PROVOST MAITLAND was awarded the premier prize for winter-flowering Begonias.

There was a charming display in the section for cut flowers, J. JENKINS Esq., Clifton Road, Aberdeen, was successful in the class for 18 blooms, having choice blooms. Mrs. REDMOND McGRATH, Leatham Grange, Arbroath (gr. Mr. J. W. Robertson), showed well in the class for 12 blooms, which included choice examples of Mrs. H. BARNES, Frances Jolliffe, Bessie Godfrey, Reginald Vallis, Mrs. R. DAVIS, F. S. Vallis, Lady Talbot, Victoria and Albert, and J. H. Silsbury.

The class for 18 varieties of decorative Chrysanthemums in vases resulted in a keen competition; Mrs. DUNBAR-DUNBAR, Sea Park, Forres (gr. Mr. John Gregory), was awarded the 1st prize. In the class for nine vases of decorative Chrysanthemums, Mr. A. GRIGOR, Duff House Gardens, Banffshire, was successful.

For 12 vases of single Chrysanthemums, Mrs. McGRATH, Leatham Grange, excelled with a meritorious display. For six vases of single varieties, the leading honours were secured by Mr. JOHN ELDER, Norwood House Gardens, Aberdeenshire.

Mr. A. SMITH, Craigielea, was successful with Hellebores, being followed closely by Mr. WILLIAM MILNE, Corsindae House, Aberdeenshire. Mr. BAIRD, of Durris, was placed 1st for six stove or greenhouse plants (Orchids excluded), with finely-grown specimens of *Clerodendron Balfouri*, *Lassianandra macrantha*, *Anthurium Andreanum album*, and *Eucharis grandiflora*.

In the amateur section the leading exhibitors were Mr. JOHN DAVIDSON, Hardgate, Aberdeen; Mr. JOHN L. MILNE, Hardgate; Mr. JAMES COUTTS, Sunnybank Place, Aberdeen; and Mr.

ALEXANDER CUMMING, 83, Cairnfield Place, Aberdeen. The last-named gentleman won for the third year in succession the 1st prize for six vases of decorative Chrysanthemums.

In the fruit section the exhibits of Apples were the most notable feature. A splendid collection of Apples was shown by Lord LOVAT, Beaufort Castle (gr. Mr. W. B. Reid). Mr. CHARLES A. CUMMING, Pitgaveny House, Elgin, was awarded the 1st prize for kitchen Apples, whilst Lord LOVAT was 1st for dessert Apples. Pears were especially fine, the prize-winners being Mrs. McGRATH, Leatham Grange; Mr. CUMMING, Pitgaveny Gardens, Elgin; Mr. BAIRD, Durris; and Mrs. DUNBAR DUNBAR, of Seapark, Forres. Mrs. McGRATH was successful in the class for Grapes; 2nd, Mr. JOHN ELDER, Norwood.

In the vegetable section the best collection was shown by Mr. TAIT, Broomend, Inverurie.

PERPETUAL-FLOWERING CARNATION.

DECEMBER 5, 6.—The 11th show of this Society was held at the Royal Botanic Gardens, Regent's Park, on Tuesday and Wednesday last, and was one of the best exhibitions held under these auspices.

OPEN CLASSES.

In the class for a collection of cut blooms staged on a table, Mr. W. E. WALLACE, of Eaton Bray, secured the 1st prize, his varieties including May Day, White Perfection, Carola, Enchantress, Gloriosa, Scarlet Glow, Delight and White Wonder; 2nd, Messrs. ALLWOOD Bros., Wivelsfield Nurseries; this firm staged their fine novelty Wivelsfield Wonder (see fig. 171), which has already received the R.H.S. Award of Merit; also a new variety named Fair-

FIG. 171.—CARNATION "WIVELSFIELD WONDER": WHITE GROUND, FLAKED WITH ROSE.
(Exhibited by Messrs. Allwood Bros. at the Perpetual-flowering Carnation Society's Exhibition.)

This exhibit comprised Potatoes, Ailsa Craig Onions, Veitch's Self-Protecting Broccoli, Solidity Brussels Sprouts, St. Valery Carrots, and Clark's Empress Celery. 2nd, the Misses MACLENNAN, Springfield House, Aberdeen (gr. Mr. William Scorgie).

Non-competitive displays proved an attractive feature; the most important exhibit being shown by the Secretary, Mr. SINCLAIR. His exhibit included Nerines, Poinsettias, Gerberas, Chrysanthemums, Begonia Gloire de Lorraine, Ferns, Palms, and a number of richly-berried plants. Messrs. THOMAS RIVERS & SONS, Sawbridgeworth, Hertfordshire, and Messrs. GEORGE BUNYARD & Co., Maidstone, showed remarkably fine displays of Apples; the ICHTHEMIC GUANO Co., Ipswich, had a display of their specialities.

mount; 3rd, Messrs. YOUNG & Co., Hatherley, Cheltenham.

Mr. BERTIE E. BELL, Guernsey, won the Challenge Cup offered for three vases of British novelties raised during the past two years with Coronation, Judith and Constance. The American Challenge Cup, offered for American-raised novelties, was won by Mr. W. E. WALLACE, Eaton Bray, with excellent blooms of Gloriosa, May Day and Scarlet Glow. Messrs. B. E. BELL and W. WELLS & Co., Merstham, were placed 2nd and 3rd respectively in this class.

Mr. WALLACE also won the "Covent Garden" Cup offered for market varieties, showing Dorothy Gordon and White Wonder; 2nd, Mrs. D. M. COLLINS.

Mr. WALLACE was also successful in the class for 25 blooms of the variety Enchantress.

his flowers also winning the Silver-gilt Medal offered for the best vase of Carnations shown in the trade classes.

Mr. WALLACE also excelled in the classes for 25 blooms of May Day, 25 blooms of a scarlet variety, staging Scarlet Glow, and 25 blooms of Rose-pink Enchantress, being followed in all cases by Mr. BELL, who was placed 1st in the class for 25 blooms of the variety Mrs. C. W. Ward, Mr. WALLACE being 2nd.

For 25 blooms of any white variety, Mrs. D. M. COLLINS was placed 1st, with White Perfection, Mr. WALLACE being 2nd.

A special prize offered for 12 blooms, of any registered variety not in commerce, was won by Mr. WALLACE with the variety "Una," which also received an Award of Merit; 2nd, Mr. BELL, with Coronation.

Mr. WALLACE also showed the best decorative vase of 36 blooms arranged and wired for effect, with splendid blooms of May Day.

In the decorative classes other than table decorations, the leading honours were won by Messrs. R. F. FELTON & SONS, Hanover Square.

The large Silver-gilt Challenge Cup offered by the President for a group of plants in bloom, was won by Mrs. BISCHOFFSHEIM, Warren House, Stanmore (gr. Mr. J. H. Bruce), with excellent specimens; 2nd, Lord FURNESS, Grantley Hall, Ripon (gr. Mr. R. Barnett). Sir RANDOLF L. BAKER, Bart., M.P., Blandford (gr. Mr. A. E. Usher), won the "Engelmann" Cup offered for six growing plants in bloom, the "Bush Hill Park Challenge Cup," offered by Messrs. Stuart Low & Co., for their novelties, and the "Burnett" Novelty Challenge Cup, offered for 12 cut blooms, together with other prizes. Lord HILLINGDON, Uxbridge (gr. Mr. A. R. Allan), and Lord BURNHAM, Beaconsfield (gr. Mr. G. Johnson), also won prizes in this section.

NON-COMPETITIVE EXHIBITS.

A large Gold Medal was awarded to Mr. C. ENGELMANN for a collection of cut Carnations; Messrs. STUART LOW & Co., Enfield, were awarded a Gold Medal for a collection of Carnations, and a Silver-gilt Medal was awarded to Mr. G. LANGE, Hampton, for Carnations. A Silver Medal was awarded to the NEWPORT CARNATION NURSERIES for a group of Carnations "Lady Meyer."

SMITHFIELD CLUB.

DECEMBER 4-8.—Whatever the forebodings of country residents may be as regards the future of agriculture, there was no pessimism apparent at this year's Smithfield Cattle Show. The prime fat cattle, the various agricultural instruments of almost luxurious finish, all suggested a flourishing state of affairs rather than lean years. Besides the immense roots of Mangels, such as those of perfect shape and finish, so well shown by such well-known firms as Messrs. SUTTON & SONS, of Reading; Messrs. JAMES CARTER & Co., of Raynes Park; and Messrs. H. KING & Co., Coggeshall, Essex, there was much of interest to gardeners.

As usual, Messrs. SUTTON & SONS had a very attractive stall. Here, set off with vases of fine Cyclamen blooms, were smooth Carrots and Parsnips, gold medal Onions, dishes of Tomato "Winter Beauty," as tempting as during the height of summer, and stems of Brussels Sprouts thickly studded with firm sprouts. Of the many varieties of Potato shown, the large, pebble-shaped Balmoral Castle, which is a second early tuber, is considered by this firm to be a superlative variety. A glass stand contained models of farm pests, which are equally of interest to gardeners. These included the wireworm, the Turnip sawfly, and Potatoes affected with black scab disease.

The sensation Potato was said to be the new tuber "Magnificent" exhibited by Messrs. FINDLAY, Auchtermuchty, N.B., which was being sold at one guinea each or two guineas per lb. This Potato, which is said to be a cross between a natural Irish seedling and a Venezuelan variety, is considered by the raisers to be of the highest quality and a very free cropper.

Messrs. JAS. CARTER & Co. showed an interesting set of tall glass jars illustrating the various processes of making sugar from Beetroots. Alongside, this firm had samples of Sugar Beet and the Sugar Mangel, which has been often grown instead of the smaller root; it contains the

higher percentage of sugar. Messrs. CARTER also exhibited selected roots of Carrot, Parsnips, and a globe-shaped garden Beet.

Other interesting collections of garden produce were shown by Messrs. E. W. KING & Co., who had immense Parsnips; Messrs. TOOGOOD & SON, Southampton, whose stand included well-coloured Tomatoes, ripe vegetable Marrows, and various Gourds.

Highly-coloured Apples were displayed by Messrs. WM. SEABROOK & SONS, Chelmsford; the KING'S ACRE NURSERY Co., Hereford; Messrs. DICKSONS, Chester; and Messrs. W. & J. BROWN, Peterborough.

As was to be expected, there were many exhibits of Potatoes. Most of the exhibitors showed large-sized tubers, as illustrating the capabilities of the varieties, whilst a few growers staged small tubers suitable for seed purposes. For the most part the Scotch growers predominated, but in Messrs. FIDLER, of Reading, whose new variety "Dreadnought" attracted a deal of attention; Messrs. WEBB & SON, Wordsley, Stourbridge; and several other growers, the English counties were well represented.

LAW NOTE.

TENANTS' COMPENSATION.

A MEETING was held recently of the Evesham Market Gardeners' and Fruit Growers' Association to discuss the decision in the Court of Appeal in the case of Kedwell v. Flint. This decision, it is stated, will mean that tenants cannot obtain compensation for any improvements effected during the last 14 years of their tenancy.

The question is being widely discussed among growers, and the proposal is being strongly advocated that what is known as the "Evesham custom" shall be legalised, i.e., that the outgoing tenant of land finds a new tenant, who pays the compensation on taking the land.

The committee have been assisted in their deliberations by Col. Long (who secured the passing of the Market Gardeners' Compensation Act), and they have forwarded the following resolution to Mr. Eyres Monsell, M.P.:

"That this committee meeting of the Evesham and District Market Gardeners' and Fruit-growers' Association view with grave concern the recent decision of the Court of Appeal in Kedwell v. Flint, which points to the fact that the law fails to carry out the intention of the Acts of 1895, 1906, and 1908; and they pray his Majesty's Government to take such immediate legislative action as will make these Acts effective in law as in intention."

It has been assumed by market gardeners, until the decision in the Kedwell v. Flint case, that the intention of the Act had been completely carried out. It now appears, however, that the capital invested by market gardeners in their holdings, including money paid to outgoing tenants, as well as capital subsequently expended in improving the holding, is, by the effect of the decision in the case cited, liable to confiscation.

Obituary.

PHILIP FRY.—We regret to record the death from heart failure, at the age of 82, of Mr. Philip Fry, for 25 years gardener and steward at Addington Park, West Malling, Kent. Mr. Fry was a native of Cirencester, and when a young man he worked for two years in the gardens at Syon House, Brentford. He was a successful hybridiser, and raised a number of new plants and fruits, his latest novelty being *Physalis Bundayii*. He leaves three sons (all gardeners) and four daughters.

STEPHEN TAPLIN.—One of the oldest representatives of the nursery trade in America, Mr. Stephen Taplin, a native of Overton, Hampshire, died at Detroit, Michigan State, on November 9. He was one of a family of florists whose combined achievements have made the name of Taplin familiarly known among florists throughout the United States.

MRS. COOMBER.—The many friends of Mr. T. Coomber The Hendre Gardens, Monmouth, will learn with regret of the death of Mrs. Coomber on the 5th inst., after a long illness.

MARKETS.

COVENT GARDEN, December 6.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—Eds.]

REMARKS.—A consignment of Apples received from Wenatchee comprised about 4,000 cases of well-graded, attractive fruits. Apples in barrels continue a very heavy supply with prices hardening. The first shipment of Oregon Newtown Apples arrived this week, the fruits being in excellent condition. Californian Newtown Pippins are also to hand, and consignments are expected to increase in quantities weekly. Pears are a limited supply from the Channel Islands and France; those from California include the following varieties: Winter Nelis, Easter Beurre, and Doyenné du Comice. Home-grown and Belgian Grapes continue a good supply, showing a slight increase in value. Carefully selected samples of Canon Hall Muscat command good prices. There are fairly good supplies of home-grown Tomatoes, and large quantities of these fruits are arriving from Teneriffe weekly. There are good supplies of Cobnuts, Walnuts, Italian and French Chestnuts, the demand for Nuts being well maintained. Brazils are increasing in value and are expected to be very scarce at Christmas. Californian Seedless or Washington Navel Oranges are due to arrive this week. The Vegetable trade remains quiet, supplies in many instances exceeding the demand. E. H. R., Covent Garden, December 6, 1911.

Edward J. Newborn, December 7, 1911.

THE WEATHER.

THE WEATHER IN WEST HERTS.

Week ending December 6.

Warm and rather wet, with a good record of sunshine.—The first and last days of the week proved cold, but during the intervening five days the weather remained very warm for the time of year, and on one day the temperature in the thermometer screen rose to 54°—a very high reading for December. On the other hand, on the last day of the week the exposed thermometer showed 12° of frost. At 2 feet deep the ground is now of about seasonable warmth, but is 1° colder than the average at 1 foot deep. Rain has fallen on each of the last four days and to the aggregate depth of about three-quarters of an inch. These rains started both the percolation gauges, 2 gallons of rainwater having passed through the gauge on which short grass is growing and 3 gallons through the bare soil gauge. The sun shone on an average for 2 hours 8 minutes a day, or for 40 minutes a day in excess of the usual duration at the beginning of December. The winds were again light, the direction being principally some point between south and west. The mean amount of moisture in the air at 3 o'clock in the afternoon fell short of a seasonable quantity for that hour by 1 per cent.

NOVEMBER.

Seasonable in temperature, wet, very bright, exceptionally windy.—This was, on the whole, a month of about seasonable temperature. The first three weeks were, as a rule, warm for the time of year, while the last 10 days proved very cold. On the warmest day the highest reading in the thermometer screen was 57°, which is a low extreme maximum temperature for the month. On the coldest night the exposed thermometer registered 14° of frost—also a rather low reading for the month. Rain fell on as many as 20 days, and to the total depth of 3 inches, which is half an inch in excess of the average. This was the wettest month as yet of the present year. To show the great dryness of 1911 I may state that there has been as yet only one other month (June) in which the rainfall has been in excess of the average. Snow fell on one day, but there was at no time sufficient to cover the ground. The sun shone on an average for 2 hours 11 minutes a day, or for 21 minutes a day longer than is usual in November. The winds were, as a rule, high, indeed, higher than in any November for 16 years. In no hour, however, did the mean velocity exceed 22 miles—direction W.N.W. For only 122 hours altogether, or 5 days, did the wind come from any point between N. and E. The mean amount of moisture in the atmosphere at 3 p.m. fell short of a seasonable quantity for that hour by 5 per cent.—thus indicating a greater degree of dryness in the air at that hour than any I have yet recorded here in November.

THE AUTUMN.

Warm and dry, with a surprisingly good record of sunshine.—Taken as a whole this was a rather warm autumn. September proved very warm, while October and November were both about seasonable in temperature. It was also a dry season, owing principally to the great dryness of the weather in September. October was also moderately dry. In November, however, the fall of rain was above the mean. The sun shone on an average for 4 hours 7 minutes a day—making this the brightest autumn I have yet recorded here. September proved remarkably sunny, but in October and November the duration of bright sunshine was not much in excess of the average.

OUR UNDERGROUND WATER SUPPLY.

Since the winter half of the drainage year began in October the rainfall has exceeded the average for the same period in the previous 55 years by about one tenth of an inch, which is equivalent to an excess of 1,180 gallons on each acre in this district. At the same time last year there was an excess of 8,370 gallons per acre. E. M., Berkhamsted, December 6.

ANSWERS TO CORRESPONDENTS.

APPLE: J. E. B. W., Herts. The seedling Apple which you suggest may be the result of a cross between Cox's Orange Pippin and Keswick Codlin has very little to recommend it. You will do well to cultivate the reputed parents rather than encourage the seedling.

APPLE DECAYING: J. G. B. and F. H. The injury is known as bitter-pit. The cause is unknown, neither fungi nor insects being—so far as is known—responsible for it.

BEGONIA GLOIRE DE LORRAINE: Lorraine. The flowers you send are remarkably fine and the foliage exceptionally healthy.

CALANTHE DISEASED: Calanthe. A fungus is present at the base of the spike, and has passed into the pseudo-bulb. If the remaining plant is not so badly attacked, treat the plant, on alternate days, with a solution consisting of 1 ounce of liver of sulphur, 2 ounces of soft soap, and one gallon of water.

CARNATIONS: Dianthus. There is no disease present in the plants. The trouble is due to some error in cultivation.

CHRYSANTHEMUM M. LOUIS REMY: G. M. The mauve-coloured flower is doubtless a vegetative sport; such sports are common in Chrysanthemums. If you wish to perpetuate the novelty, it may be possible to do this by taking cuttings from the shoot which bore the strange flower. Cuttings obtained from shoots which bore yellow flowers would prove true M. Louis Remy again next season.

CLUB-ROOT DISEASE IN CABBAGE: G. B. Do not grow Cabbages or any of the Brassica family on the ground occupied by a similar crop in the previous year. Dress the soil with lime and sulphur, applying the lime now at the rate of 15 cwt. per acre and the sulphur in the spring, using 5 cwts. to the acre.

COMMON LAUREL DAMAGED BY INSECTS: D. O. The insect tunnelling the leaves is the larvæ of a small moth known as Lyonetia clerckella, which also attacks the Cherry and Plum. It is not likely to do much harm to Laurels. The larger holes eaten in the leaves have apparently been formed some time since, and may possibly have been caused by another fruit pest—Cladius padi, the Plum and Cherry Leaf Sawfly, which also feeds on Hawthorn, Birch, and Mountain Ash. Should the trouble occur again spray the foliage with arsenate of lead (Swift's paste).

CYCLAMEN MALFORMED: B. J. F. The plants are not diseased; the abnormal development of the flowers is due to high culture, the use of a rich compost being no doubt one of the contributory causes.

EUPHARIS UNHEALTHY: Enquirer. The roots are affected. Sprinkle superphosphate on the soil and stir it into the ground, repeating the application after an interval of two months.

GRUBS ATTACKING ROOTS OF PEACHES: J. H. The grubs are the larvæ of the common weevil. They feed at night-time, and may be trapped with pieces of vegetable such as Potato, Turnip or Carrot. Another means of killing the grubs is to turn the roots out of the pots and spray the roots and soil with carbon bisulphide. The perfect insects still remain to be caught and killed, and this is necessary in order to prevent more eggs from being laid. They generally feed at night, and are apt to fall suddenly to the ground when disturbed. You should place the plants in a group during the day, standing them on a large sticky or greased sheet, then, upon holding the plants on one side late at night and tapping or shaking them, the weevils will fall on the sheet and may be easily caught.

LAWNS: W. D. and C. L. L. Apply a top-dressing of fine soil mixed with some nitrogenous manure, such as nitrate of soda or sulphate of ammonia in the spring. C. L. L. should incorporate seeds of Poa nemoralis sempervirens and Poa trivialis grasses, which are best for growing in the shade.

NAMES OF FRUITS: E. Simmons. 1, Easter Bergamot; 2, Calville St. Sauveur; 3, Beurre de Caen.—D. W. 1, Beurre d'Anjou; 2, decayed, probably Duchesse d'Angoulême.—T. Hall. 1, Byford Wonder; 2, Chelmsford Wonder; 3, Mank's Codlin; 4, Prince Arthur.—Cestrian. 1, Greenup's Pippin; 2, Catshead; 3, Winter Hawthornden.—Ned. Wadhurst Pippin.

NAMES OF PLANTS: A. H. D. 1, Bambusa Fortunei variegata; 2, Oplismenus Burmannii var. variegata, commonly known in gardens as Panicum variegatum; 3, Crassula coccinea; 4, Begonia semperflorens; 5, B. s. gigantea; 6, Acacia pulchella; 7, Colletia cruciata.—W. B. Belton. Christ's Thorn (Palurus australis).—L. D. S. Euonymus europæus (Spindle Tree).—E. T. Cymbidium Tracyanum.—F. F. 1, Davallia parvula; 2, Lastrea glabella; 3, Selaginella rubricaulis; 4, Asplenium flaccidum; 5, Adiantum tenerum; 6, Asplenium præmorsum.—R. A. Cypripedium purpuratum.

PRIVET HEDGE DYING: Maesyffynon. The roots are injured by a fungus. Thoroughly soak the soil four times, at intervals of four days, with 1 ounce of nitrate of potash dissolved in one gallon of water.

SPINACH DYING: Constant Reader. The insects which you send are Spring tails (Collembola), and are known as Lipura ambulans. These apterous insects often damage plants below ground. Hoe in soot and lime in equal parts, and treat the land when vacant with vaporite.

THE LIFE OF SIR JOSEPH HOOKER.

FIRST PERIOD, 1817-1839.

JOSEPH DALTON HOOKER was the second son of Sir William Jackson Hooker, and was born at Halesworth, Suffolk, June 30, 1817. William Dawson Hooker, Joseph's only brother, was born in 1816, and died at Kingston, Jamaica, January 1, 1840. He was an ornithologist and entomologist, an M.D. of Glasgow, and a young man of great promise. Sir Joseph was already 48 years of age when his father died, in 1865, and the lives of father and son had been so intimately associated that some particulars of the father's distinguished career naturally precede an account of the son's life and work. Indeed, many events of the one life were of almost equal importance in the other, and many acts, official and otherwise, were the issue of co-operation. Of Sir William Hooker it may be said that he achieved greatness, almost independently, and by individual effort; of Sir Joseph that his greatness was no less the outcome of natural ability, but that that ability was seconded by the special training which he received.

Sir Joseph, in his *Life and Labours* of his father, writes:—"William Jackson Hooker was born at Norwich on July 6, 1785. He was the younger of two sons, the only children of Joseph and Lydia Hooker, of that city. His father was a native of Exeter, the home of many generations of the Devonshire Hookers, descendants of

John Hooker, alias Vowell, First Chamberlain of Exeter and member for the city, and editor of *Holinshed's Chronicles*." When quite a child, William Jackson Hooker inherited a competency, through the premature death of his cousin and godfather, William Jackson, of Canterbury. He developed early a taste for various branches of natural history, in which he could indulge for his own pleasure. Botany, however, soon took the first place in his predilections, and his abilities and enthusiasm gained him a leading position and reputation, even as a young man. William Hooker entertained and corresponded with the most eminent of his contemporaries, both at home and abroad. Locally he became acquainted with Dawson Turner, banker and botanist, Sir James Edward Smith, and John Lindley. And as a young man, barely of age, he was introduced to Sir Joseph Banks and Robert Brown. In 1815 he married the eldest daughter of Dawson Turner, and in as many years there was a family of four children for which to provide. His investments had proved unsuccessful, and he felt it a duty to endeavour to increase his income by means of his botanical knowledge. Through the influence of his friend, Sir Joseph Banks, William Hooker was appointed in 1820 to the Chair of Botany in the Glasgow University. Although his course of education had in no way prepared him for such a post, he proved a brilliant lecturer, and at once became a great favourite. At first there was a little opposition to his introducing the natural system in his teaching; but that was transitory. He held the professorship at Glasgow for 20 years, till, in 1841, he was appointed Director of Kew Gardens.

Meanwhile Joseph was being educated for the long and remarkable career which has now come to an end. As subsequent events prove, his time at school and college was abundantly occupied and the range of his studies was remarkable. In his biography of his father, Joseph Hooker states that much of his own spare time was devoted to mechanical and other work in his father's herbarium.

Evidently, too, the study of Cryptogams was amongst his earliest occupations in botany, for he was joint author with W. H. Harvey, subsequently a specialist in Algae, of a paper entitled "*Musci Indici*"—Hooker's *Journal of Botany*, vol. ii. (1840), pp. 1-21. This appeared, it will be seen, during his absence on the Antarctic Expedition, and is apparently his first publication. That he studied, more or less, all the groups of Cryptogams is confirmed by the fact that he was joint author throughout of the *Flora Antarctica*, although in the rest of the series of volumes specialists worked independently.

Sir Joseph's father and Lindley both made various preliminary arrangements to travel for the purpose, primarily, of botanical exploration, but in each case circumstances conspired to frustrate their plans. Sir Joseph was more fortunate. He qualified for naval service by obtaining the M.D. degree at Glasgow in

1839, and his opportunity arrived. In that year he was attached, as Assistant Surgeon and Naturalist, to Sir James Clark Ross's Government Expedition for the purpose of investigating the phenomena of terrestrial magnetism in the south circumpolar seas. As already mentioned, little is known of what may be termed the preparatory period of Joseph Hooker's life; but his surroundings and associations from boyhood were such as to equip him with all the necessary qualities of a scientific traveller of the first rank.

Among his numerous friends, none perhaps was so keenly interested in his future as Charles Darwin, his senior by only about eight years. Darwin's correspondence with the elder Hooker was limited, apparently, to about half-a-dozen letters, in each of which the son was the principal theme. It should be remembered that Darwin had returned in 1836 from the five-years' voyage in the "Beagle" brimful of facts and observations that served as the foundation for his brilliant work of the then somewhat distant future. Darwin recognised in Hooker a man after his own heart, and predicted for him a great career. He congratulated the father on his son's appointment to the Ross Expedition. The acquaintance thus begun led to the closest friendship, and Joseph Hooker became Charles Darwin's most esteemed and intimate friend and adviser, and one of the leading coadjutors in his imperishable work. Darwin, fresh from his voyage, was in a position to teach the younger man what directions his investigations should take; what facts were required; what evidence was necessary. The results may be gathered from Hooker's essays on the southern floras, culminating in his work on the Australian flora. Darwin's friendliness and prescience were amply rewarded.

AUSTRALASIA AND ANTARCTIC ISLANDS.

Ross's Expedition consisted of two ships, the "Erebus" and "Terror." The former, to which Hooker was attached, was commanded by Ross himself, and the latter by Captain Crozier, under whom Dr. David Lyell served in the same capacity as Hooker on the "Erebus," but Lyell took no active part in working out their joint botanical collections. Later in life Lyell was attached as botanist to the North America Boundary Commission, and made extensive collections, which he subsequently worked out and published.

The expedition left the Medway in September, 1839, and on the outward voyage calls were made at the Azores, Madeira, Canaries, Cape Verde, St. Paul's Rocks, Ascension, St. Helena, and South Trinidad. The visits, though short, furnished material utilised for a lecture on insular floras, delivered before the British Association in 1866, to which further reference will be made. South Trinidad is the island, it will be remembered, that was a subject of dispute between the Governments of Great Britain and Brazil in 1896. Sir Joseph Hooker was the only botanist who had ever set foot on the island. Ross's landing party, however, was unable to scale the cliffs, and so could not reach the interior of the island.

The fragments of only four vascular plants were secured—two Sedges, a Grass and a Fern. The two Sedges were described as new in the Botany of the "Challenger" Expedition, 1884. In this connection it may be mentioned that the interior of the island has since been partially botanised, and among the plants collected is *Asplenium compressum*, previously only known from St. Helena. To follow further this eventful voyage is not within the scope of this memoir, which must be limited to results, and practically to botanical results. With truth it may be said that the botanical results of Ross's expedition surpass those of any similar expedition both in quality and quantity. Their prompt publication established Hooker's reputation as a botanist and traveller of the first rank. The botany of this expedition is indeed a monumental and magnificent work, comprising six quarto volumes, published between 1844 and 1860, and consisting of 2,214 pages of letterpress and 528 plates, mostly drawn (or finished) and lithographed by the talented W. H. Fitch. There is a coloured edition and also a plain one; the original cost of the former being £40 17s. Both are now exceedingly rare.

The secondary titles are: *Flora Antarctica*, *Flora Novæ Zelandiæ*, and *Flora Tasmaniae*; each division consisting of two volumes. The first comprises the Auckland and Campbell Islands, south of New Zealand; Kerguelen, Fuegia, The Falklands, and other islands in the American region. The other titles are sufficiently descriptive.

In the form of an introduction, the *Flora Antarctica* contains a condensed summary of the voyage, and in the second part (pp. 209-223) is an account of the Antarctic flora, excluding the islands south of New Zealand; the *Flora Novæ Zelandiæ* includes an essay on the flora in question; and the *Flora Tasmaniae*, an essay on the flora of Australia. These classical writings are remarkable throughout for the extreme caution with which theories and hypotheses are treated. Indeed, Hooker was never dogmatic; he recorded facts and discussed their bearings and probable or possible meanings, leaving his readers to make their own deductions. Latterly he agreed that some of the theories of almost general acceptance by geologists and phytogeographers of that period deserved serious reconsideration.

The avowed object of the introductory essay to the *Flora of New Zealand* was to instruct the local botanist who had few opportunities of becoming acquainted with the views and theories of their more experienced and advanced brethren in the north, and there is no doubt that the effort has produced excellent results, for the botany of New Zealand has since been as thoroughly investigated as that of almost any country. This essay was published in 1853, some six years before Darwin and Wallace's views of the origin of species became public knowledge; but, as is now generally known, Darwin and Hooker and others had discussed the subject for some years before publication was effected.

On this point the author (p. viii.) says: "Although in this flora I have proceeded on the assumption that species, however they originated or were created, have been handed down to us as such, and that all the individuals of a universal plant have proceeded from one individual, and all of a bisexual from a single pair, I wish it to be distinctly understood that I do not put this forward intending it to be interpreted into an avowal of the adoption of a fixed or unalterable opinion on my part. Whether or not

such a theory be consonant with that great mystery, the origin of organic beings, animate and inanimate, is not the point I would here dwell upon; but the fact that it appears to me essential that the systematist should keep some such definite idea constantly before him, to give unity to his design, and to guide him in the more or less arbitrary restriction of the species of a variable genus to which he is unfortunately often obliged to resort. Except he act on the idea that, for practical purposes at any rate, species are constant, he can never hope to give that precision to his characters of organs and functions which is necessary to render his descriptions useful to others; for in groups where the limits of species cannot be traced (or, what amounts to the same thing in the opinion of many, where they do not exist), the object of the systematist is the same as in groups where they are obvious—to throw their forms into a natural arrangement and to indicate them by tangible characters, whose value is approximately relative to what prevails in genera where the limitation of species is more apparent. In the present imperfect state of our knowledge of the botany of any large area, we have not the materials for solving the great questions as to the origin and permanence of species upon general principles."

This brief yet philosophical treatment of the

FIG. 172.—MEDAL PRESENTED TO SIR JOSEPH HOOKER, BY THE LINNEAN SOCIETY, TO COMMEMORATE HIS 80TH BIRTHDAY.

species question clears the way for a later renunciation of the belief in separate creation, whilst accepting the doctrine of fixity in a certain limited sense.

The greater part of this essay is devoted to the consideration and discussion of the geographical distribution of plants, and in this sense was reviewed by Alphonse de Candolle, Asa Gray, and others, who extracted copiously therefrom. Gray's review, with extracts (*American Journal of Science*, vol. xvii., 1854), is a lengthy one, and concludes in the following terms:—"On fairly weighing all this testimony, the botanist will perhaps accede to our author's conclusion, viz., that the flora of these three great areas of land in southern latitudes exhibit a botanical relationship as strong as that which prevails throughout the lands within the Arctic and northern Temperate zones, and which is not to be accounted for by any theory of transport or of variation, but which is agreeable to the hypothesis of all being members of a once more extensive flora which has been broken up by geological and climatic causes." Some recent writers, notably A. F. W. Schimper, as edited by H. Schenck, in a singularly able and ex-

haustive essay (*Vergleichende Darstellung der Pflanzengeographie der subantarktischen Inseln, insbesondere Ueber Flora und Vegetation von Kerguelen. Wissenschaftliche Ergebnisse der Deutschen Tiefsee Expedition, zweiter Band*, 1905), do not accept this theory, but account for the present flora by the agency of birds, currents and glaciation, with survivals of such types as *Pringlea*, *Pleurophyllum*, etc. This view is accepted by Mr. T. F. Cheeseman in a recent monograph of the flora of the Subantarctic Islands of New Zealand. Nevertheless, the discoveries of recent antarctic expeditions seem to favour the former existence of a circum-polar temperate flora of similar composition throughout.

Alphonse de Candolle, reviewing Hooker, hardly does him justice on the species question, due, probably, to misinterpretation. He postulates that—"Dr. Hooker ne croit pas facilement au transport de graines par le vent ou par les courants, à des distances de plusieurs centaines de lieues. . . . Ainsi en reconnaissant sur chaque île isolée, à Sté-Hélène à Kerguelen et ailleurs, des espèces particulières, il les croit autochtones nées dans la localité dès leur origine. . . . Mais de plus, il les considère volontiers comme les restes de la végétation d'anciennes terres qui auraient disparu en grande partie." And, concerning the genus *Pringlea*, he says:—"Ainsi elle a été créée dans cette localité, pour y vivre pendant des siècles d'une vie tranquille et retirée."

Though Hooker did not always obtain the first fruits of the countries he visited, he often gathered the main harvest. Thus, in the case of the sub-Antarctic islands of New Zealand and Kerguelen, he was the first to describe nearly all of the endemic species of flowering plants, and also the remarkable genera *Pringlea* (though the name is attributed to Robert Brown), *Lyallia*, and the showy *Pleurophyllum* and *Chrysobactron*, now reduced to *Bulbinella*. The *Flora Antarctica* should not be left without mention of the large amount of space devoted to the gigantic Seaweeds belonging to the *Laminariaceæ*, and to the genera *Macrocystis*, *Lessonia*, &c. Extraordinary lengths have been ascribed to plants of *Macrocystis pyrifera*, but Hooker thought that 600 or 700 feet is a reasonable estimate, though later authorities go as far as 200 to 300 metres.

The *Flora Tasmaniae* was published in parts between 1855 and 1860, and is the largest and in several respects the most notable of the three. The first volume consists of cxxviii. + 359 pages and the second of 422 pages, and the two contain 200 consecutively-numbered plates, illustrating all classes of plants except those of microscopic dimensions. Although Hooker was an excellent botanical artist, it is due to the memory of Walter Hood Fitch to repeat that the work owed much of its attractiveness to his genius. It is not an instance, however, in which the pictorial transcends the descriptive part of the book. The introductory essay on the flora of Australia generally is a masterpiece of analysis, written soon after the promulgation of the theory of evolution, and at a time when the author had arrived at a more decided opinion on the origin of species than he held when writing his essay on the flora of New Zealand. To give an idea of the questions discussed would require a whole chapter, and only a few facts and figures can find a place here. As the author states, the primary feature of the flora is its identity in all its main characters with the Victorian, except that there is a small New Zealand element or an element common to the two countries, and a larger Antarctic element. Indeed, it may be fairly described as a part and sample of the flora of extra-tropical Australia. Such characteristic Australian families as *Dilleniaceæ*, *Tremandraceæ*, *Rutaceæ*, *Leguminosæ*, *Myrtaceæ*, *Compositæ*, *Goodeniaceæ*, *Stylidaceæ*, *Epacridaceæ*, *Proteaceæ*, *Santalaceæ*, and *Casuarinaceæ* abound in species. Such genera as *Acacia*, *Eucalyptus* and *Casuarina* predominate in the vegetation. Tasmania has an area of about 26,000 square miles, or little more than a quarter of that of New Zealand, and its mountains rise to a maximum height of 5,000 feet, as against 12,350 feet in New Zealand. Hooker enumerates in his *Handbook* 1,063 species of flowering plants for Tasmania, and 935 species for New Zealand. Subsequent explorations have added considerably to the number of species of flowering plants in

Tasmania, and the number in Cheeseman's *Manual* increases the New Zealand total to 1,571. The increase in the number of New Zealand plants is very largely made up of new species of widely-spread genera. Thus of *Ranunculus* the number has increased from 20 to 38, of *Epilobium* from 17 to 28, of *Senecio* from 19 to 30, of *Veronica* from 40 to 83, of *Carex* from 27 to 54, and of *Poa* from 9 to 25. Hence it will be understood that the data for discussion and deduction are practically unaffected by the additions. A further comparison reveals the fact that the Tasmanian flora, as compared with the New Zealand, is relatively much richer in genera, the numbers being 394 and 346 genera of flowering plants respectively. These figures are taken from Hooker (1860) and Cheeseman (1906), so that, allowing for probable subsequent discoveries in Tasmania, the discrepancy would be greater. The presence of the genera *Anemone* and *Oenothera* in Tasmania, and nowhere else in Australasia, is a noteworthy fact. For later contributions to the flora of Tasmania, Ferdinand Mueller, W. W. Spicer, and L. Rodway should be consulted.

There is a translation of the "Essay on the Flora of Australia," by A. Fr. Graf Marschall, in the *Oesterreichische Botanische Zeitschrift* (vol. xi. [1861] pp. 65-81, 118-128, 155-167), preceded by an introductory note from the pen of D. Stur, a palæontologist of note, in which special allusion is made to the fact that Hooker's ideas of species had undergone a complete change. Darwinism had already taken deep root in Vienna, and Hooker's work was regarded as an extremely valuable contribution to the subject.

There are several preliminary contributions to the Antarctic voyage, of which the principal are: "Flora of Van Diemen's Land (Tasmania)," Hooker's *Journal of Botany*, vol. ii. (1840), pp. 399. This was preceded by a contribution bearing the same title in vol. i., pp. 241-258, by W. J. Hooker, and continued by J. D. Hooker under a somewhat different title in Hooker's *London Journal of Botany*, vol. vi. (1847), p. 265; and in Hooker's *Journal of Botany and Kew Garden Miscellany*, vol. v. (1853), p. 296. As a whole, it is an enumeration with descriptions of some new species.

"Notes on the British Antarctic Expedition," Hooker's *London Journal of Botany*, vol. ii. (1843), pp. 247-329, tt. 9-11. This account consists of extracts from Hooker's letters, edited by his father, and covers nearly the whole voyage, which was an exceedingly perilous one. On one occasion the two ships were in collision in a raging storm among gigantic icebergs and were both seriously damaged. Yet they weathered the storm and escaped the icebergs, although their yards were actually in contact with them. Among the plants figured are the famous "Tussock Grass" (*Dactylis caespitosa*), and the singular *Caltha dionæfolia*. It is noteworthy that only two men were lost during the four years of the expedition, one of whom was washed overboard. This is in striking contrast with the fact that Capt. Cook lost more than a third of his complement on his first voyage, in spite of his special precautions against disease; but the visit to Batavia on the homeward voyage was probably the cause of much of the mortality.

"To A Voyage of Discovery and Research in the Southern and Antarctic Regions, 1839-1843," by Sir James Clark Ross, two vols., 8vo., 1847, Hooker contributed a notice of the botany of the Falkland Islands, vol. ii., pp. 261-277, and of Hermite Island (Tierra del Fuego), pp. 288-302; and vol. i., pp. 339-346, contains Ehrenberg's "Preliminary Notice of the Minute Forms of Organic Life from Materials sent by Dr. Hooker, including seven new genera and 71 new species."

Important among Hooker's later developments on the New Zealand and Antarctic floras are his *Handbook of the New Zealand Flora* (1864-1867) and an account of the botanical collections made in Kerguelen's Land during the transit of Venus Expedition, 1874-5. The plants of the outlying islands are included in the *Handbook*; and an examination of the descriptive history of the plants reveals how deeply Hooker has left his mark on the flora, and this notwithstanding the earlier visits of Banks and Solander, the Forsters, the Cunninghams, and others, several French Government expeditions and one United States expedition. Out of 935 species of flowering plants described in the *Handbook*, 473, or more than half, have the

affix Hook. f., and 16 of the endemic genera are of his foundation. Of course, this was largely due to the fact that numerous New Zealand collectors sent him specimens of their discoveries instead of attempting to classify them.

Several among these endemic genera are of exceptional interest. *Hectorella* (Portulacaceæ) is a monotype of distinct character. *Pleurophyllum* (Compositæ-Asteroidæ), previously mentioned, is a genus of exceeding showy herbaceous plants, restricted to the islands south of New Zealand, and hitherto not brought into successful cultivation. There are excellent coloured figures of two species of *Pleurophyllum* in the *Flora Antarctica*. The huge cushion-like plants, known as vegetable sheep, belong to Hooker's genera *Raoulia* and *Haastia*, numbering collectively about 20 species. *Dactylanthus* (Balanophoraceæ) is a very distinct monotype, a remotely-isolated outlier of this singular family, and was first described in Hooker's admirably-illustrated paper on that peculiar family in the 20th volume of the *Transactions of the Linnean Society*, 1859.

Sir Joseph Hooker's foundations of the botany of New Zealand have been extensively built upon, both biologically and systematically, more especially by residents in the Dominion; and T. F. Cheeseman's *Manual of the New Zealand Flora*, 1906, is an up-to-date amplification of Hooker's *Handbook*. Dr. L. Cockayne is another accomplished writer, but more from a biological standpoint.

An additional minor contribution is "On the Botany of Raoul Island," Kermadecs. *Journal of the Proceedings of the Linnean Society*, vol. i (1856), pp. 125-129.

SIR JOSEPH BANKS IN AUSTRALASIA.

A few words fitly follow here concerning Joseph Banks, Joseph Hooker's forerunner in Australasia, and his father's staunch friend.

The publication of B. Daydon Jackson's "Life of Sir Joseph Banks" in the *Dictionary of National Biography*, and more especially the publication of the *Journal of the Right Honourable Sir Joseph Banks during Captain Cook's First Voyage, 1768-1771*, with portraits and charts, edited by Sir Joseph Hooker, 1896, were tardy acts of justice to the memory of a personage who had been misunderstood and misrepresented through nearly a century of time. The journal threw a new light on Sir Joseph Banks' work and established his reputation as a scientific man. J. H. Maiden's *Sir Joseph Banks, The Father of Australia*, 1909, and Edward Smith's *Life of Sir Joseph Banks, With Some Notices of his Friends and Contemporaries*, 1911, contain additional particulars of the career of Sir Joseph Hooker's illustrious predecessor in Australasia. The latter publication was mainly compiled from correspondence in the Kew Library, and it is dedicated to Sir Joseph Hooker. This is not the place to discuss Banks's work, but mention should be made of the publication by the Trustees of the British Museum of the *Illustrations of the Botany of Captain Cook's Voyage Round the World in H.M.S. Endeavour in 1768-1771*, three volumes, folio, 1900-1905, edited by James Britten. These illustrations are of Australian plants.

In his own day Banks had a reputation for justness, and he earned the thanks of the French nation for effecting the restitution on several occasions of natural history collections captured by British privateers. This trait in his character is enlarged upon in a glowing appreciation by Baron Cuvier, entitled, *Eloge Historique de M. Banks, in the Mémoires du Muséum d'Histoire Naturelle de Paris*, vol. xiii. (1825), p. 297.

THE ARCTIC REGIONS.

Before the completion of his Antarctic work Hooker was already engaged on collections of Arctic plants.

There is a preliminary contribution: "On Some Collections of Arctic Plants," *Journal of the Proceedings of the Linnean Society*, vol. i. (1856), pp. 114-124. This was followed by: "Outline of the Distribution of Arctic Plants," *Transactions of the Linnean Society*, vol. xxiii. (1861), pp. 251-348. This is the first general tabulation of the plants found growing within the arctic circle. The Scandinavian character of the flora, the wide range of the species, and the smallness of the endemic element are among

the prominent features of this paper. Altogether 1,687 species are enumerated—925 Cryptogams and 762 Phanerogams. Of Ferns 28 species are enumerated, of Lycopods seven, and of Horsetails eight. Subsequent explorations have added little to the number of flowering plants and Ferns, but they have established the fact that there is practically no northern limit, except the sea, to phanerogamic vegetation.

Henry Chichester Hart's "Botany of the British Polar Expedition of 1875-6 (*Journal of Botany*, 1880, and Reprint of the same date, pp. 43), is an exceedingly valuable supplement to Hooker's essay. It is a record of the author's personal observations in different latitudes, up to 83° 8', and at different seasons. Concerning the now commonly cultivated *Saxifraga oppositifolia*, the author notes: "Grows in every sort of situation, but luxuriantly only in moist places at low levels. Sometimes produces magnificent effects of purple and rose against the snow. It opened its leaf-buds in a perfectly exposed situation at Polar's Bay with the thermometer at 9° Fahr., on May 14. Gathered at Cape Columbia, lat. 83° 8', the most northern land yet visited by civilised man."

To the *Voyage to the Polar Sea*, by Captain Sir G. S. Nares, 1878, J. D. Hooker and others contributed the botany. Appendix xiv., pp. 301-326.

MISCELLANEOUS EARLY PAPERS.

Hooker's activity was not confined to botanical work, especially during the earlier period. His narratives, notably the *Himalayan Journals*, teem with information on a variety of subjects. He also published a number of separate papers mostly unconnected with recent botany; among them:—

"On the Examination of some Fossil Wood from the Macquarie Plains, Tasmania," *Tasmania Journal of Natural Science*, i., 1842, p. 24.

"Note on a Fossil Plant from the Fish River, South Africa," *Geological Society's Transactions*, vol. vii. (1845-56), p. 227.

"Note on Some Marine Animals brought up by Deep-sea Dredging during the Antarctic Voyage of Captain Sir James Ross," *Annals of Natural History*, vol. xvi. (1845), pp. 238-239.

"On the Diatomaceous Vegetation of the Antarctic Ocean," *British Association Report*, 1847, pt. 2, pp. 83-85.

"Remarks on the Structure and Affinities of Some Lepidostrobi," *Geological Survey Memoirs*, vol. ii. (1848), pp. 440-456.

"On the Vegetation of the Carboniferous Period, as Compared with that of the Present Day," *Geological Survey Memoirs*, vol. ii. (1848), pp. 387-430, &c.

It may be recorded here that Hooker was appointed botanist to the Geological Survey of Great Britain in 1846, a post he held only a short time, probably on account of his mission to India in 1847.

"Extract from a Letter to Professor Wheatstone on the Temperature of the Soil in Egypt, etc.," *British Association Report*, 1848, pt. 2, pp. 17-19.

"On some peculiarities in the Structure of Stigmara," *Geological Survey Memoirs*, vol. ii. (1848), pp. 431-439.

"On the Probable Extent of the Flora of the Coal-formation in Britain," *Silliman's Journal*, vol. viii. (1849), pp. 131-133.

"Report on substances used as food exhibited at the Great Exhibition of 1851," by J. D. Hooker, pp. 123-162. Historically, this is an interesting document, especially for comparison with the products of the present day and their sources.

"On Some Minute Seed-vessels (Carpolithes ovulum) from the Eocene Beds of Lewisham, and on Some Small Seed-vessels (Folliculites minutulus) from the Bovey Tracey Coal," *Quarterly Journal of the Geological Society of London*, vol. xi. (1855), pp. 562-570, plates 16 and 17.

"On the Structure of Certain Limestone Nodules (Trigonocarpus)," *Philosophical Transactions*, 1855, pp. 149-156.

"Note on an eatable Nostoc in the Arctic Regions and the mountains of Central Asia," *Journal of the Proceedings of the Linnean Society*, vol. ii. (1855), pp. 166-169.

"On some remarkable Erostates on the roots of various species of Coniferae," *Journal of the Proceedings of the Linnean Society*, vol. ii. (1855), pp. 335-336. W. Botting Hemsley.

(To be continued.)

ORCHID NOTES AND GLEANINGS.

MESSRS. ARMSTRONG & BROWN.

THE model Orchid establishment of Messrs. Armstrong & Brown, situated on high ground in one of the most delightful parts of Kent and close to the Southborough Station of Tunbridge Wells, is an excellent example of a perfectly-planned nursery. The main block of houses consists of eleven commodious span-roofed structures, which open into a lofty corridor about 150 feet in length.

In the internal arrangement of the houses there are some special features worthy of note. The illustration (fig. 173) of one of the Cypripedium houses serves to show the brick-work arrangement beneath the staging, which Mr. Armstrong considers a very important help in ensuring uniform moisture and even temperatures. The brickwork is kept in a moist condition, and the hot-water piping, which is laid as low as possible, gives warmth to the walls, which in turn radiate heat and evaporate moisture, thus preserving a healthy atmosphere and preventing rapid falls in the temperature, which often happen in winter, when the hot-water piping is solely relied on. Proof of the salutary effect is seen in the healthy and clean condition of every plant on the place.

The brickwork also serves another purpose. In the building of the outside walls bricks are arranged projecting inside, and below the top course of the arched walls seen in the illustration is a ledge from which from front to back angle-iron is arranged to support the tilts covered with shingle, which form the lower moisture-holding stage. Openings are left in this stage to admit of the even circulation of the heat. Most of the houses have a $4\frac{1}{2}$ -inch ledge just below the eaves inside, and on this the drip-guttering fastened beneath the rafters discharges moisture and assist in keeping the wall moist. These ledges are used for supporting small plants, and they thrive well, especially the moisture-loving kinds, a remarkable example being *Cœlogyne pandurata*, which, from single bulbs, is making strong plants.

The effect of this automatically-balanced heat and moisture is that heavy waterings are not required. Spraying is the favourite method of distributing moisture. In the many houses of fine hybrid *Cattleyas* and *Lælio-Cattleyas*, each bearing the earliest pseudo-bulb an inch or so high, and the later pseudo-bulbs showing the rapid progress of the plants, some of which now bear two or three leading growths with flower spikes, the material in the pots is comparatively dry, though filled with roots. It is certain that *Cattleyas* and *Lælias* root more freely in a properly-arranged house, where the plants can be kept plump without heavy waterings. Four saddle boilers give perfect command of the heating power, but they are worked at low pressure.

For potting material a little-known fibre called A.1., and said to be a British product, is much used here either for mixing with *Osmunda* or alone. It is finer than *Osmunda* fibre, and said to be more durable and free from fungus. Potting is carried on all the year round. When plants require repotting the date of season is not considered, but in the winter months special care is taken in watering newly-potted plants. The long corridor has suspended from the roof some thousands of hybrid *Dendrobiums* showing marvellous growth, some of the *D. rubens grandiflorum* class having stems 4 feet in length. Here also is a fine collection of *D. nobile* varieties, including about 2,000 plants of the pure white variety, many of which were shown in our illustration of Messrs. Armstrong & Brown's group of this plant at the Royal Horticultural Society's meeting in the issue for July 3, 1909.

An interesting plant in the corridor is a mass of *Cattleya Trianae* fastened to the brick wall, and sending roots around 5 feet or 6 feet in length, and clinging to the wall.

The first house is principally of showy *Lælio-*

Cattleyas, some of which were in flower, the most striking being a batch of *L.-C. George Woodhams* (*C. Hardyana* × *L. purpurata*), raised by Mr. Armstrong. Its flowers are large, of very rich rose and claret-crimson colour, and it appears to be one of the first introductions to excel *L.-C. callistoglossa*, which is also in flower. A batch of the showy *Cattleya Armstrongiæ* (*Hardyana* × *Loddigesii*) with some in bloom, bearing six or seven flowers on a spike; *C. Atalanta*, with seven flowers on a spike; some *Lælio-Cattleyas*, one being an improvement of *L.-C. Exoniensis*, and others were in bloom, and fine specimens of *Cœlogyne Dayana* with enormous growths were thriving on the stage. The second house was of *Cypripediums* mostly in flower, overhead being suspended seedling *Lælio-Cattleyas*, *Sophro-Cattleyas*, &c. Of the *Cypripediums* *C. Franconia* (*callo-Rothschildianum* × *callosum Sanderæ*) was a grand flower, the long and broad petals being uniformly spotted with claret-purple. In most of the houses are some interesting and curious species, *Cirrhopetalum appendiculatum*, *Bulbophyllum Godseffianum*, and some others being in bloom. The third house con-

insigne and *C. nitens* varieties, special forms of *C. Leeanaum*, and some new hybrids were among those in flower, and at the end was a good specimen of the rare rose-tinted *Oncidium cory-nephorum*.

The seventh large house contains thousands of seedling *Odontoglossums* with *Odontiodas*. Many of the plants were in flower or bearing spikes; one fine specimen had a heavy inflorescence of 18 large flowers, with a large seed capsule maturing on last year's spike, showing that good cultivation prevents deterioration even under such conditions. At one end of the house was probably the largest mass of *Odontoglossum nævium* in cultivation, some pretty mauve-coloured *Odontioda Thwaitesii*, and *Cattleya Skinneri alba* with seven leading growths.

Lælio-Cattleyas and *Cattleyas* in fine condition occupy the next house, with *L.-C. callistoglossa*, *L.-C. Berthe Fournier*, plants of *Cattleya Fabia*, including the variety *alba*, and others in flower, *Dendrobium Cœlogyne* having three fine blooms. Secondary crosses with *Cattleya Dowiana* promised well for bloom.

The succeeding house was filled with thousands of hybrid *Cattleyas* and *Lælio-Cattleyas*,

FIG. 173.—CYPRIPEDIUM HOUSE AT MESSRS. ARMSTRONG AND BROWN'S NURSERY.

tains *Cypripediums*, *C. bellatulum*, with very large and well-marked flowers, evidently liking a position on the moist ledge near the glass of the roof. In this house are quantities of unflowered seedlings, and suspended overhead are some *Dendrobium* crosses, one being very interesting, as it promises to prove that *D. Sibyl* is not the result of crossing *D. Linawianum* and *D. bigibbum*. This cross is *D. Linawianum* × *D. crassinode*, and the plants are not distinguishable from *D. Sibyl*.

Next we come to a house nearly filled with *Brassavola Digbyana* crosses, including all the known varieties and some as yet unflowered. Several very handsome *B.-C. Mrs. J. Leemann*, a showy lot of *Cattleya Fabia* of rich colour, *Platyclinis Cobbiana*, with graceful sprays of yellow-lipped white flowers smelling like *Celery*, and other pretty plants were in bloom.

The house of *Cypripediums* (fig. 173) comes next. The profusion of flowers may be judged by reference to the illustration, but not their varying tints. Many plants of *C. Fairrieanum* crosses, including the neat little *C. Mrs. Spender Clay* (*Actæus* × *Fairrieanum*), a large batch of *C.*

and throughout the remainder of the block vigorous and clean plants were seen on all sides.

Approached through the spacious packing shed is a block of smaller houses containing rarer plants, including white *Cattleyas* and *Cypripediums* for purposes of hybridisation or propagation. Among those in flower were *Cypripedium Bianca*, the first rival of the pretty *C. insigne Sanderæ*, and of the same yellow and white colour, but larger and of better shape; *C. Thalia Mrs. Francis Wellesley*, a standard beauty; *C. Germaine Opoix*; some very fine *C. Priam*; a new form of *C. Arthurianum*, with flowers resembling *C. Thalia*; *C. Niobe Westonbirt* variety; *C. Gaston Bultel*; a batch of *C. Maudiae* × *C. callosum Sanderæ*, which seems to be the best and most floriferous *Cypripedium* with emerald-green and white flowers; *C. Dreadnought*, a massive flower; *C. Duke of Connaught*, of great beauty, the emerald-green and white of the dorsal sepal being very attractive, and the dark spotting remarkable; several crosses with *C. insigne Harefield Hall* showing marked improvement; *C. Dayanum* × *bellatulum album*, a distinct flower, and a very large

number flowering for the first time, but not yet established sufficiently to estimate their value.

In another house secondary crosses of Cattleya Bowringiana and various Lælio-Cattleyas were maturing, and a batch of plants of botanical interest included some of the showier Bulbophyllums, such as *B. Ericssonii*, *B. virescens*, and *B. Reinwardtii*.

The seed-raising house is fitted with glass-covered cases, inside which a rather high temperature is maintained, and the seeds germinate rapidly. They are removed when large enough to handle, and many attain the flowering stage in a very short time. A plant of Cattleya Mendelii Stuart Low and other rare sorts are in this house, which also contains Dendrobium superbum album, and several interesting crosses of *D. Dalhousianum*.

A north lean-to house contains a good selection of good forms of *Odontoglossum crispum*, and some of the best hybrids, *Cymbidiums*, *Lycastes*, and other intermediate house plants in fine condition.

CYPRIPEDIUM CHAPMANII "WESTONBIRT VARIETY."

THE original form of this showy hybrid was raised by Mr. H. J. Chapman. On May 26, 1897, it was awarded a First-class Certificate, and was always a great favourite. The variety illustrated, raised by Mr. H. G. Alexander, gardener to Lieut.-Col. Sir George L. Holford, between fine forms of *C. bellatulum* and *C. Curtisii*, was shown on November 21 last, and it secured a similar award. It is larger than the original, and of a deeper claret-purple tint in the markings on its cream-white ground colour, which is also tinged with rose between the markings. *C. Chapmanii* has another advantage as a desirable garden plant in that it is one of the best growers in the section.

ILLUSTRATIONS OF ORCHIDS.*

THE first issue of this publication by Monsieur Julien Constantin indicates that the work when complete will form a valuable addition to Orchid literature, especially if taken in conjunction with *Les Orchidées Cultivées*. The object of the *Atlas* is to describe and illustrate as many of the Orchids in cultivation as possible, and yet not to exceed a handy volume in bulk. The work commences with the history of the Orchid family; the structure, variations and other characteristics of these plants. The plates represent the principal members of the genus *Cypripedium*, each being very much reduced in size, but faithful in form and colour.

TREES AND SHRUBS.

EUCRYPHIA CORDIFOLIA.

A SPECIMEN of this handsome, evergreen, Chilean shrub has for the past three years flowered annually in these gardens, and has now ripened seed. The capsules apparently require 14 or 15 months to mature in England, increasing slowly in size for at least 10 months before showing any sign of ripening. In common with most other plants, this year's crop of seeds is far more plentiful than usual. The plant is now about 13 feet in height and one-third as much in width. It is sheltered at a distance of 12 yards by a wall 9 feet high and a thin grove of trees on the north and east at distances 30 and 50 yards respectively, but it is fully exposed to the sun. Our experience proves that the plant is not so tender as is generally supposed. The sandy loam in which it is growing appears to suit it; its average increase in height for the past three years having been 2 ft. 3 in. The strongest shoots are rarely matured when checked by frost, but, though the youngest leaves are browned thereby, the terminal bud is only occasionally destroyed. I enclose a few sprays bearing seed capsules. *J. Comber, Nyman's Gardens, Handcross.*

* *Atlas des Orchidées Cultivées*. E. Orliac, 1, Rue Dante, Paris.

THE ROSARY.

THE PRUNING OF ROSES.

THE N.R.S. have recently issued to their members the third edition of the *Handbook on Pruning Roses**, containing directions for pruning some 1,200 to 1,300 varieties of Roses. The book follows very much on the lines of its predecessors, and it is only necessary to notice the modifications that have been made in the present edition. In the earlier instructions for pruning the ordinary garden Roses, that is to say, H.P.'s, H.T.'s, and Teas, the three illustrations showing the unpruned Rose which appeared in

for exhibition and garden purposes. The advantage of this alteration is not, at first sight, very obvious. It would seem generally more convenient to have the instruction placed opposite the drawing illustrating it, but, probably, the object may have been to bring into sharper contrast and accentuate the difference between pruning for exhibition and for garden purposes.

The book now contains two very clear drawings showing how to prune dwarf Tea Roses. In the previous editions, the only drawings illustrating the pruning of dwarf or bush Roses had probably been taken entirely from hybrid perpetuals, and many members had found themselves at a loss when they tried to apply the

FIG. 174.—CYPRIPEDIUM CHAPMANII "WESTONBIRT VARIETY."
(Received R.H.S First-class Certificate on the 21st ult.)

former editions are now generally omitted, no doubt with the object of saving space, and in view of the fact that in the illustrations showing the pruned plant the parts that have been cut off are shown in dotted lines, so that the size and features of the unpruned plant may be gathered from them.

The drawings illustrating the instructions for pruning, instead of facing the instruction to which they relate, are now collected together in pairs, so that each of the pair faces the other; the pair of illustrations in most cases representing the different ways of pruning the same Rose

methods shown in drawings which illustrated the rather stiff and upright habit of these varieties of the Roses of a more spreading and branching habit of growth, such as is generally found to be the case among the Tea Roses. The illustrations now inserted in the *Pruning Book* show how to deal with Roses of this branching type.

The instructions for pruning the summer-flowering, climbing Roses contained in the *Multiflora scandens* and *Wichuraiana* groups have been entirely revised and rewritten (see Instructions xxv. and xxxv.), and as these are both clear and concise, there should be little difficulty in following them, or in understanding the reasons for the operations suggested. The

* *Handbook on Pruning Roses*. Price to non-members of the society, 2s. 6d.

directions as to the time of pruning, especially in the case of the Wichuraianas, raises a question of some interest, which is, perhaps, scarcely yet settled. At the head of the instruction we find: "Prune as soon as possible after flowering is well over"; while later on it is stated: "The pruning . . . may be done as soon as the flowering is over, and should be completed by the autumn or early winter." Now, nearly all the Wichuraianas have finished flowering by the middle or end of August, and some earlier, and, admitting that the pruning of these Roses ought to be completed before the spring growth commences, the problem is whether it is better to prune in August or early winter, say, about Christmas time. The advantages of August pruning are, first, that we allow the young growths on which we are to depend for flowers next year all the sun and air they can get for ripening the wood, second, that we are able to get rid of the loose, surplus growth of summer, and make pillar or pergola neat and tidy in the autumn garden, and, third, that we have probably pleasanter weather for performing the operation. The disadvantages of August pruning, which operate in favour of deferring the operation till Christmas, are that we suddenly cut off, in August, an enormous mass of foliage, which must cause a check to the nutrition of the plant; we miss the chance of obtaining the occasional autumn flowers which, in some seasons, may be intermittently produced up to Christmas (it is curious that in the autumn following the hot summer of 1911 we seem, at least in some places, to have less of this intermittent autumn flowering than is usually the case), and, what is, perhaps, more important than anything else, we lose the rich autumnal effect produced by many Roses of this class, Dorothy Perkins, for example, when the foliage darkens and begins to turn a russet-red in the autumn frosts. It is quite likely that not only do we want further experiment and observation to settle the question, but also that the one method may be best for one position or use to which the Rose is put, and the other for other positions and uses.

Since the last edition, the names of nearly 200 Roses have been added to the list at the end of the book, which gives for each variety a reference to the instruction suitable for its treatment. This list is interesting from another point of view, for it is probably a fairly complete enumeration of the Roses now commonly cultivated in gardens. Taken all round, this little book is, perhaps, one of the most useful and generally appreciated of the National Rose Society's publications. *White Rose.*

THE ALPINE GARDEN.

HELICHRYSUM FRIGIDUM.

THE rare little *Helichrysum frigidum* has largely dropped out of cultivation, but as importations from Corsica, its native country, have been made recently, it is to be hoped that it will become plentiful again. It is classed by some authorities as only half-hardy, but with care it may be expected to stand ordinary winters. It requires, however, a very dry and well-drained soil and a sunny, sheltered position. A wise precaution will be taken if a sheet of glass is put over it to throw off the winter rains and sleet. This *Helichrysum* is one of the plants with silky foliage which require some shelter of this kind. It is not a showy, but a pleasing little plant, growing to a height of some 3 inches or so, having little leaves covered with silky hair, and bearing heads of small, silvery-white flowers. It is of rather trailing habit, and is excellent for the dry, sunny rockery. *S. Arnott.*

BACK TO THE HILLS.

(Continued from p. 410.)

THE FASSA-THAL.

THE Fassa Valley runs up into the heart of the Southern Dolomites, and in its higher reaches gives, not limestone only, but long out-crops of black igneous rock, where the flora changes instantly. At its lower end the Fassa-Thal becomes the Fleimser-Thal, and indulges in a perfect riot of miscellaneous igneous formations, porphyry and syenite, arranged in a manner which violates all geological propriety. From Canazei, however, at the head of the valley, the way goes smooth and calcareous up to the Fedaja Pass, under the northern face of Marmolata. By the rivulets, *Silene alpestris* abounds, and *Papaver rhæticum* has seeded down into the shingles by the stream. As soon as you enter the wood *Saxifraga squarrosa* begins to luxuriate in all the mossy crannies of the boulders. The more one sees of this charming little plant, the greater grows one's bewilderment as to its analogies with *S. cæsia*. *S. cæsia* is an almost universal plant. *S. squarrosa* is a much rarer one, endemic to the Dolomites; it haunts the lower mossy rocks for choice, as it seems to me, though it also ranges up to the bare, open cliffs above. It is up above, however, that *cæsia* is almost always found in the Dolomites—far up, on bare shingles and desolations. Yet here its twin, *S. squarrosa*, may also be found; and the two species, so closely allied as sometimes to seem indistinguishable, interbreed and produce *S. tyrolensis*.

As for *S. crustata*, the plant is so really ugly in flower that the gardener must resist the charm of its lovely silvered foliage. It is uglier than the ugliest aizoon, which also abounds on the Fedaja, though at much higher levels, and on much more open rocks, than those affected by *crustata*. Whereas, above Misurina, *S. crustata* climbs high upon the bare rocks, and *S. aizoon* rarely occurs at all. As the path continues climbing through the woodland, *Gentiana asclepiadea* grows frequent, and higher yet, on open slopes, *Anemone baldensis* runs about amid a solid carpet of purple *Horminum* and scarlet-orange *Senecio abrotanifolius*. The *Horminum* is a plant of intensely calcicole nature, and is lauded by catalogues. I share fully the view expressed not long ago in the *Gardeners' Chronicle*, that it is a dowdy weed, like a very inferior dingy *Salvia*, unworthy of notice. I have once, however, collected a beautiful form of it (the plant grows by the sheeted mile in the Dolomites), large-flowered and white, with a very faint, delicate hem of purple round the lip. As to *Senecio abrotanifolius*, fine-leaved, dainty and neat, it is absolutely gorgeous in its colouring. Alas, I have often grown it, but never yet have I made it flower as it should.

The path now passes under cliffs, from which the Flannel-flower flaunts in bushes. And also, much more pleasant than the Edelweiss, and much less plebeianly profuse, there are soft-green rosettes of *Primula Auricula* in one of its most marked local developments—not *Auricula*-type of the Oberland, not glorious great grey-and-silver *A. Bauhini* of Lombardy, not *A. ciliata*, golden and brilliant, of the Misurina ridges—but a form, probably, of *P. A. Obristii*, green and downy, with flowers of a bland, pale-sulphur (in at least one specimen of mine). This grows in dense limestone rock, with *Pæderota Bona-rotta* and *Saxifraga squarrosa*. And there remains at least one other form of *Auricula*, so far unnamed, I think, and undescribed—the flimsy-green, musk-scented plant from wooded rocks on Rocca Longa, whose flower I have never yet seen, though I have thrice collected the rosette, and proved it unvarying in culture. The leaves, however, darken to a sombre green in the garden, and their texture becomes much thicker.

The summit of the pass is not very repaying. Here the Marmolata descends in long, stone-slopes, all aglow with Alpine Poppy and *Thlaspi*,

with here and there rare mats in the shingle of *Saxifraga cæsia*, *S. squarrosa* and *Potentilla nitida*. Otherwise there is little, except *Armeria alpina* turning a neighbouring meadow into a sheet of pink. So wet a meadow, too, that from afar I swore that the *Armeria* was *Allium Schoenoprasum*. And the Marmolata, seen from here, is only a vast, confused, and not very dignified snowfield—like a colossal rotten tooth, many miles long, filled up with snow between its cusps. However, if one ascends on the opposite ridge the mass begins to gain in impressiveness by dint of mere size. One climbs and climbs. This ridge is all igneous, and the flowers different. Suddenly at the path-side, there is an eruption of blue flares on a dark little stone-heap. It is *Eritrichium*. Immediately, disregarding all the many acres there of flowering *Primula longiflora*, I rushed and toiled to the high crest of the ridge. And never have I seen such sights. I do not exaggerate when I say that all those crags and cliffs and screes glimmered azure from many hundred yards away. The ridge was of a curious volcanic conglomerate, black and blasted. On its rocks, wherever celestial slabs of *Eritrichium* left room, there were *Geum reptans*, *Ranunculus glacialis*, *Androsace alpina* (*glacialis*). But this was an *A. alpina* quite new to me. One knows this species well, the roseate glory of the highest granitic shingle, of which albinos are of rare occurrence. Yet here, and always on the igneous rock of the Dolomites, the plant inhabited, not fine shingles, but very rough débris or precipitous cliffs, exactly after the heart of *A. helvetica*. And here its flowers are invariably white. In many thousand specimens, I only saw two with a very faint and feeble tinge of rose. Then there was *Primula minima* lingering in bloom on the turf arête, and, actually, in those volcanic cliffs, a fair quantity of the vehemently calcicole *Androsace helvetica*. Last of all, on a stark cliff impending over gulfs unguessed, there was *Eritrichium nanum grandiflorum album virginale*, *foliis aureo-variegatis*—a marvel of white beauty, indeed, on its impregnable ledge. I imperilled my life to poke off a cutting, but with no result. *Reginald Farrer.*

(To be continued.)

SCOTLAND.

EDINBURGH ROYAL BOTANIC GARDENS.

THE dispute between the Corporation of Edinburgh and the Commissioners of His Majesty's Board of Works, regarding the building line of the proposed addition to the buildings at the Edinburgh Royal Botanic Gardens, has reached a stage at which the powers of the Court of Session are invoked by the Corporation. The record in the case has just been closed. It takes the form of an action by the Corporation against the Lord Advocate, as representing the Commissioners of the Board of Works for declarator that the defenders have no right to erect houses or buildings on a portion of the Royal Botanic Gardens at a distance of 30 feet from the centre line of the street (Inverleith Row), or to erect houses, walls, or other buildings above 7 feet high there, within a distance of 25 feet from the centre, without the consent of the complainers. Interdict is also sought against the erection of the buildings.

The defenders plead under Section 78 of the Act of 1906 their property is exempted as well as at common law, being Crown property.

In the record various statements are also made regarding the buildings erected in 1910. Lord Cullen has sent the case to the Procedure Roll.

THE "SCOTTISH BOTANICAL REVIEW."

THIS is the name of a promising new venture in the shape of a quarterly magazine, the first number of which will be issued in January. It has originated because of the decision of the

Annals of Scottish Natural History to give up its botanical section, and to limit itself to zoology. From the circular which is being issued, we gather that the magazine will, in the first place, be devoted to Scottish botany, but that this will be interpreted in its broadest sense. It is to have the support, financial and otherwise, of the Edinburgh Botanical Society, under whose auspices it will be published.

BLAIRGOWRIE AND RATTRAY FRUIT-GROWERS' ASSOCIATION.

At the annual meeting of this association it was reported that the sales of fruit through the association had amounted to 340 tons. Although there was a larger number of members, this was a decrease upon the quantity of last year. Ex-Baillie Adamson has been re-appointed president.

RETIREMENT OF MR. CHAPMAN.

MR. M. CHAPMAN, for many years gardener to the late Charles Jenner, Esq., Easter Duddington Lodge, Edinburgh, and who has for a number of years been in business as a nurseryman at Torbrex Nurseries, St. Ninians, Stirling, has disposed of the nursery and will retire to private life, residing at Bannockburn Road, Stirling. At the Torbrex Nurseries Mr. Chapman made a speciality of alpine and other hardy flowers, and he hopes to spend his leisure in tending his favourite alpine in his garden.

FLORISTS' FLOWERS.

SELECT VARIETIES OF VIOLAS.

SOME years ago the fancy Pansy held a very high place in the floral world, and as a competition flower was second to none in the amateur's estimation, but as the Show Pansy had to make room for the Fancy, so also has the latter given place in large measure to the Viola.

With the exception of the Sweet Pea, there is probably no more popular flower than the Viola at the present time.

Where Violas do best is a question often asked and readily answered, as these hardy, free-flowering subjects seem to succeed in almost any position in the garden. It would, of course, be quite useless to plant them in a position where there is a total absence of sun, for sunshine has much to do with their well-being.

They may be used for many purposes, but when massed in beds in large gardens they are seen to advantage, while for ribbon border work they are really charming during the spring and early summer. Of late years they have also been much used for carpeting Rose beds, while in terrace borders they may be employed with great effect, and if planted in groups in a herbaceous border they will add greatly to its attractiveness.

A few of the best bedding varieties and colours are:—

WHITE: Swan, Seagull, Snowflake, and White Empress.

BLUE: True Blue, Admiral of the Blue, Royal Scot, and Chas. Jordan.

PURPLE: J. B. Riding, Councillor Waters, and Mrs. C. Turner.

YELLOW: Redbraes Yellow, Grievei, Walter Welsh, Klondyke, and Moseley Perfection.

LAVENDER and LILAC: Kitty Bell, Maggie Mott, Mauve Queen, and Ophelia.

BLUSH or PALE ROSE: Wm. Neil, Florizel, and Come to Stay.

WHITE GROUND EDGE VARIETIES: Mrs. Chichester, Lark, and Lady Grant.

YELLOW and PRIMROSE GROUND EDGED VARIETIES: Minnie J. Allan and W. P. A. Smyth.

FANCY VARIETIES: Griffin Smith, Mrs. F. W. R. Johnstone, and Dr. McFarlane. J. B. M.

OSTEOMELES ANTHYLLIDIFOLIA.

THE genus *Osteomeles* has a very wide range of distribution, occurring in China, Japan, the Sandwich Isles, the Andes of Peru, and the islands of the Archipelago of Magellan. *Osteomeles anthyllidifolia* (see fig. 175) was discovered by the Abbé Delavay, who sent seeds to Paris, from which plants were raised. Although it belongs to the natural order Rosaceæ, this species, when not in flower, might very easily be mistaken for a papilionaceous-flowered leguminous plant, and it owes its specific name to the appearance of its long, pinnate leaves, which closely resemble the foliage of a Kidney Vetch (*Anthyllis*). In Paris, where it is cultivated in an unheated house, it has formed a shrub about 5 feet in height, with slightly twisted and gracefully inclined branches of a purplish-brown colour and densely coated with tomentum when in a young state. The leaves, which are alternate, are composed of 10 or 11 pairs of small, oval-cuminate

peat in a cold house. It is quite possible that the seed may not germinate until the second year after sowing, so that if no seedlings make their appearance during the first year, one must wait patiently to see what the second year may bring forth. The seedlings should be potted at about the end of August in 2-inch pots, and placed in a close frame for some time to facilitate their forming roots. In October the young plants may be removed to a cold house for the winter. In the following August the plants may be shifted into pots proportionate to their size, and treated in exactly the same way as they were during their first year. By following these directions, vigorous and thriving plants may be obtained in three or four years from the time of sowing the seed. This *Osteomeles* may also be increased by cuttings of half-herbaceous shoots inserted under bell-glasses in a cold house in July and August. The cuttings should afterwards be potted singly into small pots. They usually take from a month and a half

[Photograph by Wyndham Fitzherbert.]

FIG. 175.—OSTEOMELES ANTHYLLIDIFOLIA FLOWERING AT KINGSWEAR, DEVON.

leaflets, which are very downy on both sides. The flowers are white, and are borne in terminal corymbs of from 10 to 25 blossoms. Plants grown under glass produced flowers in February, but in the open the blossoms do not appear until April or May. This year the *Osteomeles* flowered in the latter month, and retained some of its blooms until June. The flowers are succeeded by clusters of small, oval, fleshy fruits, somewhat resembling those of some kinds of *Cotoneaster*. These fruits are at first green, then change to a purplish-red colour, and finally become black, with a mealy bloom, when quite ripe. The *Osteomeles* does not appear to be particular as to soil. In my garden at Kingswear, Devon, it is planted in sandy peat, and has done well. Propagation is effected by seeds, by cuttings, and also by grafting. As the seeds have a bony covering or shell, they should be sown as soon as they are ripe in light soil that is not too damp. They are best sown in pans of sandy

to two months to strike root, and this, therefore, will come to pass some time between the middle and end of September. They should be treated in the same way as has been indicated for seedlings. As regards grafting, it was a long time before a suitable stock was found. Quince, White Thorn, and Pear were tried unsuccessfully. The resemblance noted between the fruits of the *Osteomeles* and those of the *Cotoneasters* led to *Cotoneaster acuminata* being tried as a stock. About fifteen grafts were made, and all the stocks and scions united in a short time. The specimen shown in the accompanying illustration is about 3 feet high and 4 feet in diameter. It was very pretty in the spring when bearing its white, Hawthorn-like flowers, which are sweetly scented, and it afterwards bore about a dozen berries. The plant has been in the same position for four years, and is unprotected in the winter. Wyndham Fitzherbert.

The Week's Work.

THE ORCHID HOUSES.

By H. G. ALEXANDER, Orchid Grower to Lt.-Col. Sir G. L. HOLFORD, K.C.V.O., C.I.E., Westonbirt, Gloucestershire.

CYPRIPIEDUM AND SELENIPEDIUM.—The members of the section of this genus which flower during late autumn and winter are of foremost importance, as they provide an almost endless variety of beautiful flowers when other blossoms are scarce. When we remember the ease with which these Cypripediums may be grown, their floriferousness, and the lasting properties of their flowers, it is not surprising they are held in high estimation in gardens. Another excellent quality of the Cypripedium is that the flowers suffer less from the effects of fog, perhaps, than those of any other Orchid in cultivation. For all kinds of decorative purposes the flowers are invaluable. As cut blooms, arranged with suitable foliage, they present a pleasing appearance. Well-flowered plants are also beautiful subjects for decoration, and, if reasonable care be taken, specimens in bloom may be brought into a dwelling house for a few days without any damage resulting. The members of an allied group, the Selenipediums, are also highly-ornamental plants. The various kinds flower at almost all times of the year, but principally in winter. The plants are not only valuable on account of their finely-coloured flowers, but also for their floriferousness, the flower-spikes producing a succession of blooms which last during several weeks in a good condition.

WINTER TREATMENT.—Plants of these Orchids are always, more or less, in active growth, hence absolute dryness of the rooting material for any length of time would prove injurious. During the present season the minimum amount of root moisture is required, and, when the plant has its flowers fully developed, the compost may be allowed to become comparatively dry before affording water, following up this treatment for some few weeks after the plants have ceased to flower. A moist atmosphere must be maintained always, but care should be exercised to avoid a saturated one with a low temperature, especially when the plants are in bloom. During this stage they should be afforded a minimum temperature of 50° to 55°.

EPIDENDRUM VITELLINUM MAJUS.—This late autumn-flowering Orchid is a most attractive subject, and one of the easiest to cultivate if grown in a well-ventilated structure where a cool, intermediate temperature is maintained. Up to the time the pseudo-bulbs are fully matured, copious supplies of water at the root are needed, but during the winter season, when the plants are resting, moisture afforded at long intervals will suffice to keep the pseudo-bulbs firm, the roots healthy, and the foliage fresh.

MILTONIA VEXILLARIA.—Miltonia vexillaria needs very careful treatment in the matter of root watering during winter. The plants should occupy a light position in a house where a minimum temperature of 50° to 55° is maintained. Under these conditions moisture at the roots must be afforded with caution, as only sufficient water is necessary to keep the pseudo-bulbs from shrivelling, and the roots and foliage healthy. The plants should be examined occasionally to ascertain if the edges of the central leaves of the young growths are adhering to each other; if so, they should be released with the aid of the thin part of a budding-knife handle, or some similar instrument. The above remarks apply also to M. Bleuiana, except that this species should be afforded a slightly higher temperature.

CÆLOGYNE BARBATA.—This is a most useful winter-flowering Orchid that succeeds well under a cool, intermediate treatment. It is a suitable subject for growing in baskets, but ample drainage should be afforded. During its period of active growth the plant enjoys a fair supply of water at the roots, but much less after its pseudo-bulbs are matured. The flowers will continue in perfection for a long period, provided they are kept free from damping.

PLANTS UNDER GLASS.

By JAMES HUDSON, Gardener to LEOPOLD DE ROTHSCHILD, Esq., Gunnersbury House, Acton, Middlesex.

LAPAGERIA.—Where it is proposed to remove Lapagerias that are planted out, the work should be done during the present season, and the roots should be taken up with a good mass of soil attached to them. It is advisable to renew the soil occasionally for this plant and to put the drainage materials in a proper order, using broken potsherds in preference to brick rubbish, as it is my experience that the Lapageria is not partial to lime in any form. My practice is to use good peat, but not of a spongy or soft texture with about one part in four of fibrous loam and a liberal quantity of silversand. Make the new soil quite firm about the roots, and then give a good soaking with water. Thin out any of the very weakly growths, and afterwards train the remaining shoots in the position they are to occupy. It is probable that insect pests are present on the plants, and the white scale insect especially may be looked for. Now is the best time to give the plants a thorough cleansing, first syringing them with warm water, and afterwards sponging the leaves and stems with a suitable insecticide, remembering that the leaves are very brittle and care is necessary to prevent damage. Young plants may need an extension of the root run, and if this be necessary employ the same soil as recommended above, but be careful not to provide too much fresh compost at one time. In doing all these operations, remember that the young shoots, as well as the leaves, are very tender, and care will be needed to protect them from becoming damaged. Slugs are very fond of the young growths, but these may be prevented from doing harm by pegging a band of cotton wool on the soil around the plants, or sprinkling Oat chaff at the foot of the stem. Take care that Lapagerias in pots do not become excessively dry at the roots. Any specimens that are pot-bound may be afforded a slightly larger pot; the roots will soon enter the new soil, as they are nearly always in an active condition. Lapagerias do not need to be placed in full exposure to the sunshine; beneath a north wall or other situation that is shaded is a suitable place, but be careful not to stand the plants too close to the hot-water pipes, as dry conditions are very harmful to them.

CORDYLIN.—Any plant of Cordylina with a bare stem but healthy head of foliage may be made into a good specimen by ringing. This is an easy operation, and the present is a good time to carry it out. In the case of a large plant, select a 6-inch pot, cut it in halves with a saw, and make holes large enough to fit easily around the stem in the bottom of each half. Secure the pot firmly around the stem and then cut a notch in the latter, just below the pot, say, for a distance halfway round, increasing the size of this notch afterwards a little at a time. Fill the pots with soil, which should be kept in a fairly moist condition to encourage roots to develop. In the spring, when the pot is well filled with roots, replace it by a larger receptacle cut in the same manner and filled with good soil. When the roots have filled this larger receptacle, sever the stem below the pot, and in order that the plant may have every favourable opportunity, place it inside square handlights, one or more on top of each other, as may be necessary. After a time the handlights may be removed. Good specimens may be obtained in this way, but it will be as well not to employ them for decoration out-of-doors the first season, as winds may cause too great a strain on the young roots.

PELARGONIUMS.—Plants of Show and Regal Pelargoniums should be placed in a position well up to the light. My practice is to stand these plants on shelves at this season. Keep the roots on the dry side, as it is not desirable for the plants to make much top growth until the days lengthen. Cuttings inserted last season may need a little extra attention in the matter of watering, but avoid an excess of moisture in order to prevent a sappy growth. Scented-leaved Pelargoniums intended for specimen plants should receive attention in training. If the shoots are stopped now, suitable growths will develop in the spring. Do not damp the foliage of these plants until the days are brighter. All these Pelargoniums should be given a cool treatment, with plenty of ventilation: a night temperature of 40° will be suitable in frosty weather. Aphids

may make its appearance, and whenever this pest is detected, the house should be fumigated at once. Zonal Pelargoniums intended for flowering at this season should be afforded a warmer and more generous treatment than the others: a temperature of 50° is suitable. Keep the atmosphere of the house buoyant and free from excessive moisture, also the glass of the roof scrupulously clean both inside and out, in order that all the light possible may enter.

THE HARDY FRUIT GARDEN.

By W. HEDLEY WARREN, Aston Clinton Gardens, Buckinghamshire.

STANDARD CHERRIES.—Standard Cherries succeed best when planted in a good, rich loamy soil, with a dry, porous subsoil. If the position is somewhat elevated, and the soil such as I have described, the trees should continue healthy and productive for a great number of years. In common with most other stone fruits, the Cherry succeeds best in a soil containing lime, and where this element is not present naturally it should be added in some form or another. Few other kinds of fruits grown under favourable conditions as orchard trees give such quick returns or are so profitable as the Cherry. When the trees have reached the bearing stage, little labour is required in pruning them; in fact, the less they are pruned then the better, for a free use of the pruning knife is one of the chief causes of gumming. After the head of the tree has been formed, all the main branches should be allowed to remain their entire length, removing only those shoots that are produced on the spurs when there is a sufficiency of fruit buds without them. Never shorten a spur unless there is a young growth at its base, or a growth bud, for shoots are not readily developed from the Cherry, as in the case of the Apple, Pear, or Plum. This rule also applies to trained trees growing against walls. When purchasing standard Cherry trees for orchard cultivation select those that have been worked upon the wild Cherry stock. Many trees are grafted on the Mahaleb Plum, but my experience is that trees on the English stock in the majority of instances make a cleaner and freer growth. Standard trees should be planted not closer than 25 to 30 feet apart, or even a greater distance in the case of the stronger-growing varieties. It is not advisable to plant a large number of varieties, for the fewer the better, selecting sorts that suit the soil and locality. For orchard planting the following varieties may be recommended:—Belle d'Orleans, yellowish-white and red fruits, a good early variety, ripening at the end of June. Bigarreau, large, pale yellow fruit; the tree is hardy, vigorous and free bearing; season, July and August. Bigarreau Napoleon, large yellow fruits mottled with red; the tree is a good bearer and makes a good standard; the fruits ripen in August. Black Heart, an old but reliable variety; season, July. Elton, large pale yellow fruits of good flavour; season, end of July. Florence, large yellow fruits with very firm flesh; the tree succeeds best in sheltered positions; season, middle of August. Kentish, the red fruits are of a medium size and useful for preserving; season, end of July. Knight's Early Black, a large, juicy fruit; the tree is a free grower and prolific bearer; season, early July. May Duke, large dark-red fruit, richly flavoured and slightly acid; season, early July. Noble, large, reddish-black Cherry, one of the best for market or private uses; season, July. Windsor, large, reddish-black fruit, of fine flavour; season, July and August. White Heart, pale yellow fruit, of medium size; season, July.

The Morello Cherry, if grown as a standard or half-standard in orchards, may be planted at half the distance recommended for the sweet Cherries, the trees being less vigorous in growth. This variety requires less pruning than any other, the fruit being produced principally upon the shoots of the previous season, and not upon spurs. Particular attention must therefore be paid to preserve and encourage these growths in every part of the tree. When a lateral branch has become extended as far as it can be allowed to go or is beginning to overcrowd younger and more suitable growths, it should be cut back to a younger branch near its base, or removed altogether.

THE KITCHEN GARDEN.

By JOHN DUNN, Kitchen Garden Foreman, Royal Gardens, Windsor.

DIGGING AND TRENCHING.—This important work should be pushed forward as quickly as possible, so that by the end of the year most of the vacant plots will have been cultivated. North borders and all heavy land should be dug first, in order to expose the soil to the influence of the weather for as long a time as possible. But although every effort should be made to get this work finished, it must be postponed during periods when the ground is saturated with rain.

ASPARAGUS.—The trenching of ground for Asparagus plantations may be proceeded with as soon as it is in a good workable order, although the plantation will not be made until late in the spring. The situation chosen for this crop should be sheltered from west winds, which frequently cause serious damage during the autumn, especially where it is not convenient to give support to the shoots by stakes or wires. At the same time the ground should be fully exposed to the sun, this being necessary for the production of early Asparagus. If the land is light and of an open character, little more than an ordinary trenching and manuring will be necessary, but, if stiff and cold, the soil should be well drained and trenched to the depth of 3 feet, leaving the bottom soil where it is, but applying a liberal dressing of manure, and a quantity of old lime. The top spit of soil from the next trench may then be placed over this and covered with a liberal quantity of manure, which in turn will be covered with the second spit of soil from the same trench, and so on until the required breadth of ground has been prepared. Asparagus beds in need of top-dressing should be pricked over carefully with the points of a digging fork, and some of the soil removed in order to make room for a good covering of thoroughly decomposed farmyard manure, which should be well broken up before it is placed on the bed and a light covering of soil spread over it, to prevent the wind from drying it up.

PEAS IN PITS.—If unheated pits are available, a sowing of dwarf-growing Peas may be made at once. Fresh soil should be placed in the pits for this crop, such, for instance, as is obtainable from the potting sheds or exhausted Melon borders, with good farmyard manure freely mixed with it. When moderately dry, the bed may be lightly trodden before drawing the drills. Dwarf-growing varieties are best for this sowing, and may be sown in drills 18 inches apart and 3 inches deep. Nothing more than protection from frost should be attempted now, and as soon as the young plants are well through the ground air must be admitted freely to keep them stocky. Young Pea plants will stand a considerable amount of cold weather, providing they are brought up hardy from the first. But cold draughts should be prevented when air is applied, or mildew may set in and ruin the crop. Langley Gem and Harbinger are good varieties for this sowing. Langley Gem requires a little more room than Harbinger, which seldom grows more than 14 inches in height.

CABBAGE.—In consequence of the mild season, autumn-planted Cabbages have grown so much that, in the event of severe frost, the plants will be liable to suffer serious injury; it is therefore necessary to prick off all plants which are still in the seed-bed, so that if the worst happens there may be sufficient in stock to make good the failures. If such plants are scarce, a sowing of some early variety should be made at once, selecting such varieties as Dickson's First and Best, Early Express, and Little Queen. When the young plants are large enough to handle, they should be pricked into boxes close to the glass, or they may be transferred into a cold pit, still keeping them near to the glass.

FRUITS UNDER GLASS.

By E. BECKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Hertfordshire.

EARLY PEACHES AND NECTARINES.—As the buds of early Peach and Nectarine trees commence to swell, a slight increase in the temperature may be afforded; this will necessitate extra fire heat, but do not drive the hot-water system to excess in order to maintain a standard temperature. Much will depend upon the amount of hot-water piping in the house; where ample is installed the requisite temperature may easily be maintained, but where there are few

pipes much harm may accrue from attempting to keep the temperature to a set degree. Forty-five to fifty degrees at night time, according to the weather, will suffice, but in very cold weather a few degrees lower will do no harm. Where it is convenient, much assistance may be given in keeping up the warmth by covering the roof with mats. The trees will require slight syringing, whenever the weather permits, on bright days, both mornings and afternoons, but sufficiently early to allow the branches to become dry by nightfall. Damp the paths and borders as often as is necessary to provide sufficient humidity, wetting especially those parts, such as places near the water pipe that need it most. As the trees come into flower, slightly warmer conditions may be allowed with a little ventilation. Artificial pollination of the flowers will be necessary daily about noon; an occasional sharp tap of the trellis about mid-day will greatly assist in dispersing the pollen, especially when the sun shines. As soon as the flowers have set, damping the bare spaces may be resumed and the trees sprayed with tepid water. For this purpose fill a large watercan or two and stand them in the house so that the water may become warmed.

POT VINES.—The night temperature of the house in which pot vines are growing may be slightly increased as the buds break into growth. On mild nights the thermometer may be allowed to reach 60°, with a fall of 3° towards the morning. On cold nights this degree of warmth may be slightly reduced. Attend carefully to the watering of the plants, using water that has been warmed to the temperature of the house: occasionally the water may be mixed with a small quantity of liquid manure. Have the roof glass well cleansed so that the maximum amount of light may reach the plants and favour a strong growth. Continue to spray the canes with tepid water and damp the bare spaces as often as is considered necessary. Disbud the growths gradually and as soon as practicable: stop the shoots two joints beyond the flowers, rubbing out the sub-lateral between the bunch and the cane and stopping those beyond the bunch at the first leaf. If the growths are not in contact with the glass I prefer not to pull them down too hastily, believing that they become strengthened when growing thus, whilst there is less risk of them becoming broken. Admit air with caution at all times, especially guarding against cold draughts, regulating the ventilation according to the weather. Close the ventilators early in the afternoon and start the fires sufficiently early to maintain the requisite degree of warmth.

STRAWBERRIES.—One or more batches of plants should be brought indoors and allowed to start gradually in a cool house near to the roof-glass. Those of the earliest batch will, as growth increases, need increased supplies of water at the roots. Only those plants that promise well should be retained, discarding worthless specimens. Gradually inure the plants to warmer conditions and either keep the foliage syringed or damp between the pots, according as is considered best suited to the weather. Whether the plants are benefited or not by top dressings directly after they are brought indoors is a matter of opinion. If space permits a top dressing of soil may be given, but feeding can always be resorted to at a later date, and when the roots are in more need of stimulants.

THE FLOWER GARDEN.

By R. P. BROTHERSTON, Gardener to the Earl of HADDINGTON, K.T., Tynningham, East Lothian.

FRAMES.—The continued damp weather has resulted in a green mantle of Algae covering the soil in frames where cuttings are growing in boxes and beds. This green layer should be lifted off carefully in thin sheets without disturbing the cuttings, many of which are not yet rooted. Afterwards sprinkle a thin layer of dry sandy compost over the soil, and the cuttings will require nothing further for several weeks unless it be the removal of dead foliage, which is always inimical to the well-being of the plants. Slugs are sometimes troublesome, and are especially fond of Chrysanthemums. Very slight dustings of hot lime, applied occasionally, will destroy slugs, but a better plan is to place chaff on the surface of the boxes and on bare parts inside the frames. In the case of frost, even the cuttings of hardy plants are the better for some protection, and it should be remembered

that often a hard freezing does not cause so much damage as alternate freezings and thawings. Because of this danger, the frames should not be uncovered till the frost is quite gone and the thaw complete. As long as the temperature is low semi-darkness does the cuttings no harm.

BEDDING PLANTS IN PITS.—Sometimes serious losses occur about this time of the year amongst the bedding plants, and occasionally the whole batch of some particular plant dies. This is perhaps due to the temperature being too low. Some plants, including Verbenas and Ageratums, need to be kept growing all the winter; the growth need only be slight, just sufficient to prevent them becoming inactive. Pelargoniums, provided they are kept in a low temperature and dry at the roots, are not difficult subjects to winter. When placed closely together in boxes, the lower leaves are apt to wither; let the decaying foliage be removed from time to time.

BOG PLANTS.—Our bog plants were rather untidy, but, on the first opportunity that offered, all the withered leaves, stems, weeds, &c., were removed and a surface dressing of some light material spread evenly over the ground. This is a suitable time to divide and replant moisture-loving Orchids, the spikes of which are much dwarfed, when the roots are crowded. *Alisma Plantago* fails altogether to flower if allowed to remain for too long a period in the same place, whilst *Lilium pardalinum*, which does splendidly in a bog, becomes so weak when crowded that many of the stems fail to flower. These and other plants that need attention should be lifted, separated, and replanted in fresh soil. Certain Ferns, including *Adiantum pedatum*, the difficult *Polystichum Lonchitis*, and species of *Cystopteris*, succeed on the borders of a bog. The flower-heads of *Primula cashmeriana* frequently begins to show about this time, and it is important that they do not become rotted through soft wet material lying about them. *P. cashmeriana*, *P. alpina* and *P. capitata* succeed here only as bog plants.

NANDINA DOMESTICA.—The hot summer has suited this Bamboo-like shrub, and flowers forming a second crop are half expanded. The plant's chief charm, however, is in the various shades of colours the young foliage assumes. In *Trees and Shrubs for English Gardens* *Nandina* is noted as being hardy only in the South and West of England, and it is not even mentioned in *The English Flower Garden*. I should be inclined to say that, provided it be planted in a dry, warm soil and in a sheltered position, it would prove hardy very generally. It would probably lose some of its leaves during the winter, but they would be renewed later. Plants have been established at Tynningham for many years, the only attention they receive being a covering of straw from December to about the middle of March, with an occasional surface-dressing of manure about the roots.

MOTILE MECHANISMS IN PLANTS.—Dr. J. BRETHERLAND FARMER, F.R.S., lecturing on this subject at the Royal Horticultural Society's meeting on the 5th inst., pointed out that motile mechanisms, as seen in plants, could be divided into two groups: 1, those dependent on the presence of living protoplasm; 2, those which were not due to vital action, but to inequality of physical absorption of water. In the latter class some depend on unequal swelling (the so-called hygroscopic movements), others on the result of the cohesive force of water when enclosed in membranes that could be wetted and that are also impervious (or relatively so) to air. The subject matter was illustrated by lantern slides to elucidate the particular examples selected for description. Amongst the special types of mechanism, the following were described:—*Biophytum sensitivum*, with its sensitive hairs; the Rose of Jericho, the peculiar structure of the stem of which accounts for the inrolling of the branches when dry and their spreading when wetted; the Moss peristome, with its hygroscopic teeth. The Fern sporangium and the elaters of liverworts afforded illustrations of the water-cohesion mechanisms. The lecture closed with observations on the general interest of these phenomena in connection with the large biological problems of the meaning of adaptation in living things.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, as well as specimens of plants for naming, should be addressed to the EDITORS, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Local News.—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Illustrations.—The Editors will be glad to receive and to select photographs or drawings, suitable for reproduction, of plants, or of remarkable plants, flowers, trees, &c., but they cannot be responsible for loss or injury.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY, DECEMBER 18—
Nat. Chrys. Soc. Executive Com. meet.

TUESDAY, DECEMBER 19—
Roy. Hort. Soc. Com. meet (no general exhibition).

THURSDAY, DECEMBER 21—Linnean Soc. meet.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last Fifty Years at Greenwich—89°1'.

ACTUAL TEMPERATURES:—
LONDON.—Wednesday, December 13 (6 P.M.): Max. 49°; Min. 44°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—Thursday, December 14 (10 A.M.): Bar. 29°4'; Temp. 47°; Weather—Fair.

PROVINCES.—Wednesday, December 13: Max 48° Cambridge; Min. 42° Lincolnshire.

SALES FOR THE ENSUING WEEK.

MONDAY—
Rose Trees, Shrubs, Bulbs, including Liliums; Perennials, Palms and Decorative Plants, at 12.30, at Stevens' Auction Rooms, 38, King Street, Covent Garden, W.C.

WEDNESDAY—
Dutch Bulbs, Herbaceous Plants, &c., at 11; miscellaneous Bulbs and Seeds, at 12; Roses, at 1; 2,664 cases Japanese Liliums, at 2.30; Palms and Plants, at 5, by Protheroe & Morris, at 67 & 69, Cheapside, E.C.

Sir Joseph Hooker died at his residence at Sunningdale, on Sunday, December 10.

His death will be mourned throughout the world of science and in the larger world, wherever there are men to reverence a noble life and to honour splendid achievement. For Hooker was not only the greatest of British botanists; he was one of the great outstanding men of his age. That position he won by the hardest yet surest of ways, that of doing his special work supremely well.

Though he lived far beyond the allotted span of human life, Hooker, the man of science, never grew old. As each new generation of botanists arose, it turned to Hooker as its acknowledged master. The man who had been alive and at work in what seemed to the younger men a remote past was still alive and at work in their midst. The man who led the van of scientific progress in the '50's of last century remained, by right of brain and example, our leader till his death.

The advancing years seemed almost to pass him by, save that they brought him the sacred accompaniments of old age—love, honour, and obedience, troops of friends, till at the age of 94 death surprised him whilst he was yet at work.

Those of us who knew Hooker in his hale, serene old age might well have imagined that his life had been spent in sheltered retirement from the vexations, troubles and perils of the world. Yet to few men, in whatsoever walk of life they be, falls such an eventful career as he chose for himself. Well-nigh three-quarters of a century ago—in 1839—he sailed, a youth of two-and-twenty, with Ross in the "Erebus," and on that famous voyage of the "Erebus" and "Terror" he shared in the hardships and dangers which await the explorer in the bleak Antarctic seas.

Alone he trod the passes and hills of the Himalayas and penetrated whither no white man had gone before. In later years he travelled to Syria, in order to investigate the Cedar groves of Lebanon, and surely none since Solomon had more title to speak "of trees, from the Cedar tree that is in Lebanon, even unto the Hyssop that springeth out of the wall."

Unlike so many journeys the labours of which cease with the home-coming, Hooker's travels involved years of arduous toil after the wonderful harvests of plants which he collected had been garnered in. The working out of his own collections was in itself a herculean task, and beside the plants which he had gathered with his hands, Hooker received countless specimens from his correspondents in the four quarters of the globe.

We have been told by one of his disciples that even in his herbarium Hooker was wont to adopt methods of classification which he had learned to follow in the wilds. The plants to be arranged were strewn upon the floor, and related plants were coaxed gradually by his unerring eye and judgment into their proper groups.

Of the magnitude of Hooker's contributions to systematic botany we speak elsewhere; it suffices here to say that in this domain he was the equal, if not the superior, of his great contemporaries, William Hooker, Bentham, and Lindley.

Hooker's claims to immortal memory in the annals of science rest by no means solely on his contributions to systematic botany. A great observer, the range of his observations in the countries which he visited included geological, geographical and meteorological phenomena. Of them that other great traveller Humboldt pronounced that they are "a perfect treasure of important observations in which a prodigious extent of previous knowledge is brought to bear on every topic and which is marked with great sagacity and moderation in all the views brought forward."

Versatility is the relaxation of genius, and though Hooker was first and last a botanist, his broad sympathies with all domains of natural knowledge gained for him the sobriquet of the "Versatile Hooker" and established him whilst yet a young man in the first rank of men of science.

Yet, remarkable as were Hooker's achievements as a traveller, collector, and observer, they do not complete the tale of his contributions to knowledge. To many of us, at all events, Hooker's most abiding title to lasting memory is his

epoch-making work on the geographical distribution of plants, and the application of that work to the elucidation of the problems of evolution and the origin of species.

Hooker was happy in the moment when he embarked on the "Erebus" and his life's work. Shortly before he sailed with Ross, Darwin had returned from the memorable voyage of the "Beagle." The experienced traveller recognised the high promise of the novice and none better than Darwin could advise Hooker for his journey of exploration. In those days began the acquaintance which ripened into a close and life-long friendship.

There is no doubt that Darwin's attitude of mind towards the "species question" influenced Hooker, and there is also no doubt that Hooker's cautious yet broad judgment proved invaluable to Darwin. Already in his earliest writings Hooker had taken, consciously or unconsciously, the first step away from the dogma of the constancy of species. Similar forms of plants in distant Antarctic lands he attributes not to so many separate acts of creation, but to the isolation—from geographical or climatic causes—of forms which once spread continuously over the whole area. For more than 20 years after his return from his voyage, Darwin—deep and slow, exhausting thought, and hiving knowledge with each studious year—pondered the problem of the *Origin of Species*. At every stage, as he acknowledges, Darwin availed himself of the large stores of knowledge and excellent judgment of his friend Joseph Hooker. Hooker and Lyell it was who prevailed on Darwin to publish jointly with Alfred Russel Wallace the outline sketch of his theories. That sketch was communicated to the Linnean Society in 1858. The review of the *Origin of Species* which most pleased Darwin was that written by Hooker, with Lindley's acquiescence, in the pages of the *Gardeners' Chronicle*. In 1868, when he presided over the Norwich meeting of the British Association, Hooker devoted his presidential address to an exposition and defence of the *Origin of Species*. Thus, both by sober counsel and subtle advocacy, Hooker lent most powerful aid to Darwin. Many years afterwards, in 1908, the conspicuous part which Hooker had played in Darwin's work was recognised officially. At the meeting of the Linnean Society, held to commemorate the 50th anniversary of the communication of the Darwin-Wallace joint paper on natural selection, Hooker attended in person to receive one of the Darwin medals, and delivered—at the age of 91—a vigorous speech recalling the far-off times when the great events were happening.

And through all these eventful years, from pre-Victorian to present Georgian times, Hooker's special systematic and explorational work went on unceasingly. His Antarctic collections were worked out and the *Floras* of the Antarctic, New Zealand, and Tasmania were published. The Indian journey was accomplished, and that classic, *The Himalayan Journal*, was written. Therein is evidence enough that, had Hooker devoted himself to literature,

SIR JOSEPH DALTON HOOKER, O.M.

JUNE, 1817 — DECEMBER, 1911.

he would have achieved no less distinction than he won in science.

Hooker's official connection with Kew began a little more than 50 years ago. After serving for 10 years under his father, William Jackson Hooker, the son succeeded to the Directorship in 1865. In that post his great powers of organisation and his vast knowledge of plants enabled him to add another great reputation to the great reputations which he had already built up. As is well known, Hooker passed through troublous times at Kew, where at one period the hand of dull officialdom was heavy upon him. But Hooker, though never one who could suffer fools gladly, won in the long run. Thanks to the saving sense of the Press and the support of men of science, he emerged victorious from the struggle, and preserved Kew from the worst of evils—the uninformed meddlesomeness of an ill-educated bureaucracy.

Of the honours which fell to Hooker, it is scarcely necessary to speak. He received from the Royal Society the Royal, Copley, and Darwin medals, and attained in 1873 to the highest position open to a British man of science: the presidency of the Royal Society. In 1877 he was created K.C.S.I., and 40 years later, on his 90th birthday, he received the Order of Merit. It is right that the Abbey should offer to receive his ashes side by side with those of our poets and painters, statesmen and warriors. Yet it is more fitting that he should lie beside his father at Kew. His early life, his whole life, was devoted to botany, and it is meet that he should lie in the Mecca of botanical pilgrims.

COTTAGE GARDENS IN SURREY.—The Royal Horticultural Society's Knightian Silver Medal has been awarded to Mr. E. SPOONER, of Witley, for the best kept cottage garden in Surrey. A second Medal, offered for the best kept allotment, was won by Mr. C. AYLING, of Chiddingfold.

WORSHIPFUL COMPANY OF GARDENERS.—In our issue of November 25 we reported that the Court of Aldermen had received a petition from the Gardeners' Company praying for an increase of the livery from 60 to 100, in order that a number of distinguished citizens might be admitted. The petition was referred to the General Purposes Committee for consideration. At a meeting of the Court of Aldermen on December 5 the General Purposes Committee recommended that the proposed increase be granted, and the Court confirmed this recommendation.

BATTERSEA PARK.—At its meeting on December 5 the London County Council adopted the proposal of its Parks and Open Spaces Committee to convert the botanical garden at Battersea Park into an old English garden at an estimated cost of £265. Some particulars of the proposal were published in the *Gardeners' Chronicle* of December 2.

"LE CHRYSANTHEME."—This interesting publication, the official organ of the French Chrysanthemum Society, has now reached the 141st number, and the editor has decided to issue in parts an index to the first 140 numbers. This index will facilitate reference, especially as the paging has been somewhat unusual for a serial publication.

SINGLE FLOWERS ON THE ROSE GLOIRE DE DIJON.—The remarkable behaviour of a Gloire de Dijon Rose in suddenly producing a crop of single flowers forms the subject of a note presented by M. VIOLLE to the Académie des Sciences (November, 13) and referred to in the *Revue Horticole* (No. 23, December 1, 1911). The Rose is planted in the open, and has been in its present position for about ten years. It is extraordinarily vigorous and floriferous. The heat and drought of the present summer were not without their effect upon the Rose, which produced, during August, fewer and less excellent flowers than during the earlier part of the year. Suddenly, about September 12, all its branches produced a crop of absolutely single Roses, then the curious phase passed, and the same branches bore, some eight days later, their normal double flowers.

CIDER INDUSTRY.—With a view to restoring the cider industry in Suffolk, the Framlingham Agricultural Co-operative Society has purchased a cider press, which will be available for growers in the neighbouring villages.

THE APPLE HARVEST IN U.S.A.—The crop of Apples produced in 1911 in the United States of America is estimated by the French Consul at Chicago as exceeding 20 million barrels, an increase of 6 millions on that of last year.

THE MODIFICATION OF FLOWER COLOUR BY ARTIFICIAL MEANS.—Recent experiments by Mr. A. GAWALOWSKY (*Wiener Land. Zeit.*, lxi., 53 and *Bot. C. B.* 13, No. 45, 1911) show that the addition of sodium orthophosphate to the soil causes the petals of *Rosa centifolia* to assume a deep red to blue-violet colour. Under similar treatment flowers of *R. rubra tinctoria* become of a dark brown-red tint.

DROUGHT AND CORN CROPS.—It would appear from the prices for Corn now ruling that the hot summer has produced at least some good effects. According to *The Standard* the average price of British Wheat, for the three months of the cereal year—September 1 to November 30—is 32s. 9d. as compared with 30s. 5d. last season; the rise being due to improved quality. British Barley averaged 30s. 10d. as against 24s. 7d., and Oats 19s. 8d. against 16s. 5d., quality again accounting for the rise.

MANURING OF ERICAS.—M. MAX LÖBNER describes in the current number of *Flora Dresden*, p. 80, the results of experiments on the effects of various manures on *Erica gracilis*. As the results of his experiments MAX LÖBNER recommends the use of horn shavings or dust and of bonemeal. He finds that good results are obtained by the addition of these manures to the soil used for potting purposes, some time before the plants are potted up. The proportions recommended are for 20 lbs. of potting soil, 1½ ounce of horn meal, and 1 ounce of bonemeal. The smallness of the amounts to be used is to be noted, since larger quantities act deleteriously. The effects of the manure are to be seen both in the vigorous growth of the plant and the good colour of the flowers.

"THE ORCHID WORLD."—The current number of *The Orchid World* maintains the high standard of excellence which previous issues have led us to expect of this excellent periodical. The illustrations include *Vanda Sanderiana* (coloured plate), *Cattleya Her Majesty* and *Calanthe Cooksoniae*. The Orchid collection of J. J. HOLDEN, Esq., of Auburn House, Southport, is described, and among the articles of interest is the first instalment of an account by ED. KRONER of an Orchid collector's travels through British Guiana to Brazil.

HYBRID BETWEEN PEACH AND ALMOND.—M. PIERRE PASSY, writing in *Le Jardin* (December 5, 1911), gives a brief account of the branches of hybrids between Peach and Almond which were exhibited at a recent meeting of the French Society of Horticulture. The branches in question were of the second generation. The plant raised from the original cross exists in the nurseries of M. BEAUMONT at Bellenaves (Allier), and is a very ornamental tree. Though it flowered prolifically for years, the hybrid did not produce fruits till 1908. In that year it yielded plenty of good seed, and from that seed some 25 plants of the second generation were raised and still exist.

"LA VIE AGRICOLE ET RURALE."—We have received the first number of a new French weekly review which bears the above title, and extend our best wishes for success to our young contemporary. The review is illustrated and contains articles on the extension of meadow land in central France, horse-breeding, Mushrooms, bees, and many other subjects of interest to farmers. A special page is devoted to law notes bearing on agricultural matters. The subscription price is for France 12 f., abroad 15 f., and the editorial committee contains the names of many well-known agriculturists.

NEW HYBRID LILACS.—By crossing the North Chinese species *Syringa Giralddii*, which flowers about a fortnight earlier than other Lilacs, with early varieties of Lilac, Messrs. LEMOINE ET FILS (Nancy) have produced several new varieties, which have greater precocity than the Chinese species. According to the *Revue Horticole*, No. 23, December 1, 1911, the hybrids grow luxuriantly and form large bushes. Two which will be put in commerce this year are Lamartine, which has single, mauve flowers, borne in large panicles, and Mirabeau, with very large, single rosy-lilac mauve flowers, which open about April 25.

M. VIGER.—At the end of the present month M. VIGER's appointment as President of the National Horticultural Society of France comes to an end, but we are glad to announce that he has acceded to the request of his brother officers and colleagues to continue in office. The National Horticultural Society of France in particular, and French horticulture in general, could ill-afford to do without this sympathetic friend of gardening in its broadest sense.

THE PARIS SHOW.—Our contemporary, *La Vie à la Campagne*, edited so ably by our confrère, M. ALBERT MAUMENÉ, gives an excellent account, in its current issue, of the Paris autumn show recently held by the National Horticultural Society of France. A series of interesting photographic illustrations accompanies the report. Among them is one of Jacqueline Ochs, the new Japanese Chrysanthemum, staged by Mr. THOS. STEVENSON at that show, and an appreciative commentary on his fine exhibit is also given.

PROPOSED NATIONAL DIPLOMA IN HORTICULTURE.—The Council of the Royal Horticultural Society have requested the following gentlemen to be so kind as to act as a committee to inquire into the desirability of establishing a national diploma in horticulture, and if it is thought desirable, to recommend what steps should be taken for the purpose:—W. WILKS, Secretary R.H.S.; the Right Hon. A. H. DYKE ACLAND, Mr. W. BATESON, M.A., F.R.S., Mr. E. A. BOWLES, M.A., Mr. F. J. CHITTENDEN, F.L.S., Prof. J. B. FARMER, D.Sc., F.R.S., Mr. C. R. FIELDER, V.M.H., Mr. W. HALES, Mr. J. HUDSON, V.M.H., Prof. KEEBLE, M.A., Sc.D., Sir DANIEL MORRIS, K.C.M.G., V.M.H., Lieut.-Col. D. PRAIN, M.A., F.R.S., Mr. H. J. VEITCH, V.M.H., Mr. WALTER P. WRIGHT.

AGRICULTURAL RETURNS: GREAT BRITAIN.

—The effects of the drought of the past summer are illustrated in eloquent fashion by the preliminary statement of *Produce of Crops*, issued by the Board of Agriculture. The statement shows the estimated total produce and yield per acre of the Potato and root crops in the year 1911, with comparisons for 1910. Though the average yield of Potatoes per acre in 1911 is a little higher than that of the previous year (6.70 tons as against 6.44), the averages for root crops are very considerably below, not only those of 1910, but also those of the last ten years. Thus, for Turnips and Swedes, though the acreage in 1911 was much the same as in 1910, the yield this year is 16,397,602 tons as against 25,695,018 tons in 1910; a shortage of upwards of nine million tons. England appears to have suffered more severely than either Scotland or Wales; for whereas the yield per acre in 1911, as compared with 1910, falls from 18.4 to 14.2 in Scotland, and from 17.1 to 14.3 in Wales, it decreases from 15.5 to only 8.7 in England. The severity of the drought in England is further illustrated by the shrinkage in the yield of Mangolds. These "roots of scarcity" have done well on the average in both Wales and Scotland, but in England the yield per acre is so little as 16.51 tons as against 21.2 tons in 1910, and the ten years' average of 20.1.

CAMPANULA LACTIFLORA.

THE accompanying illustration (fig. 176) is from a photograph taken here last July, and shows on the left-hand side the edge of a colony of *Campanula lactiflora* Bieb. In the foreground on the other side are a few plants of the same species at the edge of the park, a position in which self-sown seedlings often appear, doubtless owing to the seeds being washed or blown into small plants edging the path. The main group which is not shown covers a level space in the centre of my rock-garden, which is mainly devoted to bulbous plants and the Dwarf Almond. *Campanulas* such as *persicifolia*, *glomerata* and *Hostii* are encouraged to grow there in a semi-wild manner where they like, to carry on the flowering season after the bulbs are over. I planted three seedlings of *C. lactiflora*, and I feel sure, if anyone had foretold that their offspring would take possession of this level space and also place sentinels along the entire length of the main path, I should have at once removed the three

innocent-looking babes. But as the invasion was so gradual and the effect of the tall spires of blossom is so beautiful each July, I hope they will long continue to flourish. By removing the growing points of young shoots, one can regulate the height of the masses of flowers, and I find a good effect is produced by shortening the stem nearest the path, and by doing this at different times a slight continuation of the flowering period can be obtained, but as a rule those shortened before mid-June flower at the same time as those untouched. In the illustration, shortened stems may be seen on either side, and one is very noticeable on the left hand. They consist almost entirely of

good gardeners have told me that either the blue or the white forms never seed with them, and they possess only one plant of the colour they naturally wish to get more of and which is sterile with them. Is it possible that the pure white and really blue forms are each fertile with pollen from a plant of their own colour form and sterile to that of the other colour form? Has anyone a single plant of each form planted near each other and no others within easy distance, and has he observed whether either plant bears good seed? If so, I should be very grateful for information, and still more so for a pinch of the resulting seed or a seedling or two.

This colour difference has been the cause of

[Photograph by J. A. James.]

FIG. 176.—*CAMPANULA LACTIFLORA* IN MR. BOWLES'S GARDEN AT WALTHAM CROSS.

the pure-white form, with a small number of the faintly-blue-tinted one among them, but very rarely have any appeared that could be rightly called blue. In another part of the rock-garden I have a group of the blue form, which also seeds freely, and all the seedlings thus far have been as blue as their parents.

The existence of these two races has given rise to some erroneous notions as to the nomenclature, and I take this opportunity to state the facts so far as I have been able to collect them.

In this garden, where either form is grown in a group, they seed freely, but wherever I have planted a solitary specimen at a distance of 100 yards from another, good seed is very rarely produced. This may account for the fact that many

Boissier's name of *C. celtidifolia* being applied to the blue form. It is true that he described a plant under that name in Boissier's *Diagnoses Plantarum Orientalium*, ser. ii., vol. iii., p. 111. He there writes "Corollâ azureâ," and he must have had poor material before him, as he leaves the radical leaves and capsules undescribed, and writes, "caulis 2-2½ pedalis," and further, "Quoad faciem refert *C. rhomboidalem* caule tamen crassiori densiusque folioso." I trace to this description the prevalent notion that there exists a *C. celtidifolia* that is blue flowered and much dwarfer than *C. lactiflora*. I find here the better the soil the taller any of the forms will grow, and 6 feet is about the usual height of a healthy, well-established specimen of either

colour. But the great point, which seems to have been overlooked, is that Boissier afterwards described the plant in the *Flora Orientalis*, vol. iii., p. 935, under the name of *C. lactiflora*, Bieb., giving *C. celtidifolia*, Boiss., *Diagn.*, ii., 3, p. 111, among the synonyms, and stating "corollâ . . . albidâ vel cœruleâ." Bieberstein seems to have met with the pale forms only and writes, "corollisquæ . . . lacteis aut dilutissime cœruleis." So unlike other *Campanulas* of which blue and white forms are known, the white one is the type.

There is a good figure of the pure-white form in the *Bot. Mag.*, t. 1973, but although I have observed seedlings here with a slight rosy tint on the unopened buds, I have never seen it so marked as in the colouring of this plate, nor have I ever seen the calyx lobes so red. The figure in *Bot. Reg.*, t. 241, represents the "very dilute blue" one.

Both blue and white forms sometimes produce seedlings with abnormally-formed corollas, divided to the base in the same manner as also happens with *C. rotundifolia*, and as De Candolle has figured on Pl. 2 of his *Monograph of the Campanulas* in *C. medium*, calling the form *poly-petala*. It is rather curious that in *C. lactiflora* these forms can be easily recognised by the correlated character of narrow lanceolate leaves, and I have never seen one of them exceed 2 feet in height, and generally the stems are thin and weak and inclined to bend over. Mr. Wolley-Dod recorded this form as of frequent occurrence at Edge Hall. *E. A. Bowles, Waltham Cross.*

NOTICES OF BOOKS.

AMONG THE HILLS.*

MR. FARRER is well known to readers of the *Gardeners' Chronicle*, not less perhaps on account of his valuable contributions to the literature of Alpine plants, than as one who possesses a wide, first-hand knowledge of the native haunts of the plants themselves. His most recent book, entitled, *Among the Hills*, will be sure of a welcome, and we can confidently say that everyone who cares about the mountains and their floral children will do well to read it. The second title of the work, "A book of joy in high places," aptly describes the vein in which it is written, and if the style is whimsical, and here and there even extravagant—well, we have learned to expect that from Mr. Farrer, and would miss it if we did not find it.

The book is a real contribution to the subject. The author has the faculty of making his reader feel and enjoy with him the subtle but very real influence of the mountains, whilst the man who wants to realise the natural conditions under which the plants thrive in their wild habitats will find here a mine of information. Critical notes are not wanting, and the author discusses the vexed question of species in some of the more troublesome *Saxifragas*. These variable forms, often constant in individual localities, are the despair of the conscientious horticulturist and botanist alike—but they present a fine field for experimental study. The *Lantoscana* series seem to be nearly, if not quite, as bad as the *Caesia-Tirolensis-squarrosa* set of the Eastern Alps.

Mr. Farrer has won for himself a unique place among writers on Alpine plants, and his reputation as an observer and as a painter of word pictures of the plants themselves and of their habitats will be undoubtedly enhanced by this his latest volume. The gift of discriminating enthusiasm, which is his peculiar secret, will awaken many a sympathetic echo in the minds of those who, sharing his love of Alpines, yet find their less exuberant vocabulary incapable of expressing adequately the feelings which they cherish for their favourites. As all who know his

works recognise, Mr. Farrer does not write round his subject, but contrives to impart a wealth of solid information, whilst dazzling us with pictures, and his style is as a setting of fine workmanship which at once secures and enhances the gems contained in it.

ORCHID GATHERING IN THE EAST.

It is difficult to imagine any class of reader who would not be interested and delighted with Mrs. Talbot-Clifton's cleverly-written book *Pilgrims to the Isles of Penance**. Graphic descriptions of strange lands, and of the manners and customs of the little-known natives of the Far East, blended with the personal experiences of the writer and her husband, make up a work

every now and then into the wild regions off the track. The authoress frequently mixed in the daily life of the natives, and, being a keen observer, she gleaned many interesting facts concerning the religious beliefs and folk-lore of the people. Orchid hunting, however, was always made the chief object, and the book abounds in tales of absorbing interest of the experiences of the travellers.

A map of the route is given, and 54 fine illustrations taken from photographs, many of which were taken by Mr. and Mrs. Talbot-Clifton themselves. Part of the work consists of the diary of the authoress, written while on her travels; it is not in any sense of the word a scientific or cultural work on Orchids, but is pleasant and in-

FIG. 177.—THE DENT D'AMBIN AND PYRAMID MOUNTAIN.

From "*Among the Hills*."

of absorbing interest even to those not especially interested in Orchid culture.

The British horticulturist associates the names of Mr. and Mrs. Talbot-Clifton with their beautiful gardens at Lytham Hall, and the very interesting collection of Orchids in cultivation there. It was the love of Orchids, and the desire to see them in their native haunts, that induced Mrs. Talbot-Clifton to undertake the journey she has described so well, and she achieved the distinction of being the only European lady to collect the rare *Phalenopsis tetraspis*. Burma, from the Chinese frontier to the Southern border by Siam, the Andaman Convict Settlement, the Nicobar Islands, the Malay Peninsula, Java, were all visited in turn, a detour being made

structive reading for everyone, and well worth more than one perusal.

In any future edition a few errors which occur in the spelling of the plant names should be corrected.

FLORAS OF FRANCE, SWITZERLAND, AND BELGIUM.*

WE have received Fascicle 1 of this useful work by Professor Gaston Bonnier, published under the direction of the Minister of Public Instruction. It is provided with a large number of coloured illustrations, accurately representing the plants enumerated. The first issue deals with *Ranunculaceæ*, with *Clematis*, *Thalictrum*, and *Anemone*, and contains five plates illustrating the several members of these genera.

* *Among the Hills: A Book of Joy in High Places*, by Reginald Farrer. (London: Headley Bros.) Price 10s. 6d. net.

* *Pilgrims to the Isles of Penance: Orchid Gathering in the East*, by Mrs. Talbot-Clifton. Demy 8vo., 54 illustrations, 12s. 6d. net. (London: John Long, Ltd.)

* *Flore Complète de France, Suisse, et Belgique*. E. Orliac, Paris.

The descriptions (in French) are very clear and easily understood. The work is one which will be useful to the student, the botanist, the gardener, and all who wish to become familiar with the plants they may find in their country walks.

CHRYSANTHEMUMS.

NEW JAPANESE VARIETIES.

AUTUMN has come and gone, and has left us the usual batch of new varieties in the different sections—some of real merit, and some of indifferent quality. It is a great pity that more discrimination is not shown by dealers on the points of quality possessed by new varieties. I am, of course, prepared to admit that the views of critics differ in this matter; but at present it is left to the cultivator to determine which varieties are worthy of an extended trial.

The list of novelties for this season cannot be said to contain anything particularly striking, though it embraces some desirable varieties in the colour sections. We are still waiting for a really good white of the type of Mme. Carnot, and for a yellow flower with the characteristics of F. S. Vallis, or even Bessie Godfrey, neither of which is so well displayed now as it was a few years ago. In the section for bright colour, it is always pleasing to note the presence of a variety of the latter type; it is not easy to secure, and in a list of my own making I should always give it the preference.

J. SURRY (Mileham, F.C.C., N.C.S.) is a fine flower, the full-sized blooms of which measure 10 inches in diameter. The flower has a full centre, and the long florets droop in a very graceful manner. The colour of the surface is a rich crimson, but it shows very little of the gold reverse, a common fault in very many varieties. However, I look upon this variety as one of the most promising.

MISS ROOPE shows a tendency towards the Japanese incurved. It is a full, solid flower, with florets incurved at the points; the colour is an intense yellow, and the bloom measures 9 inches across.

MRS. J. H. COCKEN will take a leading place among yellow varieties; it produces blooms as deep in colour as The Hon. Mrs. Lopes, and the florets are even clearer and brighter than that well-known variety. They are long, of medium width, with a slight curl at the tips.

MISS BEATRICE HOAR.—This is another variety of note which is of an intense crimson colour, with a chestnut reverse. The florets are of medium width, with a slight curl at the tips, and have an elegant droop.

KING EDWARD V. is the same as the Hon. Mrs. Dalgety as shown by Mr. Baxter at Portsmouth. It will be known in future by the first-named title, and is likely to do credit to the raiser (Mr. Godfrey). The colour of the long, drooping florets is an improvement upon that of Master David; it is brighter and clearer, a distinct point in favour of the novelty.

KARA DOW is not exactly a novelty, but is not so well known as its merits deserve. When properly grown it is an improvement on J. H. Silsbury; the colour is a rich chestnut, with golden reverse.

MISS ELSIE DAVIS.—This variety is a thick, solid flower, with short florets of a semi-reflexed character; the colour is purple-lilac, with an occasional silver tip to the florets. It reminds me of a well-proportioned bloom of Etoile de Lyon.

MISS RODNELL is the name of a very attractive variety with flowers 9 inches in diameter; the florets are long, wide, and drooping, white, with flushed edges and purple stripes.

MRS. GILBERT DRABBLE.—This variety should take a prominent place among white-flowered sorts. The blooms measure 9 inches across, and the long florets have a distinct upward curl.

QUEENIE CHANDLER has twisted, drooping florets of a soft primrose yellow. This is a chaste-looking flower, which should be much more popular than it is.

DECEMBER GOLD was introduced as a decorative variety on account of its fine colour, an intense orange-yellow. Its medium-sized florets droop and curl at the tips; it is a full, solid bloom, well suited for the front row of an exhibition stand. Early in November I saw some blooms of this variety measuring 8 inches across, and of almost equal depth.

RED CHIEF has now been named "Thomas Lunt," and will in future be known by the latter title. It is of a rich crimson colour, with gold reverse on the broad florets.

JAPAN has long, wide, drooping florets, loosely incurved. The colour is rich yellow, with an orange suffusion, and the flower is exceedingly attractive. *E. Molyneux.*

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

MECONOPSIS INTEGRIFOLIA (see p. 378).—With regard to the difficulty in raising seedlings of *Meconopsis integrifolia*, it is not improbable that imperfect fertilisation plays a most important part. My experience with one of the earliest packets of seeds received may serve to illustrate this point. The seeds were sown with care, and three weeks later there was evidence of an abundant crop of seedlings. But only three of the seedlings grew, and I had the tantalising experience of seeing the greater number remain stationary for a while and then perish. Observing their lack of progress, I had previously lifted some, and, more closely examining them by the aid of a magnifying glass, found that the cotyledons appeared unable to get free of the integuments. Whether this was due to weakness (it did not appear to be so), to indifferent fertilisation, or to the hardness of the seed-coats I am unable to say. I was at the time rather inclined to think that it was due to the hard seed-coats, and intend at some future sowing to test the point by soaking some of the seeds in warm water, sowing others as usual. The same difficulty is experienced with seeds of *M. Wallichii*. Sowing the seeds in a cold-frame treatment has resulted, I believe, in the loss of quantities of good seeds. A quick vegetation of the seeds I regard as well-nigh essential, and they are best raised in a rather moist greenhouse atmosphere of about 45°. *E. H. Jenkins.*

CHRYSANTHEMUM REMINISCENCES.—It is more than a dozen years since I last attended the great autumn exhibition of the National Chrysanthemum Society, so, although in the interim I had seen many good shows in the provinces, I looked forward with great interest to the recent display at the Crystal Palace. It is difficult to take the mind and memory back over a decade and, further, "comparisons are odious." But, whilst I was at the Chrysanthemum Show, the inevitable question forced itself: Is the Chrysanthemum of to-day superior to that of ten years ago? This is one of the questions which cannot fairly be answered with a plain yea or nay. In sheer point of size the old-time flowers decidedly have the advantage, for there was nothing at the Crystal Palace this year which could for a moment be compared with the gigantic blooms of Mme. Carnot, Vivian, Morel and Etoile de Lyon, which we used to grow. So it is evident that if we find any improvement, it must be in the quality of the blooms, and here there certainly is an improvement, but who shall say how great an improvement? No one could have more admired the lovely bloom of December Gold, which Mr. Davis exhibited so grandly, than I did, but then a dozen years ago we had good, rich-yellow blooms, and may not part of the charm of December Gold be due rather to the skill of the cultivator than to any inherent beauty of the flower itself? In any case I think we may safely claim that the Japanese Chrysanthemum is, on the whole, more refined and of better colour than it was. The Incurved blooms have had their day, and possess but little real beauty. There is a cer-

tain amount of colour value in such rich yellows as Buttercup, Emblème Poitevine and Godfrey's Eclipse, whilst a few varieties, J. Wynn and Miss Cora Stoop, for instance, have a desirable shade of silvery-pink, which finds many admirers. The improvement in Chrysanthemums becomes evident when we consider the decorative types. In the newer race of Japanese flowers and the single varieties there is an immense improvement. These have quite taken the place of the Pompons and Anemone-flowered Chrysanthemums, which formerly were the only really decorative varieties. Where are what one may, perhaps, call the "freaks" of the Chrysanthemum family, the "hairy" varieties and the "spidery" flowers with their frivolous names? These seem to be almost as extinct as the dodo. The nearest approach to them were blooms of Mignonette and Honeysuckle, shown by Messrs. Cannell & Sons, but these varieties have much more beauty than the older freaks possessed. Honeysuckle, a Swanley seedling, has petals very strongly suggestive of the wild hedge-row climber from which it takes its name. Mignonette with its fluffy balls of yellow is very attractive. Little as one may regret the passing of the Incurved varieties, the presence of Mrs. George Rundle in Messrs. Cannell's stand struck a responsive chord. A champion grower of the 80's beheld the blooms with retrospective interest. *A. C. Bartlett.*

THE REMOVAL OF TREE STUMPS (see p. 411).

—The removal of tree stumps by blasting described in last week's issue reminds me of a method I have seen employed in New Zealand which needs no expert, is attended by no danger, and would probably be cheaper than the American method. Tree stumps there on the settlers' clearings are generally 4 feet to 5 feet high—the height of a man's shoulders swinging an axe. Three to five, or more, holes, depending on the size of the stump, are bored with a 1-inch auger, starting at about 2 feet from the ground and slanting down from one side in a direction towards the centre of the large main roots on the opposite side where these enter the ground. The holes are then filled with saltpetre (nitre) and roughly plugged up. This is done in the autumn or early winter. In spring or early summer, as soon as there is a spell of dry weather, the plugs are removed and the saltpetre is found to be absorbed, having been carried into the wood by the receding sap or by the winter moisture. The holes are then filled up with kerosene (paraffin) oil, and more is poured on the top of the stump. The tops and brushwood, which have been left on the ground, are piled up against the stump, and it is set alight. After the upper part of the stump is burnt the base and large roots smoulder on for some time, even for weeks, and to a considerable distance underground. I do not know how far this method is reliable, that is, whether the saltpetre is always certain of being carried down sufficiently into the roots to ensure them being completely burnt out, nor whether it is more suitable for some kinds of trees than others. I have always seen a few stumps left unconsumed. On the other hand, I have more than once had unpleasant experience of the distance from the stumps to which the roots will smoulder away underground. The average cost, I should think, would not be more than 2s. per stump. *A. J. Bliss.*

GIVE THE JOURNEYMAN A CHANCE!—Mr.

Ward, on page 399, considers that a *A Royal Journeyman* is expecting too much when he asks to be allowed to take part in the pruning of vines, Peaches, and other indoor trees. I consider that a journeyman should be given every opportunity to assist in these operations. Mr. Ward goes on to say that a head gardener cannot be expected to risk the symmetry and general welfare of his vines and Peaches by entrusting the pruning to a novice. I am not suggesting that journeymen should do the pruning alone, but I do think that they should assist the gardener or foreman in this work and thus obtain the opportunity of learning the methods of pruning. I am now speaking of journeymen gardeners who take an interest in their work and who want to get on and do their best. It would encourage the young men if they knew that the head gardener had confidence in them and had set them tasks under his guidance that required skill and care. *H. Mason.*

THE LATE JAMES DOUGLAS.—As one who knew this great horticulturist for some forty-six years may I be allowed to add "a little peggle to the cairn" of justly deserved praise of one who shed lustre on the art of gardening? It was in the memorable year of the great International Horticultural Exhibition at South Kensington in 1866, that I first became acquainted with Douglas, and 1866 was the year in which he won the Royal Botanic Society's Silver-gilt Medal for the best Pineapple; but it was as Secretary and Treasurer of the National Auricula and National Carnation and Picotee Society's exhibitions that I was brought into close touch with him, and such other eminent florists as Charles Turner, E. S. Dodwell, Samuel Barlow, Ben Simonite, and the Rev. F. D. Horner, who has touched no flower that he has not adorned. Shakespeare has well said that the fairest flowers of the garden are our Carnations. Turner, Douglas, Dodwell and Simonite never allowed their love of the Carnation to die, even in degenerate days when it was neglected, and to them we owe many of the beautiful varieties now so largely grown. A revival of the love of the Auricula has taken place, thanks in a great measure to James Douglas. In Phyllis Douglas (Alpine) he has given us what may well be described as the most perfect flower in its class yet raised. It received an Award of Merit from the Floral Committee of the Royal Horticultural Society in 1910. A reference to a new variety also compels attention to an old sort, Urania, for which Mr. Douglas received a First-class Certificate twenty years ago. Would it not be a graceful and appropriate memorial to James Douglas for gardeners to subscribe such a sum to the Royal Gardeners' Orphan Fund as would maintain a child perpetually on the funds, to be known as the "James Douglas Memorial"? J. B.

MARKET GARDENERS' IMPROVEMENTS.

Evesham and Pershore market-gardeners are much perturbed by the judgment of the High Court in the case of Kedwell v. Flint (see p.), in which an outgoing tenant claimed compensation under the retrospective sub-section of the Agricultural Holdings (Consolidation) Act of 1908, which incorporates the Market Gardeners' Act, for improvements carried out some years ago. The tenant, a widow who succeeded to her late husband's tenancy, was non-suited on the ground that she had no retrospective claim for improvements, because, under a definition in the Agricultural Holdings Act, 1883, of "a contract of tenancy current at the commencement of this Act," read by the judges into the Market Gardeners' Act as incorporated in the Consolidation Act, such a contract is deemed to continue only up to the earliest day after the commencement of 1896, on which it could be determined by a notice served by either landlord or tenant on the other. In the case of a yearly tenant with a Michaelmas entry that earliest day would be Michaelmas, 1898, and the Court decided that after that date a yearly contract of tenancy, however long ago it was actually made, would be deemed to be one commencing after January 1, 1896, under which no retrospective claim for market-gardeners' improvements would be valid. Of course, this disability was not contemplated by Parliament when the Market Gardeners' Act was passed, for its effect is that no yearly tenant could claim for such market-garden improvements as fruit-planting carried out before January 1, 1896, unless the claim were made between that date and the end of a year from either the next Lady Day or the next Michaelmas Day following, according to the date of entry. But the most curious point is that the definition of "a contract of tenancy current at the commencement of this Act," under which the judges non-suited Mrs. Kedwell, was not incorporated in the Consolidation Act with the rest of the Agricultural Holdings Act, 1883, in which it appeared, and the latter was repealed by the former. It follows that the judges non-suited Mrs. Kedwell on a definition which is obsolete. However, they could have non-suited her much more simply by a proviso to the retrospective sub-section of the Consolidation Act of 1908, inserted by the House of Lords annulling the claim of any yearly tenant to improvements made before January 1, 1896. This is the second retrospective section which has been annulled in the law courts, the first having been annihilated through an astounding misinterpretation of its wording in the case of Smith v. Callender in 1901. As the law now stands, no

yearly tenant has any claim for improvements made before 1896; nor has he any claim for such improvements as fruit-planting, for example, made since that date, unless he and his landlord agreed in writing that the holding was to be treated as a market-garden, or unless his landlord has given his consent to a named improvement included in the first schedule of the Act of 1908 as one of those for which the consent of the landlord is required. *A Southern Grower.*

CELERY DISEASE.—Growers of Celery who have been and are troubled with the Celery disease will find the present correspondence in these columns of much use. I will not altogether dispute the contention that the disease is introduced by means of tainted seed (see p. 399), but how did the seed get tainted if the plants from which seed was saved were not first affected? It seems almost the old query over again as to which came first, the hen or the egg? Mr. Calthorpe says that the director of the R.H.S. laboratory, in his booklet, writes: "Wild Celery seems 'not' to be attacked by this disease," which is very likely, and somewhat strengthens my contention, as it is very unlikely that seed would be saved from wild Celery. I still think that some error in cultivation, manure, or soil, or both, combined with suitable climatic conditions for the spread of the fungus, are the reasons for its appearance year after year. There are myriads of spores and germs of many kinds always with us, awaiting suitable conditions for development. The Potato disease does not appear every year. I think if seed was principally to blame, the disease would be far more prevalent than it is, and if seed were mainly to blame, is it not strange that the disease has not appeared with Mr. Calthorpe before, whilst other growers have been troubled with it? It is certainly strange that Mr. Calthorpe's first trouble with this disease should happen when he used pig-manure for the first time (see p. 399). Mr. Slaughter, writing on p. 419, states that he uses only pig-manure (and, by the way, his experience, as recorded in his note, of manured plants affected, and unmanured plants free from disease, is the same, practically, as mine, p. 341). Since my first letter appeared, I have had two or three private letters from gardeners telling me that their plants have suffered from the disease, and that they have used pig-manure. Pig-manure may cause a certain growth in the Celery, which favours the development of the disease. Mr. Smith (p. 419) uses horse-manure and nitrates. According to Thompson's *Gardeners' Assistant*, 1859 edition, pig-dung contains more nitrogen than either horse or cow-dung; and nitrates supply extra nitrogen, which may mean that too much nitrogen may, in some way, cause suitable conditions for the development of the disease. It may be possible to give too much manure to Celery, that is why I have given less manure to my plants since they were affected with the disease in 1907. With regard to spraying with the Bordeaux mixture, I do not think any danger is to be feared. I consulted a chemist on this point, and he assured me that he would have no hesitation in eating Celery a day or two after being sprayed with the mixture; and I can assure Mr. Smith that the spraying in no way affects the taste of the Celery. *J. Jaques, Bryanston Gardens, Blandford.*

My first experience with this disease occurred last year, and when first noticed infested leaves were removed and burnt. The plants were also frequently sprayed with a solution of sulphide of potassium, and at intervals dusted with lime and sulphur, with little or no effect. After reading up on the subject I found that I may possibly have bought the fungus with the seed, so this season special and early observations were made, with the result that I found perithecia on seedling Celery plants, and these were especially numerous on the variety Sulham Prize. I presume the seed-coat would form a nidus for resting spores. If so, would it be possible before sowing to treat seeds with some process that would destroy the fruits of the fungus, without doing harm to the seed? This is a case in which immediate steps should be taken to try and stamp out the disease. Unlike other fungi, it seems to resist ordinary sprayings and dustings. *G. H. H. W.*

THE SUMMERS OF 1906 AND 1911.—The summer which practically came to an end on September 12 will long be remembered as the hottest and one of the driest that has been known in this country since reliable records have been kept. Yet in this locality, at all events, the effect, both on vegetation and the water supply, has been far less injurious than could have been expected, considering the tropical heat of the 74 days from July 1 to September 12, with the shade temperature over 80° on 26 days, a mean maximum of 78°, and a rainfall of only 1.60 in. Coppices cut down last winter and most kinds of Roses (not watered) have made more growth than I can remember ever to have seen, and the only shrubs or garden flowers that occur to me as having wanted water are Rhododendrons, Spiræas, Phloxes, and Lobelias. A Penzance Briar grown as a pillar Rose made an aggregate growth upon nine shoots amounting to 81 feet. And, best test of all, the two hydraulic rams that provide the house with water, and are supplied from a spring hard by, have had an ample supply throughout. Let us compare this with the summer of 1906. In that year I find in my diary on September 11 that "the drought is getting very serious; there has only been water enough to work one ram for the last fortnight," and—on the 13th—that about 200 yds. of a white Thorn hedge "appeared to be dead from the drought." That hedge has remained perfectly green all this summer. It is clear, therefore, that the drought was more severe in 1906 than this year, though in the former the shaded thermometer never touched 80° till August 31, after which there were three days in September over 80° but under 85°, making four in all for the summer against 26 in 1911. What, then, is the cause of this apparent anomaly? It is not to be found in the rainfall of the summer, or even of the nine months ending June 30, as will be seen by the following figures:—

RAINFALL.			
Oct. to Dec., 1905	6.03 in.	1910	7.79 in.
Jan. to June, 1906	11.57 in.	1911	10.35 in.
July 1 to Sept. 12, 1906	1.57 in.	1911	1.60 in.
			19.17 in.
			19.74 in.

The difference of .57 in. (all in 1910) in favour of this year is not enough to balance its far higher temperature, so we must go farther back for an explanation of the above phenomena. This will be found in a comparison of the total rainfalls of the two years preceding each of the above, viz.:—

1904	23.29 in.	1909	31.04 in.
1905	23.62 in.	1910	27.09 in.
	46.91 in.		58.13 in.

So that 1911 started with a balance of 11.22 in., or, say roughly, 1,100 tons of rain per acre in its favour. In conclusion I may mention that all the data given relate to one piece of land of less than 20 acres (thus ensuring their accurate correlation), and are offered as a contribution to the study of that much neglected, but to farmers and gardeners most important, branch of science, local meteorology. Also, that the thermometers used have the Kew correction and are in a Stevenson screen, and that I have had nearly 40 years' experience in recording. Such an example of the inability of high solar temperature seriously to affect the water supply beneath the earth's surface is rarely to be met with. *Alfred O. Walker, F.L.S.*

COAL OIL FOR CHRYSANTHEMUMS.—It may interest your readers to know that I feed my Chrysanthemums with gas tar (or coal oil). I will try and explain why and how I do it. Five years ago there was upset a quantity of gas tar on the manure heap, or it might have been thrown there. This was melted into a thin liquid by the hot manure, and it found its way into the tank where we get our manure water to feed the Chrysanthemums and other plants. At first I did not know that this gas tar was in the water until I saw the tar on the soil at the top of the pots; then, of course, I was afraid that damage to the plants would result, but I saw no bad results. On the contrary many young roots could be seen at the top of the pots, and I noticed, further, that the plants were vigorous and the leaves were a darker green. I decided to give them a further quantity of this liquid tar manure, and since the first year, I pour gas tar on

the manure heap (when the manure is hot) so as to melt the tar, and I am not afraid of using it. I am sure the flowers are brighter and of greater substance, the foliage is of a darker green, and the plants generally are more vigorous. I am no chemist, but I feel sure that by accident I have found out a good manure for plants. I might say here that I won 1st prize and silver cup for groups of large-flowered Chrysanthemums, also 1st prize for a group of single-flowered Chrysanthemums at Stockport on November 17 and 18 last. These plants were fed with manure-water where gas or coal tar was added. *Jas. Atkinson.*

PROPOSED BRITISH GARDENERS' RECEPTION AND DINNER.—Kindly grant me a space in your columns on behalf of the members of the Gardeners' Dinner Committee of 1903, to inform your readers that, assuming a favourable response be made, it is proposed to organise in connection with the Royal International Horticultural Exhibition of May next a similar reception and dinner to that held in 1903, and which resulted in a very remarkable success. The members of the above-named committee have recently met for consultation, and have, with a view to obtaining, if possible, some expressions of opinion from the gardeners of the kingdom, requested me, on their behalf, to communicate with you and thus inform your readers of what is proposed. I need hardly say that only in the case of a favourable response from gardeners would arrangements for the dinner be proceeded with. Whilst it is known that great receptions, conferences, and banquets will be arranged by the Exhibition authorities, the council of the Royal Horticultural Society and other distinguished bodies, these functions will be chiefly provided in the interests of visitors from all parts of the world. The Gardeners' Dinner Committee therefore hold that the British gardener should not be overlooked, and hence have put forward the dinner proposal for May next, as mentioned. If the date for such dinner be fixed for the first week of the Exhibition, it must be so late as Saturday, May 25, seeing that preceding days are fully occupied with important functions. Admission to the Exhibition will be 1s. on that day for gardeners, and 2s. 6d. for their wives. On the previous day it is 2s. 6d. for the gardener and 5s. for the wife, thus making the visit, especially to gardeners coming from remote places, very expensive. During the ensuing week the charge for admission all round is 1s., but it is feared few gardeners would care to come far to see the Exhibition at so late a period. The proposal of the Dinner Committee is that dinner tickets shall not exceed 5s. each, and that gardeners' wives would be welcomed. Will all gardeners who favour the proposed dinner kindly send me a postcard to that effect at an early date. The committee will then have information on which to act. *Alex. Dean, 62, Richmond Road, Kingston-on-Thames.*

CROSS AND SELF-FERTILISATION OF PLANTS.—In your leading article of the *Gardeners' Chronicle* for December 2, 1911, entitled "Increased Yields from First Generation Hybrids," you observe:—"As to the scientific aspect of these matters there is nothing to say, for nothing is known." This, however, is not quite correct. No mention is made of Darwin's *Cross and Self-Fertilisation of Plants* (1876), nor of a series of articles analysing and criticising that work in the *Gardeners' Chronicle* for 1877, nor of my paper on "Self-Fertilisation of Plants" in the transactions of the Linnean Society (November 1, 1877, pp. 317-398), nor in my *Origin of Floral Structures*, wherein the same subject is discussed (1888). The results of experiments proved that crossing was only a temporary stimulus, that is, for one or few years—as you show to be the case with Maize—so that, after the plants have been crossed for a few generations they lose their seed-bearing power. As examples, Mr. H. B. Smith, of Baling, once known for his Cyclamens, told me that, after securing fine plants, the seed failed; so that he always kept a number of the "weediest" plants, as he called them, wherewith to raise seed, for if not crossed they seeded abundantly. These he then crossed, and so kept up his standard. Another florist told me by continually crossing Primulas of the same kind he lost the whole stock, for they failed to set seed at last! Darwin's cultivation of *Ipomœa purpurea* revealed a similar thing. He grew it for ten generations, and he gives the

heights of the crossed and self-fertilised for every year. Taking 100 as the fixed height for the crossed, the self-fertilised show maxima and minima; but if these are grouped by three years together, we find the ratio is 100:74.3, 100:77.6, and 100:81.6; that is to say, the self-fertilised were steadily gaining upon the heights of the crossed generations. *Dianthus* like *Lobelia fulgens* is strongly protandrous, but with regard to fertility, "eight crossed plants produced 21 capsules, of which only 12 contained seed averaging 8.5 per capsule. On the other hand, the eight self-fertilised produced no fewer than 36 capsules, with an average of 11 seeds." This shows how flowers readily, even if specially constructed for cross-fertilisation, revert to the usual prolific condition of self-fertilisation. *George Henslow.* [Professor Henslow's remarks serve to emphasise our statement that "as to the scientific aspect of sterility nothing is known."—EDS.]

JUDGING AT THE FRUIT SHOW.—I am not dismayed by the anger of *A Judge* through my drawing attention to the unfairness involved by the judges' intermingling with the exhibitors during the hours of staging. Far from being a disappointed exhibitor, I am a very successful one, and undoubtedly the successful exhibitor is the proper person to adjudicate at any show, but not if he is a competitor at the show in which he is a judge. In my letter on page 310, I did not mean to reflect on any one of the judges at the recent fruit show. This point was raised by *A Judge* himself, and he appears to be very sore about it. Now he has raised it, however, I will ask him a question, namely, Why did he not see that the awards made in the class for "any other cooking variety" were not altered? Would it not have been more straightforward to have announced, through these columns, the error of judgment? Had *A Judge* read carefully the very plainly-worded rules of the R.H.S. before adjudicating at this show, instead of taking a general inspection, he would, without doubt have avoided this error and escaped all discussion. As it is, I think many readers will agree with me that there was cause for complaint, and *A Judge* must not forget that while he defends his honour and integrity, he must, in fairness, consider the exhibitor, who, after having staged his exhibit, expects at least to have it judged according to the rules of the schedule. *Fairplay.*

—I was pleased to read *A Judge's* reply to *Fairplay*; but must say that I think judges should not be present whilst exhibitors are staging their exhibits. We have lately had a show near here, and while we were putting up the exhibits one of the committeemen and one of the judges were walking round the room and passing remarks on them. They know the exhibitors of several of the groups, and the committee member himself was showing in some of the classes. When I am exhibiting in competition, I much prefer that the judges should not know to whom the individual exhibits belong. *North Dorset.*

"IRISH AND SCOTTISH FLOWER GARDENS."—"Nothing is more a Child of Art than a Garden." This is the title of one example in a very charming exhibition (at James Connell & Sons' gallery, 47, Old Bond Street) of "Flower Pieces and Gardens" done in pastels by Mary G. W. Wilson, a Scottish artist, who evidently loves her garden. She has studied nature and art side by side and has a control of the technicalities of pastel-painting, achieving a delicacy and point in her delineation of flower forms—which is rare in this medium of craftsmanship—as well as the brilliance of colour which is peculiar to it. Indeed, these pictures combine the excellences of both oil and water without being either. One of the most interesting "gardens" is that of "Mount Usher, Co. Wicklow," which conveys quite an Oriental impression as an avenue composed of rare trees, in which the fan Palm predominates over the lesser stature of the English trees and large masses of tropical plants. These all speak for the mildness of the Irish climate. One, "An Irish River Garden," tempts the beholder to set sail for the Emerald Isle at once. These British gardens hold their own even against such luxuriant scenes as that "Venetian Garden" embowered in Wistaria blossom which affords Miss Wilson such fine scope in mauves and purples, lighted up by sunlight and contrasted in shadows. Delicacy and tender feeling

for the more intimate form and restrained colour of wild flowers in soft-toned daylight are shown in several studies of flowers, such as "Love-in-a-Mist," that most delightful of wildlings in colour, of palest blue, and of form so graceful. And, again, in a pink "Tangle of Wild Roses" and deep-red "Penzance Briars." These floral pieces are interspersed with some excellent landscapes, among which the Cornfields tell the most pleasingly in their lowered tones of pale gold and grey shadow. *Mary L. Breakell.*

GREENGAGES NOT FRUITING.—A Frankfort correspondent writes to say that the failure of Greengage trees to fruit has been noticed in Germany, and attributed not to the absence of other varieties of Plums near them to insure cross-fertilisation, but to the fact that the trees were grafted. Those grown from suckers, he remarks, have fruited well, and, in some parts of Germany, such trees alone are now being planted. But if, as I believe, all Greengage trees in England have been raised from buds or grafts, while some fruit fairly and others very little, there is still some mystery to be explained, though it may be the case that the trees generally would have fruited better if they had been raised from suckers. *A Southern Grower.*

SOCIETIES.

ROYAL HORTICULTURAL.

Scientific Committee.

DECEMBER 5.—*Present:* Mr. E. A. Bowles, M.A., F.L.S. (in the Chair); Dr. A. B. Rendle, F.R.S., Messrs. G. Gordon, A. Worsley, W. Fawcett, G. F. Wilson, J. O'Brien, W. C. Worsdell, and F. J. Chittenden (hon. sec.).

The late Mr. James Douglas.—It was unanimously resolved to convey a vote of condolence to Mrs. Douglas on the death of Mr. James Douglas, who had for many years been a member of the Scientific Committee.

Double Odontoglossum crispum.—Mr. GURNEY WILSON, on behalf of Mr. JENSEN, showed a double flower of *Odontoglossum crispum*. The two outer whorls were normal, but the stamens had apparently developed and become petaloid. The plant showed the same peculiarity each year.

Gall on Ribes alpinum.—Dr. RENDLE exhibited a branch of *Ribes alpinum* from a place near Grantham, having large numbers of black galls upon it about $\frac{3}{4}$ inch to 1 inch long so numerous that the whole bore a superficial resemblance to a small branch of Larch bearing numerous small cones. The cause of the production of these galls was unknown.

Uncommon fruit.—Mr. GEO. GORDON exhibited a ripe fruit of *Holboellia latifolia* (*Stauntonia latifolia*) from a wall at Somerleyton Hall, where it had not been known to fruit before.

Aberrations of Saxifraga ligulata.—Mr. W. C. WORSDELL showed specimens of leaves from a plant of *Saxifraga ligulata* at Kew which, season after season in the autumn, produces leaves of ascidia form and developed in different degrees. Many of the leaves showed cresting as well.

Violets with branched peduncles.—Mr. WORSDELL also exhibited Violets with branched peduncles from Mr. Williams. The specimens were sometimes branched low down and sometimes so near the flower, that two double flowers were developed almost touching one another.

UNITED HORTICULTURAL BENEFIT AND PROVIDENT.

DECEMBER 11.—The monthly meeting of this Society was held at the Royal Horticultural Hall, Vincent Square, S.W., on this date. Mr. Thomas Winter occupied the chair.

Three new members were elected, making a total of 48 for the year.

A long discussion took place on the State Insurance Bill, and it was decided that a circular letter relative to the above Bill be sent to all members.

It was stated by the Secretary that the amount of sick pay disbursed during the past month amounted to £38 9s.

MANCHESTER AND NORTH OF ENGLAND ORCHID.

NOVEMBER 30.—Committee present: Rev. J. Crombleholme (in the Chair); and Messrs. R. Ashworth, W. R. Lee, C. Parker, H. Thorp, A. Warburton, Z. A. Ward, J. Cypher, J. Evans, W. Holmes, A. J. Keeling, D. McLeod, and H. Arthur (secretary).

W. R. LEE, Esq., Heywood (gr. Mr. Woodhouse), was awarded a Silver-gilt Medal for a miscellaneous group, amongst which were noticed some fine *Odontoglossums*.

R. ASHWORTH, Esq., Newchurch (gr. Mr. Gilden), was also awarded a Silver-gilt Medal for an effective exhibit, the more noteworthy plants being given under "Awards of Merit."

Z. A. WARD, Esq., Northenden (gr. W. Weatherby), staged a good group for which a Silver Medal was awarded; a magnificent plant of *Odontoglossum Charlesworthii*, "Ward's var.," with a branched spike 6 feet long, *Lycaste Skinneri* "alba," and *Oncidium tigrinum* were noticed in this exhibit.

Col. J. RUTHERFORD, M.P., Blackburn (gr. Mr. Lupton), was awarded a Silver Medal for *Odontoglossums* in variety, including a fine plant of *O. ardentissimum* "zanthotes," *O. eximium* "Rutherfordianum," *Cattleya labiata* and hybrids, *Cypripedium* "Bonar Law" (J. Howes × *Actæus*), several plants of *Oncidium tigrinum*, and a batch of *Epidendrum vitellinum* majus.

Rev. J. CROMBLEHOLME, Clayton-le-Moors (gr. Mr. Marshall), staged a group of *Cypripediums*, for which a Bronze Medal was awarded.

A. WARBURTON, Esq., Haslingden (gr. Mr. Dalgleish), was also awarded a Bronze Medal for a group of *Cypripediums*, the insigne section being represented by fine examples of *Harefield Hall*, *King Edward VII.*, *Clara Measures*, *Barryanum* and *Bohnofianum*.

J. MCCARTNEY, Esq., Bolton (gr. Mr. Holmes), was awarded a Bronze Medal for a mixed group of *Cattleyas*, *Lælio-Cattleyas*, *Cypripediums*, and several plants of *Oncidium Rogersii*.

G. H. PEACE, Esq., Monton Grange (gr. Mr. Mace), showed a group of *Cypripediums*, for which a Bronze Medal was awarded.

WM. THOMPSON, Esq., Walton Grange, Stone (gr. Mr. Stevens), was awarded a Bronze Medal for a small but interesting group, showing *Cypripediums* *Harri-Leeanum*, *Golden Gem*, *Our King* (*Harefield Hall* × *Niobe*), and a number of plants of the sweet-scented *Oncidium cheiroporum*.

J. J. HOLDEN, Esq., Southport (gr. Mr. Johnson), staged several choice albino *Cattleyas* and a remarkable *Odontoglossum* × "Bronze Dragon."

R. LE DOUX, Esq., West Derby (gr. Mr. Fletcher), staged several novelties in *Odontoglossums* which received awards.

H. J. BROMILOW, Esq., Rann Lee, Rainhill (gr. Mr. Morgan), staged *Cypripedium Leeaunum* var. "Mona."

Messrs. J. CYPHER & SONS, Cheltenham, were awarded a Silver Medal for a group composed principally of *Cypripediums*.

Messrs. A. J. KEELING & SONS, Bradford, were also awarded a Silver Medal for a collection of *Cypripediums*.

Messrs. SANDER & SONS, St. Albans, staged *Cypripediums* *Thalia* var. "splendens," *Gratrixæ* and *Alabaster*.

Mr. D. McLEOD, Chorlton-cum-Hardy, showed *Cypripedium Seymouræ* (*Leeaunum* *Clinkaberryanum* × *Fairrieianum*), *C. Actæus revoluta*, *C. triumphans*, *C. vexillarium*, *C. Zena*, *C. Cravenianum*, and several seedlings.

Messrs. STUART LOW & Co., Middlesex, staged several choice *Cattleyas*, one named "Rhoda" being very fine.

Mr. H. ARTHUR, Blackburn, staged *Cypripediums* *Laura Kimball*, *Sanderæ*, *Chantini* *Lin-denii*, and *Aberdeen*.

AWARDS.

FIRST-CLASS CERTIFICATES.

Odontoglossum crispum var. "Briseis," a heavily-blotched round flower; *O. "Thais,"* a hybrid of uncertain parentage; both from W. R. LEE, Esq.

Cattleya Roehrsiana "Ashworth's var.," a large flower of good colour; *C. "Gildenii"* (*Hardyana* × *Maggie Raphael*), a beautiful hybrid; both from R. ASHWORTH, Esq.

Cypripedium Our King (*Harefield Hall* × *Niobe*), from WM. THOMPSON, Esq., a fine, bold flower, the *Harefield Hall* parent predominating.

Odontoglossum × *Bronze Dragon*, one of the most beautiful *Odontoglossums* yet seen; the flowers are $3\frac{1}{2}$ inches across and coloured all over a delightful shade of pink or "crushed Strawberry"; *Cattleya labiata* "albanscens"; both from J. J. HOLDEN, Esq.

AWARDS OF MERIT.

Odontoglossum × *Harmaches*, *O. × Lais*, *Mil-tonia Leopoldii* "nobilior," a very fine flower of good colour, and *Cattleya labiata* "Virgin Queen," all from W. R. LEE, Esq. *Odontoglossum crispum* "Rosemount," a well-formed, evenly-marked flower; *O. eximium* var. "Nubian," of very deep colour; and *Vanda cærulea* "alba," a rather small flower, with pure-white segments and lip of a beautiful blue colour. These were from R. ASHWORTH, Esq. *Cypripedium Corneyanum* var. "Marie Louise," *C. Alcibiades* "Ward's var.," and *C. James Renwick* (*Harefield Hall* and *Actæus*), all from Z. A. WARD, Esq. *C. Bonar Law* (J. Howes × *Actæus*), a very neat flower, showing the characters of both parents, from Col. RUTHERFORD, M.P. *Lælio-Cattleya Captain Starkie* (*L.-C. Eudora* × *C. labiata*), from J. MCCARTNEY, Esq. *Cypripedium hybrid*, of unknown parentage, shown by WM. THOMPSON, Esq. *Cattleya O'Brieniana alba*, from J. J. HOLDEN, Esq. *Odontoglossum Mrs. H. B. Irving* (*Lambeauianum* × *Pescatorei* *Duchess of Westminster*), a fine, well-coloured flower; *Cattleya Mrs. Frank Hurndell* (*Trianæ* × *Iris*), and *Sophro-Lalia Miss Edith d'Abrew* (*Etonensis* × *Iris*), all from R. LE DOUX, Esq. *Cypripedium Leeaunum* var. "Mona," a fine flower of uncertain parentage, from H. J. BROMILOW, Esq. *C. Mrs. Alice Walmsley*, a dark flower of good shape, with a band of white all around the dorsal sepal, from JAS. WALMSLEY, Esq. *C. Hitchensæ giganteum* and *C. magnificum*, both fine forms, from A. J. KEELING & SONS. *C. Seymouræ* (*Leeaunum* *Clinkaberryanum* × *Fairrieianum*), from Mr. D. McLEOD.

CARDIFF HORTICULTURAL.

NOVEMBER 29.—The annual general meeting of the Cardiff and County Horticultural Society was held on the above date. The Chairman, Mr. S. Medhurst, in presenting the annual report, stated that it was not as favourable as could be desired, and it would have been almost disastrous from a financial point of view if it had not been for the great generosity of friends of the society. The balance to the bad would probably then have been considerably over £100, instead of, as at present, £34. With regard to 1912, Mr. Godfrey L. Clark had consented to be the president of the society. The following officers were elected:—Mr. Gilbert Robertson, chairman; Mr. Victor E. Brukewich, vice-chairman; Mr. E. J. August, hon. treasurer; Mr. A. Maurice Bailey, secretary; and Messrs. J. Percy Mountjoy and Co., auditors; Messrs. J. Hugh-Howell and W. Edward Horley were added to the executive committee, other members of which, and the general committee, were re-elected.

LEEDS PROFESSIONAL GARDENERS' FRIENDLY BENEFIT.

DECEMBER 5.—The yearly meeting of the above Society was held at the Green Dragon Hotel, Leeds, on this date. The principal business was the completing of arrangements for the annual dinner and the election of officers for the ensuing year.

Mr. Donoghue presided over a well-attended meeting. The officers were elected as follow:—Chairman, Mr. A. Allinson, Roundhay Park; vice-chairman, Mr. C. Lewis, Oakwood, Leeds; treasurer, Mr. John Franklin; and secretary, Mr. Geo. Carver.

A statement of accounts will be published on the 31st inst.

SCOTTISH HORTICULTURAL.

DECEMBER 5.—The monthly meeting of the above association was held in the Goid Hall, Edinburgh, on this date. Mr. Massie, the president, presided, and there was an attendance of 120 members.

A lecture with lantern illustrations was delivered by Mr. Thos. Anderson, M.A., B.Sc., Edinburgh, and East of Scotland College of Agriculture, on "Insects and Flower Pollination." The lecture was much appreciated.

The exhibits were:—New single *Chrysanthemums* Miss Callander (creamy-white), Mrs. G. F. Eyre, Miss E. L. Cowan, and Mrs. R. C. Cowan, from Mr. WM. G. PIRIE, Dalhousie Castle, Bonnyrigg; new single *Chrysanthemums* Lady Helen and another seedling variety (un-named), from Mr. D. McLEAN, Raith, Kirkcaldy; collection of *Chrysanthemums* from the CITY OF EDINBURGH DISTRESS COMMITTEE'S FARM at Murieston, shown by Mr. Cairns; *Chrysanthemums* and Christmas Roses, from Mr. CHARLES COMFORT, Davidson's Mains; and a vase of *Chrysanthemum Felton's Favourite*, from Mr. JAMES BRUCE, Davidson's Mains. A First-class Certificate was awarded to *Chrysanthemum* Miss Callander and Certificates of Merit to Mrs. G. F. Eyre and Miss E. L. Cowan.

The convener of the Finance Committee stated that there was a balance to the good of approximately £25 on the *Chrysanthemum* show accounts, which was very satisfactory, considering the bad state of the weather on the first and second days of the show. It was agreed to hold a three days show in 1912, the dates to be November 14, 15 and 16.

The following office-bearers were nominated for the session 1912:—Hon. president, Captain Archibald Stirling; of Keir, Dunblane, in succession to Sir John Gilmour, Bart.; president, Mr. W. H. Massie (for re-election); vice-presidents, Messrs. J. Phillips and D. W. Thomson. There were 11 nominations for seven vacancies in the council.

The annual business meeting will take place on January 16, 1912, when the office-bearers for the year will be elected, and the revised constitution and by-laws will be submitted to the members for their acceptance.

It was intimated that Captain Stirling had invited the members to visit Keir in 1912, and the invitation was cordially accepted.

HORTICULTURAL CLUB.

LECTURE BY MR. ARTHUR SUTTON.

DECEMBER 5.—On this date the usual monthly dinner of this club was held at the Hotel Windsor. Mr. Harry J. Veitch presided, and there were present about 50 members and guests, including ladies.

After the dinner a lecture was delivered by Mr. Arthur W. Sutton, J.P., V.M.H., entitled "Four Hundred Miles on Horseback East and West of the Jordan." The lecture was illustrated by means of 100 beautifully coloured views of the Lebanon, Gilead, Basham, Moab, and Southern Palestine, and was intensely interesting, as most of the views had been taken by Mr. Sutton himself, who described them in detail, relating the difficulties and adventures which were encountered on the journey, together with the habits, customs, and industries of the Arabs, Jews, and other inhabitants of the district traversed by him and his party, who travelled under the care of Messrs. Cook & Sons.

As Palestine is only about 150 miles from north to south, the first slide represented a map of that country, upon which Mr. Sutton indicated the tortuous route which made up the 400 miles traversed, embracing the many points of salient interest which the plan included. As the scene of innumerable scriptural references, Mr. Sutton increased the interest of most of the slides by briefly alluding to these, indicating now and then how a visit to the actual localities dissipated critical doubts which had been raised on biblical statements. The many magnificent ruins of ancient temples of Roman, Greek, and still older periods, which indicate the presence at some time or other of great populations in districts that are now deserts, were shown on the screen to great advantage, and among these undoubtedly the most curious and interesting were those of Deraa. Here there are at least four cities superposed the one above the other. The present Arab buildings are founded upon a Greco-Roman

city, which in its turn stands on the remains of a still older one in which bevelled stones are used, whilst below these three there is a troglodyte city entirely excavated in the native rock, the subterranean residence of King Og. This subterranean city consists of a labyrinth of streets with shops and houses and a market place, but it is hardly safely accessible to foreigners. A reference to the Dead Sea related to the curious fact that it lay no less than 1,300 feet below the level of the Mediterranean, and forms the lowest lying body of water on the earth's surface. It was computed that about six million tons of water pour into it daily, the whole of which is evaporated, as there is no obvious outlet; its excessive saltiness is therefore the outcome of accumulation from the Jordan of the minute quantity of salt in its waters. From the Dead Sea to Jerusalem there is a rise of nearly 4,000 feet, as that city is about 2,500 feet above sea level. The Jerusalem of Christ's time lies about 100 feet below the level of the present city, and in this connection and others the lecturer alluded to and showed some slides of the valuable work effected by the "Palestine Exploration Fund," which has now been busy for 45 years in bringing to light the many buried treasures of Palestine.

After the delivery of the lecture, Sir Chas. Watson, Chairman of the Palestine Exploration Fund, and Mr. Harry J. Veitch offered some remarks, and referred in highly appreciative terms to the lecture and views.

Particulars of membership of the club may be obtained from Mr. R. Hooper Pearson, Hotel Windsor, Westminster.

PERPETUAL-FLOWERING CARNATION.

DECEMBER 5.—The annual meeting of this Society was held at Anderton's Hotel, Fleet Street, on this date. The meeting was preceded by a dinner, at which about 30 members and friends were present, including Messrs. J. S. Brunton, W. E. Wallace, W. H. Page, H. F. Mason, G. W. Leak, W. Wells, junr., L. J. Cook, and the Rev. J. Jacob.

The first business of the annual meeting was the consideration of the annual report, which was read by the Hon. Secretary, Mr. E. F. Hawes.

The following extracts are from the report:—

Two exhibitions were held during the year, the winter show taking place at the Royal Horticultural Hall, Vincent Square, on December 13, 1910, and the spring show at the Royal Botanic Gardens, Regent's Park, on May 2 and 3, 1911. With a view to encourage amateur members residing at a distance of over 50 miles from London, and who do not compete in other classes, your committee introduced a special section in which they provide vases and stage the flowers.

The *Year Book* of the Society having proved such a great success during the preceding year, your committee decided to continue its publication in 1911 in a larger and improved form.

A steady increase of membership has taken place. The roll of active members on October 31, 1910, was 272; on October 31, 1911, 301.

The series of trials undertaken by the Society in order to ascertain the suitability of the perpetual-flowering Carnation as a decorative plant for the open border, were again conducted in Regent's Park, and extended to St. John's Wood, Hampstead, and other centres. Full reports of these trials will appear in the *Year Book* for 1912.

The steps taken at the last annual meeting to ensure that no varieties raised in the British Isles would be considered for certificate or award unless registered have proved most successful. The total number of British-raised varieties registered to date has reached the large number of 84.

Your committee were fortunate in arranging with Messrs. J. S. Brunton, C. Engelmann, and W. E. Wallace, who were visiting America, to represent the Society at the Horticultural Congress at Boston, U.S.A., and the annual meeting and show of the American Carnation Society, in March, 1911.

Your committee is further pleased to report that a working arrangement has been made with the American Carnation Society in regard to preventing the duplication of the names of varieties raised both here and in the United States, which it is anticipated should prevent confusion in nomenclature in the future.

On behalf of this Society, a donation of 10 dollars has been made to the fund which is being raised by the American Carnation Society to perpetuate the memory of the late Mr. Fred Dozier, whose great work on behalf of Carnations is so well known and so greatly appreciated. The object of this fund is to raise a sum sufficient to establish a gold medal to be awarded annually at the American shows for the best new variety of Carnation exhibited.

Your committee is pleased to record that the directors of the Royal International Horticultural Exhibition, 1912, have made excellent provision for perpetual-flowering Carnations, and have practically adopted the whole of the suggestions made by your committee in the classes where gold medals presented by this Society are offered. Mr. J. S. Brunton and Mr. Hayward Mathias are the Society's representatives on the general committee of the Royal International Exhibition.

The adoption of the report was formally moved by the Chairman, who briefly outlined the work of the Society.

The Hon. Treasurer read the financial statement, and this, together with the report of the committee, was ordered to be printed and circulated.

It was decided to increase the general committee from 18 to 30 members, eight to form a quorum, and ten to retire annually.

A letter was read from Mr. Hayward Mathias, who has been Secretary of the Society since its formation, and conjointly with Mr. Hawes for the past two years, regretting that he was unable to attend, owing to severe illness, and was therefore compelled to resign his office. Mr. Hawes was asked to write on behalf of the Society, expressing sympathy and hopes for a speedy recovery.

Lord Howard de Walden was again elected president; the vice-presidents were also re-elected, with the addition of Messrs. H. Mathias and F. C. Harwood. Mr. J. S. Brunton was re-elected chairman, Mr. W. E. Wallace vice-chairman, Mr. L. J. Cook hon. treasurer, and Mr. E. F. Hawes hon. secretary and show superintendent.

NATIONAL SWEET PEA.

DECEMBER 8.—Committee meetings in the forenoon, the annual general meeting of the members at 2 p.m., followed by a dinner at 6 p.m., and a conference in the evening, provided a busy day's work for the members of the National Sweet Pea Society, at the Hotel Windsor, Westminster, on this date.

ANNUAL MEETING.

The annual meeting was attended by close upon 100 of the members: the chairman, Mr. G. W. Leak, presided. At the commencement of the proceedings Mr. S. B. Dicks referred to the serious illness of Mr. William Deal, a well-known member of the Society, and it was unanimously resolved that a telegram be sent to him expressing the sympathy of the meeting. The Chairman submitted the committee's annual report and financial statement, from which we extract the following details:—

The year 1911 has been an eventful one for the Society. Quite early in the year difficulties arose in connection with the formation and election of the Floral Committee, due chiefly to the fact that there were no rules governing these matters, or for the guidance of the Committee when elected. Eventually rules were adopted by a special general meeting, and under these rules the Floral Committee for the year was elected.

The Society has sustained a great loss by the death of its Trials Superintendent, Mr. Charles Foster.

A record for the accession of new members has been established, no fewer than 303 having joined during the year. The membership shows a considerable increase, over 1,200 now standing on the books, notwithstanding losses from various causes amounting to 140. It may be necessary in the near future to safeguard the interests of the Society by withholding the *Annual*, and tickets of admission to the exhibition, until the annual subscription has been paid. Societies in affiliation now number 125, an increase of 16 for the year.

The Society is in a sound financial position, as £150 are on deposit, and a cash balance is again carried forward. The profit balance on the year's work is not so large as last year, and this is due chiefly to the increased expenditure in connection with the work of the Floral Committee, extra printing and postage incurred by several special meetings, and the grant of £25 to the International Horticultural Exhibition of 1912.

There were 260 Novelty Trials and eight Purity Trials. Greater space was provided this year, and shading was afforded the orange and salmon varieties.

Attendance at the show was not so large as usual, and the receipts at the gate amounted to £41, as compared with £65 8s. 6d. in 1910. The exhibition for 1912 will be held at the Royal Horticultural Hall, on Tuesday and Wednesday, July 9 and 10.

The second Sweet Pea Conference, held at the Hotel Windsor, on December 11, 1910, was an unqualified success. The popularity of the *Annual* steadily increases.

The forthcoming Schedule of Prizes will be distinct from its predecessors in several ways. Classes for specified varieties have been entirely omitted, and novelties provided for in liberal fashion. The district classes are a quite new feature, as also are the classes for new seedlings and for flowers with double standards.

During the year 1912 the great horticultural event will be the International Horticultural Exhibition. Our Society has contributed £25 towards the expenses, will present one Gold and two Silver Medals, and has guaranteed a further £25 in the event of financial loss.

The balance sheet showed a total income of £932 15s. 4d., including £336 11s. 1d. subscriptions for 1911; balance from 1910 of £128 18s. 9d., and bank deposit £100. The heaviest item of expenditure was £213 4s. for printing and stationery.

There was some discussion with regard to the withholding of tickets from the members until their annual subscriptions were paid, but on the proposition of Mr. Cuthbertson, the report was adopted as printed. Regarding the financial statement, Mr. Walter P. Wright drew attention to the very large expenditure for printing, posting, and stationery, observing that, in view of the extra trials this year, it behoved the members to

practise the strictest economy. He proposed that a small sub-committee be appointed to consider this matter. This was seconded by Mr. F. W. Harvey. Mr. Wright's suggestion, however, was not adopted, as it was considered that the items were not unreasonable, especially in view of the extra number of meetings that had been held this year and the drafting of rules, forms, etc., all necessitating a corresponding increase in postage. The secretary, Mr. C. H. Curtis, said that the lowest tender submitted for printing was accepted. The financial report was thereupon adopted without further discussion. The meeting then proceeded to elect the officers for the ensuing year. The retiring president, Lady Northcliffe, was, on the proposition of Mr. Hugh Dickson, accorded a hearty vote of thanks. Mr. Leak, the retiring chairman, was also thanked for his services, and presented with the special gold medal of the Society. The medal was handed, amidst applause, to Mr. Leak by Mr. C. W. Breadmore, who referred to the kindness and great tact shown by Mr. Leak at the committee meetings, and especially in reconciling differences of opinion. It was all the more pleasure, said Mr. Breadmore, to have the privilege of proposing the vote of thanks, as he was afraid he himself had been rather prominent in the discussions. Mr. Robert Sydenham was, on the proposition of Mr. Horace Wright, elected president for the ensuing year. The secretary, Mr. C. H. Curtis, was re-elected amidst enthusiasm, and asked to accept the sum of 70 guineas as an honorarium. The treasurer, Mr. N. N. Sherwood, was also re-elected. Mr. Unwin proposed the election of Mr. Thomas Stevenson to the post of chairman for the ensuing year, and this was carried unanimously and with applause.

ALTERATION OF RULES.

The next business before the meeting was the consideration of a revision of the rules as proposed by the General Committee, a subject which caused a long discussion. The committee recommended that Rule 4, referring to the privilege of the members, should have added "and to a copy of the *Annual* and schedule." Some argued that no members should be sent a ticket, nor the *Annual* or schedule, until his subscription be paid, but this was considered an unwise policy, and the rule was adopted as it stood and without the committee's recommended addition. The Rules 8 and 9, relating to the Floral Committee, caused the keenest discussion. In both cases, the General Purposes Committee submitted alterations, whilst there were other propositions in the names of members. As Rule 8 was considered to be more or less governed by Rule 9, it was decided to consider Rule 9 first. Rule 9 reads: "The Floral Committee of the National Sweet Pea Committee shall consist of nine members of the Society irrespective of whether they be amateurs or traders." The General Committee proposed to add the words "anyone sending a novelty or novelties to the trials, or having any interest as raiser or distributor in any novelty or novelties sent, or who is in the employ of such raiser or distributor, shall not be eligible to serve on the Floral Committee while such novelties are under trial. Should a vacancy arise under this rule, the General Purposes Committee shall have power to fill such vacancy, and the substitute shall be eligible for election the following year." Mr. Robert Sydenham stated that the proposed amendment was against the best interests of the Society. Mr. Vernon Hill and Mr. George Gordon adopted the same attitude in their speeches. Mr. Walter Wright considered that it was undesirable for any person having any financial interest in a variety to adjudicate upon it at the trials, and said that there was a deep feeling among the members in favour of some change in the constitution of the Floral Committee. Captain Ashworth supported Mr. Wright. Mr. Cuthbertson opposed the recommendation of the General Committee, of which he was a member, and stated that the proposed alteration was only carried by a small majority. If the committee's recommendations were adopted, he considered that the Society would lose some of the best expert opinion for ever. He would suggest that the classification of varieties should follow alphabetical order, and that one-third of the committeemen, consisting of members receiving the fewest number of votes, should retire annually. Also that a member of the Floral Committee interested in a novelty should retire when that particular variety was being adjudicated upon, as is

the practice in the Royal Horticultural and other societies. Mr. Wright, who was forced to leave at this part of the proceedings, agreed to support Mr. Cuthbertson's proposals. Several other amendments were proposed, and the Chairman then proceeded to take the feeling of the meeting. Mr. Cuthbertson's proposition (1) that any member of the Floral Committee having any interest in a novelty should retire from the committee when the variety was under consideration was defeated, but the suggestion that one-third of the members should retire annually was adopted and tacked on to Rule 8. All the other amendments were lost, including the proposal by the General Committee, and Rule 9 was passed as it stood, without amendment, by a majority of 50 to 6. It was explained that with reference to members of the Floral Committee retiring when a variety they were interested in was under consideration, things worked better under the old system. If a member voted for a variety he was interested in, his vote was disallowed. If he retired, he proclaimed to the others whose variety it was. Rule 8 was next considered, and it was passed, after a considerable discussion, as it stood, with Mr. Cuthbertson's rider that one-third of the members (those receiving the fewest number of votes) shall retire annually, and shall not be eligible for election the following year. The rule relating to trials was next considered, and it was stated that the second trial would be held at Burbage, Hinckley, under the charge of Mr. C. C. Hurst. Mr. F. J. Harrison advocated the holding of this second trial further north, as he considered that Hinckley was quite unsuitable for a northern trial, being scarcely in the Midlands. He had come prepared to offer a suitable trial ground in his district (Ulverston), and was surprised that the matter had been already settled. The Chairman stated that, although no definite arrangement had been come to with regard to the Hinckley trials, the committee felt itself more or less bound to accept Mr. Hurst's offer, but it would be pleased to go further north, the difficulty being to obtain a suitable trial ground. In any case, Mr. Harrison might be assured that his proposition would be favourably considered for the northern trials in 1913. The committee's proposition in regard to Rule 14, providing for Awards of Merit being made to novelties as well as First-class Certificates, was adopted, and Rule 22 made to read "The Floral Committee shall indicate the three varieties it considers best in each colour class, and shall place them in alphabetical order."

THE DINNER.

With the close of the annual general meeting at six o'clock, about three dozen members adjourned to dinner. Hard work for four hours had given them excellent appetites. Mr. Robert Sydenham, who had been elected President of the Society for the year at the previous gathering, occupied the Chair, and was supported by Messrs. F. J. Chittenden, G. W. Leak, W. Weeks, R. Hallam, G. Gordon, G. H. Mackereth, F. J. Harrison, W. Cuthbertson, H. Smith, T. Stevenson, A. Malcolm, A. E. Hallam, the Rev. Joseph Jacob, and others. The only toasts were "The King and Queen," and "The Continued Prosperity of the Society." The Chairman moved both in brief, well-considered words, and the latter was eloquently responded to by Mr. F. J. Harrison, of Ulverston.

THE CONFERENCE.

At 7.30 the conference was opened by Mr. G. W. Leak as Chairman, and it was between 9.30 and 10 p.m. before the company, numbering nearly 70 members from all parts of the country, dispersed.

The first paper was contributed by Mr. F. J. Chittenden, F.L.S., of Wisley Laboratory, and it was entitled "Diseases of Sweet Peas." Mr. Chittenden did not read the whole of his essay, but effectively covered the subject in the form of a chatty lecture. Passing allusion was made to the insect enemies, but interest and attention concentrated upon mildew and streak respectively. Mildew is well known as a parasite on many plants, including culinary Peas as well as Sweet Peas, and is preventable in many instances by sound cultural methods, and, being superficial, succumbs to dressings of flowers of sulphur or spraying with liver of sulphur at the rate of 1 ounce in 3 gallons of water. In plants showing streak Mr. Chittenden invariably found the

fungus *Thielavia basicola*, but he could suggest no cure. He spoke with a deep note of regret when explaining how he had failed time after time in inducing the fungus to grow on plants in sterilised soil, and exulted in the fact that when he had over-watered a portion of the plants in a further experiment the inoculation was a real success. This led him to the conclusion that it was only plants which had suffered a check at some period of their progress which were likely to be seriously affected, if they were affected at all. He advocated rational manuring, perfect soil cultivation, and such unremitting and intelligent attention as would ensure uninterrupted steady growth. As a preventive, he suggested sterilisation, by steam, if possible, of the soil to be used for seed sowing, and recommended the application of a 1 per cent. solution of formalin to the outdoor soil about three weeks before sowing or planting. Mr. Chittenden said positively, "it does not seem practicable to use any fungicide in the soil during the growth of the crops, and certainly spraying the tops of the plants would be entirely useless, so far as this fungus is concerned."

The subsequent discussion, in which Messrs. Perkin, Voss, Sydenham, Stevenson, Usher, Weeks, Leak, Malcolm, Weston, Cuthbertson, Ayley, Leach, Bunyard, Harrison, Davis, and several others participated, was remarkable for the extraordinarily contradictory statements that were made, and for the absolute lack of anything which would aid one in preventing the ravages of the disease. In brief, the discussion was undeniably interesting, but inconclusive.

The second paper was read by Mr. T. Stevenson, The Gardens, Woburn Place, Addlestone, a recognised champion in the exhibition arena, and its title was "Packing Sweet Peas for Exhibition." It was practical throughout, and those who scrupulously follow the suggestions made could not fail, provided, of course, that they had flowers of sufficiently high excellence, to beat Mr. Stevenson himself. The paper provoked a short discussion, almost exclusively favourable to Mr. Stevenson's recommendations.

The third and last paper was written by Mr. Thomas Page, Avenue Nursery, Hampton-on-Thames, the well-known grower for market, and was entitled, "Packing Sweet Peas for Market." In the absence of Mr. Page, the paper was read by Mr. Stevenson. The advice was sound, and the methods suggested were those of the best market cultivators. Mr. Vernon Hill, a successful and clever grower, described his methods of packing and, with Mr. Page, was heartily thanked.

ROYAL SCOTTISH ARBORICULTURAL.
ABERDEEN BRANCH.

DECEMBER 9.—A good attendance of the members gathered at the annual meeting of this branch in the Aberdeen University Buildings, Aberdeen, on this date. Mr. Sydney J. Gammell, of Drumtochty and Countesswells, the President, occupied the chair. In moving the adoption of the annual report, Mr. Gammell said that the members were to be congratulated on the sound financial condition of the Society. The year started with a credit balance of £20 11s. and ended with a credit balance of £13 10s. They had met all their ordinary expenditure, and had given a grant of £10 to the branch library.

The report was adopted. The meeting then proceeded to elect the office bearers for the coming year. The Chairman having retired, after holding the office for three years, he proposed as his successor Mr. Alexander Forbes Irvine, of Drum, who was appointed. Sir John Fleming, of Dalmeintie; Dr. Trail, professor of botany in Aberdeen University; Mr. John Michie, M.V.O., the King's factor on the Balmoral estates; and Mr. Gammell were appointed vice-presidents of the branch.

The Right Hon. Robert Farquharson, of Finzean, Aberdeenshire, then addressed the meeting, taking for his subject the "Past, Present, and Future of Forestry." In dealing with the best kinds of trees to plant in Great Britain, Dr. Farquharson said that Spruce Fir, which was formerly regarded as being a practically useless wood, now commanded the highest price in the market, because it was largely used in the making of paper pulp. It was a quick-growing tree, and could be grown on ground not suitable for other trees.

MARKETS.

COVENT GARDEN, December 13.

We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—Eds.]

Watercress, p. dz. bunches	0 6-0 6½	

REMARKS.—English dessert Apples are a very limited supply, but of culinary varieties there is a sufficient quantity to meet the demand, consisting principally of Bramley's Seedling, Lane's Prince Albert, and Dumelow's Seedling (Wellington). Apples from California and Oregon are fairly plentiful; the fruits are packed in boxes containing from 8 to 12 dozen fruits each, presenting a very attractive appearance. The best all-round dessert Apples imported are from the noted Wenatchee Valley, Washington State, including the following varieties: Rome Beauty, Winter Banana, Wine Sap, Jonathan, Esopus, and Grimes's Golden. Heavy shipments of Apples are expected from Nova Scotia, Canada, and the United States, and there will apparently be ample supplies of this fruit to meet the extra demand at Christmas. English Pears and Pears from the Channel Islands are practically finished. Pears from California consist of the following varieties: Winter Nelis, Easter Beurre, and Doyenné du Comice, all the fruits being, as usual, well graded and of the finest quality. There is every prospect of a good supply of Oranges from Spain, Jamaica and California. All varieties of hot-house Grapes are scarce in comparison with previous seasons; but Almerian Grapes are very plentiful, and as many as 10,000 barrels are being unloaded at the docks at the time of writing, which, we learn on good authority, is the last shipment for the season. Supplies of Pineapples from the Azores are expected to be quite equal to the demand. There will be a fairly good selection of other tropical fruits, consisting of Mangoes, Custard Apples, Avocado Pears, Persimmons and Lychees. With the exception of Pears, Nuts of all varieties are fairly plentiful. English Tomatoes are practically finished. Tomatoes are arriving from Teneriffe in fairly large quantities, the colour of the fruits and their packing being

quite up to the requirements of the buyers. The vegetable trade shows no improvement. The market is fully supplied with all kinds of produce in season. *E. H. R., Covent Garden, December 13, 1911.*

REMARKS.—The trade remains very steady. There is a fair demand for Potatoes of best quality. Consignments were large during the past week, consequently stocks in London are heavy. *Edward J. Newborn, Covent Garden and St. Pancras, December 13, 1911.*

THE WEATHER.

THE WEATHER IN WEST HERTS.

Week ending December 13.
The wettest week for 12 months.—There occurred one cold day at the beginning of the past week, but with this exception the temperature has remained rather high for the time of year. On the one cold day the highest reading in the thermometer screen was only 40°, and during the previous night the thermometer exposed on the surface of the lawn showed 14° of frost. Both at 1 and 2 feet deep the ground is at the present time at about a seasonable temperature. Rain fell on each of the first six days, and to the total depth of more than 1½ inches—making this the wettest week experienced here since the third week in December last year, or for 12 months. On the 10th rain began falling at 4 a.m., and continued without intermission until 9 p.m. on the same day, or for 17 consecutive hours. Virtually the whole of the rainfall has passed through the percolation gauges during the week, about 7 gallons having come through the gauge on which short grass is growing, and 7½ gallons through the bare soil gauge. The sun shone on an average for 2 hours 38 minutes a day, or for more than twice the average daily duration for this period of the year. On one day the record of bright sunshine amounted to as much as 5 hours 37 minutes. The winds were, as a rule, moderately high, and in the windiest hour the mean velocity reached 21 miles—direction S.S.E. The average amount of moisture in the air at 3 p.m. fell short of a seasonable quantity for that hour by 2 per cent. *E. M., Berkhamsted, December 13.*

DEBATING SOCIETIES.

WARGRAVE AND DISTRICT GARDENERS'.

There was a very good attendance of members at the meeting on November 22, when Mr. Geo. Howe, gardener to the Rev. H. M. Wells, Scarlets Park, Twyford, read a paper on "Forced Vegetables," treating of Cauliflower, Asparagus, Seakale, French Beans, Tomatoes, Mushrooms, Potatoes, Carrots, Vegetable Marrows, and Peas. He referred to the best varieties of these vegetables for forcing purposes, and described the methods he employed in growing them.

CHELMSFORD & DISTRICT GARDENERS'.

The fifth meeting of the winter session was held at the County Laboratories, Chelmsford, on the 1st inst., about 80 members being present; Mr. C. E. Seales presided. Mr. Messenger, of Woolverstone Park, Ipswich, read a paper on "Select Vegetables and their Culture." Mr. Messenger has lectured before the members on previous occasions. Asparagus, Beans, Cauliflower, Celery, Peas, and Carrots were all dealt with by Mr. Messenger, who said that the proper management of the soil was the main factor in securing good crops.

BRISTOL AND DISTRICT GARDENERS'.

A well-attended meeting of this association was held on November 30, at St. John's Parish Rooms; Dr. Shingleton Smith presiding. A paper on "Winter-flowering Begonias" was given by Mr. Horne, of Cardiff, who described the choicest varieties and the best methods of cultivating them. The lecturer specially recommended the new hybrids, and stated that they would take largely the place of those of the Gloire de Lorraine type. The best and easiest method of propagation, said Mr. Horne, is by leaves, which produce the strongest and most bushy plants. Mr. Horne showed flowers of about 20 varieties of Begonias, chiefly of the newer hybrids. A prominent member of the society, Mr. Francis Tagart, F.L.S., recently died in his 94th year.

READING GARDENERS'.

At the meeting of this association held on the 27th ult., Mr. Alderman Parfitt presided over a large assembly. The hon. secretary submitted the balance sheet relating to the recent exhibition, which resulted in a net profit of £16 9s. 6d. This sum would be equally divided between the Gardeners' Royal Benevolent Institution and the Royal Gardeners' Orphan Fund. The speaker for the evening was Mr. F. G. Drew, instructor in horticulture at the Reading University College, his subject being "The Education and Training of a Gardener." The lecturer advocated aiming at high ideals, and stated that intelligence, thoroughness, skill and knowledge of technical details, combined with tact, adaptability and a due recognition of proportion, were qualities which should be carefully cultivated. Mr. Drew urged head gardeners to afford every assistance to their juniors in pursuit of knowledge. He held particularly optimistic views with regard to the future of the profession, and felt sure that with the advantages offered by the University College at Reading and like institutions in other large centres, the studious gardener might look forward with certainty to a "good time coming."

STIRLING & DISTRICT HORTICULTURAL.

The last meeting of this association for the session 1911, took place on the 5th inst., Mr. Jas. Johnston in the chair. The essayist for the evening was Mr. A. R. Ferguson, Stirling, his subject being "Colour in the Garden." Three new members were elected and three nominations made for membership. Office-bearers and members of the committee were nominated for election at the annual meeting.

ANSWERS TO CORRESPONDENTS.

BEGONIA GLOIRE DE LORRAINE AND EUPHORBIA (POINSETTIA) UNHEALTHY: *Begonia-settia*. No disease is present in the plants. The injury is due to some error in culture. Maintain drier conditions in the plant houses.

BOOKS: *Hardworker. British Floral Decoration*, by R. F. Felton. The work may be obtained from our Publishing Department, price 7s. 11d., free by post. We cannot trace your query re Sweet Williams. Please send again.—*C. H. E.* The book most suitable for the purposes you require is Nicholson's *Dictionary of Gardening*, in five vols., price £4 2s., from our publishing department.

CAMELLIAS: *M. N.* The failure of your Camellias to set the flower-buds points to some wrong condition at the roots, causing a check. Probably the drainage is at fault. Bud-dropping is a common trouble with these plants and is very easily provoked by dryness at the roots.

CHRYSANTHEMUM: *O. H.* The flower is interesting as a sport from Nellie Pockett, but we scarcely think that it possesses sufficient value to become a standard variety.

DAISIES ON LAWNS: *H. N.* The best plan is to divide the lawn into small sections by means of garden lines, and to remove all the Daisies from each section in rotation. The plants may be dug up with an old chisel or small trowel, filling in any holes made in the turf with fine soil mixed with suitable Grass seeds. When all the Daisies have been removed, encourage the Grass to grow freely by applying a nitrogenous manure.

GOOSEBERRY SHOOTS: *J. G. D.* The shoots are affected with American Gooseberry-mildew. You should notify this fact to the Board of Agriculture, 4, Whitehall Place, Westminster.

GREENHOUSE PLANTS UNHEALTHY: *E. Rekenz.* No disease is present on any of the plants. The injury suggests impure air from fumes, or imperfect ventilation.

GRAPE RAISIN DE CALABRE: *R. R. G.* There is no disease present in the Grapes. The trouble is due to some wrong treatment in cultivation.

HYACINTHS FAILING: *Zola.* The roots are destroyed by the bulb mite. In future, mix a little flowers of sulphur with the soil when potting.

NAMES OF FRUITS: *Timms.* 1, Ringer; 2, Gooseberry Apple.—*E. Tate-Largo.* Calville Garibaldi.—*E. Ellis.* 1, Royale d'Angleterre; 2, Golden Knob; 3, Hanwell Souring; 4, Baxter's Pearmain.—*H. J. Rabjohn.* White Paradise.—*P. R. F.* 1 and 2, Dumelow's Seedling (Wellington); 3 and 4, Round Winter Nonesuch; 5 and 6, D'Arcy Spice.—*A. S.* 1, Hawthornden; 2, Minchull Crab; 3, Brabant Bellefleur; 4 and 10, Reinette de Caux; 6, not recognised, probably a local variety; 7, Northern Greening; 8, Scarlet Golden Pippin; 9, Byford Wonder; 11, Mabbott's Pearmain; 12, Cullen; 13, Hanwell Souring; 14, Dredge's Fame.

NAMES OF PLANTS: *H. J. Rabjohn.* 1, Quercus Lucombeana var. crispa, a seedling from the original type which has reverted partially to Q. Suber; 2, Q. sessiliflora rubicunda; 3, Q. macranthera. Thanks for fruit of Wistaria chinensis. Owing to the hot summer, fruits of this plant have been quite commonly developed this year.—*C. H.* Chrysanthemum Balsamita "Costmary."—*Largo.* Helxine Soleirolia.—*Y. Z.* 1, Cheiranthus alpinus; 2, Colletia cruciata; 3, Lastrea serra.—*H. T.* 1, Onoclea sensibilis; 2, Lastrea montana; 3, L. dilatata; 4, Onychium japonicum; 5, Davallia bullata; 6, Adiantum cuneatum.—*A. W. G.* 1, Begonia fuchsioides; 2, Jasminum grandiflorum.

POTATO: *P. R. F.* Your red-skinned Potato is no doubt Leinster Wonder. It is a very robust grower and a heavy cropper. The flesh is slightly yellow, and of excellent quality.

THE COLOURING OF APPLES.

SO far as I know, but few scientific men have devoted any attention to an enquiry into the reason why Apples colour better in one season than in another, or, indeed, to the cause of the development of colour generally, and to the precise nature of the change which takes place in the skin of an Apple when the colour turns from green to red or brown. From the fact that an Apple colours most on the side exposed to the sun's rays, it is clear that sunlight or heat is the main cause of colouring; but the general opinion appears to be now that colour is intensified by rainy weather. Mr. H. H. Raschen, now living at Southport, claims to have been the first person to suggest this theory. Writing in the *Agricultural Gazette*, of December 11, he says that at the Fruit Shows of the Royal Horticultural Society in the "nineties" he noticed that the Apples were generally well coloured when the late part of the

summer had been rainy, and generally lacked colour when that period of the season had been dry. It can hardly be held, however, that a sunless season would be productive of colouring. If rain has any influence at all, it must be in alternation with sunshine; but that sunshine alone promotes the highest colouring seems to be negated by the results of the past season, one of the driest and most sunny seasons ever known, when, as a rule, neither Apples nor Plums were conspicuous for colouring.

It is not known with certainty whether colouring is affected by influences outside the fruit or exclusively by those acting from within. Yet there is much evidence to indicate that the character of the soil has an influence upon colouring, as Apples from some districts are more highly coloured than those from other places. The fruit sent to shows by certain exhibitors is always coloured above the average, and that which is grown in my own soil, which contains a somewhat large proportion of iron, is generally highly coloured.

If rain helps to colour Apples, its influence is no doubt indirect, for rain tends to increase the growth of fruit, and, so far as my observations enable me to judge, increase in the growth of Apples is antagonistic to colouring. Evidence of this statement is afforded by the fact that Apples on young trees are larger and less coloured than those on old trees; also by the fact that Apples grown on arable land are larger and less coloured than those grown on grass land. I have about three acres of Apples on grass, all the rest of my orchards being arable, and the differences in the size and the colouring of fruit of the same variety from grass and cultivated land respectively are so great that an observer who is not an expert would hardly believe that the two lots are of the same variety. What is the explanation of these great differences? In my opinion it is that any conditions which increase size tend to reduce colour, while those which stunt size increase colour.

Mr. Raschen's immediate object in writing the letter referred to above was to dispute a statement made by a previous writer to the effect that the colouring of Apples is influenced greatly by thinning the fruit. In support of this statement the writer says that "when two pickings are made, the half-coloured fruits left at the first round will, within two or three weeks, increase in size and put on much more colour." Of course they will, for they will be longer under the influences producing colour, which increases as ripening approaches completeness. That the thinning increases the size of the fruit left there is no doubt, but my opinion is that the increase in colour is due entirely to the retention of the Apples on the trees for a longer time, and not at all to the thinning. Mr. Raschen's suggested explanation of the reason why, as he believes, colouring is promoted by rain, and hindered by sunshine without rain, is a curious one. It is that sun-heat promotes nitrification in the soil, and thus causes the increased development of leaf and branch at the expense

of fruit and fruit-buds; whereas, if rain falls, it lowers the temperature of the soil, reduces nitrification, and develops fruit. But why should it be supposed that nitrification benefits only leaves and branches, and not fruit? There seems to be no reason for such a supposition. As for fruit-buds, it is well known that they develop and ripen best in a sunny season. As stated above, it seems to me that the influence of rain upon the colouring of fruit is mainly an indirect one, and it may be added that such an effect is caused in spite of, instead of in consequence of, the influence of rain in increasing the size of the fruit.

To the theory that any influence which conduces to increase of size is antagonistic to colouring, it may be objected that the "tails" or "culls" of Apples are seldom well coloured. This, however, is because they are not ripe. If left to ripen, the smallest Apples are often the most brilliantly coloured; and so are the undersized Apples grown on a stunted tree or a cankered branch.

It must not be supposed from any of the preceding remarks that there is an intention of representing sunshine and rain as antagonistic influences. Both are needed for growth of trees and fruit, and probably both are needed for the colouring of fruit. But that sunshine, with the heat which it affords, is most essential to colouring seems to be indicated not only by what is said above as to the side of an Apple exposed to the sun being the most highly coloured, but also by the fact that fruit grown in tropical countries or in countries such as British Columbia and California, where the summers are more sunny and hotter than our own, is more highly coloured than fruit grown in this country.

It is possible that any influence which rain has upon the colouring of fruit is due to the sudden lowering of temperature which it causes. When we leave Apples on trees as long as it is safe to leave them, which with late varieties is until the nights become quite cold, they tend to become highly coloured, and this may be due to great and sudden changes in the temperature. The differences between day and night temperatures in such countries as British Columbia and California are greater, I believe, than in England.

That the colouring of fruit is not entirely due to external influences, however, is proved by the fact that some varieties of Apples are always more highly coloured than others. No external influences will render a Lord Grosvenor or a Lord Derby as brilliant in colour as a Bismarck or a Queen, or bring the tint of a Blenheim Pippin or a Duke of Devonshire up to the deep redness of a Gascoyne's Scarlet or a Fearn's Pippin. But this season I have some fruits of Lane's Prince Albert and Bramley's Seedling off grass land as deeply coloured on their sunny sides as Bismarcks are, though differing widely in tint. The same varieties grown on arable land and on younger trees are much larger and less coloured.

If the evidence given above be accepted as correct, it appears that colour in Apples depends upon variety, soil, stimulation or retardation of growth as influenced by age

of trees or their situation in grass or arable land, sunshine and its accompanying heat, and changes of temperature due to rain or other causes; some of these influences tending in one direction and some in the other, individually or in combination. Eliminating differences due to variety, soil, age of trees, and stimulation or retardation of growth, we come down to the differences in colouring due to seasonal influences upon the fruit of trees of the same varieties and age, growing in the same soil in different years. These are sunshine and its accompanying heat, and changes of temperature due to rain or other causes. Other things being equal, it seems to me that we have the greatest colouring in Apples when we have a season of abundant sunshine and yet enough rain or other causes of changes of temperature when the fruit is nearly mature, and the least when in the ripening period of each variety the weather is either comparatively sunless and cold, or so dry that the changes of temperature caused by rain or other circumstances are few and slight. Of the precise chemical or physiological action which produces colour in fruit I do not pretend to have any knowledge. *A Southern Grower.*

NOTES ON IRISES.

I. VARTANI ALBA.

A DELIGHTFUL addition to our winter-flowering Irises is now available in the white variety of I. Vartani, which was already in bloom on December 5, both in the open ground and also in a pot, where the bulbs had no more protection than was afforded them by the shelter of a cold frame.

This plant has appeared, I believe, in various catalogues as a white form of I. Histro, but it is much more probable that it has been obtained from the Palestine representative of the reticulata group, to which the name of I. Vartani was given. Whether we look upon I. Vartani as a species or as a form depends, of course, on the view we take of the meaning of a species, but in any case the white form agrees with the type in having noticeably long and large crests to the style branches and in the Almond perfume of the flowers. Moreover, I understand that this albino appeared among cultivated plants in the neighbourhood of Jerusalem. It is unfortunate that the cultivator has presumably over-cultivated and over-fed his bulbs, with the result that a certain proportion of the flowers show deformities or abnormalities in the shape of an extra fall or style branch, in addition to the usual number. In a letter which I received from the raiser, he even insisted on the fact that the bulbs were capable of producing flowers with four or six falls. As a matter of fact, the bulbs were very large and each is producing two or three flowers, but I still fail to see that the extra fall in any way adds to their beauty. Indeed, the normal form is, to my mind, infinitely preferable.

The slender standards are not erect, but diverge outwards at an angle of about 45°; the style branches with their crests are as long as the falls, which have a narrow, lanceolate blade. The whole flower is pure white, except for the raised, pale, greenish-yellow, central ridge running along the haft of the falls and for a few faint veins of the same colour on the blade and haft.

The leaves are about the same height as the flowers, and are distinguished by a very long, white, horny tip. The tip, which in some cases is over $\frac{1}{2}$ inch long, is comparatively much longer in this Iris than in other reticulata Irises at present known to us.

Unless this Iris proves to have a better constitution than I. Vartani, it will probably fail to ripen bulbs in the open. Plants in pots need careful treatment when the flowers are over if their growth is to be well ripened, but if the soil has been made sufficiently rich, and if the roots are watered judiciously until the leaves begin to turn yellow, it should be possible to obtain some bulbs for another year. *W. R. Dykes, Charterhouse, Godalming.*

THE LIFE OF SIR JOSEPH HOOKER.

(Continued from page 429.)

INDIA.

In 1847, in the midst of the preparation of his great work on the *Botany of the Antarctic Expedition*, Hooker undertook a mission to India, under Government auspices, the main objects being to study tropical and Alpine vegetation, and to make collections of dried plants. But no branch of knowledge appertaining to the scientific traveller was neglected. Originally it was intended that Hooker should extend his travels to Borneo, for the purpose of reporting on the capabilities of Labuan for the cultivation of Cotton, Tobacco, Spices, and Guttapercha; but this part of the plans fell through, and his stay in India was prolonged to about three years and three months. Concerning the incidents of Hooker's journeyings, perilous, pleasurable, and profitable, reference should be made to his narrative, which appeared in 1854, under the title *Himalayan Journals, or Notes of a Naturalist in Bengal, the Sikkim and Nepal Himalayas, the Khasia Mountains, &c.* It is in two octavo volumes, containing maps and numerous illustrations. A second cheap edition, edited by G. T. Bettany, was published in one volume in 1891. Of this work it may be asserted that it is a book for all time, full of information on a variety of subjects, information mostly of a kind that years will not render obsolete, conveyed in a simple style, intelligible to the average reader. There is a great temptation to make extracts, but limited space forbids. The volumes are dedicated to Charles Darwin, "by his affectionate friend J. D. Hooker."

One event was very nearly having a tragic termination. While in Sikkim Hooker was joined by Dr. Campbell, a political officer, against whom there was a strong feeling, which ended in their both being made prisoners by the Rajah of Sikkim. Hooker's life was probably never in danger, so far as the Rajah himself was concerned; but Campbell was brutally ill-treated, and, had he not been a very strong man, would probably have succumbed to the injuries and hardships he had to endure. It was soon discovered that a serious mistake had been made, and all sorts of schemes were resorted to in order to escape the consequences and shift responsibilities. Finally they were released from captivity on Christmas Eve, and ponies being supplied, they made with all speed for Darjeeling, where they arrived without encountering any further difficulties. Here Hooker met with Dr. T. Thomson, his companion during his subsequent travels and his collaborator after their return to England. For several years they were both busily engaged classifying and approximately naming their enormous collections ready for distribution. Before this was finished the herbaria of Falconer, Griffith and Helfer, of which there were seven wagon-loads, were sent to Kew from the India Office, and for a number of years up to 1865, a constant stream of duplicates was flowing to Kew from all parts of the world, where botany was cultivated. Of Hooker and Thomson's collections alone sixty sets were made up. Wight's and Burchell's herbaria were also presented to Kew towards the end of this period. The latter was estimated to contain 15,000 species, mostly represented by several or many specimens, the duplicates of which were liberally distributed.

A *Catalogue of the Plants Distributed at the Royal Gardens, Kew, from the Herbaria of Griffith, Falconer, and Helfer*, was printed in 1865, and supplied to the recipients of sets of the plants.

The preliminary, and what may be termed the supplementary literature of the Indian Mission is extensive. The preliminary contributions began to appear as soon as the mails brought the first letters from the traveller, and these were edited, in part, by Sir William. The titles of the most important follow here:—*Botanical Mission to India, 1847-1851*; Hooker's *London Journal of Botany*, vol. vii.; and *Journal of Botany*

and *Kew Gardens Miscellany*, vol. i. and ii., *passim*. Not all of the details contained in these articles were embodied in the *Himalayan Journals*.

"Observations made when Following the Grand Trunk Road, &c.," *Journal of the Asiatic Society of Bengal*, vol. xvii. (1848), part 2, pp. 355-412. Translation in *Berghaus's Zeitschrift für Erdkunde*, 1849, pp. 230-242. This is a highly-interesting paper, treating of the geology, meteorology, botany, &c., of the country traversed.

"Observations made . . . across the Hills of Upper Bengal, Paras Nath, &c.," *Journal of the Asiatic Society of Bengal*, vol. xvii. (1848).

"Forschungen in östlichen Himalaya aus einem Briefe desselben (J. D. Hooker) an A. von Humboldt," *Geographisches Jahrbuch*, 1849.

"Notes, chiefly Botanical, made during an Excursion from Darjiling to Tonglo," *Journal of the Asiatic Society of Bengal*, vol. xviii. (1849), pp. 419-446; *Horticultural Society's Journal*, vol. vii. (1852), pp. 1-23.

"On the Physical Character of the Sikkim Himalaya," Hooker's *London Journal of Botany*, vol. iii. (1851), pp. 21-31.

"A Fourth Excursion to the Passes into Tibet by the Donkiah Lab.," *Geographical Society's Journal*, vol. xx. (1851), pp. 49-52.

"On the Climate and Vegetation of the Temperate and Cold Regions of East Nepal and the Sikkim Himalaya Mountains," *Horticultural Society's Journal*, vol. vii. (1852), pp. 69-131; *Indian Agricultural Society's Journal*, vol. viii. (1854), pp. 35-65 and 73-95. This paper includes detailed descriptions in English of 28 species of *Rhododendron* with observations on their habitats, &c.

"On *Maddenia* (Rosaceæ-Amygdaleæ) and *Diplarche* (Ericaceæ-Rhodoreæ), New Genera," Hooker's *Journal of Botany and Kew Garden Miscellany*, vol. vi. (1854), pp. 381-382, plates 11 and 12. This is a joint production of Hooker and T. Thomson, who designate the genera in question as "two of the most remarkable that have hitherto presented themselves to us during the examination of our Indian Herbarium."

The Rhododendrons of Sikkim Himalaya, edited by W. J. Hooker, 1849-1851, folio, containing 30 coloured plates, with descriptive and explanatory text. This magnificent work was issued in parts during Sir Joseph's absence in India. It was a revelation of the wealth and splendour of the *Rhododendron* element of the Himalayan Flora. Sir Joseph's sketches were developed by W. H. Fitch into gorgeous representations of many of the finest species; many of which were successfully introduced into English gardens by Hooker himself in 1850-51. The species figured are: *R. æruginosum*, *argenteum*, *Aucklandii*, *barbatum*, *camelliæflorum*, *Campbelliæ*, *campylocarpum*, *candelabrum*, *ciliatum*, *cinnabarinum*, *Dalhousiæ*, *Edgeworthii*, *elæagnoides*, *Falconeri*, *fulgens*, *glaucum*, *Hodgsonii*, *lanatum*, *lanceifolium*, *Maddenii*, *niveum*, *pendulum*, *pumilum*, *Roylei*, *salignum*, *setosum*, *Thomsonii*, *triflorum*, *virgatum*, *Wallichii*, and *Wightii*. There are many interesting passages in the *Himalayan Journals* relating to *Rhododendrons*, one of which runs: "In order of prevalence, the trees were the scarlet *Rhododendron arboreum* and *R. barbatum* as large, bushy trees, both loaded with beautiful flowers and luxuriant foliage; *R. Falconeri*, in point of foliage the most superb of all the Himalayan species, with trunks 30 feet high, and branches bearing at their ends only leaves 18 inches long, deep green above, and covered beneath with a rich brown down." In a passage relating to the collecting of seeds of *Rhododendrons* he adds, with much satisfaction, a list of species "now all flourishing at Kew and elsewhere." It was hardly to be expected that so rich a harvest of new *Rhododendrons* would be repeated, but Western China has since yielded an even larger number of endemic species, several of them not inferior in beauty to the finest of the Himalayan species.

Another superb publication is the *Illustrations of Himalayan Plants*, chiefly selected from drawings made for the late J. F. Cathcart, Esq., the plates by W. H. Fitch, 1855, folio, with 24 plates and descriptive letterpress. The plants figured are: *Hodgsonia heteroclita*, *Magnolia Campbelliæ*, *Talauma Hodgsonii*, *Michelia Cathcartii*, *Meconopsis simplicifolia*, *M. nepalensis*, *Decaisnea insignis*, *Duabanga*

sonneratioides, Aucuba himalaica, Begonia Cathcartii, B. gemmipara, Vaccinium salignum, Codonopsis gracilis, C. javanica, C. inflata, Eschynanthus Peelii, Buddleia Colvillei, Rheum nobile, Quercus lamellosa, Larix Griffithii, Cytosia Lindleyana, Vanda Cathcartii, and Paris polyphylla. With few exceptions the plants of the foregoing list are, or have been, in cultivation; though not one of them has become common in gardens, yet almost every one is remarkable in some respect, and something of interest might be told of them all. Hodgsonia heteroclita is a very tall, shrubby climber of the Cucurbitaceæ, with large, yellow, unisexual flowers, and a rotate, deeply-lobed corolla, the lobes terminating in very long, curled tendrils. This plant has been cultivated in England for many years, growing most vigorously, but it has never produced flowers. The fruit is like a ribbed Melon. It is sufficient to recall the extraordinary colours offered by the herbaceous genera Meconopsis and Codonopsis, of which some striking new species are amongst the most

pages, and embraces the Orders from Ranunculaceæ to Fumariaceæ; the Orders actually dealt with being: Ranunculaceæ, Dilleniaceæ, Magnoliaceæ, Schizandraceæ, Anonaceæ, Myristicaceæ, Monimiaceæ, Menispermaceæ, Sabiaceæ, Lardizabalaceæ, Berberidaceæ, Nymphaeaceæ, Nelumbiaceæ, Papaveraceæ, and Fumariaceæ. The definitions of the orders, genera and species, are in Latin, supplemented by elaborate notes on their distribution, affinities, and uses. The matter averages about two species to the page, so that if the work had been continued and completed on this scale it would have run to about 11,500 pages! After a long pause, Hooker started on a different plan, some particulars of which are given further on. Appended to this volume is an excellent map, by the authors, to illustrate the physical geography of India and the botanical provinces adopted in the work.

"On Brandisia, a New Genus of Scrophulariaceæ," by J. D. Hooker and T. Thomson, *Journal of the Proceedings of the Linnean*

also consulted in the matter, and his *Flora Hongkongensis* was adopted as a model for the series. Bentham undertook the *Flora Australiensis*, which consists of seven volumes, published between 1863 and 1878, and J. D. Hooker the *Flora of British India*. Bentham is sole author, but Hooker had the assistance of various botanists. His work also runs to seven volumes, which were published between 1872 and 1897, and consists of 5,668 pages, dealing with approximately 16,000 species*, belonging to 176 of the 200 Natural Orders recognised in Bentham and Hooker's *Genera Plantarum*. There is a general index to some 42,000 names.

Sir Joseph supplemented his *Flora* in 1904, by "A Sketch of the Flora of British India," under the auspices of the Secretary of State for India. It appeared separately, and as a chapter in the descriptive volume *The Indian Empire*, in the *Imperial Gazetteer of India*. It is supplementary to the essay in the *Flora Indica*; but before proceeding to extracts therefrom, attention may be directed to a census of the plants of India, com-

FIG. 178.—MUTISIA ILICIFOLIA: FLOWERS PALE MAUVE.

(See p. 470.)

desirable of later discoveries in China. Quercus lamellosa is one of the handsomest of the many fine Asiatic Oaks; its Acorns being something near 2 inches in diameter.

Flora Indica.....The *Plants of British India*, by Joseph Dalton Hooker and Thomas Thomson, 1855. Only one volume appeared, octavo, pp. 280 + 285. The first 280 pages are occupied by an introductory essay on "The History of Botanical Discovery in India; on the Flora of India and its Relationships, and on Cognate Subjects." It is a remarkable array of facts and general information, but some excerpts will be given further on from Hooker's *Sketch of the Flora of British India* (1904), rather than from this. It may be mentioned, however, that W. Griffith's *Indian Herbarium* was estimated to contain 9,000 species, and Hooker and Thomson's 8,000 species.

The descriptive part of this work runs to 285

Society, vol. v. (1856), p. 11, t. 4. Several species of this genus have since been discovered in China. They are shrubs or small trees of ornamental character.

"Præcursores ad Floram Indicam," J. D. H. and T. Thomson, *Journal of the Proceedings of the Linnean Society*, vol. ii., p. 1. 54, and 163; vol. iv., p. 106; vol. v., p. 123 (1857-1861). Descriptions of the Indian species of various natural orders, including the Balsaminaceæ, Cruciferae, Campanulaceæ, and Caprifoliaceæ.

In 1863 Sir William Hooker formulated a scheme for the publication of a series of Colonial and Imperial Floras, which was sanctioned by H.M. Government, and has since been carried out almost in its entirety. It may be assumed that in this, as in many other things, Sir William had the aid of his son and official assistant. George Bentham, whose *Flora Hongkongensis* had already appeared (1861), was

piled at Sir Joseph's suggestion for comparison with other floras, in the Introduction to the botany of Salvin and Godman's *Biologia Centrali-Americana*, 1888, pp. ix-xxvii. It was compiled from the *Flora of British India*, as far as then published, and the rest from monographs and the Kew Herbarium. Statistics of the floras of Mexico and Central America, India, Australia, and the world are given in parallel columns. Some of the figures came as a surprise at the time, especially the estimated number of species of Orchids and of grasses, giving them first and third positions in ordinal predominance. The subsequent working out of these Orders proved that the estimates were in both instances considerably below the actual totals, and the ordinal positions the same as those assigned to them in the tabular comparisons.

* Not including the plants of British Burmah in the earlier volumes, for which another 1,000 species would have to be added.

In the *Sketch* Sir Joseph divides India into nine provinces, and discusses their floras separately and comparatively. The provinces are: Eastern Himalaya, Western Himalaya, Indus Plain, Gangetic Plain, Malabar, Deccan, Ceylon, Burma, and Malay Peninsula, with definitions. It is obviously out of the question to reproduce particulars here of the various provinces, but some generalisations and a few details are offered, mostly in the author's words. The number of recorded species of flowering plants in India, including British Burma, approaches 17,000, belonging to 176 Natural Orders, and there are probably 600 species of Ferns and their allies. The ten dominant Orders are: Orchidaceæ, Leguminosæ, Graminaceæ, Rubiaceæ, Euphorbiaceæ, Acanthaceæ, Compositæ, Cyperaceæ, Labiata, and Urticaceæ, in the sequence given. Of Palms there are more than 220 species; of Bamboos, 120; of Conifers only 22; and of Cycadaceæ, 5. The following genera (four of which are Orchidaceæ) are represented by 100 or more species:—*Dendrobium*, *Impatiens*, *Pedicularis*, *Strobilanthes*, *Ficus*, *Bulbophyllum*, *Eria*, *Habenaria*, and *Carex*. The number of different kinds of trees is about 2,500, exclusive of those of the Malay Peninsula, where trees are relatively more numerous and the endemic element larger.

About 570 European genera and 760 species are indigenous in India, of which about 430 genera and over 400 species are British. Many species of *Strobilanthes* (Acanthaceæ), like some Bamboos, grow gregariously, and flower simultaneously in different localities, and then die. *Aldrovanda vesiculosa* (Droseraceæ), a south European plant, with leaves like those of *Dionæa*, has hitherto been found nowhere in India, except in some saline ponds near Calcutta. There is no indigenous species of *Tilia*, *Fagus*, or *Castanea* in India, although all three genera are represented in both eastern and western countries. The Australian element in the Indian flora consists of one or a few species of the genera *Baeckea*, *Leptospermum*, *Melaleuca*, *Leucopogon*, *Stylidium*, *Helicia*, and *Casuarina*.

Returning to the Orchids of India, Hooker states that "more than 1,600 species are recorded, and additions are constantly being discovered." The number is evidently a misprint, or an error of calculation, for the total number described in the *Flora of British India* is 1,278, belonging to 116 genera. It is a little uncertain whether the Ceylon flora is included in the various totals recorded by Hooker. Assuming that it is, the addition to the Orchids would be only 74, as all—or nearly all—of the rest of the species (86) occurring in Ceylon are also found in India. Still, Orchids largely predominate over any other Order in actual number of species, but this only in the Eastern Himalaya and the Malay Peninsula. Orchids generally are very local, more especially epiphytal kinds, yet no fewer than 11 of the British terrestrial species extend to the Himalayas. The most widely-dispersed Orchid is *Spiranthes australis*, as defined by most authors. It is closely allied to our native *S. autumnalis*, and extends from the Ural Mountains and Afghanistan to China and Japan, Ceylon, Java, Australia, and New Zealand. *Dendrobium* is the largest genus, numbering, according to Hooker, 200 species, though only 164 are described. Indian Orchids are more extensively figured than those of any other large area. Upwards of 600 plates in the *Annals of the Royal Botanic Garden* are devoted to this family, and they include a *Century of Indian Orchids*, by J. D. Hooker, vol. v., 1895, tt. 1-100. Next to Orchids come the Leguminosæ, and Grasses take the third place numerically. There are 848 species of Grasses described in the *Flora of British India*, representing 154 genera, of which no fewer than 58 by one species only. Bamboos attain their greatest concentration in India, where 118 species belonging to 15 genera are known to exist. *Melocalamus* and *Melocanna* are remarkable for their very large "grain," that of the latter being 3 to 5 inches in diameter, and, as recently shown by Dr. O. Stapf, destitute of endosperm and viviparous.

As already mentioned, it is not quite clear whether the numbers of species, &c., extracted from Hooker's *Sketch* include the Ceylon flora, which exhibits some interesting peculiarities in its composition and affinities. Of the 2,800 species of flowering plants in Ceylon, a third (940) do not occur in the Peninsula, the majority of them being Burmese or Malayan. Ceylon

possesses no fewer than 23 endemic genera, of which 10, comprising 46 species (all except 2 endemic), belong to the characteristic Malayan Order of Dipterocarpaceæ, which is represented by only 12 species in the Peninsula. Altogether, there are 780 endemic species of flowering plants in Ceylon. The great Malayan affinity of the Flora is its most marked and interesting feature.

A *Handbook to the Flora of Ceylon*, by Henry Trimen. Consequent on the death of Dr. H. Trimen, Sir Joseph Hooker undertook the completion of this work, and he edited vol. iv. (1898), comprising the Euphorbiaceæ to the Naiadaceæ, and vol. v. (1900), containing the Eriocaulaceæ to the Gramineæ, the greater part of which he also wrote.

Hooker's *Flora of British India* has already

MUTISIA ILICIFOLIA.

IN the interesting article on *Mutisia* by W., in the issue for December 9, the writer expresses a doubt if *Mutisia ilicifolia* is still in cultivation in this country. I send you a specimen and a photograph (see fig. 178) taken from one of the plants that have grown in the Royal Botanical Gardens, Edinburgh, for several years.

The plant thrives very freely in a cold greenhouse, and flowers almost the whole year round. Specimens planted out-of-doors at Edinburgh in a rather exposed position passed through the winter of 1910 unharmed by frost. Seeds are produced freely if the flowers are pollinated, and

FIG. 179.—MUTISIA DECURRENS GROWING ON THE ROCKERY IN THE ROYAL BOTANICAL GARDENS, EDINBURGH.

served as a foundation for a number of other provincial and local Indian Floras. There is Dr. Theodore Cooke's *Flora of the Presidency of Bombay*; Lieut.-Colonel David Prain's *Bengal Plants*; Mr. J. F. Duthie's *Flora of the Upper Gangetic Plain*; and Colonel Sir Henry Collett's *Flora Simlensis*; besides numerous minor contributions to the botany of various parts of India. Notable and partly concurrent botanical works are the *Annals of the Royal Botanic Garden, Calcutta*, and Sir George King's *Materials for a Flora of the Malay Peninsula*. W. Botting Hemsley.

(To be continued.)

young plants may be raised in quantity from home-saved seed.

I also send you a photograph of *Mutisia decurrens* (see fig. 179) growing on the rockery here, where it rambles very freely over the stones, sending up freely-flowering shoots of 3 feet or more in length. The fruit of this species is interesting; the photograph (see fig. 180) shows the pappus attached to the seed. It is greatly to be desired that other species of this genus may be introduced to gardens; some are of a shrubby, dwarf character, and would form admirable subjects for the rock-garden. R. R. Harrow.

THE ROSARY.

NEW ROSES OF THE N.R.S. "CATALOGUE."

I.—ROSES OF 1911.

THE 1912 edition of the N.R.S. *Catalogue* contains some 90 new Roses brought out in the years 1909, 1910, and 1911. Of these 32 are attributed to the year 1909 and 29 each to 1910 and 1911. It may be of some interest to consider a few of these Roses, but it must be understood that with regard to the Roses of the current year little can yet be known of their behaviour in the garden, and for the most part we must be dependent on their appearance at the shows, the reports of our friends who may have experimented with them, and the occasional observation of a few early-budded maidens that have "grown out."

ALEXANDER HILL GRAY.—The 1911 list begins with Alexander Hill Gray; it has been well shown this year, and from the fine pillar of flowers of this Rose that was staged at the autumn show at Vincent Square we may surmise that it is a good autumn rose, and that it may make a useful decorative Tea Rose for the garden, and sometimes be good enough for exhibition. The colour is a lemon yellow, some flowers having a brownish shading which is very attractive. It is a Gold Medal Rose.

CARINE is a garden or decorative Rose, and is certainly of a wonderful colour, difficult to analyse on account of the number of different shades it contains. Orange-carmine to buff or creamy-salmon is the description attempted by the *Catalogue*, and doubtless all and any of these shades may be found in the Rose, but the mental picture conjured up by this mixture of colours is somewhat bewildering, and I think less beautiful than my recollection of the Rose itself. The distribution of colour and creamy texture of the petals recall Mme. Antoine Mari, but the shades and tints of colour are more intense than in that Rose. The plant is said to be vigorous and to flower freely, and if so when the price gets a little more reasonable it should be largely grown.

DOROTHY RATCLIFFE is another Rose of a striking colour, it is described as red-shaded fawn yellow, but my recollection of the Rose as shown is that the type of colour is similar to that we have become familiar with in Mme. Second Weber and Mme. Edmee Metz, but somewhat deeper in shade than either of these Roses, and with rather more pronounced yellow shading. It is said to be from 2 feet to 2½ feet high and to flower continuously, in which case it should prove a useful bedding Rose.

DUCHESS OF WESTMINSTER.—In this variety we have another curiously-coloured Rose described as Rose Madder. I remember a fine vase of it at the last show held at Holland House in 1910 that produced a striking effect.

EDWARD MAWLEY, H.T., will be remembered by many as a deep crimson Rose, with large shell-shaped and somewhat loose petals, shown at the Botanical Garden Show of the N.R.S. in 1910, where it received the award of a Gold Medal. Among my friends I find very varying opinions expressed as to the merits of this Rose. Some, who have it in their gardens think very highly of it, both for decoration and exhibition, while others have suffered disappointment. My only personal observation of growing plants has been that of some early-budded maidens, with a few flowers in the heat of September. This was scarcely a fair test, for, as was the case with most red Roses, the sun seemed to have spoilt the colour. I am therefore keeping an open mind for next year with regard to this Rose.

ELIZABETH, H.T., is one of the many Roses described as a pink Frau Karl Druschki; only trial in the garden can determine the validity of the claim.

EVELYN DAUNTSEY, H.T., is salmon rose in colour, and some good flowers of this variety have been shown, well shaped with a pointed centre. It is said to resemble La France in habit.

FLORENCE H. VEITCH, H.T., is a semi-climber with crimson-scarlet flowers. A really good free-flowering pillar Rose of this colour is badly wanted, and it should be worth a trial for this purpose when the price becomes moderate.

FRANCIS CHARTERS* SETON, H.T., has been seen at the R.H.S. fortnightly shows. It is rose-pink in colour, and the form is full and fairly shapely.

JAMES FERGUSON, H.T., is a paler sport from Caroline Testout. It should be useful to exhibitors in giving them another dependable Rose.

LADY BARHAM, H.T., is a light or shell pink with a shade of orange.

LADY MARGARET BOSCAWEN, H.T., is a similar colour with fawn-shading.

FIG. 180.—FRUIT OF MUTISIA DECURRENS.

(See p. 450.)

LESLIE HOLLAND, H.T., is one of the most promising of the new Roses. Its chief point is its colour, which is a bright crimson that does not seem to turn at all blue in the sun, but keeps its colour to the last. A very fine exhibit of 18 blooms of this variety in a bamboo stand was staged at the 1910 summer show of the N.R.S., and several good flowers have been seen this year. It is said that it is of good constitution and that the flowers open freely and well. From the little I have seen of growing plants of this variety I should say this is probably correct, and if so it will prove a desirable Rose to possess when the

* In N.R.S. *Catalogue* the raisers spell the name "Charteris."

stock gets larger and the price smaller. Without doubt a red Rose that will stand the sun will be a real acquisition to the Rose garden. This Rose received a Gold Medal at the Luton show, 1910.

MABEL DREW, H.T., is also a promising new Rose of a creamy yellow colour, rather after the style of Mrs. David Mackee.

MELODY, H.T.—Of this Rose I know very little as yet, but I hail it with gratitude if only for its name. Garden Roses have been less fortunate than Daffodils in the names they have been asked to carry. Is it because of the greater number of new Roses produced annually, or because the raising of new varieties of Roses has been to a greater extent in the hands of trade growers than is the case with Daffodils, where a larger proportion of successful hybridisers have been amateurs who have, perhaps not unnaturally, sought for somewhat simpler and more poetic names for their favourites? I do not know, but be it as it may, I welcome this new "break" in Rose nomenclature. Melody is a decorative or garden Rose of deep saffron-yellow with a paler border to the petals, and the raisers claim that it is free-flowering and mildew-proof.

MRS. AMY HAMMOND, H.T., a Gold Medal Rose, has white petals, with a yellow or orange base. Its colouring is not altogether unlike that of Mme. Jules Graveraux, but the flowers I have seen have been less rounded. It should make a useful garden Rose.

MRS. C. E. ALLAN, H.T., is a yellowish Rose, which may be tried for garden purposes; it has received a Silver-gilt Medal from the N.R.S.

MRS. CORNWALLIS WEST, also a garden Rose, has white flowers with a pinkish centre, which contrast well with its dark foliage. It has received a Gold Medal from the N.R.S.

MRS. FRANK WORKMAN, H.T., has well-formed flowers of a deep rose-colour. It has been well shown this summer and autumn.

MRS. GEORGE SHAWYER, H.T., has good well-shaped flowers of a bright rose-colour. No one who saw the grand pillar of Roses of this variety at the Temple Show, 1911, could fail to be struck with the fine effect of which this Rose is capable when grown by able hands under glass. At the N.R.S. summer show it was, I think, hardly looking its best, but even so it was well worth notice. In the garden I have found it a good grower, and the flowers last a long time when cut and put in water, but my experience of it is insufficient for me to speak of its decorative qualities. The flower is well shaped and has large shell-like petals of considerable substance.

MRS. J. H. WELSH, H.T., is a very large Rose of a rosy-pink colour, which has received a Gold Medal from the N.R.S.

MRS. W. T. MASSEY is a single-flowered Rose of orange-yellow colour. It is classed as a H.T., but as it is said to be an off-spring of Gloire de Dijon it is perhaps doubtful whether it should not be classed as a Dijon Tea.

OTHELLO, H.T., is a dark maroon-red Rose, a distinct colour for this class. It is said to be derived from that useful Rose Gustav Grunerwald, and it seems to be a good grower and fragrant.

PORTIA, H.T., was well shown at the R.H.S. exhibition in the Temple gardens as a nearly white flower with flesh-coloured centre.

ROSE DU BARRI, H.T., was also noticeable at the Temple Show, 1911. It is a rather small sweet-scented flower, semi-double, of the colour indicated by its name.

SYLVIA (Wichuraiana) also put in an appearance at the Temple. It is a creamy-white climbing Rose, flowering in long sprays. The point about this Rose is that it is said to flower both in summer and autumn, and its success will depend on its ability to make good this promise.

The other three Roses of 1911 contained in the *Catalogue*, viz., Deutschland, Ferniehurst, and Lady Greenall, are unknown to me as yet. Of the 1910 and 1909 Roses I hope to say something later. *White Rose.*

(To be continued.)

FLORISTS' FLOWERS.

NATIONAL SWEET PEA SOCIETY.

GREAT interest was manifested in the annual meeting of this Society, reported in the last issue. For many months its work has been freely criticised in the Press and elsewhere, and it was expected that the discontented ones would be sufficiently strongly represented at the annual meeting to reverse the method of procedure in the election of the Floral Committee. By an enormous majority, fifty to six, the annual meeting decided to adhere to its former method, and, with a solitary exception, declined every amendment. The one accepted was to the effect that one-third of the Floral Committee shall retire each year, and shall not be eligible for re-election for one year. This will ensure new blood being introduced annually. Of course, it does not mean that the remaining two-thirds have any lease of their position. All the nine members require to be elected each year, but the three receiving the lowest number of votes the year previous are not eligible even for nomination until a year has elapsed. It is to be hoped that strife, which is a good thing up to a point, will now cease in this useful and prosperous Society. The Floral Committee's constitution may not be perfect, but it has done excellent work in the past under the chairmanship of Mr. Walter P. Wright, and last year under that of Mr. Alexander Malcolm. Its decisions have always appeared to me to be, in the main, right, my reason for this conclusion being that they have been confirmed by the audits of the varieties shown at the exhibitions. That is, the Floral Committee's decisions in the classification lists agree with the opinions of the best exhibitors as indicated by the flowers they choose for exhibition. It is a great pleasure to know that the National Sweet Pea Society is not only increasing in membership, but also consolidating its financial position. The development of the Sweet Pea and its enormous popularity are one of the outstanding horticultural events of the last 10 years. *E.*

A PROLIFIC BANANA.

THE photograph of the remarkable Banana reproduced in fig. 181, was kindly sent to us by Mr. S. V. B. Down, of Singapore. The plant shown (*Musa sapientum*, var. "King of Thousands") is growing in a Singapore garden, and the bunch of fruits is about 7 feet in length. It is difficult to form a correct estimate of the number of fruits on this single stem, but it must be well over 2,000. As may be seen, room has been made to enable growth to continue, for the inflorescence is still throwing off its large bracts, and developing fresh flowers.

It may be remembered by some of our readers that in the issue for December, 1902, p. 471, an illustration was given of a similar bunch of Bananas from Penang, Federated Malay States. This was known locally as the "Elephant's Trunk," but we strongly suspect that it is really identical with "King of Thousands."

Although a tropical fruit, the Banana is more popular as a food in England than in very many countries where it is grown out-of-doors. Indeed, it is marvellous to look back over the past 20 years, and consider the enormous increase in the imports of Bananas into this country. Formerly, this fruit was scarcely known here, except in a few gardens where it was cultivated, and it was considered a choice dessert fruit, ranking in this respect with the hot-house Pine, though its comparatively insipid taste made it much less sought after. But now the Banana is known and valued by all, and as a dessert fruit at Christmas rank with the ever-popular Apple and Orange.

The West Indies and the Canary Islands are the chief sources from which we obtain our supplies of Bananas, although *Musas* are grown in almost all tropical lands.

BACK TO THE HILLS.

(Continued from p. 432.)

THE FLEIMSER-THAL.

THE eastern wall of the Fleimser-Thal is almost wholly igneous, and on the west impend the awful Dolomitic needles of the Rosengarten group, no less terrible from here than as one sees them from the summit of the Schlern, or from their very heart, on the crest of the Antermoja Pass. Gradually their full splendour unfolds as we ascend one of the many lateral valleys climbing eastwards out of the Fleimser-Thal. By this time all the lowland flowers were

world but calcareous. But limestone was not lacking, for the other sloping wall of the glen was white as milk. Among the red, igneous rocks, as we continued, there were already huge jungles and tussocks of *Geum reptans*, interspersed with fat great bosquets of *Ranunculus glacialis*—here, once more, the stout robust *glacialis* of one's old friendship, rather than the more exiguous form that haunts the Nunda and the Clear Lake above the Mont Cenis. Passing this tract of stone, one comes to a tiny pool, with turfy slopes descending to it from a dark-red mountain overhead on the right. And here my first alarm was dissipated, for amid the

FIG. 181.—BANANA "KING OF THOUSANDS" IN A SINGAPORE GARDEN.

gone, and there was no hope of any treasure short of the highest ridges. I was in fear for the result of that day: it was my first hunting after hybrid *Primulas* (for in these ranges *P. minima* meets *P. glutinosa*), and I feared lest children and parents and all might be out of flower, and I be left to pore arduously along the ground, collating every leaf in half an acre. We mounted rapidly, seeing only as we climbed the purple glare of *Linaria alpina* in the shingle. But at last, after three hours of toil, we came over the shoulder, and up into the desolate places where Hope has her dwelling.

All around was bald, red *débris*—porphyry, granite, syenite—I cannot say; anything in the

brown darkness glimmered here and there the violet sparks of *Primula glutinosa*. After this the track led over limestone. *Potentilla nitida* at once abounded, also lovely, snowy *Ranunculus Seguieri*, Flannel-flower, Alpine Poppy, *Thlaspi*. No sign as yet of *Ranunculus parnassifolius*. I marked, however, high ahead, certain rippled ridges of calcareous silt, as being its likely home. And there sure enough the Buttercup abounded; but, alas! it was a disappointment. Be it well known that the real *R. parnassifolius* is one of the loveliest of all high Alpines, with five perfect petals, big, and round, and snowy-white, like a little *Anemone Honorine Joubert*. But you can never be sure of your

plant unless you find it in flower. I know, and have often seen, and dearly prize, the gloriously beautiful *R. parnassifolius* of the Ampezzo Dolomites. But too often people suffer, as I have suffered, from a *R. parnassifolius*, such as that on Piz Padella, which grows in dense, promising clumps, on open, earthy slopes, and flowers profusely; but rarely, if ever, has it any petals at all, only screwed-up, little yellow-green sepals, and chaffy-pale tabs, to do duty for the pure splendour of the best form. The latter is *not* a tuft-plant, and grows, not in open earth-pans, but in the very highest, finest, wet mud-silt of the limestone ridges, in single crowns, and wide, sparse colonies. Here, now, were the ridges, the silt, the limestone, the single crowns, indeed, and the plant accordingly was the same in habit as the Ampezzo beauty; but, with the best efforts, it never seemed able to produce more than two perfect petals to a flower, thus only going a little better than the Padella form, which never produces any at all.

Leaving this, one passes over on to the granite again. *Androsace alpina* (white), *Ranunculus glacialis*, and *Geum reptans* by the acre among the stones. Then up on to turfy, marsh lips and hollows. And here the whole world is turned violet by the purple of *Primula glutinosa*. This is, indeed, a most glorious plant—so blue, so beautiful, so sweet. It has a very bad name in cultivation as a shy flowerer, though it grows readily enough with us, and, I fancy, would answer exactly to the treatment of *P. farinosa* or *P. rosea*, in very fine turf. And I was consoled to notice, too, that, in Nature, though its abundance is such as to stain the hills, yet that it is not really a free flowerer even here. Innumerable among the innumerable flowering clumps are those that are flowerless. I seemed to gather, doubtfully, that the freest in bloom were good, crowded tufts, occurring on the lip of an earth-pan, or on some ridge of silted peat. It monopolised in glory all the hollows, and *P. minima* still lingered in crimson flecks amid the grass on the slopes.

And I need not have feared for my hybrids. There they all were in profusion, glowing like blots of bright lilac among the soft blue distances of *P. glutinosa*. The whole range of them was here, except that covered by the names of *P. Huteri* and *P. salisburgensis*. *Floerkeana* ran riot in a dozen nameable forms, however—most glorious, with the size and illuminated colour of *minima*, the height and habit of *glutinosa*; *biflora* and many another kindred form, primary or secondary hybrids, lurked more coyly. I found some superb developments, vast-blossomed, and one, a pure grandiflorous *biflora*, with the two-lobed segments of the corolla divided deeply yet again at their end. And, finally, I found a perfect albino of *P. glutinosa*.

After one leaves the cool hollows of the *Primulas*, there only remains the final ridge of granite. This is all blue with *Eritrichium* (I found another white one here, and from the mountain above was brought down a pure-white *Linaria alpina*), and the way up to it is thick with *Geum*, *Thlaspi*, *Ranunculus glacialis*, and *Anemone baldensis*. Most curious of all, the exact notch of the Pass is a strip of limestone silt, between two wide stretches of igneous rock. On that narrow piece of limestone—and there only—abounded *Ranunculus Seguieri*, pure white, exquisite, ferny-leaved; on either side of it, within a foot, on the igneous rock—and there only—abounded *R. glacialis*, fat-leaved, splendid, pearly-pink; and there was no sign of any intermediate, though both species were in full bloom. Indeed, I believe that *R. glacialis* has yielded no known hybrid. *R. Seguieri* has given only one, *R. Yvesii*, and that by the polygamous *R. pyrenæus*. *Reginald Farrer.*

(To be continued.)

HEATHS THAT FLOWER AT CHRISTMAS.

THE cultivation of greenhouse Heaths is nowadays largely left to a comparatively small number of nurserymen, who grow them in immense numbers, and turn out model little plants in a wholesale manner. The kinds chiefly in vogue are those that flower during the autumn, winter, and early spring, though some of the summer bloomers, especially the forms of *Erica ventricosa*, are grown to a limited extent. They are chiefly cultivated in the neighbourhood of London, and the September sales of these plants, just before the nights get too cold for them to be safely left out-of-doors, attract buyers from all parts.

The first to bloom of what may be regarded as the autumn-flowering Heaths is *E. gracilis*, which bears its rosy-purple flowers in great profusion. This Heath is naturally of a sportive character, and several forms of it are now in cultivation. Variations in depth of colour may, to a certain extent, be influenced by the treatment given, but, apart from the rosy-purple form of varying tints, there are the well-marked *E. nivalis*, with white blossoms, that occasionally show a little colour; another, *E. rosea*, in which the purple tinge is almost if not quite eliminated, and *E. vernalis*, which is considerably later in flowering than the others, as well as being of a more sturdy habit of growth.

A universal favourite is *E. hyemalis*, which is in considerable demand just before Christmas time. It is more particular in its cultural requirements than *E. gracilis*, but, still, delightful little bushy plants of it, in 5-inch pots, may be seen in the florists' shops of London, while, what is more, they are sold at a comparatively cheap rate, especially when the length of time the plants require to reach an effective size, and the care needed in all stages of their culture are taken into consideration. Beside the ordinary *E. hyemalis*, there is a richer-coloured form known as *E. superba*, and a pure white variety named *alba*. It is about 30 years since this last was brought prominently forward, and at that time it attracted a great deal of attention.

Another Heath that will flower freely in the greenhouse at Christmas time is *E. melanthera*, which may be grown into fair-sized bushy specimens. This is one of the least exacting of all the tender Heaths. It is naturally of a dense, twiggy habit, and the tiny blossoms are borne in great profusion. They are of a distinct mauve colour, with blackish anthers, and have a slight but pleasing fragrance.

E. caffra is somewhat in the way of *E. gracilis*, but of dwarfer habit. The flowers are white.

At the commencement of the new year comes *E. Wilmoreana*, a showy Heath, of garden origin, but, like *E. hyemalis*, its early history seems to be unknown. This is followed by the tiny white-flowered *E. persoluta alba*, the bluish-tinted *E. Spenceriana*, *E. candidissima*, with pure-white, tubular flowers, and the yellow *E. Cavendishii*.

MINIATURE PLANTS.—Within the last few years large quantities of tiny little plants in pots of corresponding size may be seen in the florists' shops, and as they can be dropped into the small jardinières, now so popular, they find a ready sale. The soil of these little plants dries quickly, so that they need particular attention with regard to water, but, at the same time, water must not be allowed to stand in the receptacles, otherwise the soil will turn sour, and the plants will perish. Given strict attention, the blossoms remain fresh for a long time. The sorts most amenable to this treatment are *E. gracilis*, *E. caffra*, and *E. persoluta*. *W. T.*

THE KITCHEN GARDEN.

By JOHN DUNN, Kitchen Garden Foreman, Royal Gardens, Windsor.

CUCUMBERS.—Plants intended for early spring planting should be raised now. The seeds should be sown singly in small, clean pots, placing them on a mild hotbed in a warm forcing-pit as close to the roof-glass as possible. It will be well to cover the pots with sheets of clean glass as a protection to the seed from mice, but the glass must be removed as soon as the seedlings appear. The soil may consist of fine loam and leaf-mould in equal parts, and the seeds should only be covered very lightly. Good, reliable varieties for this sowing are *Dreadnought*, *Every Day*, and *All the Year Round*. Cucumbers which were planted in September to furnish supplies in the early part of the New Year should now be showing plenty of young fruits, but they should not be allowed to carry more than are required for the needs of the establishment. The fruits should be thinned whilst they are young; overcropping soon ruins Cucumber plants at any time, but especially during January and February. Thin the young growths, training in only shoots which are likely to bear fruit, and remove all decaying foliage. It is important that frequent light top-dressings of fine loam and leaf-mould be applied to the roots in order to keep them in an active condition. Stopping should not be practised so severely as in the summer months. A light dusting of artificial manure may be given occasionally with advantage. In mild weather maintain a night temperature of 70°, and 80° to 85° in the day with sun heat. The walls and floor of the house should be syringed frequently to promote a moist atmosphere, and the plants may be lightly syringed on sunny days. When the fruits are large enough they should be cut and laid on a clean slate slab in a cool cellar, where they will keep in good condition for eight days.

FRENCH BEANS.—A sowing of French Beans may be made now to furnish supplies about the middle of February. Seven-inch pots are large enough for this sowing, and they should be filled to within two inches of the rim with a good, rich compost, leaving the remaining space for a top-dressing when extra rooting material is necessary. The compost may consist of three parts turfy loam, and one part well-prepared horse manure, which should be exposed to the air for ten days before it is broken up for mixing with the loam. Seven or eight seeds may be placed in each pot, but after the plants have grown a few inches high they may be thinned, leaving only five healthy plants in each pot. A night temperature of 65° with plenty of atmospheric moisture will suit the plants, which should be placed near to the roof-glass. There are many good varieties of Beans for this sowing, but I prefer *The Belfast*, a Bean of recent introduction, and a free cropper. The long, narrow pods are gathered whilst they are quite young, and cooked whole for the Royal table.

PARSLEY IN PITS.—Carefully examine the plants of Parsley in pits, removing all decaying foliage. The soil should be lightly pricked up between the rows, and air admitted to the pit both night and day, in order to prevent the plants from becoming drawn. Plants in the open garden should also be kept free from decaying or overgrown foliage, so that the air may circulate freely amongst the plants. Lettuce and other salad plants in pits will also require a careful treatment. Afford an abundance of fresh air, and keep the soil between the plants stirred to maintain a healthy atmosphere.

POTATOS.—The stock of tubers should be examined carefully during wet weather, and the seed tubers selected, placing them in a single layer on shelves or trays. The selecting of the "seed" is a most important matter in the successful cultivation of Potatoes.

ONIONS.—These should be examined, removing all decaying bulbs. Any showing signs of growth should be selected for immediate use. Onions are keeping well this season.

PLANTS UNDER GLASS.

By JAMES HUDSON, Gardener to LEOPOLD DE ROTHSCHILD, Esq., Gunnersbury House, Acton, Middlesex.

BEGONIAS.—The beautiful Begonias of the Gloire de Lorraine type provide charming and reliable flowering plants during the winter season. At Gunnersbury the prevalence of fogs during the winter season, in conjunction with a smoke-laden atmosphere generally, makes it a difficult matter to grow these lovely Begonias successfully, and we find that the variety Mrs. Leopold de Rothschild (see fig. 182) withstands these unfavourable conditions better than any of its class. Others who may be situated in a district where fogs are frequent should give this variety a trial.

in larger pots. Plants rooted late will flower well in 4½-inch pots, and even in 3-inch pots (60s). Before taking them into the dwelling room, immerse the pots in a pail of water so that the soil will keep moist for several days.

ERANTHEMUM PULCHELLUM.—The beautiful *E. pulchellum* is an old plant in gardens, and there is none other better in its colour. The flowers are not strikingly conspicuous, for being blue they do not light up well, but in the stove this *Eranthemum* is one of the best subjects at this season. The taller-growing *E. Andersonianum* has white flowers with rosy-purple veins, and the inflorescences are larger than those of *E. pulchellum*.

by a cold stove. Under these conditions the flowers develop better. After the blooming is over, the plants may be placed again in the greenhouse.

THYRSACANTHUS RUTILANS.—Those who grow these plants should arrange their specimens so that the long racemes are not hidden by other subjects. Small plants raised from cuttings this season will, when in flower, prove useful decorative subjects at this time of the year.

CHRYSANTHEMUM.—If suitable cuttings are available, do not delay the work of propagating Chrysanthemums. Plants developed strong shoots suitable for cuttings early this year: the early kinds yielded very stocky shoots, and we have inserted ours in thumb pots. If no better place is available, they may be rooted in a cold frame, but the cuttings will be longer forming roots than if a little heat was provided. Keep the old stools as hardy as possible in order that the cuttings may be stout and short-jointed. It is possible that the plants of late kinds, which are now in flower, may have suitable cuttings upon them, and it will be better to secure these now rather than let them become drawn. Do not water any plants that are in flower, but rather keep them on the dry side.

FRUITS UNDER GLASS.

By E. BECKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Hertfordshire.

MELONS.—Preparation must now be made for the earliest batch of Melons. The house and its surroundings should be cleansed thoroughly before making the hotbed. Though it is not essential to have hotbeds in houses where ample means for heating exists, they are very desirable, as they promote a quick growth. The manure and leaves should, therefore, be brought into the house and made firm, using long strawy manure and oak leaves (for preference) in equal parts. Allow the hotbed to settle before placing the soil thereon, otherwise it will be a difficult matter to make the bed as firm as it should be. Use good fibrous loam, with a sprinkling of wood ashes, soot, and bone-meal, and either mortar rubble or coarse road grit. Be careful not to employ too much wood ash, soot or bone-meal. Sow the seeds in small pots plunged in a brisk bottom heat, and covered with a sheet of glass. As soon as the seedlings appear place the pots near to the roof-glass in a warm house, and water them very carefully. Place a small stick to each plant as soon as a support is needed. Some prefer to pot again into 6-inch pots, and this is an excellent plan to secure strong plants for the earliest batch, especially where it is a difficult matter to maintain a suitable night temperature, or where the position they are to occupy is not available until later.

CUCUMBERS.—It is the custom of many to grow a batch of Cucumbers with the earliest Melons, planting them on the shaded side of the house. These require a much looser rooting medium than Melons. Much less soil is required at the commencement, and this also is best placed over a good layer of fermenting materials. Good, lumpy loam of a fibrous nature, mixed with fresh horse droppings and leaf-mould, will provide an excellent rooting medium. Plenty of space should be allowed for additions of soil as the roots penetrate through the original heaps. Sow the seeds as recommended for Melon in small pots filled with loamy soil that has been warmed. If the soil is used in a suitably moist condition, little water will be required until the seeds have germinated. Where space does not permit of a bed being formed, a plant or two may be grown, and finally potted into large pots, leaving room for top-dressings, and finally tying the growth to the trellis in a warm stove or other house. When the soil in the pots become filled with roots, the plants will need constant waterings with liquid manure on frequent occasions.

POT FIGS.—As Fig trees in pots advance into growth increased supplies of water will be needed by the roots. Admit fresh air whenever the weather permits, if only for an hour or two, in the middle of the day, closing the ventilators early in the afternoon, with plenty of moisture

FIG. 182.—A FINE PLANT OF BEGONIA MRS. LEOPOLD DE ROTHSCHILD.

In purer and brighter conditions Begonia Gloire de Sceaux will give a splendid display of blossoms, being unrivalled at this season for indoor decoration. I regret that we are unable to cultivate it at Gunnersbury because of our impure atmosphere. *B. socotrana*, which is the prototype of these winter-flowering Begonias, is also a choice and distinct plant flowering at this season. Besides this, further choice is offered in the beautiful varieties of the semi-tuberous-rooted section, which have been shown so numerous at the recent meetings of the Royal Horticultural Society. Plants of this type are valuable at this season for decorating the conservatory, and they will be found of more use for this purpose than for dwelling rooms. For this latter purpose, those of the Gloire de Lorraine type are the best. Choose plants that are in relatively small pots, as these are better able to withstand the changes of temperature in dwelling rooms than specimens

APHELANDRA AURANTIACA ROEZLII.—The bright scarlet colour of the flowers of this *Aphelandra* are not surpassed in beauty by those of any other stove plant which blooms at this season. Those who followed the directions I gave early in the season, and raised a stock of this plant from seed, will have specimens now about to flower. The silvery-grey foliage is very handsome, and combines with the flower to make the plant distinctly beautiful. I have proved it to be an excellent subject for decorating dwelling rooms, specimens having lasted in a good condition, when so employed, for a fortnight in the winter season. I strongly recommend this plant to other growers.

EPIPHYLLUM TRUNCATUM.—Although *Epiphyllums* are usually regarded as greenhouse plants, it is an advantage to allow them a little more warmth at this season, such as is afforded

in the atmosphere. Guard against frequent syringings overhead when the weather is dull, but keep the paths and bed of fermenting materials moist, damping the house in the evening. Start other permanent houses as required for successional fruiting, maintaining at first a night temperature of 45°-50° according to the weather conditions. Syringe the plants lightly twice daily during bright weather and, if needed, give the borders a watering. Always admit air on every favourable occasion to sweeten the atmosphere, which is extremely beneficial.

ORCHARD HOUSE.—Forced fruit trees must not be excited in their early stages. Endeavour to maintain a sweet, even temperature, admitting a free circulation of air. Damp the surface of the house, and lightly syringe the trees. Afford water to the roots with great care. When it is needed, see that sufficient is given to thoroughly soak the entire ball of soil.

THE ORCHID HOUSES.

By H. G. ALEXANDER, Orchid Grower to Lt.-Col. Sir G. L. HOLFORD, K.C.V.O., C.I.E., Westonbirt, Gloucestershire.

DRIP.—This is the season of the year that drip upon Orchids is most injurious, therefore every care should be taken to prevent it. It is desirable to have the houses constructed on scientific principles, providing them with roof bars that will prevent damage by drip condensation, but where such houses do not exist, care should be taken to place each plant where it will not be affected by the drip. Drip does not show its effects upon any plants so soon as one would expect; in fact, some plants may grow freely for a time, but eventually there is deterioration if the plants are not actually killed. Cattleyas, Dendrobiums, and many other Orchids that have completed their season's growth, are kept comparatively dry at the roots to prevent them starting again prematurely, but this care is ineffective if they are exposed to drip. Drip falling into the centre of any young growth in course of development, if not soon detected, may cause it to rot.

ONCIDIUM TIGRINUM.—There are very few Orchids in bloom more acceptable at this dull season than this old species. Perhaps its most delightful quality is the sweet scent of the flowers, a few spikes filling a room with fragrance somewhat resembling that of Violets. It is one of the showiest of *Oncidiums*, and makes a fine display when mixed with other Orchids. The flowers continue beautiful for a considerable time, but they should not be allowed to remain too long upon the plants. This species succeeds well when given a light, well-ventilated position in a cool intermediate house. After the flowering stage, throughout the resting period, infrequent applications of water will suffice to keep the pseudo-bulbs plump and the roots and foliage in a healthy condition.

CYMBIDIUM.—Such members of this genus, as *C. giganteum*, *C. Mastersii*, *C. Traceyanum*, *C. Winnianum* and *C. Pluto*, are most useful Orchids for flowering during the closing days of the year. They are now in flower, and last a considerable time in good condition either on the plant or in a cut state. Plants of the late-winter and spring-flowering kinds have mostly completed their season's growth, and are pushing forth flower-spikes. The amount of root-moisture needed by *Cymbidiums* will not be so great as hitherto, water being applied only when the rooting material has dried out.

MAXILLARIA PICTA.—This quaint old Orchid, now in flower, is not remarkable for the beauty of the individual flowers, but for the number of flowers produced from a single pseudo-bulb. This species thrives well in pots that are provided with ample drainage. For a rooting medium pure *Osmunda* fibre pressed firmly about the roots should be used. The plants seldom get out of health if placed in a favourable position in a house where a cool intermediate atmospheric temperature is maintained.

COVERING THE HOUSES.—With winter again upon us, special preparations must be made to exclude frost from the houses. To drive the boiler fires at full speed and heat the pipes excessively is not only wasteful but also in-

jurious to the plants. The need for excessive firing may be prevented by using external coverings. Archangel mats, or specially-prepared canvas, of which there are many qualities on the market, form the best protective materials, and these should be laid over the roofs, covering all exposed glass ends and sides, making them secure against wind. Those used on the roof should be removed in the morning immediately the temperature commences to rise.

THE HARDY FRUIT GARDEN.

By W. HEDLEY WARREN, Aston Clinton Gardens, Buckinghamshire.

VINES ON WALLS.—It is still the practice with some to prune vines growing on walls out-of-doors during the spring, but the plants are apt to "bleed" if the pruning is deferred until the sap commences to rise; therefore it is better to prune in the autumn as soon as the leaves have fallen, when the vines are practically dormant, with no risk from bleeding. Outdoor vines are apt to become bare of shoots towards the base of the main stem, but judicious pruning will obviate this defect. They are best pruned on the spur system, as the buds then break into growth more regularly, and are more likely to produce fruitful growths than under any other system. Some growers remove the bud nearest to the old wood, and allow the next one to form the fruiting growth, but this practice results in ungainly spurs, which detract from the general neatness of the vine. The usual method of pruning is to shorten the lateral growths to two or three buds, and when these break into growth the following season, to select the best and most suitably-placed shoots for fruiting, rubbing off all the others. This process may be followed for several years, until the spurs become too long, when they may be either cut back to the main stem, from which dormant buds will start into growth, or young canes, arising from near to the base of the vine, may be trained in the place of the older rods.

PRUNING APRICOTS.—The Apricot fruits on shoots of the previous year's growth, and also on spurs arising on the older branches of the tree; in pruning, therefore, retain as much of the young wood and as many branches bearing spurs as may be necessary to fill the allotted space upon the walls. The work of pruning may be done any time during mild weather from the fall of the leaf until the end of February. Remove old branches that are bare of young wood or healthy spurs either entirely or to a well-placed lateral. The space they occupied should be filled with young and fruitful wood. Cut away all dead or decaying spurs which often are too plentiful in these trees. Reduce the stronger shoots the least of all in proportion to the others—not more than one-fourth of their entire length; in the case of weaker shoots reduce them to two-thirds, and in some instances to one-half of their length. Shoots that are very weak may be pruned to two or three buds. This reduction of the growths will result, generally, in the production of lateral shoots during the following summer from the buds on the lower parts of the shoots, whereas if the branches are not shortened, the new growths would proceed mostly from near to the ends of the shoots, leaving the bottom parts destitute of either fruiting buds or spurs. Always prune to a wood bud, except when it is desired to produce growths nearer the origin of the branch, as before-mentioned. Healthy trees have often fruit-spurs 1 inch or 2 inches in length present on two and three-year-old shoots; such spurs should be retained, especially if there is a deficiency of young wood, but when spurs project for several inches from the face of the wall they should be removed, because, notwithstanding that they may blossom profusely, they often fail to bear fruit of good quality, unless the season is unusually favourable. Thick clusters of spurs, which are often found on very old trees, should be periodically thinned, or if not wanted, cut out entirely. As each tree is pruned the branches should be fixed into position closely and regularly. Apricots are generally trained in fan shape, which is undoubtedly the correct method to adopt, as, when a branch dies, the space can be filled better than in the case of branches trained horizontally.

THE FLOWER GARDEN.

By R. P. BROTHERSTON, Gardener to the Earl of HADDINGTON, K.T., Tynninghame, East Lothian.

PRUNING SHRUBS.—Some species of shrubs, whose chief charm at this season lies in the colour of the bark, for example, the Dogwoods and Willows, should not be pruned until late in the spring. Others should have all shoots of a year or more old cut out, in order that the highly-coloured bark of the new growth may show as much as possible. One of the most effective of these is *Rubus phoenicolasius*. In rich, friable soil, shoots made in a single summer will often measure 12 to 15 feet; but if a highly-coloured bark is desired it is usually necessary strictly to limit the number of shoots on each plant, in order that all may be exposed to the sunshine. The fruit-bearing shoots of the previous year assume a drab hue, and should be cut clean away, being far from ornamental. The effect, when pruning is completed, is most pleasing, especially when the sun brightens the brown stems to a ruddy golden colour. The young stems of *Deutzia Wellsiana* and *D. Watereri* assume a pinkish tinge in winter. The older shoots, which flowered in summer, should be cut completely away; partly for the sake of effect, and partly because such excision is always followed by long, healthy fresh shoots. *Stephanandra Tanakæ* and *S. flexuosa* have shoots of a ruddy colour, and should be treated in the same manner as the *Deutzias*. *Spartium junceum* may also be thinned now, and also the Barberry, with its purple stems and leaves. *Eleagnus argentea* owes its specific name to the colour of its bark, which is a silvery colour. *Ribes sanguineum*, and other species of *Ribes*, give a pleasing effect in winter, though the stems are not very brightly coloured.

WINTER-FLOWERING SHRUBS.—*Jasminum nudiflorum*, one of our best winter-flowering shrubs, is flowering very unevenly this year; some plants have scarcely any flowers, whilst others are covered with blossoms. Next in order comes *Arbutus Unedo* and its varieties. This is valued not so much on account of its flowers, as for its beautiful berries, which are known as Winter Strawberries. The *Arbutus* forms a small tree, and all the forms are well worthy of cultivation. The *Laurestinus* (*Viburnum Tinus*) is beginning to assume its flowery garb, but it is only in a fine winter that it can be depended on to blossom. The male plants of *Garrya elliptica*, which species is far hardier than is usually supposed, are already well furnished with the grey catkins. The decorative effect of the plant is often ruined by improper pruning; all that is needed is a careful thinning of the shoots. The Rosemary is in flower now, but this is exceptional, and is due to the unusual mildness of the season. It is a peculiarly spicy-smelling shrub, surpassing even the Lavender in this respect, and also in its appearance when not in flower. *Piptanthus nepalensis* occasionally bursts into flower about this time of the year; it is a fine shrub, and is not appreciated quite as it deserves. Of Heaths, *Erica carnea* is the best winter representative. The Vincas (*Periwinkles*) sometimes yield a few flowers about Christmas time, and even without blossoms they are highly ornamental plants. The glossy foliage of *V. major* and *V. minor* are very attractive, trails of the latter being suitable for the decoration of dinner tables. Associated with *Jasminum nudiflorum* and varieties of *Helleborus*, the Vincas form a delightful combination; the pity of it is that many people are superstitious about the pretty Periwinkles, believing that when they enter the house, death stalks in behind them.

THE WINTERING OF SUMMER SPORES.

Experiments by a number of different observers demonstrate that the summer spores (conidia) of various parasitic fungi are capable of withstanding the winter and of germinating in the following spring. R. EWERT has shown this to be the case with *Glæosporium Ribis* and species of *Fusicladium*, and V. PEGLION—working in Italy—demonstrates the same thing for the *Oidium* (conidial) stage of Rose mildew (*Sphaerotheca pannosa*) and for that of *Podosphaera leucotricha* (Apple mildew), which winter in the buds of their respective host plants, the Apple and Rose.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, as well as specimens of plants for naming, should be addressed to the EDITORS, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Local News.—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY, DECEMBER 25—Christmas Day.

TUESDAY, DECEMBER 26—Bank Holiday.

THURSDAY, DECEMBER 28—
Soc. Nationale d'Hort. de France (Paris) General Meet.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last Fifty Years at Greenwich—38°6'.

ACTUAL TEMPERATURES:—

LONDON.—Wednesday, December 20 (6 P.M.): Max. 52°; Min. 46°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—Thursday, December 21 (10 A.M.): Bar. 29.0°; Temp. 48°; Weather—Raining.

PROVINCES.—Wednesday, December 20: Max 50° Cornwall; Min. 44° Yorkshire.

Variation in Natural Species.

It is much to be desired that systematic botanists should encourage some of their younger members to take up the study in the field of the variations presented by our common plants. For it is a remarkable fact that our ignorance of this most important matter is still very considerable. Detailed knowledge of the varieties of a given species is valuable alike to the systematist, to the student of genetics, and to the practical horticulturist. Lack of such knowledge leads to mistaken ideas, not only of species, but also of the rôle of the plant-breeder in "creating" new varieties. It is hardly an exaggeration to affirm that many scientific botanists still contemplate a wild species as one composed of an assemblage of identical, or essentially identical, individuals. They acknowledge the existence of varieties, but very rarely, if ever, realize the extent of the variation which exists among the members of a species. Hence it is that variation comes to be associated in the minds of many botanists and horticulturists with cultivation, and fixity of type, with a state of nature. The only means of determining whether this tacit assumption is true or false is for systematic botanists or other trained observers to turn their attention to this much neglected field of observation and to ascertain once for all the nature and extent of the variations which occur in natural species.

It may be that this branch of study has fallen into neglect owing to the idea that variations are small and trifling matters which represent rather the vagaries of the individual than the properties of the species.

Yet the most superficial study of records

of horticulture shows that species exhibit quite marked and no doubt, in many cases, constant variations. Thus anyone who reads Mr. Dyke's contributions on Irises, which appear from time to time in this journal, discovers that well-marked varieties of the various species of Iris are not uncommon in the native, uncultivated plants. Similarly the same fact comes out with striking clearness from Mr. R. Farrer's observations on Alpine plants and particularly on the Primulas. Whence we may naturally conclude that directly we leave the laboratory or the garden and proceed to the study of plants in their native haunts we shall find that they are characterized by well-marked, and in many cases, constant differences, and we shall, without doubt, obtain a fund of information which will prove invaluable in the study of the origin of cultivated plants. Information on the subject of the actual extent of variation in wild species is of particular value at the present time. The student of genetics is busily engaged in working out the relations of the varieties of cultured plants with one another. He has demonstrated, for example, that these varieties are due in many cases to the recombination of characters which occur in parent forms. As the result of his experiments the plant-breeder may be able presently to predict the forms are to be met with naturally. This, even if achieved, does not absolve the systematist from the scientific duty of ascertaining the extent and kind of variety of form presented by given species of plants in their natural state.

In urging the necessity for this work on the systematist we are not forgetful of the fact that he has other work to do, that it is impossible and perhaps undesirable that all systematists should vex their souls with variation: nor are we unaware of the considerable amount of investigation of variation which has been done already. What we wish to emphasise is that with the rise of genetics this study of variation has become at once of primary and obvious importance. Before Mendelian discovery, it seemed an almost hopeless business to take up the study we are now advocating, and yet even at that time, it is to be remembered that by working in this field Bateson was the first to establish on the sound basis of observation the pregnant fact of discontinuity in variation.

Let us give a few examples to illustrate our ignorance of the range of variation among common species. The sinensis form of Chinese Primula is dominant to the star form. Which is the native form? We know that the star form occurs wild for both Henry and Wilson have described it. Is the sinensis form a product of cultivation or does it also occur in nature?

Again, what is the range of colour in the Primrose and in the Cowslip? If Polyanthus are derived from Primrose and Cowslip it is in the highest degree likely that colour forms of either the Primrose or the Cowslip—and probably the latter—occur naturally. We have, it is true, the blue Primrose, but who knows definitely its origin?

Of recent years Prof. Baur and Miss Wheldale have each independently made remarkably complete Mendelian analyses of the complex colour-variations of the multitudinous garden races of Snapdragon (*Antirrhinum majus*). What do we know of the range of variation in *Antirrhinum majus* as a wild species? Only that this plant is pleomorphic and occurs in two distinct colours, purple and pale yellow. Are these the only colour-forms which occur naturally? If so, what are their "colour constitutions," and still more important—why are these the only naturally occurring colour-forms? The term "struggle for existence" has become a sort of scientifically pious expression and we do not know at the present day, despite of reams of printed paper and of interminable speculations, how far the struggle for existence is playing a part in evolution.

The practical horticulturist is less concerned with origins than with accomplished facts. He obtains a new form of garden flower and is rightly content with the fact that it is his—though, unfortunately, his reward is by the nature of the case only too frequently disproportionate to his labours—but the scientific horticulturist wants to know the origin of the new plant, and who can tell him? The raiser forgets through lapse of time or discretion, or perhaps never knew with certainty. Thus it is that mystery veils the origin of many of our cultivated garden plants. One contribution toward the replacement of this mystery by knowledge is to be made by a survey of the range of variations in those natural species which are known or suspected to have been concerned in the making of garden varieties.

OUR SUPPLEMENTARY ILLUSTRATION

represents a table of choice fruits exhibited in August last by the Duke of WESTMINSTER, Eaton Hall, Cheshire (gr. Mr. N. F. Barnes), at the show of the Shropshire Horticultural Society in the class for decorated fruit tables. It was generally conceded by the fruit-growers present on that occasion that the exhibit taken collectively was one of the very best of its kind ever seen at a public exhibition. The dishes were as follow, and the number of points obtained for each dish is appended:—*Apples*: Cox's Orange Pippin, 6½; Emperor Alexander, 6; Gascoyne's Scarlet Seedling, 6; Cox's Orange Pippin, 6½. *Cherries*: 4. *Figs*: 6. *Grapes*: Muscat of Alexandria, 9½, 9, 9, 8½; Chasselas Napoleon, 5½, 7; Appley Towers, 7½, 8½, 8, 8½; Madresfield Court, 9, 8½, 8, 8. *Melon*: 6, 6, 7, 7. *Nectarines*: Humboldt, 7½, 7½; Pineapple, 7½, 7½. *Peaches*: Belle Bauce, 7; Dymond, 7; Royal George, 7½, 7. *Pears*: Doyenné du Comice, 7; Marguerite Marillat, 6½, 7½; Triomphe de Vienne, 7. *Plums*: Transparent Gage, 5. Beauty of flowers and foliage, 6. General arrangement for effect, 5½. The total number of points that was possible was 324, and the points actually awarded 278½.

THE GALTON LABORATORY.—The London University Gazette announces that the response to the appeal for the proper housing of the Galton Laboratory of Eugenics (University College), to the needs of which reference was made recently in these pages, has resulted in donations amounting to £2,629.

A DECORATED TABLE OF CHOICE FRUITS EXHIBITED BY HIS GRACE THE DUKE OF WESTMINSTER.

NATIONAL CHRYSANTHEMUM SOCIETY.—The great autumn exhibition of this society will be held next year, as usual, at the Crystal Palace, the dates being Tuesday, Wednesday, and Thursday, October 29, 30, and 31. These early dates are necessitated because the Receiver of the Crystal Palace has received permission from the High Court to make fixtures up to the end of October only. The committee are, however, making arrangements for the holding of a supplementary exhibition at Essex Hall on Wednesday, November 20, and a meeting of the floral committee and conference will be held on the same day. The annual meeting will be held on February 5 at Carr's Restaurant, Strand.

BIRMINGHAM HORTICULTURAL SOCIETY.—This society is the Handsworth Horticultural Society under a new name, the fresh title having been suggested by the recent absorption of the town of Handsworth into the City of Birmingham. W. H. BOWATER, Esq., the Lord Mayor of Birmingham, has consented to become the first president of the society, and the committee are anxious that the flower show shall be a great success. The secretary is Mr. W. G. CARRADINE, 84, Hamstead Road, Handsworth.

THE LATE SIR JOSEPH HOOKER.—The funeral of Sir JOSEPH HOOKER, O.M., took place on Friday, the 15th inst., at Kew. The service was conducted in the parish church, and the mourners included Lady HOOKER (widow) and other members of the family, Sir WILLIAM THISELTON-DYER, Sir ARTHUR and Lady RÜCKER, and Dr. TRAIL. There were also present Sir OLIVER LODGE, Sir NORMAN and Lady LOCKYER, Sir ARTHUR CHURCH, Sir ARCHIBALD GEIKIE, Sir JOSEPH LARMOR, Sir JOHN ROSE BRADFORD, Professor BAYLEY BALFOUR, Regius Keeper of the Royal Botanic Gardens, Edinburgh, Dr. C. H. READ, President of the Society of Antiquaries, Dr. D. H. SCOTT, President of the Linnean Society; Dr. B. DAYDON JACKSON, Secretary of the Linnean Society; Professor W. W. WATTS, Professor J. W. JUDD, Mr. W. E. DARWIN, Mr. E. M. HOLMES, Sir DANIEL MORRIS (representing the Royal Horticultural Society), Mr. Harry J. VEITCH, Professor F. O. BOWER, Glasgow University, Mr. E. G. BAKER (Natural History Museum), Lieut.-Colonel PRAIN, Professor Sir GEORGE DARWIN, Dr. FRANCIS DARWIN, Professor S. H. VINES, Mr. G. CLARIDGE DRUCE, Professor F. W. OLIVER, Mr. A. HENRY, Reader in Forestry, Cambridge, Dr. A. GUNTHER, Mr. F. GUNTHER, Mr. A. H. LYELL, Captain FRANCIS H. LYELL, Dr. G. S. BOULGER, Dr. D. OLIVER, Mr. R. HOOPER PEARSON (*Gardeners' Chronicle*), Mr. J. S. GAMBLE, Mr. J. R. DRUMMOND, Dr. F. N. WILLIAMS, Dr. R. W. WILSON, Mr. G. GORDON, Mr. C. H. CURTIS, and the curators and staff of the Royal Botanic Gardens, Kew.

STUDY OF FRUIT DISEASES.—An important announcement with regard to the proposed establishment of a Government institution for the study of fruit diseases was made during the fruit growers' conference at Ashford, on the 11th inst. Mr. DUNSTAN, the principal of Wye College, stated that the Government, under the development grant, proposes to establish an institution for the study of fruit diseases. As it was rumoured that this would be in the west of England, he urged united action to ensure that Kent, as the largest and best fruit-growing county, should have its station. He did not ask that it should necessarily be at Wye College, but promised that if it were placed anywhere else in Kent he would support it energetically. A petition urging the claims of Kent in this matter was signed by many of those present at the conference.

THE INTERNATIONAL INSTITUTE OF AGRICULTURE.—The Rome International Institute of Agriculture is conferring a boon on agriculturists and horticulturists in issuing with such promptness its volumes of agricultural intelligence. Nos. 6 and 7, year 2 (June, 1911) have just been distributed, and contain valuable summaries of the world's work in the various departments of agricultural investigation. In this number, the following matters are treated of:—The Development of Agriculture in Different Countries, Agricultural Physics, Chemistry, Botany. Horticulture, Plant Diseases, &c.

CHINESE PLANTS.—"A Supplementary List of Chinese Flowering Plants" is the title of a paper by Mr. S. T. DUNN, formerly Superintendent of the Botanical and Forestry Department of Hong Kong, in the last part issued No. 274, vol. xxxix, of the *Journal* of the Linnean Society. It is supplementary to FORBES and HEMSLEY'S *Enumeration*, including the "List of the genera and species discovered in China since the publication of the various parts of the *Enumeration*," compiled by Miss M. SMITH. It is on the same plan, and it is something more than a list, being in reality an index to the places of publication of the additional new genera and new species, and to further records of previously-described species, up to the end of 1910. The last part of the *Enumeration* appeared in 1905. The author states: "Out of the 3,500 citations of flowering plants, about 2,000 are references to first publications of species, while some 700 refer to other published additions to the flora." The remainder consists of records of new localities represented by specimens in the Kew Herbarium.

LECTURES ON GENETICS.—Professor WILLIAM BATESON'S lectures, at the Royal Institution, on "The Study of Genetics," will be given on Tuesdays, January 16, 23, 30, February 6, 13 and 20, at three o'clock. A course of five lectures on Genetics is also to be given by Professor KEEBLE in the University of London (Imperial College of Science, S. Kensington), on Fridays, January 19, 26, February 2, 9 and 16, at 4 o'clock.

PROMISING NEW FRUITS IN U.S.A.—The Year Book of the Department of Agriculture for 1910—published during the present year—contains notices of fruit which appear to promise well for extended cultivation in the United States. Beside two Apples—Lowey Apple and Kinnard Apple—both of which originated in the States, mention is made of Payne Peach (syn. Highland Beauty), which originated as a sport from the stock of a St. John Peach tree in 1901. The Payne Peach is said to be harder than most commercial varieties of its section. A Raspberry (Hoosier) is also mentioned. Hoosier is said to be a good disease-resisting variety. It bears roundish berries, large to very large, in moderately-loose clusters of 15 to 18, flesh dark purplish-red, firm, moderate, juicy, seeds rather large, hard; flavour sub-acid, with pleasant aroma; quality good. The article is illustrated by admirably-printed colour plates.

THE "WHITE" MEDAL.—The Trustees of the Massachusetts Horticultural Society have awarded the George Robert White Medal of Honour for the current year to M. VICTOR LEMOINE, of Nancy, France, who has since died (see p. 465). This medal is awarded annually to the person who has done the most during the year or in recent years to advance the interest in horticulture in its broadest sense. The award for the year 1911 is eminently appropriate as a recognition of the accomplishments of M. LEMOINE in the production of so many varieties of flowering plants and

shrubs which have become of permanent value to the horticultural interests of the United States and of Europe. This is the third award of the medal, which was founded by Mr. WHITE in 1909. It will be remembered that the first recipient of the medal was Professor CHARLES SPRAGUE SARGENT, Director of the Arnold Arboretum, Boston, U.S.A., in 1909, and the second Mr. JACKSON THORNTON DAWSON, also of the Arnold Arboretum.

COLD STORAGE OF MUSHROOMS.—Experiments described in the *Revue Générale du Froid* (June, 1911) demonstrate that after a month's cold storage Mushrooms undergo no deterioration, either in appearance or in nutritive quality; in fact, cold-stored Mushrooms could not be distinguished from those picked for a day or two and left in the open air.

A SEEDLING PELARGONIUM.—Messrs. H. CANNELL & SONS, Swanley, have forwarded a truss of a new seedling zonal-leaved Pelargonium with blooms measuring 2½ inches across. The petals are of a pleasing cerise colour. The truss is not only of large size but of excellent form.

A PRUNING COMPETITION.—The good work done by the Madresfield Agricultural Club was described by Mr. OWEN THOMAS in our issue for December 9. The society recently held its annual pruning competition, when prizes were offered for the best work in three classes. Nineteen competed in the class for present and past pupils of the Club, or students of the Worcestershire County Council, under the age of 25 years, when the 1st prize was awarded to Mr. H. J. PARSONS, Callow End. Mr. ERNEST GARDENER, of Bransford, was successful in the similar class for those above the age of 25 years, whilst Mr. JOSEPH KITCHING, Madresfield, excelled in the open class. In addition, each of the pupils was presented with a new pruning knife. The judges, in declaring their awards, congratulated the club on the work being done by these classes and competitions, not only for the district but for the country at large, and expressed their great satisfaction at the high standard of general excellence attained by the competitors.

A REMARKABLE APPLE TREE.—According to the *Morning Oregonian*, of Portland, U.S.A., states the *Florists' Exchange*, a seedling Apple tree was sold on October 18 for 600 dollars. The tree was a chance seedling which grew up in a fence corner on the farm of Mr. DAVID E. JUNKIN, 10 miles south-east of Albany. It is now 10 years old, and for several years has borne ripe fruit from May to November of each year, having blossoms, green fruit and ripe fruit all on its branches at the same time during the summer. The Apples are stated of good quality. The tree was bought by a nursery company, which is to have all its products for 10 years. The tree will be left in its present situation and the company will utilize it in securing buds and scions for purposes of propagation.

SCHEDULE OF CLASSES FOR HARDY PLANTS AND FLOWERS.—The National Hardy Plant Society has compiled a model schedule of classes for hardy plants and flowers, with a view to helping committees of horticultural societies in the task of providing suitable classes for these subjects. There are separate lists for spring, summer and autumn shows, and these are calculated to provide hints to committees that will save them considerable trouble. Copies may be obtained, post free, from Mr. FRANK BOUSKELL, Market Bosworth, Nuneaton.

CARNATION WHITE CHIEF.—This variety of perpetual-flowering Carnation, referred to on p. 420 as being of American origin, was raised by Mr. H. BURNETT, St. Margaret's Vineries, Forest Road, Guernsey.

LEAF CURL OF POTATOS.—The most recent researches into the nature of this obscure disease indicate that it is the result of the attack of a fungus, probably a *Fusarium*.

THE OFFICE OF WOODS AND FORESTS.—From the 89th report of the Office of Woods and Forests it appears that the income derived from the woodlands under its control—in which are included the New Forest and Windsor—is £6,320, and that the outgoings amount to £6,313. The good balance gives plentiful cause for reflection.

THE HERBERT SPENCER LECTURER, 1912.—The University of Oxford has invited Professor WILLIAM BATESON, Director of the John Innes Horticultural Institution, to deliver the Herbert Spencer lecture in 1912. The subject of the lecture, which will be given on Wednesday, February 28, is "Biological Fact and the Structure of Society."

A NEW TROPICAL FRUIT.—The number of edible plants which grow in sandy situations in tropical regions is so small that any addition to the group deserves notice. According to the *Boletín de la Sociedad Agrícola Mexicana*, the Cucurbitaceous plant *Acanthosicyos horrida*, which grows among the dunes of Walfish Bay (South Africa) produces a fruit which forms a staple article of diet among the Hottentots of the German colony. Its extremely long root system enables it not only to exist in sandy soils, but to produce a fruit of from 2 lbs. to 3 lbs. in weight. The fruit is green, with a pulp which is at first bitter, but which becomes sweet and nutritious when ripe. Commenting on this fruit, the *Journal d'Agriculture Tropicale* (No. 125, November, 1911) suggests that experiments should be made in the cultivation of the plant in the Sahara and other dry and sandy regions of hot countries.

THE COLSTOUN PEAR.—The Earl of DALHOUSIE is the life custodian of an alleged magical heirloom, known as the Colstoun Pear. The *Edinburgh Dispatch* tells the story. In the year 1250 the daughter of HUGO DE GIFFORD, believed to be in league with Satan, and thus known as the WARLOCK o' GIFFORD, married a neighbour, BROWN, of Colstoun, in the chapel attached to the WARLOCK's stronghold, Yester Castle. As his child's dowry the WARLOCK plucked a Pear from a tree and handed it to the young couple, giving them the assurance that so long as the fruit was preserved intact their descendants would prosper. The BROWNS, true to the WARLOCK's prediction, flourished down to the reign of CHARLES I. Then a BROWN old maid was imprudent enough to try her teeth on the Pear. The result was that her people became involved in unsuccessful litigation, and had to dispose of a couple of the best farms on Colstoun Estate to pay expenses. CHRISTIAN BROWN, the heiress of the late BROWN, of Colstoun, married, in 1805, the ninth Earl of DALHOUSIE. Thus her husband's family obtained possession of the heirloom, which is kept in a silver box of quaint make nearly as old as itself.

PLANT COLLECTING IN THE CHINESE ALPS.—The following is an extract from a letter sent home by Mr. F. KINGDOM-WARD, who has been collecting for Messrs. BEES LTD., and is now on his way home. It will be seen that Mr. WARD indicates the altitude of most of the new plants discovered. "The subjoined list of plants I confidently believe to be first-class; seeds of all these are now collected:—1, *Meconopsis* (Cambridge blue, tall, 17,000 feet); 2, ditto (Oxford blue, tall, 14,000 feet); 3, ditto (Oxford blue, dwarf, 6 inches or less, 17,000 feet); 4, ditto (yellow, tall, 13,000 to 14,000 feet); 5, *Primula*

(blue, dwarf, 1 to 2 inches or less, 15,000 feet); 6, ditto (blue, tall, bell-shaped corolla, 16,000 feet); 7, ditto (blue, small, 13,000 feet); 8, ditto (brilliant crimson, rocks, large corolla, 17,000 feet); 9, ditto (red flowers in umbels, 13,000 feet); 10, ditto (mauve, small, 14,000 feet); 11, ditto (mauve, tall, 14,000 feet); 12, ditto (crimson, marsh, 12,000 feet); 13, ditto (pink, tall, 12,000 feet); 14, *Ranunculaceæ* (violet, on rock, 14,000 feet); 15, ditto (pink shade, 13,000

also six large white *Anemones*. We shall also add the following plants:—1, *Lilium* (gigantic, white, 12,000 feet, forest); 2, ditto (pink, 14,000 feet); 3, *Primulas* (one striped yellow and orange, one mauve); 5, ditto (violet). By the way, should my Cambridge-blue *Meconopsis* prove to be a new species, may I suggest that it should be called *M. Cantabridgiensis*? It is the only flower I remember ever to have seen that is a true Cambridge blue without being

FIG. 183.—*SPATHODEA CAMPANULATA* IN SAJJAN NIWAS GARDENS, UDAIPUR.

(See p. 459.)

feet) I already have seeds of pink, yellow and crimson species of *Scrophularineæ*, *Senecio*, *Epilobium*, *Saxifragas*, *Corydalis*, *Pæonia*, *Iris* and *Potentillas*. The following is a list of specimens of which I may reasonably hope to get seeds:—1, *Saxifraga* (golden, large flower, 14,000 to 15,000 feet); 2, ditto (golden, small flower, 14,000 to 15,000 feet); 3, *Campanula* (blue or mauve, twiner, 12,000 feet); 4, *Gentiana* (blue, large, 14,000 feet); 5, ditto (blue, small, 15,000 feet);

washy. Every time I travel, every time I camp in the mountains, I come in for the dregs of the original 'deluge,' and no doubt it is partly this, partly the altitude, and partly the rapid changes of temperature which have upset me during the last month. My work has not so far been interfered with, however, and I think I can hang on for two months. I am crossing to the Yangtze shortly to try and find the small scarlet *Primula* in seed. I have got six or eight kinds of

Roses and more species of *Rubus Rhododendrons* are not satisfactory. I have not seen more than half-a-dozen species in flower. Have had no letters from home later than May 31, and no news, though the people here persistently state that we have annexed Western Tibet. However, there are no more rumours of extermination, so I shall carry out my programme. The official honoured me with another visit the other day, and I told him how the official at Ya-kalo had treated me. He lets me go anywhere now, and since I returned the last soldier he gave me with thanks, is not trying to spy quite so much, but I anticipate a row over the Salwen business. To my previous list may, I think, be added the following plants, recently acquired:—*Primula* (flowers purple, small tubular in a capitulum); another (flowers blue). Both are so badly attacked by fungus that they hardly do themselves justice here, but I think that they will prove first-class in cultivation.) *Omphalodes* (blue) and another species of *Boraginaceæ* (ditto)—both small but splendid blues, and a Larkspur of the most wonderfully vivid blue I have ever seen in flower, sea or sky. The *Cæsalpinia*, noted south, had no red in it; will try and procure seed. Have seen nothing of your black *Rhododendron*, but found a magnificent crimson Alpine Rose (*Azalea*) on the summit of the Mekong-Salwen, which I hope to secure. Another good plant I have just got is a twining *Cucurbita* with large sulphur-yellow flowers, an annual. The weather is at last clearing up. A few days ago I was in the forest enveloped in clouds of rain when a big black bear stood up 10 yards from me. *F. Kingdon-Ward.*"

PUBLICATIONS RECEIVED.—*Journal of Genetics*, No. 4. November. (Cambridge: University Press.) Price 10s. net.—*The Smallholder's Year Book, 1912*. (London: C. Arthur Pearson, Ltd.) SPATHODEA CAMPANULATA.

WHEN in full flower, as was the specimen from which the photograph is reproduced (fig. 183). *Spathodea campanulata* is a superb sight. The campanulate tube of the flower is 3 inches in length and of a beautiful orange colour. *S. campanulata* forms a tall tree, whereas *S. laevis* (Newbouldia laevis) is a subject for greenhouse cultivation. This genus of the *Bignoniaceæ* includes various species which form large trees in tropical Asia and America. In the province of Bombay the native fisherfolk make nets from the branches and roots of *S. Rheedii*, and stain the nets with a dye extracted from the root of the same species. The photograph was kindly sent us by Mr. T. H. Storey, Superintendent, Sajjan Niwas Gardens, Udaipur, India.

CITRUS MEDICA.

THE accompanying photograph (see fig. 184) represents an exceptionally large fruit of *Citrus medica* and an ordinary shop Lemon for comparison. The former fruit was sent to Kew by Mr. F. G. Sly, Director of Agriculture, Nagpur, Central Provinces, India, and it was grown in the Government Gardens there. It weighed 7½ lbs., and was a foot long and 7 inches in diameter. *Citrus medica* is a very variable species, both as regards its leaves and its fruits. It includes the Lime, the Lemon, and the Citron, the large-fruited, sometimes "fingered," varieties belonging to the last-named. Firminger limits the name of *medica* to this big-fruited tree, which is known in India as the Citron or "Beg-Poora." It is well known for its great size, as well as for its dense, spongy rind, from the external portion of which an excellent preserve is made. The three big-fruited varieties he describes are:—

1. The common Citron, of the size of an ostrich egg, or somewhat larger, much knobbed and warted.
2. A Citron of enormous size, fully a foot or more long. This, seemingly, is the kind known in Europe as "Poncire."
3. The fingered Citron, resembling a man's hand with the fingers bent up with cramp.

FIG. 184.—FRUIT OF CITRUS MEDICA AND (ABOVE) AN ORDINARY LEMON TO SHOW PROPORTIONATE SIZE.

"Malooni," of Woodrow's *Gardening in India*, appears to be this No. 2 or "Poncire." Woodrow describes "Malooni" as a low-spreading shrub, bearing fruits attaining 4 lbs. in weight, of an oblong shape, irregularly ridged and wrinkled, the surface smooth with prominent convex oil glands and a small papilla at the stigma end. The skin, 1½ inch in thickness, is firm and solid, enclosing 10 carpels, having a pale coloured pulp between very strong endocarpal layers, and with scanty bitter acid juice and about 100 seeds, which are small in proportion to the size of the fruit, but generally contain several embryos, as in many other seeds of this genus.

There is a great difference between this fruit and Metford's Lemon, of which there are fruiting examples at Kew (see *Gardeners' Chronicle*, April 28, 1900, fig. 86). The fruit in this case closely resembled an ordinary Melon, whereas that now figured might easily be mistaken for a yellow, warted Vegetable Marrow. A Lemon weighing over half a stone may be regarded as somewhat of a novelty. These varieties are said to be reproduced from seeds. We have proved this at Kew in the case of Metford's Lemon. W. W.

SCOTLAND.

THE CLASHING OF SCOTTISH CHRYSANTHEMUM SHOWS.

THIS year no fewer than four Scottish Chrysanthemum shows were held on the same date namely, November 24, when the annual Chrysanthemum shows were held at Aberdeen, Dundee, Dunfermline and Hawick. It is difficult to avoid this drawback to the Scottish Chrysanthemum season, as it is comparatively short, and it is expedient to have the exhibitions at the end of the week. Yet surely an effort should be made to keep the Aberdeen, Dundee and Dunfermline shows on different dates. Hawick is further away and will interfere but little with the exhibits at the others.

The Dunfermline show promises to take a leading position, as it is subsidised by the Carnegie Dunfermline Trust, under whose auspices the display is held. The prize money is larger than at most other Scottish provincial shows, and therefore the Dunfermline one attracts a larger proportion of exhibitors than the others. This has undoubtedly reduced the exhibits at the Dundee show.

EDINBURGH PUBLIC GARDENS.

At a meeting of the Edinburgh Parks Committee, held on November 30, a representation

of great importance was made to the committee by Mr. J. W. M'Hattie, the superintendent of parks respecting suggested improvements in the East Princes Street Gardens. These, with the relative plans, have been remitted for further consideration. The proposals have been prepared by Mr. M'Hattie. The first, or "Scheme A," refers to the fact that the growth of the trees has caused the present flower-beds to look shaded and overcrowded, and that 14 larger and less formal beds should be substituted for the 54 at present existing. This would allow of more grass between the beds, and would also remove the overcrowded appearance. It is also suggested that the lawn next the railway be formed into a garden with 13 flower-beds, and that the present border next the North British Railway be widened from 10 to 30 feet. This would hide the railway much better than at present. It is added that the cost of annual maintenance would remain the same, and that no increase of the staff would be required, the alterations being made by those at present employed.

"Scheme B" is specially noteworthy from the fact that it embraces the removal of the present railings between Princes Street and the gardens,

a widening of the footpaths, and the division of the flower garden into four sections, each being laid out in beds and a low fence surrounding each section. Two fountains are also proposed, and it is suggested that the lower part should be treated as in the preceding scheme. The cost of this is estimated at £456, the annual expenditure remaining the same—£675.

THE WAGES OF EDINBURGH BOTANIC GARDENS EMPLOYEES.

THE dissatisfaction which has for some time prevailed regarding the remuneration of the employees at the Royal Botanic Gardens, Edinburgh, has found expression in a memorial which has been sent by the members of the Edinburgh Royal Botanic Gardens employees Union to Earl Beauchamp, the First Commissioner of his Majesty's Board of Works. The memorial points out the disparity between the wages in the Edinburgh Botanic Gardens and those paid in London, although the rate of living is not less expensive in Edinburgh. It is, for example, said that the young men in the gardeners' and foresters' departments receive 21s. per week; skilled labourers, 24s.; and unskilled labourers, 21s. The park keepers are paid from 22s. to 25s. weekly. Their request in 1910 for a reconsideration of their wages has not received attention. Another point made is that only about £100 of the grant for patrols, amounting to £325, was spent in 1910.

LEGACIES TO GARDENERS AND FORESTERS.

By her will and various codicils, the late Countess of Seafeld bequeathed legacies to several of the gardeners and foresters who might be in her employment at the time of her death. Among the legatees mentioned was Mr. Johnstone, gardener at Castle Grant, £100. To the following foresters sums of £200 each were left:—Messrs. Jas. Ward, Keith; Jas. Mackenzie, Cullen; John Blacklaw, Portsoy; John Stuart, Castle Grant; John Stephen, Abernethy; R. Mackinnon, Duthil; John Bryson, Rothes, and Wm. M'Bain, Glen Urquhart. Lady Seafeld also left to the outdoor servants, including the head gardeners and head foresters, who had been in her service for 10 years a year's wages, and to those with less than 10 but more than five years service, half-a-year's wages, this being in addition to any separate bequests as above.

A NEW ROCK GARDEN.

THE cultivation of rock plants is spreading in Scotland, and in many places extensive rock-gardens have been constructed recently, including one on the estate of Sir Alexander M'Robert, Douneside, Tarland. The work has been carried out by the firm of Messrs. James Backhouse & Sons, York. The Douneside rock-garden includes a winding streamlet and several miniature ponds, with connecting rills, whilst the pathways have been so arranged that the plants may be inspected without inconvenience. *Correspondent.*

RAVENALA MADAGASCARIENSIS.

RAVENALA MADAGASCARIENSIS has the appearance of a gigantic fan, the leaves being all in one plane. This noble tree has been called by the French, the Traveller's Tree, on account of the water which is stored up in the large cup-like sheaths of the leafstalks, and which is sought for by travellers to allay their thirst. The broad leaves are used as thatch in Madagascar to cover the huts. The seeds are edible, and the blue pulpy aril surrounding them yields an essential oil. The blades of the leaves are oblong in form, and are larger in size than those of any known plant, being simple, with the exception of *Victoria regia*.

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

ONE REASON WHY JOURNEYMEN GARDENERS APPEAR TO BE DETERIORATING.—I hardly think that *Journeyman* is correct when he attempts to give a reason for the deterioration of journeymen. His reason, which practically amounts to this, that the journeyman has too much work to do, is, I think, puerile. I have had a number of journeymen under me during the last few years, and I think many head gardeners will bear me out when I say that there is a remarkable difference in the work done by

then perhaps receive only a bare living wage, prevents many good men from joining the profession. The liking for work near a town is, I think, another reason, many gardens being so far in the country. Then there are many inducements held out to young men to emigrate, and it is nearly always the best who go. I know one garden where three good men left in less than three years to join the Metropolitan Police Force. I think these are more likely to be some of the reasons why journeymen appear to be deteriorating, as the best and most energetic men will not join the ranks of gardeners, which leaves a lower grade of man for the service of the profession. That there are good journeymen yet to be had, I should be the last to deny, but I

[Photograph by C. B. Ussher.]

FIG. 185.—RAVENALA MADAGASCARIENSIS (TRAVELLER'S TREE) AT NEBONG TEBAL, STRAITS SETTLEMENTS.

journeymen passing through the same garden. One man will do the work well, and always have things tidy and in order, and perhaps the next journeyman who follows him is always in a muddle, work always behind, and consequently never so well done. One man is methodical and painstaking, and keeps to his work. The other has a "don't care" bearing and never loses a chance of standing about and of talking. I think some of the reasons why journeymen appear to be deteriorating is due to choice of other work. The low wage paid in many gardens, and the years which so many men have to wait before they can obtain a head place, and

am sure that these would be the last to complain about too big a charge. There are doubtless other reasons than I have stated for the deterioration, but the one advanced by *Journeyman* should be the last to enter one's mind. *Head Gardener.*

A GARDENERS' DINNER.—Mr. Dean's proposal (p. 442) to have another gardeners' dinner, on the occasion of the International Horticultural Exhibition, next May, will doubtless be welcomed by many gardeners who enjoyed the very pleasant evening which the committee arranged for us a few years since. A gardener's life is a

very isolated one in most instances, he has but few occasions when he can meet his fellow workers in the profession. But the selection of Saturday is very unfortunate because few gardeners at a distance from London will be able to attend on that day. If it cannot be arranged earlier in the week, it will be chiefly for those who are living in the neighbourhood of London. *W. H. Divers, Belvoir Castle Gardens, Grant-ham.*

CARBON-DIOXIDE.—While not being in a position at present to publish the results of my experiments on the question as to whether an artificial supply of carbon-dioxide to plants growing in somewhat abnormal conditions in the English climate is beneficial or otherwise, it may interest your readers to know the nature of the results of the preliminary stage of the experiments. It was necessary in the first place to know what amount of carbon-dioxide was present in the house at different times of the day and in various conditions; therefore, in March last, I decided upon making an experiment in an early vinery: it is a modern, spacious house, and at this time of the year the vines were growing vigorously, the roof being completely covered with large, healthy foliage.

Date.	Time.	Weather.	Inside Temperature.	Outside Temperature.	Inside per cent. Carbon-dioxide.	Outside per cent. Carbon-dioxide.
Mar. 1	9.30 a.m.	Dull	75°	30°	0.127	0.038
" 11	11.30 "	Bright	88°	41°	0.076 ⁽¹⁾	0.038
" 11	3.0 p.m.	"	90°	39°	0.103 ⁽²⁾	0.038

(¹) The house was opened at 8.30 a.m.; (²) the house was closed at 1 p.m.

All the determinations were made in duplicates, and the pairs agreed exactly. In determinations of this kind, many complications are encountered, such as difference of temperature, pressure, tension of aqueous vapour, &c., the atmosphere in the house being saturated with moisture, but all these were allowed for, and the results calculated on the basis of normal temperature and pressure. I was somewhat surprised at the results as regards the amount present during the day, but I attributed the excess of carbon-dioxide in a great measure to the rapid fermentation taking place on the surface of the soil, which is rich in manures, and the atmospheric conditions were ideal: an abundance of heat and moisture. Anyway, the figures obtained appeared to suggest an abundance of carbon-dioxide at all times. Overlying every square foot of the earth's surface there is 2,160 lbs. of atmospheric air, and in this quantity there are about 21 ounces carbon-dioxide, equal to 5½ ounces carbon. This is a constant quantity, and is far in excess of the actual requirements of plants, or, in other words, the air contains one gallon of carbon-dioxide in 2,500, and to catch this minute quantity, the tree hangs out thousands of square feet of leaf surface in perpetual motion through an ever-moving air. *W. H. Dobson, Stapleton Park Gardens, Pontefract.*

WINTER-FLOWERING PLANTS AT "THE NODE."—It was my privilege recently to visit these gardens, to see the extensive alterations which are now being carried out by the new owner, C. A. Cain, Esq. "The Node" gardens promise to become equal to the more important gardens in this county of Hertfordshire. On the occasion of my visit I was especially struck with the wealth of flowering plants and their superior condition for mid-winter flowering. Very fine was a house of *Euphorbia* (*Poinsettia*) *pulcherrima* all growing in 6-inch pots, and though not nearly developed, many of the bracts already measure 17 inches in diameter. These were remarkable for their vigour, healthy foliage, and deep colouring of the bracts. A batch of 100 plants of *Euphorbia jacquiniiflora* in 5-inch pots formed another striking object. Each plant was stopped once in the early stage of its growth, and three shoots were allowed to each, the result being plants of medium height and carrying long wreaths of brilliantly-coloured flowers, whilst the foliage clothes the stems from the pot upwards, showing the best possible culture. *Calanthe Veitchii* is also cultivated with unusual success. These are grown in 8-inch pots, each containing several bulbs. Other important subjects were winter-flowering *Begonias*, includ-

ing a particularly fine batch of *Gloire de Sceaux*, a large number of well-grown *Cyclamen*, winter-flowering *Carnations*, and late-flowering *Chrysanthemums*. Though the gardener, Mr. J. Pate-man, is probably best known as a successful fruit-grower, he is equally skilful in providing a show of flowers at a season when they are most in demand for decorative purposes. *E. Beckett.*

MUTISIAS AT KEW.—The note on p. 413 headed "Mutisia" and signed W. is almost a transcript of part of an article which I wrote to accompany an excellent coloured plate, by Moon, of *M. Clematis*, which appeared in the *Garden*, 1889, vol. xxxvi., p. 78. I there stated that *M. ilicifolia* used to be in cultivation at Kew, but it had died, and, so far as I knew, was no longer in gardens. But that was over 22 years ago, since when much water has flowed under Kew Bridge and many things have occurred in the gardens. Thus in 1890 we had seeds of *M. ilicifolia* from Chili, and by 1894 we had a plant of it which half filled a greenhouse and it flowered profusely in August of that year. Then it died, but we have had others since, and W. may see a big example of it not far from the plant of *M. Clematis* about which he wrote. When I read the note on p. 413 I scratched my head, for it looked like my distinguished style; moreover, it was signed W. Worse still, Sir Frederick Moore and Dr. Bayley Balfour wanted to know why Kew could not grow this *Mutisia*, why I did not ask them for it, &c. Whilst I cannot claim to be the only W., I do claim the sole right to plagiarise my own writings, which for my sins, be it said, are scattered over a considerable number of years and in a variety of publications. Most of us are, consciously or unconsciously, indebted to others for ideas and information, but the wary among us are careful not to excite suspicion by appearing in coats and hats that are too large for us. *W. W.*

JUDGING AT THE FRUIT SHOW.—*Fairplay* seems to infer that because something occurred in connection with the judging of a class apparently that of "any other cooking variety" of Apple, and what that something is he does not specify, that I am personally responsible. Although I do not understand to what he is referring, it must have been very serious to have aroused such strong feeling on his part, yet it does not seem to have been noted by anyone else. If he saw something seriously wrong, he should have drawn the attention of the Show Superintendent to it at once. By not doing so, he seems to have put himself out of court. *A Judge.*

THE QUINCE.—At the recent autumn fruit show of the Royal Horticultural Society it was noticeable that none of the nurserymen included the Quince in their collections of hardy fruit. This does not necessarily imply that nurserymen do not attach any importance to this fruit; such an inference would be incorrect, for last year I purchased from one of our leading growers a dozen trees which bore the stamp of careful and attentive culture. Whatever the cause may be, the omission is regrettable, for the exhibition of a few dishes of well-grown Quinces would give a needed impetus to the cultivation of this handsome and aromatic fruit. A North London fruiterer remarked to me in the course of conversation that the English Quinces are nearly always miserable, undersized specimens, and he enquired if there were any difficulties attendant on the cultivation of the Quince. During the past few years there has been an increasing demand for Quinces, and many buyers would prefer home-grown fruits if they were obtainable. At present very few market growers are able to supply the need, and the demand has to be met with French Quinces, which are usually of good size, arrive tastefully packed in boxes of one or two dozen, and sell at remunerative prices. The Portugal Quince, which is the best of the three kinds usually grown, requires a warm soil, and is not to be recommended for general culture, but where suitable conditions can be found this variety should be grown. The fruit is not so astringent as the other sorts, and when cooked its colour changes to red. Of the two remaining varieties that known as the Apple-shaped Quince is the better. The large, roundish fruits are, as the name suggests, shaped like Apples, and they are of a fine golden colour when ripe. The Pear-shaped Quince is most often grown, and from an ornamental point of view this variety is superior

to the foregoing, but the flesh is rather dry and woolly. When grown in shrubberies the usual form of tree is that of a low bush, but for orchard purposes the low standard is to be preferred. Except for the Portugal variety a somewhat moist position is the best, but none of the varieties will thrive in heavy soils. Too often the Quince is planted and then left to its own devices, when it makes a dense thicket of twiggy shoots bearing a few undersized fruits. When the branches are kept thinned and summer pruning is practised plenty of good fruits is assured. Though few people can eat the raw fruits, the Quince makes a delicious preserve; in fact, marmalade (marmelo in Portuguese) was originally made of Quinces, and a few slices of Quince improve an Apple tart. When ripe the Quince does not keep long; if placed in a cool cellar the fruits keep for eight or ten weeks, but care must be taken not to place them near other fruits, or the latter become impregnated with the Quince aroma. *A. C. Bartlett.*

HOGG'S "FRUIT MANUAL."—*A. D.*, p. 400, seems to be under a misapprehension on this subject. The last edition was published some 30 years ago at the price of 15s. In consequence of its being now out of print and holders of copies sticking to them, the price of a good, clean, second-hand copy is now £1 10s. Is this not a proof that if a new up-to-date edition were published at a reasonable price it would in due time meet with a good demand? I fear *A. D.*'s suggestion of 5s. is out of the question. *Yorkshire Gardener.*

LILIUM LONGIFLORUM.

LILIUM LONGIFLORUM is in evidence in Covent Garden Market all the year round, and especially at Easter and Christmas, when there is a larger demand than usual for white flowers. Our illustration (fig. 186) shows the Trumpet Lily as grown in boxes in the Dale Nurseries, Canada, where a large trade is done, not only with Lilies, but also with *Carnations*, *Roses*, and other flowers. An account of these Nurseries appeared in the issue for March 25, 1911.

SOCIETIES.

ROYAL HORTICULTURAL.

DECEMBER 19.—The Committees of this Society met at the Vincent Square Hall on Tuesday last, but no attempt was made to hold a show. The exhibits consisted exclusively of novelties submitted for awards.

Floral Committee.

Present: Messrs. W. Marshall and Henry B. May (Chairmen); and Messrs. W. P. Thomson, G. Reuthe, George Gordon, J. F. McLeod, E. H. Jenkins, W. J. James, Herbert J. Cutbush, Arthur Turner, John Dickson, Jno. Green, E. A. Bowles, C. Dixon, Jas. Hudson, J. T. Bennett-Poë, George Paul, and R. Hooper Pearson.

There were several new *Chrysanthemums* and a few other subjects shown before the Floral Committee, but the only plant that gained an award was a new species of *Buddleia* (*B. officinalis*).

AWARD OF MERIT.

Buddleia officinalis.—This is a new species from the Yangtze Valley, China, where it was discovered by Mr. E. H. Wilson. It has small flowers of mauve colour, with a brilliant, orange-coloured eye, and is just too tender for cultivation in the open garden in this country. As shown by Messrs. JAS. VEITCH & SONS, LTD., it promised to make a good, cool-greenhouse plant for flowering in December. An illustration of this species formed a Supplement to our issue for April 1, 1911, Messrs. VEITCH having shown plants on January 3 last.

Orchid Committee.

Present: Harry J. Veitch, Esq. (in the Chair); and Messrs. Jas. O'Brien (Hon. Sec.), J. Gurney Fowler, C. J. Lucas, W. Bolton, A. Dye, H. G. Alexander, J. E. Shill, W. H. Hatcher, J. Charlesworth, T. Armstrong, A. McBean, F. J. Hanbury, Gurney Wilson, and C. H. Curtis.

No large groups were accepted for this meeting, but a more than usually large number of

AWARDS.

FIRST-CLASS CERTIFICATES.

good novelties were shown. Messrs. CHARLES WORTH & Co., Haywards Heath, showed the rare *Oncidium anthocrene*, which, as in the case of the original of many years ago, was imported with *Miltonia Warscewiczii*. The name implies a fountain of flowers, and the stout, branched scapes some 4 feet long bearing large yellow-lipped brown-petalled flowers give some excuse for the term. Messrs. CHARLESWORTH also showed the brilliant red *Odontioda Cooksonii* venustum, the yellow and rose-coloured *Lælio-Cattleya Myrrha* var. *flavescens*, and *Cypripedium Actæus Durbar*. (See Awards.)

Mr. E. V. Low showed a selection of good *Cypripediums*, including *C. The Nizam* (Helen II. × *insigne* Harefield Hall) with wax-like cream-yellow flowers spotted with purple; *C. The Gaekwar* (*Ceres Fascinator* × *Leeanum*), in which the *C. hirsutissimum*, parent of *C. Ceres*, is very pronounced; *C. The Maharajah*, *C. Napoleon*, and *C. Samuel Gratrix*, all fine flowers in which *C. insigne* Harefield Hall appears; and *C. Beryl West Point* variety.

Sir JEREMIAH COLMAN, Bart. (gr. Mr. Collier), sent *Odontioda Diana*.

Lælio-Cattleya Nella (*L.-C. Dominiana langleyensis* × *C. labiata*), from Messrs. JAS. VEITCH & SONS, Chelsea. A finely-formed and very brightly-coloured hybrid in which the rich colour of *L.-C. Dominiana* has been intensified, and the flower given the good shape of the best form of *C. labiata*. Sepals and petals bright rose colour with silvery veining and a white spot at the base of each segment. The lip is glowing ruby-red, with thin yellow lines from the base.

Cypripedium Royal Sovereign (*Hera robustum* × *Urania* var. "*Martin Cahuzac*"), from Messrs. SANDER & SONS, St. Albans. A complex hybrid of fine size and great beauty, in whose production *C. Boxallii*, *C. Spicerianum*, *C. insigne*, *C. Argus*, *C. Lawrenceanum*, and *C. Charlesworthii* have participated, and may be traced in some degree. The large well-formed dorsal sepal is evenly decorated with dotted and feathered lines of claret-purple, the markings being the darker and heavier at the base, the white ground showing through clearly towards the mar-

verse of the flowers are tinged with purple which shades to the surface in places.

Cypripedium Actæus Durbar (*insigne* Harefield Hall × *Leeanum giganteum*), from Messrs. CHARLESWORTH & Co., Haywards Heath. A very broad and finely-formed flower of good substance. The upper part of the large dorsal sepal is white, the lower yellowish-green with large sepia-brown blotches. Petals and lip yellow shaded with sepia-brown. The extraordinary breadth of the short labellum is remarkable.

Cypripedium insigne "*Gatton Park*" variety, from Sir JEREMIAH COLMAN, Bart., V.M.H., Gatton Park (gr. Mr. Collier). A stately flower the result of crossing *C. insigne* Harefield Hall with a fine *C. insigne montanum*. The flowers were as large as those of *C. insigne* Harefield Hall, but with a more flatly-arranged dorsal sepal and with darker markings, the spotting on the white upper half of the dorsal sepal being of a rose colour.

Fruit and Vegetable Committee.

Present: Owen Thomas, Esq. (in the Chair); and Messrs. E. Beckett, A. Dean, J. Willard, J. Davis, G. Reynolds, and H. Markham.

The only exhibits before the Committee were two seedling Apples. One named *George V.* came from W. L. HUBBLE, Esq., Faversham, Kent. Fruits not unlike large *King of the Pippins*; very handsome and richly-coloured in appearance.

The other, unnamed, came from Mr. A. HUSSEY, Cambridge Road, Crowthorne, Berks.; of similar shape, but more delicately tinted and striped. It was advised that the variety be seen in a growing state next year.

LINNEAN SOCIETY.

DECEMBER 7.—Mr. H. N. Dixon gave an abstract of his paper entitled "*Some Mosses of New Zealand*." He stated that several collectors had contributed to this account, and specially referred to the Mosses sent by Mr. W. Gray from Mauriceville, Wairapa, North Island, which were of the highest interest, and the difficulty in which the author was involved by the extreme modesty of the collector, who would not consent to a new genus bearing his name; ultimately it was named *Tetraphidopsis*, Broth. and Dixon.

Dr. George Henderson then showed a series of more than 70 slides, taken during an official mission through Kashmir, Little Tibet, and Turkestan in 1870. The original photographs had been lost sight of, but having recently been discovered in the keeping of a friend, lantern-slides had been made from them, and were now shown, with explanations by the author. He traced the progress of the expedition from Lahore to Yarkand, where the series ended.

Dr. Stapf and the president commented on the interest of the exhibition, and the botanical results obtained 40 years ago.

Dr. Henderson also showed three variations in the foliage of *Alnus glutinosa* from the banks of the River Darent, in full view of his house, and explained that these differences corresponded with varying dates of leafing, leaf-fall, and fruiting.

The president spoke on the changes induced by trees and shrubs being cut back, the luxuriance of the new growth making it almost unrecognisable, as in a case observed at Oakley, when it was found that *Rhamnus cathartica* had assumed a new form owing to severe coppicing.

Dr. A. B. Rendle showed a fine specimen of a viviparous *Poa trivialis*, Linn., found by Mr. Miller Christy at Stisted, near Braintree, in Essex. The normal inflorescence was almost entirely replaced by a mass of vegetative outgrowths replacing the flowers.

ROTHESAY HORTICULTURAL.

DECEMBER 15.—The Norman Stewart Institute, at Rothesay, was the scene of an interesting ceremony on this date, when a special committee meeting was held for the purpose of presenting to the Secretary of the Horticultural Society, Mr. Urquhart F. Innes, some gifts to mark the occasion of his marriage. Mr. Innes has long been connected with the work of the society.

FIG. 186.—LILIUM LONGIFLORUM AS FORCED BY MARKET GROWERS.

(See p. 461.)

FRANCIS WELLESLEY, Esq., Westfield, Woking (gr. Mr. Hopkins), showed the beautiful *Brasso-Lælio-Cattleya Veitchii*, to which a First-class Certificate was given in 1907. The large rose-coloured flowers have a very fine broad rose-purple lip with bright yellow disc; also *Lælio-Cattleya Rubens* Westfield variety of good size and shape.

The Honble. Lady NEELD, Grittleton (gr. Mr. Pitts), sent *Cattleya Venus* var. *Lady Neeld*.

From TRACY'S NURSERY, Twickenham, came *Lælio-Cattleya Floryi* (*L.-C. Violetta* × *C. Trianae*), a very pretty flower with silver-white sepals and petals with a pearly-pink flush and bright violet-crimson front to the lip. Also *Cypripedium villosum* Tracy's variety, a large flower of peculiar colour.

Messrs. SANDER & SONS showed *Cypripedium Troilus Invincible*, a massive flower of the *C. Eson giganteum* class.

Messrs. JAS. VEITCH & SONS, Chelsea, sent a fine variety of *Cypripedium Clonia*, and *C. Snowden* like a light form of *C. insigne* Sanderæ.

Messrs. STUART LOW & Co., Bush Hill Park, sent *Vanda Amesiana* albens, an almost entirely white-flowered form.

gin. The broad petals and lip have a glossy surface and are tinged with mahogany-red, some of the spotting of *C. Argus* appearing on the petals. It is a very distinct hybrid.

AWARDS OF MERIT.

Cypripedium Lord Wolmer "*Westonbirt*" variety (*Lecanum* × *Euryades leopardinum*), from Lt.-Col. Sir GEORGE L. HOLFORD, K.C.V.O., Westonbirt (gr. Mr. H. G. Alexander). A well-rounded flower in which the lower sepals have wings coloured like the upper sepal. The dorsal sepal is white spotted with claret-purple, and the petals and lip yellow, tinged and spotted with dark purple. The middle part of the lower sepals is apple green, and the abnormally-developed sides white with purple spots.

Odontoglossum crispum Alcione, from J. GURNEY FOWLER, Esq., Glebelands, South Woodford (gr. Mr. J. Davis). Although flowering out of season, this presented itself as a very fine, distinct, and well-grown plant, the heavy inflorescence having 14 large white flowers, the sepals blotched with purple and the petals bearing clusters of light purple small spots. The re-

NORTH OF ENGLAND HORTICULTURAL.

CONFERENCE AT LEEDS.

DECEMBER 13.—At a well-attended meeting of the above society, Major J. W. Dent in the Chair, papers were read by Dr. Burtt, York; Mr. W. F. Emptage, London, expert to the *Fruit Grower*; and Mr. J. Smith, F.L.S., Durham.

Dr. Burtt submitted the following resolution: "That this Conference views with concern the persistent increase in this country of the pests American blight or woolly aphis (*Schizoneura lanigera*) and Currant bud mite, or Black Currant gall mite (*Eriophyes* [*Phytoptus*] *ribis*), both causing dangerous and contagious diseases of plants, and urgently requests the Board of Agriculture and Fisheries to place them on the schedule under the Destructive Insects and Pests Acts 1877 and 1907."

Dr. Burtt said: We have our Destructive Insects Act of 1877 (the first recorded instance of legislation against specific plant diseases). We have the supplementary Act of 1907. We have orders and regulations from time to time of the Board of Agriculture and Fisheries, and yet we have with us still to a varying extent such old enemies as the large Larch sawfly (Cumberland, 1904) (not given as a scheduled pest in Board of Agriculture leaflet 186); black scab, or Potato canker; Tomato leaf-spot; American Gooseberry mildew, and others.

It may not be out of place to consider what are the causes which tend to prevent the successful combating of plant diseases.

These may be tabulated as follow:—

- I.—Ineffectual legislation.
- II.—Want of accurate knowledge of plant pathology.
- III.—Indifference.

In the first category may be mentioned:

- (a) The absence of statutory ports of entry for imported plants, &c., with compulsory inspection and fumigating stations connected therewith.
- (b) The delegation of duties under the Acts above mentioned to local authorities under the Diseases of Animals Act, 1894.
- (c) An uncertain scheme of compensation—the question of compensation being at the discretion of the local authority.
- (d) Absence of compulsory and periodic inspection of growing stocks by expert officials.

What is the legislation in respect of destructive insects and pests in Canada?

C. Gordon Hewitt, D.Sc., Dominion entomologist, Ottawa, wrote as follows in the *Gardeners' Chronicle*, July 15, 1911:—

"The Department of Agriculture of Canada is empowered by the Destructive Insect and Pest Act of 1910 to take such action as may be deemed necessary to prevent the introduction or spreading of injurious insects, pests, and plant diseases. All plants, with the exception of certain classes, such as greenhouse-grown plants, herbaceous perennials, and bulbs, may be imported at certain seasons of the year only and through certain ports as specified in the regulations. The Department of Agriculture has power to inspect plants liable to be infested with certain insects and plant diseases, to destroy the same if necessary, or to prohibit their importation into Canada.

"At six of the ports of entry (see Section 3 of the Regulations) fumigation stations are established where plants from countries and states infested or liable to be infested with the San Jose scale are fumigated with hydrocyanic acid gas by special officers in charge.

"Plants from Europe, Japan, and the States of Vermont, Maine, Massachusetts, New Hampshire, Connecticut, and Rhode Island, six of the United States of America, are inspected by officers of the Department for the brown-tail moth and gipsy moth. In some cases this inspection is made at the port of entry; in other cases at the destination of the stock. In the latter case the plants may not be unpacked except in the presence of an inspector.

"It is necessary for all persons and transportation companies importing or bringing plants into Canada to notify the Dominion entomologist, Ottawa, of the fact, and, through the co-operation of the Department of Customs, the Customs officers at the ports of entry also send advices of the arrival of shipments of plants at the various ports through which plants may enter.

"In addition to the inspection and fumigation of imported plants, field officers are employed in inspecting orchards and in carrying out eradication measures against the brown-tail moth in those regions in Nova Scotia and New Brunswick infested with the insect. This eradication work is carried out in co-operation with the respective provincial governments. The fumigation and inspection of imported plants and infested regions and all measures for eradication work are carried out under the direction of the Dominion entomologist.

"The Minister of Agriculture has power to prohibit the importation of plants from any given region should it be deemed necessary, owing to the presence of serious insect pests or diseases in such a region. This has been done in the case of Potatoes from Newfoundland and the neighbouring islands, to prevent the introduction of Potato canker (*Chrysophlyctis endobiotica*)."

The delegation of duties under the Destructive Insects and Pests Acts, 1877 and 1907, to local authorities acting under the Diseases of Animals Act, 1894, in addition to other duties devolving upon such local authorities, is unsatisfactory from our point of view (making use of the wrong tools), and might with advantage be altered to the extent of appointing a staff of horticultural inspectors with powers similar to those obtaining in Canada.

It is not surprising to learn from the 1909-10 Report of the Intelligence Division of the Board of Agriculture that the severest attacks of American Gooseberry-mildew occurred in the county where the local authorities did not appoint a properly-qualified inspector to deal with the disease.

The following critical account of European nursery conditions appears in *Farmers' Bulletin*, No. 453, issued by the U.S. Department of Agriculture, and dealing with "The danger of spread of the gipsy and brown-tail moth through imported nursery stock":—

"During the summer of 1909, and also again in 1910, Dr. Howard, who was in Europe principally to supervise the introduction of parasites for the gipsy and brown-tail moths into Massachusetts, made a careful inspection of the nursery regions of Holland, Belgium, and northern France, and also England."

In England, Dr. Howard found that, as in France, there was no governmental nursery inspection (see Mr. Pearson's note in *Gardeners' Chronicle*, August 5, 1911, p. 94). The nursery conditions there are somewhat better than in France, but the brown-tail moth and other injurious insects, which might easily be imported on nursery stock, occur in England.

Turning for a moment to the legislation on the question, we find in Article 3 of the Destructive Insects Act, 1877, that where the Privy Council may by order direct or authorise the removal or destruction of any crop, they may direct or authorise the payment by the local authority of compensation and the local authority shall pay the same, subject to certain provisions as to amount, &c.

This article is endorsed in the Destructive Insects and Pests Act, 1907, with the proviso that the Board of Agriculture and Fisheries shall not make an order for compensation unless the local authority consent to make the payment.

These enactments in reference to compensation for compulsory destruction of plant-stocks find due place in the Orders issued by the Board of Agriculture, dated May 3, 1910, and September 11, 1911, respectively.

After instituting a number of inquiries in various parts of the country, I have not been able to discover from the replies so far sent in either that an order has yet been made for compulsory destruction—(with one exception where destruction by order of the local authority resulted in "quite unimportant" loss), or that compensation has yet been granted.

On the other hand, I have met with an instance (previous to the issue of the American Gooseberry-mildew order of September, 1911), where, after inspection by an officer of the Board of Agriculture, followed by the voluntary destruction of stock to the value of over £150, no compensation could be claimed, the Board declining responsibility.

I venture the suggestion that the eradication of some of the most dangerous and destructive insect and fungous pests, some of which have long resisted the individual efforts made against them, would be hastened if compulsory destruction, ac-

companied by a fair and certain compensation were more generally adopted.

In making this suggestion I do not wish for one moment to under-estimate the value of the efforts which many nursery firms and private growers are making to combat disease. I cannot, however, endorse the opinion which obtains, I believe, in the trade, that legislation against disease is not needed. Experience tends to show that individual efforts, stimulated as they doubtless are by the thought of maintaining a great and well-deserved reputation, are frequently rendered of no avail, and that the only certain cure lies in the direction of effective legislation.

PAPER BY MR. EMPTAGE.

Mr. Emptage stated the commercial aspect of the case. He pointed out that in our Colonies and elsewhere the fumigation of general nursery stock was compulsory, also the destruction of affected fruit.

In the case of the American Gooseberry-mildew the Board of Agriculture were to blame for letting the disease obtain a firm hold before taking efficient steps to prevent its being spread throughout the country. He advocated intelligent cutting out of diseased wood and compulsory spraying with sulphide of potassium or Bordeaux mixture in summer and sulphate of copper (11 lb. to 25 gallons of water) in winter. The official plan of worrying nurserymen and omitting altogether to inspect private places or imported bushes could not be too strongly condemned.

As regards the black scab of the Potato, he advocated the burning of all diseased roots and the offering by local authorities the sum of 1s. per affected tuber.

Silver leaf in fruit trees, said Mr. Emptage, was too often spread by derelict trees on land awaiting the builder. No system of compulsion could be effective if such plague spots were overlooked.

Generally speaking wholesale compulsory destruction could never be carried out. Spraying should, however, be made compulsory and would prevent or limit the spread of disease.

The cyaniding of nursery stock was cheap and effective. Foreign imported stocks for fruit trees especially could be cleared of American blight by cyaniding.

Mr. J. Smith advocated the inspection of markets. He said that packing materials, green-grocers refuse, cork dust, and refuse from docks should be burnt and not allowed to be placed on to manure heaps and spread disease up and down the country.

Mr. W. Cuthbertson stated that the export of Potatoes to Australia was at present an impossibility owing to the refusal of the Board of Agriculture to grant clean bills of health to exporters. Any compensation should come from Imperial sources. He recommended the self-denying ordinance of the Government of South Africa in placing the work of the agricultural authorities outside party politics for three years. In England a similar resolution would enable much practical progress to be made. He advocated the establishment of a research station in the north of England, conditions of climate, &c., demanded such a station.

Professor Seton, of Leeds University, pointed out the need for inspection at our entry ports of both stocks for fruit trees and also fruits.

After further discussion Major Dent laid stress on the necessity for only destroying diseased stock, and that compensation for diseased stock alone should be given and paid for out of the Imperial Exchequer. In Agriculture the principle adopted was to compensate a man for stock apparently healthy but infected by accident or misfortune with diseased stock.

The Chairman then put the following resolution, which was carried unanimously:—

That this conference urges upon the Board of Agriculture and Fisheries the urgent necessity

- (1) of a staff of trained horticulturists as inspectors to carry out the provisions of the injurious insects and pests orders;
- (2) of more stringent precautions against the entry of diseased plants, fruits and vegetables and packing materials used for same, at our ports;
- (3) of the establishment of stations for horticultural research in the north of England and other parts of the country.

KENT COMMERCIAL FRUIT SHOW.

DECEMBER 11, 12.—An association of Kentish fruit growers promoted a competitive exhibition of hardy fruits at the annual cattle show at Ashford, held on these dates. In the words of the secretary, Mr. R. Wellington, "the aims of the show are to boom and advertise British-grown fruit, in order to counteract the efforts of foreign and Colonial growers to capture our markets, and, at the same time, to introduce a standard package, with better methods of packing and grading."

The committee was composed of representative growers from all parts of Kent, and the judges were Messrs. Lobjoit and Martin, who adjudicated simply from the growers' standpoint, while Mr. Poupart judged the exhibits entirely from a wholesale buyer's point of view. The majority of the exhibits were received by rail, and hence the effect of the handling by the railway porter could also be studied. Judging was from the commercial standpoint only, points being given as follow:—

Uniformity of Apples in box	...	30
Condition (bruising, &c.)	...	30
Packing (attractiveness, &c.)	...	30
Colour	...	20
Size (commercial standpoint only)	...	20

100

In the class for five boxes of Bramley's Seedling Apples, the 1st prize was awarded to C. S. SMITH, Esq., Boughton Monchelsea; 2nd, W. L. HUBBLE, Esq., Faversham; 3rd, W. W. BERRY, Esq., Faversham. The season was undoubtedly unsuited for this variety, this class being the worst in the show. The 1st prize fruits were of a medium size, good colour, and well packed; those awarded the 2nd prize were green, well graded and packed, but small. In the opinion of many these were the better fruits.

The fruits in the class for five boxes of Apple Newton Wonder were the finest in the show. The packing, however, was below that of any other class. The 1st prize was awarded to S. SMITH, Esq., Barming; 2nd, W. W. HUBBLE, Esq., Hunton.

The next class was for five boxes of Lane's Prince Albert Apples, and although there were some fine fruits, the majority were not in the best condition, owing to the very early season. The 1st prize was awarded to W. L. HUBBLE, Esq., Faversham; 2nd, SOUTH-EASTERN AGRICULTURAL COLLEGE, Wye.

For five boxes of Blenheim Pippin, Mr. W. W. BERRY, Faversham, was successful; 2nd, Mr. W. W. HUBBLE, Hunton; 3rd, Mr. S. SMITH, Barming.

A class for any dessert Apple (with the exception of Blenheim Pippin), three boxes, attracted a large number of entries, chiefly of Cox's Orange Pippin, which, another year, should be placed in a class by itself. Some surprise was expressed at the 1st prize going to a superb exhibit of King of the Pippins. Although only of a good medium size, the condition, colour, grading, and packing, of these boxes was perfect. This exhibit showed to what excellence this variety can be grown on some soils. The 2nd and 3rd prizes were awarded to Cox's Orange Pippin, which, although very beautiful, were not of such fine quality. The 1st prize was won by Mr. W. L. HUBBLE; 2nd, Messrs. GASKIN & WHITING, Faversham.

A class was provided for the best-packed box in the show, branded and labelled ready for market. The packing in this class was, in the majority of cases, excellent. The prizes were given for boxes packed with no wood, wool or paper between each Apple or layer. That such an amount of material is not required was easily demonstrated by the condition of the Apples in the prize boxes, and so long as the Apples are well graded and packed tightly, they will travel perfectly well. The labels, however, were not attractive; these should be as striking as possible, without offending the artistic tastes of the public. The 1st prize was won by Mr. S. SMITH, Barming; 2nd, SOUTH-EASTERN AGRICULTURAL COLLEGE, Wye.

The next three classes were for growers having fewer than 20 acres, and it seems a matter of regret that these should not have been more supported. (1) One box of Bramley's Seedling Apple. Whereas the boxes in Class I. seemed to point that this Apple does not show to the best

advantage when packed in a box, the exhibits in this class, however, refuted this statement, and the box which took 1st prize showed that the "pack" pre-eminently suited to Bramley's Seedling is that termed the "off set." 1st prize, SOUTH-EASTERN AGRICULTURAL COLLEGE, Wye; 2nd, Mr. G. STUDD, Sittingbourne. (2) One box of Lane's Prince Albert. The smallest class in the show. 1st, Mr. C. BATES, Ashford; 2nd, Major NICHOLSON, Sutton Valence. (3) One box of any dessert Apple. All the prize boxes contained Cox's Orange Pippin. 1st, Mr. F. H. WHEELER, Marden; 2nd, Mr. H. E. HUTCHINSON, Staplehurst.

A class open to any grower in Great Britain for one box of a cooking Apple in season attracted many exhibits. The 1st prize was won by Messrs. GASKIN & WHITING, Faversham, with Annie Elizabeth, which also obtained the champion cup as being the best box of Apples in the show. The exhibit was a superb one, the packing being so good that the Apples arrived with no blemish whatever. The fruits were of a good size, very even, clear, and of excellent colour. A box of Dumelow's Seedling (Wellington) exhibited by the same growers, was thought by some to be equal. 2nd, Mr. A. MISKIN, Chart Sutton, with an even and well-packed box of Newton Wonder.

The class for one box of a dessert Apple in season composed the finest collection of dessert Apples in the show, and the judges had difficulty in awarding the prizes. 1st, Messrs. GASKIN & WHITING for Cox's Orange Pippin; 2nd, Mr. J. REDMOND, Loughgall, Co. Armagh, Ireland, for Gascoyne's Scarlet Seedling.

A cup offered for the best exhibit of 25 maiden fruit trees on the Crab stock was won by Mr. J. W. TODMAN, Boro' Green.

There was a large collection of trade exhibits of firms supplying all the requisite sundries required by the fruit grower, from a 1 lb. chip to a power sprayer.

On Monday a fruit conference was held, at which papers on "Lime Sulphur and Apple Scab," &c., by Mr. E. S. Salmon, and "Packing and Grading of English Apples," by Mr. C. S. Smith, were read. A packing demonstration was also given.

NATIONAL ROSE.

DECEMBER 14.—The annual general meeting of this Society was held at the Westminster Palace Hotel on this date. The President, Rev. J. Pemberton, occupied the Chair, and amongst others present were Messrs. C. E. Shea, E. J. Holland, G. W. Cook, H. R. Darlington, Rev. Page Roberts, A. Tate, Frank Cant, G. Gordon, and John Green.

After the minutes were read, a letter was read from the hon. secretary, Mr. Edward Mawley, regretting his inability to be present owing to a severe illness, this being the first time in 35 years that he had been absent from the annual meeting. It was resolved to send a telegram of condolence to Mr. Mawley regretting his absence, and expressing a wish for his early and complete restoration to health.

The report of the council was presented; the following being extracts:—

In submitting their report for the past year, the Council congratulate the members upon the continued satisfactory position of the Society from whatever point of view that position may be regarded. For the first time in the history of the Society the number of members exceeds 5,000. The membership has doubled in the last four years, and is still increasing rapidly.

The Metropolitan Exhibition was again held by the kind permission of the President and Council of the Royal Botanic Society in their Gardens in Regent's Park. It took place this year on July 7, and proved one of the largest the Society has yet held. The most noteworthy feature in regard to this exhibition was that it occupied a canvas structure, with a level-boarded floor.

The provincial show took place at Ulverston on July 19. Unfortunately, owing to the excessively hot and dry character of the weather from the beginning of July, this exhibition proved much less extensive than usual.

The autumn exhibition, the eighth of the series, again took place in the Royal Horticultural Hall, Vincent Square, Westminster.

On the occasion of the Coronation of his Majesty King George V. the Society had the honour of presenting a basket of choice Rose blooms to her Majesty the Queen, and also to her Majesty Queen Alexandra, which were most graciously acknowledged by their Majesties.

At a special general meeting of the Society, held on April 25, a number of alterations and amendments were made in the rules and by-laws of the Society, with a view to ensure a more satisfactory method of electing the officers and council at the annual general meeting.

On the same day a Rose Conference was held at the Westminster Palace Hotel. The President delivered an address on "Roses for the Garden," which was followed by a discussion. The room set apart for the conference was

packed with members, some few being unable to obtain seats.

During the course of the past year the following publications have been issued to the members. In March, the *Rose Annual* for 1911; in October, the 1912 edition of the *Official Catalogue of Roses*; and in November last the 1912 edition of the *Handbook on Pruning Roses*.

At the last annual general meeting the Dean Hole Memorial Medal was presented to the hon. secretary of the Society, Mr. Edward Mawley, for his invaluable services as hon. secretary of the National Rose Society, extending over a period of 33 years, and for his efforts on behalf of the Rose. The Council feel that this medal can never be more worthily bestowed.

The number of societies in affiliation with the National Rose Society is now 56.

The Council announce with regret the death in April last of one of the Society's Vice-Presidents, Mr. R. N. G. Baker, of Heavitree, Exeter. Although known to but few of the present generation of exhibitors, he was in the early days of the Society its most famous and successful amateur exhibitor. In those days there was no Amateur Champion Challenge Trophy, but in the same leading class he was the most successful competitor. He was the first winner of the Amateur Challenge Trophy in 1881, and in 1888 again succeeded in winning it.

The Rev. Alan Cheales, another veteran and respected Rose grower, has passed away from among us during the year. He will, perhaps, be best remembered as the founder of the Brockham Amateur Rose Association, the oldest Rose Society in the kingdom. He was for many years a member of the Committee of the National Rose Society, and was a frequent exhibitor at the Society's exhibitions.

The receipts from all sources during the past year, including a balance from the previous year of £364 12s. 10d., amounted to £3,516 13s. 6d., and the expenditure to £3,027 17s. 8d., leaving a balance at the bankers of £488 15s. 10d. after £250 had been placed to the reserve fund. The reserve fund now stands at £1,250.

During the past 12 months 836 new members have joined the Society. Allowing for the losses by death and resignation, the total number of members is now 5,125. Taking the year as a whole, between two and three members a day have, on an average, been added to the list of membership.

On the occasion of the jubilee of the Southampton Royal Horticultural Society, it has been decided to hold a Rose Show in conjunction with that Society on June 26.

The Metropolitan Exhibition will take place in the Royal Botanic Gardens, Regent's Park, on Tuesday, July 9.

The Provincial Show will be held at Belfast, in connection with the Irish Rose and Floral Society, on Friday, July 19.

As at present arranged, the autumn exhibition will be held in the Royal Horticultural Hall, Vincent Square, Westminster, on Thursday, September 12.

If suitable arrangements can be made, the foreign Rosarians present at the International Horticultural Exhibition in 1912 will be invited to dinner during their stay in this country, and a Rose conference will be held early in the afternoon of the same day.

The financial statement was explained in detail by the treasurer, Mr. G. W. Cook, who referred to the amount spent on publications which were sent to every member of the Society, also to the extra show at Southampton during 1912, and proposed dinner to foreign rosarians attending the Royal International Horticultural Exhibition, in 1912. The adoption of the report was moved by the president. This was seconded by Mr. J. Jefferies. Mr. H. R. Darlington drew attention to the large number of members subscribing half-a-guinea, and asked the members to consider whether additional benefits could not be given to one-guinea subscribers? He also referred to the new classes held at the last autumn show, which proved a distinct feature. The report was carried nem con.

Mr. George Paul moved that the usual honorarium of £100 be given to the honorary secretary, and also a special one of £105, be granted this year. The motion was carried unanimously.

On the proposition of Mr. C. E. Shea, seconded by Mr. H. R. Darlington, Bye-law 7 was made to read as follows:—

By the word "Nurseryman" is understood a person who maintains a garden, or other horticultural establishment, for the purpose of gaining a livelihood, and who intends it to return him an annual profit. By the word "Amateur" is understood a person who maintains a garden with a view to his own use and enjoyment, and not for the purpose of gaining a livelihood. The fact of his occasionally disposing of surplus produce, or new varieties, for money, does not change him into a Nurseryman, unless the whole maintenance of the garden is intended to return him an annual profit, but no person shall be allowed to compete as an Amateur who sells Rose plants (except when giving up possession of the place where they grow, and in the case of new seedlings or sports), Rose blooms or buds for budding. No lady may exhibit as a Lady Amateur who is either engaged in the floral or horticultural trade herself, or is a resident member of the family of one engaged in such trade, or as a paid gardener. To exhibit in the ladies' artistic classes, a lady must either be a subscriber to the Society, or else a member of the family, and of the household, of a subscriber. Any objection raised as to the rightful qualification of an exhibitor shall be referred to the Council for arbitration, and their decision shall be final and binding on all parties.

The election of the members of the Council was next declared, those whose names appeared on the ballot list being appointed, with the addition of Mr. C. M. Edwards.

CONVERSAZIONE.

Following the annual meeting, a *conversazione* was held in an adjoining room, at which more than 200 members and friends were present. Refreshments were provided, and a selection of vocal and instrumental music rendered. An address was delivered during the afternoon by the President. Mr. Pemberton said that the development of the Rose during the past 10 years had been very rapid. When he first began to

grow Roses, only one class, the H.P.s., was grown in any considerable quantity. One reason why the Rose was so popular, was owing to the fact that the flower was adapted to all purposes in the garden, and the exhibitions were another influence for good. Years ago, amateur growers staged their own blooms, and were often to be seen travelling the country with their boxes, but this was now given up largely to their gardeners. After being in cultivation for a number of years, many varieties deteriorate, but some few improve by cultivation, as, for example, Bessie Brown and Earl of Warwick, which were small when introduced, but afterwards developed into varieties suitable for exhibition. Marechal Niel was instanced as a variety which had deteriorated. Referring to the decorative classes at the Society's exhibitions, Mr. Pemberton said a matter worthy of consideration was that the Roses should be grown by the exhibitors as in the open classes. His advice to beginners was not to search too much after novelties, but wait until the new varieties had been proved. Soil, aspect, pruning and the general health of the plants have a considerable bearing on the success achieved at flower shows. Horticulture in general, and Rose-growing in particular, said the speaker, is an ennobling pursuit, and the most satisfactory of all hobbies.

A coloured photograph of the Coronation basket of Roses presented to Her Majesty Queen Mary was on view. The room was beautifully decorated with Roses by Mr. L. F. Felton.

BIRMINGHAM AND MIDLAND COUNTIES CHRYSANTHEMUM, FRUIT AND FLORICULTURAL.

DECEMBER 13.—The annual dinner of this society was held on the above date at the Exchange Restaurant, Birmingham. There was a good attendance, both of professionals and amateurs, from Warwickshire and the adjacent counties. An interesting speech was made by Mr. T. Humphreys, in which he sketched the present position of the society, which, though improving, is not quite so prosperous as it should be in so important a place as Birmingham. The subscribers to the society number 300 to 350—a somewhat inadequate membership, when it is considered that each show costs between £700 and £800. It is not expected that the society's accounts will show a profit, but the income will probably balance expenses, and the committee are taking vigorous steps towards the attainment of this desirable object.

LAW NOTE.

NURSERYMEN AND THE UNDEVELOPED LAND TAX.

FOR some time past there has been a certain amount of argument on the question of how far nurseries are liable to pay the annual tax known as "Undeveloped Land Duty." When the Budget (which imposed this tax) was referred to the electors, certain nurserymen were freely assured by some of its supporters that nurseries would be wholly exempt. It has since been pointed out in these columns that such an assertion is absolutely untrue, and that the only portion of a nursery which is exempt from the tax (apart from any question of value) is that portion of the soil on which a greenhouse actually rests for support.

When once a false impression gains credence it is very difficult to correct it, and accordingly steps have just been taken to get the matter openly discussed in the House of Commons, in the hope that as soon as the hardships of nurserymen were explained something might be done to alleviate them. The debate on the subject took place on Tuesday, December 12, and will be found reported in the newspapers of the following day. A short summary of what transpired will probably be of interest to nurserymen.

THE DEBATE.

Mr. Newman (Enfield) moved an amendment to this year's Finance Bill to the effect that Undeveloped Land Duty should not be charged in respect of land used for nursery gardens, market gardens, or allotments. He complained strongly of the hardship imposed by this tax on horticulturists, and stated that the duty

would probably be charged on every acre in his constituency, although every acre was being put to excellent use. He made a powerful appeal for fairplay to be extended to growers.

Mr. Campion (Lewes, Sussex) strongly supported the appeal.

The Chancellor of the Exchequer (Mr. Lloyd George) said market gardens or nursery gardens were often the best means of utilising land, and in many cases the value of the land for agricultural purposes exceeded its building value. Where the value of the land for agricultural purposes was high the burden of the tax would be very small. In the majority of cases the people who were using the land did not own the freehold, and had, therefore, no tax to pay. He knew of many cases where the rent paid was £10 or £15 an acre, or even more, and in such cases the owner could well afford to pay a tax of a few shillings.

Mr. Austen Chamberlain (Worcestershire, E.), who is closely in touch with the Evesham growers, argued that the principal defence of the Chancellor of the Exchequer in his earlier speeches for this tax was that it would help to force land into the market for building purposes. The effect on the market garden or allotment industry in a particular place would be

THE LATE VICTOR LEMOINE.

just as injurious if it were made unprofitable to the landlord as if it were made unprofitable to the tenant.

Mr. W. Horne (Guildford, Surrey) supported the last speaker.

Mr. Courthope (Rye, Sussex) stated that the Undeveloped Land Duty was hampering the attempt to provide allotments within easy reach of the dwellings of the working classes at a rent which they could afford to pay.

Mr. Wedgwood (Newcastle-under-Lyme) contended that the tax would have the effect of encouraging the use of land for market gardens. Having to pay the tax, the owner would avail himself of the opportunity of getting £3 an acre for the land as a market garden rather than £1 an acre for it as agricultural or grazing land. The tax would tend to change grazing land to market gardens, and these, in their turn, to building land.

Mr. Butcher (York) argued that a man would naturally endeavour to get the best rent he could for his land, and it was not necessary to encourage him to do this by taxing the land. He especially pleaded for more favourable treatment in respect of land used for allotments. The effect of the tax must inevitably be to increase the rent for allotments.

The House divided upon the subject, and the result was as follows:—

Against the concession to nurserymen, etc. 177
For the concession to nurserymen, etc. ... 103

Majority against ... 74

JUSTICE FOR NURSERYMEN.

It will be seen therefore that the statement of the position given in previous issues of the *Gardeners' Chronicle* was correct, and for the present, at all events, nurserymen must submit to the tax, though it is understood that their efforts will by no means be relaxed. The matter is of some urgency from their point of view, as the tax is to be calculated as from April 30, 1909, so that they have already nearly three years arrears on their backs. Also a fresh valuation has to be made in 1914, and every five years afterwards.

With all due respect to the Chancellor of the Exchequer, the writer is entirely unable, from the practical point of view, to endorse his argument that the tax will necessarily fall on the landlord and not on the tenant. As a business man, the landlord will naturally seize the earliest opportunity of increasing the rent by the amount of the tax, and, according to the laws of supply and demand, the landlord should be able to do this in almost every case where the demand for land exceeds the supply. Furthermore, the Chancellor did not explain why a nurseryman who owns and cultivates his land should pay the tax, although every other trade is wholly exempt. It is absolutely incomprehensible why nurseries, at all events, should be penalised in this manner, as it is obviously impossible to "hold up" land on the outskirts of towns by letting the whole of it for nurseries. Few towns can support more than a few acres of nursery ground in any given district.

It is understood that, as the above appeal to the Government has failed, nurserymen are considering the question of laying full details of their grievances before the Opposition, in the hope of securing some promise of redress in the future. Those who sympathise with the nurserymen are urged to communicate their views to their M.P., and also to the agent of both political parties in any constituency where they may carry on business or reside. H. M. V.

Obituary.

VICTOR LEMOINE.—It is with deep regret that we have to announce the death, on the 12th inst., of Monsieur Victor Lemoine, the head of the well-known and widely-honoured firm of Lemoine et Fils, of Nancy, France. The veteran horticulturist—who had almost attained the great age of four-score years and ten—has been for many years past a prominent figure in the horticultural world. A "Membre d'Honneur" of the National Horticultural Society of his own town, his fame may be said to have become almost worldwide. He has been the means of introducing countless new plants, many of his own raising. His name will always be associated with the *Gladiolus*, for he is responsible for the beautiful hybrids known as G. Lemoinei and G. nanceianus, and those who have visited the nurseries at Nancy will never forget the effect produced by the sight of so many rare and beautiful plants, the care of which was the delight of their veteran owner. In Monsieur Lemoine, we have lost a horticultural genius, and his native town will mourn its most notable citizen. Besides many distinctions in connection with his profession, he was also an officer of the Legion of Honour; that title so prized by all Frenchmen, so well deserved by him, and only recently was selected by the Massachusetts Horticultural Society for the award of the "White" Medal (see p. 457). To Monsieur Emile Lemoine, his eldest son, himself an eminent horticulturist, and to his daughters, we express sympathy, and the assurance that in England, and in all lands where horticulture takes a high place among national pursuits, the name of Lemoine is known and honoured, and will be remembered.

MRS. WALKER.—We regret to announce the death of Mrs. Walker, widow of the late W. Stephen Walker, of the firm of John Walker, nurseryman, Thame, in her 68th year.

MRS. W. BARNES.—The death of Mrs. Barnes, wife of Mr. Walter Barnes, of Bearwood, Wokingham, took place after a long illness on Tuesday the 12th inst.

MRS. WILLIAM HOWE.—The many friends of Mr. William Howe, of Park Hill Gardens, Streatham, will learn with regret of the death of his wife, which occurred on the 14th inst., following an operation.

EDOUARD BORNET.—The French Press announces the death of the distinguished cryptogamic botanist, M. Edouard Bornet, who was born in 1828. M. Bornet possessed an unrivalled knowledge of the lower plants, and received in 1891 the Gold Medal of the Linnean Society in recognition of his eminence in the botanical world.

GEORGE R. M. MURRAY, F.R.S.—We regret to record the death of Mr. George Murray, formerly keeper of the Department of Botany in the British Museum. Mr. Murray, who was educated at the University of Edinburgh and at Strasburg, held various teaching posts in London before his appointment, in 1895, as head of the Botanical Department of the British Museum. Mr. Murray, who was a Fellow of the Royal Society, was specially interested in marine botany and was the author of the text book entitled *An Introduction to the Study of the Seaweeds*. Owing to ill-health he retired from the British Museum in 1905. Mr. Murray died at Stonehaven, Kincardineshire, on Saturday, December 16.

ENQUIRY.

A PLAGUE OF STARLINGS.—A friend is very much tormented with a flock of starlings which has taken up its quarters on the trees in front of his house. There appear to be thousands of them. How can he scare them away? The firing of guns appears to be ineffective. *J. M.*

* * * The Editors will be glad to receive, for consideration, large photographs of horticultural subjects, suitable for reproduction in this Journal.

APPLES DISEASED: *Enquirer.* The Apples sent us are attacked by the disease known as bitter-pit, which is due to some condition of growth not understood. No cure is known.

BLACK ARUM: *C. Luxford.* Arum palestinum (sanctum) is known as the black Arum, the spathe being of a dark vinous purple colour. It may be purchased from dealers in hardy herbaceous and bulbous plants.

BRANCHED VIOLETS: *Williams.* The Violet affords a good instance of forking or dichotomy of the peduncle. There is no evidence whatever of fusion of two stalks; the stalk, uniform below, gradually acquires a groove on one side, which eventuates in forking above. Of the two secondary stalks so formed, one is usually somewhat stronger than the other, and may, in its turn, be forked again at the top, so that two distinct flowers occur side by side. In specimen A this inequality in strength of the secondary stalks is very pronounced; the stronger branch of the primary fork in its turn forks again, but one of the products is excessively weak as compared with the other, and appears as a tiny rudimentary stalked flower seated laterally on the strong peduncle. Each of these luxuriant forking peduncles possesses two pairs of bracteoles. The anomaly is due to the special vigour and luxuriance of growth of the plants concerned.

CALANTHE DISEASED: *Enquirer, J. B.* The injury is due to a fungus, *Gloeosporium cinctum*. Sponge the plants with liver of sulphur at a strength of 1 ounce in 3 gallons water.

CALANTHES FAILING. *W. H. D.* The pseudobulb sent, although small, is healthy, and in the ordinary course should have flowered. The

cause of failure must be in some way connected with the cultural treatment the plant received about the time the flower-spikes should have been produced. Probably too much water was given before, and at that time the plants were subjected occasionally to too low a temperature.

CELERY DISEASED: *B. K.* The disease attacking your plants is Celery heart-rot, which is caused by *Botrytis*. This fungus is usually introduced in the manure, and another season kainit should be mixed with the manure before it is used.

CHRYSANTHEMUMS FOR FLOWERING OUT-OF-DOORS IN SEPTEMBER AND OCTOBER: *F. B. L.* The following dwarf varieties are suitable for September flowering:—Leslie (yellow), Normandie (pink), Savoie (white), Goacher's Crimson (deep crimson), Nina Blick (chestnut red), and Rosie (brownish terra cotta). Taller varieties:—Roi des Blancs (white), Roi des Jaunes (yellow), Ethel Blades (chestnut), Hector (mauve pink), Nina Williams (rich crimson), and Mons. Bachmann (buff). Dwarf varieties for October:—Maxim (orange brown), Mrs. J. B. Wheeler (deep crimson), Perle Rose (bright rose pink), Bronze Soleil d'Octobre (bronzy fawn), Hermione (snow white), L'Argenteuillais (reddish crimson), Taller October varieties:—H. H. Crane (chestnut), Jason (pure yellow), J. Bannister (lemon, shaded copper colour), Lucifer (deepest crimson), Mrs. J. W. Scott (ivory white), and De la Guille (orange).

CORRECTION.—In our notice of the Islington Cattle Show, the name Messrs. H. King & Co., Coggeshall, was given wrongly for Messrs. John. K. King & Son, of that town.

GARDENER'S TESTIMONIAL: *A Reader.* If your late employer addressed a testimonial to your present employer it was probably a personal communication, in which case you cannot claim it, although your present employer does not wish you to continue in his service. Your letter, however, is not perfectly clear. If we have misunderstood you, please write us again on the subject.

GENTIANA Verna: *C. W. Firebrace, Uckfield.* It is unusual for this Gentiana to flower now, but the weather is uncommonly mild.

GRUBS ON CYCLAMEN: *R. H. E.* The grubs are weevils. See reply to *J. H.* in the "Answers to Correspondents" column for December 9.

INSECTS' EGGS: *J. J. H.* The egg masses are those of one of the Psocidae, small insects which in this country are harmless to fruit trees.

KAINIT AS A MANURE FOR GRASS: *W. G.* Apply the material at the rate of $\frac{1}{2}$ ounce to the square yard in the spring. Better results would probably accrue from the use of some nitrogenous manure.

LANDSCAPE GARDENING: *Ambitious.* We do not know of any school of landscape gardening in this country, and, so far as our experience goes, Colleges which have horticultural classes either neglect the subject entirely or merely deal with it in the most elementary fashion. There is much truth in the general opinion that landscape gardeners are born rather than made, but, at the same time, many men who might be trained to take up this work with credit to themselves and advantage to the public, are prevented by the lack of any provision to help them in obtaining correct knowledge respecting the principles of design. It ought to be possible to study this subject at a school in which the teachers themselves would be landscape gardeners, for it is obvious that but little good would result from the teaching given by an ordinary drawing master. It is to be hoped that some day a school of landscape gardening will be established where these first principles will be under authoritative auspices. When these have been learned and much beside, there is still a vast amount of knowledge to be acquired before the student can hope to be trusted with the laying-out of important gardens. He must acquire an intimate knowledge of out-door trees, shrubs and flowers in order to select these with wisdom for the various positions in his newly-formed landscapes. Beyond everything else, it is necessary to travel abroad and study the famous gardens

on the Continent, such travelling to be undertaken after the College period. In your own case the only advice we can give you is to try to get lessons by correspondence from some practical landscape gardeners. This system might be possible if you insert an advertisement.

MEALY BUG IN VINERY: *A Reader.* By using the cyanide of potassium (poison) and other insecticides, it is possible to do a great deal in 12 months towards exterminating mealy bug, but admitting this much, we should scarcely feel in a position to blame a gardener because he failed to entirely exterminate the pest from old structures which have been infested for years and not repainted.

NAMES OF FRUITS: *Mrs. Goodden.* 1, Rymer; 2, Kedleston Pippin.—*E. Stone.*—Annie Elizabeth. Either one or the other of the books you mention would be useful.—*Fakham.* 1, Rosemary Russet; 2, Egremont Russet; 3, Passé Colman; 4, Princess of Wales; 5, Olivier de Serres; 6, Leon Leclerc de Laval.

NAMES OF PLANTS: *J. E.* Ivies: 1, a golden sport of Emerald Gem; 2, argentea variegata; 3, Emerald Gem; 4, latimaculata; 5, atropurpurea; 6, aurea; 7, palmata; 8, minima.—*J. Turner.* 1, Bridgesia spicata; 2, Pittosporum crassifolium; 3, Sterculia diversifolia; 4, Osmanthus ilicifolius.—*J. D. I. B., Devon.* Reineckia carnea, a charming little plant rarely met with in gardens.—*Rev. T. H. Hyde.* Luzuriaga radicans.—*T. H.* 1, Pteris tremula; 2, P. hastata; 3, Polypodium aureum; 4, Davallia dissecta; 5, Cheilanthes lendigera; 6, Adiantum hispidulum.—*M.* Mormodes Oberlanderianum.—*Gad.* 1, Salsvia leucantha; 2, Cestrum (Habrothamnus) elegans.

PETROL: *A Reader.* Petrol would be most harmful, and the potting soil should be preserved from contamination at all costs.

PHŒNIX CANARIENSIS: *L. C.* The fungus attacking your plants is one of the "smuts," *Graphiola phœnicis*, and it is always found to be present wherever species of Phoenix are cultivated. The fungus also occurs on uncultivated trees. The best method of checking the disease is by sponging the plants with a solution of permanganate of potash.

PLUMS FOR PLANTING AMONGST GREENGAGES: *H. A.* Plant one tree each of the following varieties of Plums in the four blank spaces: Monarch, Victoria, Rivers' Early Prolific, and Pershore. These varieties produce flowers in plenty. Monarch blooms early, Victoria and Rivers' Early Prolific following, and Pershore later, whilst the Greengage flowers fairly early. It would be an advantage to place a hive of bees amongst the trees whilst the latter are in flower.

RHODODENDRONS: *J. G. W.* Rhododendrons will grow in any good soil provided that it does not contain lime to any appreciable extent. The situation you mention would probably suit them, unless it is so enclosed as to be draughty, in which case it would be difficult to get most kinds of plants to thrive. When Rhododendrons are in bloom, the flowers are liable to become damaged by strong winds in exposed or draughty situations.

RICHARDIAS DYING: *H. K.* There is no fungus present in the plants. The crown has been probably injured by the nicotine solution. Fumigation is a safer method for destroying aphids.

TENNIS COURT UNDER COVER: *W. F. B.* The floor of a covered tennis court may be made of asphalt, wood, cement, or gravel.

VIOLETS DISEASED: *Hadleigh and H. W.* The fungus present in your plants is *Cercospora violæ*, which is favoured by too much moisture. Spray the plants with liver of sulphur, at a strength of 1 ounce in 4 gallons water, and afford them plenty of ventilation.

LINKS WITH THE PAST.*

PROFESSOR SEWARD'S book should be read by all who take a real interest in plants, whether they be botanists, horticulturists, or intelligent laymen. The problem with which the work is concerned is the origin of the British flora. This present-day assemblage of plants: whence and when did its constituents come hither? Some we know are recently-introduced aliens; others we have in common with the neighbouring continental shore; others again, though these are few in numbers, have no representatives immediately across the Channel, and may be sought all the ground over between Ireland or the Scottish Hills and some part of Europe as far distant as the Pyrenees. The questions opened up by a study of our flora are very numerous, and of them not a few are unanswerable. Yet Professor Seward shows how appeals to the geological record, to the floras of other parts of the world, to the means whereby plants are distributed from place to place, and to our knowledge of the changes of climate and configuration of land and sea, all help to throw light on the problem of the origin of our present-day flora.

When modern botanists take away from us one by one our trees, telling us that they are not natives but merely parvenus, of comparatively recent arrival, to the society of the British flora, it is consoling to have authority for believing that some

representatives of our old forest nobility still survive among us. Professor Seward allows us the Scots Pine, the Oak, Beech, Aspen, and Yew and several other trees as native to these islands.

In this connection Professor Seward propounds the interesting question—which of our present-day plants have title to boast of being the oldest inhabitants of the British Isles? Though properly cautious in such a matter of birth and origin, he allows that something is to be said on behalf of that curious collection of plants which occur only in the west of Ireland. Connemara, as is well known, possesses three kinds of Heath—St. Dabœc's Heath (*Dabœcia polifolia*), the Mediterranean Heath (*Erica mediterranea*); and *E. Mackaii*, which are known nowhere else in these islands nor in northern Europe, though they occur again in the Pyrenees. London Pride (*Saxifraga umbrosa*) grows in the south and west of Ireland and also in the Pyrenees. The Strawberry tree of Kilarney has its nearest kin in the Mediterranean region. What is the meaning of this remarkable discontinuity of distribution? The most plausible explanation is that these plants are relics of a vegetation which, in an olden time, spread along a by-gone coast-line stretching unbroken from Ireland to Spain. Such a claim to high antiquity extending back to pre-glacial times is not, however, allowed to escape challenge, and there are those who would maintain that the Strawberry tree, the London Pride, and the Heaths of Western Ireland are rather to be likened to shipwrecked mariners, which in comparatively recent post-glacial times, embarking on some unknown "ship"—a bird's back, a floating log—reached, "long wandering yet not lost" and by happy chance, the hospitable shores of Ireland.

Other of old-time invaders, like some of the men of these isles, have come out of the north, and are representatives of the Scandinavian flora. This flora, like Puck, putting a girdle round the earth, stretches continuously around the globe in the Arctic circle and makes an occasional dash for less-frigid quarters. In long-past time even this Arctic flora could not stand the rigours of an increasingly severer climate. Southward ho! it sped, and found congenial cold on the sides of mountains in lower latitudes. Thus some seek to explain the occurrence on the mountains of Scotland of such plants as *Silene acaulis*, *Dryas octopetala*, *Saxifraga oppositifolia*, and other Saxifrages, the Cloudberry (*Rubus Chamæmorus*) and the dwarf Birch. This Arctic Alpine element of our flora has some right then to share, with the Pyrenean element, the honours attaching to antiquity of origin, but, as in like claims among human beings, no small measure of uncertainty attaches to such.

Nevertheless, though confident answers to such questions can only be given by the incompetent, the discussion of the questions by so eminent an authority as Professor Seward has led to the production of a delightful book, which may be recommended unreservedly to all who care for plants.

PLANT NOTE.

EXACUM MACRANTHUM.

THIS plant, though by no means new, is still generally regarded as something of a rarity, perhaps one reason being the fact that very few growers have been able to grow the species with success. Lately, however, it has been exhibited well, with the result that many gardeners are taking up its culture. Flowering as it will, at practically any season of the year, within six or seven months from seed, it is capable of becoming one of our most popular greenhouse flowering plants.

Exacum macranthum is a variety of *E. zeylanicum*, and is practically a greenhouse annual. Its flowers, freely produced, are carried well above the polished, lightly-striped leaves, rendering it useful either for cutting or for decorative purposes. The individual flower, which measures about 1½ inch in diameter, in many ways resembles a glorified *Saintpaulia ionantha*, but the colour is a deeper and richer blue, and this richness, contrasted with the large golden-yellow anthers, produces a very pleasing effect.

One of the peculiarities of the *Exacum* is its variation of colour under the influence of different lights. In the early morning the colour is of a light purplish tint, deepening as the day advances, to a rich blue, while in the twilight, when it is perhaps seen at its best, it changes to a lighter azure blue. Like all blue flowers, it appears violet in artificial light, but it is still very attractive.

The *Exacum* may be successfully raised from seed in a warm greenhouse. Being a native of Ceylon, it requires considerable heat and light. The plants should be kept as near the glass as possible in order that the growth may be sturdy and compact. Whilst the atmosphere should always be moist, too frequent syringings must be avoided, as the water causes the tips of the leaves to decay. The plants should be potted very carefully to avoid bruising the roots, giving them the smallest shift possible, as over-potting is a very serious mistake. A mixture of two parts peat, one part loam, and one part leaf-mould and sand is suitable. The long shoots may be pinched back when desirable as the plants break away readily after pinching, and make symmetrical specimens, or they are equally effective for decorative purposes, when grown three or more in a pot and allowed to flower unchecked. *C. H. Middleton.*

AMERICAN NOTES.

CELERY DISEASE.

ON p. 310 Mr. D. Calthorpe tells of his experience with Celery crops. I had supposed we had a monopoly of the disease (*Septoria Petroselinii* Apii) in this country. In any case, it has been a continuous fight for over 20 years to keep the crop after we have grown it, the disease spreading during the damp weather of early autumn with great rapidity. Stripping off the outer leaves did no good, but, on the contrary, weakened the plants.

Spraying with the copper solution will arrest the disease, and may be regarded as curative if taken in time, but my reason for writing is, that after trying very many kinds of Celery it has been found that Sutton's White Gem is immune, even part of a row escaped attack when planted next other varieties badly affected. This is classed as a mid-season variety, but we find it is the best keeping Celery; it has a sturdy habit and is a good exhibition variety. The flavour is not as good as some others, but we have arrived at the situation where, if we are to have any Celery, it is White Gem, and many are growing it exclusively. *E. O. Orpet, Estate of Cyrus M. McCormick, Illinois.*

* *Links With the Past in the Plant World*, by A. G. Seward, F.R.S. (Cambridge University Press.) 1911. 1s

FORESTRY.

EXPERIMENTS IN REGARD TO THINNING.

In 1857 I planted six acres of land with 12,271 Larches, 800 Spanish Chestnuts, 100 Cornish Elms, 500 Scotch Elms, 500 Scotch Firs, 500 Austrian Pines, 50 Silver Firs, and 150 English Oaks. (See *Gardeners' Chronicle*, June 17, 1905, p. 386; December 8, 1906, p. 388, and March 6, 1909, p. 155.)

A friend advised me to practise no regular thinning, for if there are open spaces in the plantation and the other parts thick there is always a circulation of air, whether there be any wind or not. In the open spaces the sun rarifies the air, causing it to become lighter and consequently to rise. The air from the other parts of the wood comes in and takes its place, causing more air to pass the leaves than would be the case if the air were still. I have also tried an experiment with the Douglas Fir. I noticed in Lord Mansfield's plantation of *Abies Douglasii* that the trees were very much branched after the Larch planted between them had been cut down, leaving a pure Douglas Fir plantation. On my return from Scotland in 1885, I planted a Douglas Fir in a thick part of the wood, where it had just head room. Thirty years afterwards, Larches were planted near to it. The Douglas Fir has now become as large as the Larches around it and has its head above them, having grown as much in 20 years as the Larches have in 50 years.

This led me to plant 1,100 trees of Douglas Fir in three or four years among the Larches, which are of 50 years growth. They have grown very well and straight, and I hope to have specimens without strong branches. I have lately had 78 Larches cut down amongst the Douglas Firs to encourage the growth of the latter trees.

The following extracts from my log will show how I have carried out my friend's advice.

The trees were planted in 1857. September, 1864, made winding cuts through the field part of plantation from corner to corner, crossing in the centre, as the trees had made greater growth than in the part that had been an Oak wood, and the grass was killed under the trees. In June, 1867, I found that a *Picea Douglasii*, planted in 1864, which had been trodden down when the hunt went through the plantation, had thrown up a shoot. The tree was cut off above this shoot and the shoot grew into a tree, and is now finer than any Larch in the plantation. June, 1871, began a road for taking out the poles, cut 359 Larches, which was the first opening made in the main wood. 1872, continued road to near Bicton Mill. Cut through rock 14 feet high, and built up 9 feet to support road. 1875, finished roads. 1879, began to cut up the wood, nearly at right angles to the road, taking down two trees and leaving eight between each two cuts, making cuts 12 feet wide. 1882, made cuts 15 feet wide. At this time the 12 feet cuts had almost closed up. 1883, made short cut parallel to road above the last one at 48 feet distance. 1884, made a wide cut in field part as the grass was all killed under trees. 1886, Professor Ward and Gilbert Rogers, Conservator of Forests in India, advised me to make no more cuts for some years. In 1887 cut 124 Larches, mostly dead, in field part, and from this time until I made a 20 feet cut in field part many large trees died here, though no large Larch died in wood, where the blocks of trees were 8 trees one way and 12 trees the other. In 1892 cut off branches of Spanish Chestnut. In 1893 cut many dead Larch. May 7 to 21, four men cut vistas 20 feet wide in the direction in which trees had been planted all through the wood; made one cut same width in field part, since which very few Larch have died. August, raked up dead branches to the middle of each cut and burnt them. October 18 to November 25, planted three rows of trees in 20 feet cut 6 feet apart, centre row had every other tree Silver Fir, the remaining trees being Beech. Forest trees in cuts were left standing. May 13-22, 1879, cut Larch among taller trees,

many good for railing poles, 40 years' growth, but they whipped the larger Larches and injured them; thinned the Larch in thick parts to 8 feet apart, taking care to cut any Larch that had canker. 1893, under-planted Larch with Beech and Silver Fir. 1905, planted 400 Douglas Fir, 18 inches to 2 feet high, 6 feet apart, 26 feet from any tree. 1906, planted 493 Douglas Fir. 1908, planted 60 Douglas Fir. 1910, planted 332 Douglas Fir, 2 feet 6 inches high. 1911, cut 78 Larches, four Oaks, two Spanish Chestnuts among Douglas Fir. The Larch canker has done very little injury in this mixed plantation. Some trees cut this year had a little canker at the top, but as there was a clump of living branches below the canker this had not done much harm beyond killing the head. *H. Rogers, Capt. R.N., Hartley, Plymouth.*

LINUM NARBONENSE.

It is somewhat strange that this good Flax is not more often seen in gardens, considering that it is quite the handsomest of the blue forms. Though its habit is rather stiffer than that of *L. perenne*, the flowers are larger and of a deeper and truer shade of blue.

It may be that it suffers from a reputed

FIG. 188.—LINUM NARBONENSE IN MR. BOWLES'S GARDEN.

delicacy of constitution, but I think the charge is unfounded. Possibly in heavy clay soils it may be unhappy in winter, but most gardens can provide a well-drained, sunny position that should suit this plant. It does not often sow itself with me as *L. perenne* does, but then, on the other hand, clumps of it last in perfect health for many more years than those of the species that monopolises the name suggestive of long life.

The plant illustrated in fig. 188 has occupied its present position certainly for 10 years, and I have cut away large portions from it from time to time to keep it within proper proportions with its surroundings.

It is growing on a raised bank in the rock garden facing due south, and requires no attention beyond an occasional cutting down when it appears to be growing too leggy.

It is easily propagated, either by seeds or division, as it has a habit of running at the root and forming fresh tufts 1 inch or 2 inches from the main clumps. If the seed heads are cut off in July, the plant will last in beauty till the end of the autumn. *E. A. Bowles, Waltham Cross.*

THE LIFE OF SIR JOSEPH HOOKER.

(Continued from page 450.)

AFRICA.

HOOKE'S first acquaintance with any portion of the living flora of Africa was made on the outward voyage of the Antarctic Expedition, when he visited Cape Verde Islands in 1839 and made a collection of dried plants. He contributed to the "Flora Nigritana" in his father's *Niger Flora*, 1849, and his Cape Verde plants are included in P. B. Webb's *Spicilegium Gorgonea*, forming part of the same volume. But practically all of Hooker's work on the African flora was on collections made by others, chiefly by Gustav Mann; and partly by Charles Barter: Mann's predecessor of a decade earlier.

"On *Barteria*, a New Genus of *Passifloraceae*," *Journal of the Proceedings of the Linnean Society*, vol. v. (1856), p. 14, t. 2. Named in memory of Charles Barter, a promising botanical collector and an early victim of the Niger Expedition.

Gustav Mann's collections included the first fruits of the mountain flora of West Tropical Africa, elaborated in the papers described below:

"On the Vegetation of Clarence Peak, Fernando Po, from the Plants Collected by Mr. Gustav Mann," *Journal of the Proceedings of the Linnean Society*, vol. vi. (1862). This is the earliest account of the vegetation of any of

the mountains of tropical Africa, outside of Abyssinia, and its main feature is the demonstration of the sameness of the temperate flora of the east and west, though separated by about 30° of longitude, equal to some 2,000 miles. The summit of Clarence Peak is upwards of 10,000 feet above the sea, and Mann made two ascents, one in April and the other in December. Only the plants collected at or above 5,000 feet are dealt with, and, contrary to expectation, the flora is comparatively poor—76 species belonging to 66 genera. Of the total 76, 37 are Abyssinian and 16 others closely allied to such, and no fewer than 17 were at that date known only to inhabit these two distant mountain regions. Thirty species are described as new, including four species of *Impatiens*, the genus that occupied several of the later years of Sir Joseph's long and busy life.

"On the Plants of the Temperate Regions of the Cameroons Mountains and Islands in the Bight of Benin Collected by Gustav Mann," *Journal of the Proceedings of the Linnean Society*, vol. vii. (1864), pp. 171-240, t. 1. This sketch of the vegetation of the mountains of Western Tropical Africa left little of importance botanically for subsequent travellers to discover. It embodies the data afforded by Clarence Peak,

Fernando Po, and carries the analysis and comparisons of the flora much further. The most remarkable features of this flora are: poverty, preponderance of Abyssinian types, considerable proportion of European species, paucity of South African genera and species, rarity of new or peculiar genera, and absence of St. Helena types. *Ardisiandra* is the only new genus described, and this is a member of the Primulaceæ with the habit of *Sibthorpia*. Gustav Mann was the first European to ascend these mountains, which rise to upwards of 13,000 feet; Captain Burton, following him and joining his expedition, afterwards claimed priority.

"A German Translation of the Introductory Part of Hooker's Paper on the Cameroons, &c.," appeared in Petermann's *Geographische Mittheilungen*, 1865, pp. 22-26.

"Description of Some New and Remarkable Species of *Aristolochia* from West Tropical

actions of the *Linnean Society*, 2nd series, Botany, vol. ii. (1887), pp. 327-355, tt. 60-63.

On *Welwitschia*, a new genus of Gnetaceæ, *Transactions of the Linnean Society*, vol. xxiv. (1863), pp. 1-4, tt. 1-14. The discovery of this remarkable plant caused, perhaps, the greatest botanical sensation of the last century, not exceeded even by *Rafflesia*. It was first announced, with some particulars, in the *Journal of the Proceedings of the Linnean Society*, vol. v. (1861), p. 186; and Hooker's *Memoir* is one of his most elaborate and splendidly-illustrated productions, both in organography and anatomy. By an unfortunate combination of circumstances, Hooker's intention to commemorate the first discoverer has been frustrated, and following the most generally-accepted rule, *Welwitschia mirabilis* has to give way to *Tumboa Bainesii*. Thomas Baines, an artist and traveller, discovered the plant independently of Dr. F. Wel-

sperm of which the pollen is conveyed by insects to the ovule.

"On *Welwitschia*, a New Genus of Gnetaceæ," by Joseph Dalton Hooker. *Extracto e Noticia publicados no Diario de Lisboa*, de 2 de junho de 1863. This is a free translation into Portuguese, with intercalated comments by Dr. E. Gomez.

"On *Fropiera*, a New Genus." *Journal of the Proceedings of the Linnean Society*, vol. v. (1861), p. 1, t. 1. In Bentham and Hooker's *Genera Plantarum*, this plant, a native of Bourbon and Mauritius, is classed as a genus anomalum, and placed at the end of the Myrtaceæ. Baillon subsequently identified it with *Psiloxylon*, Thou., and referred it to the Lythraceæ.

Hooker also elaborated the Melastomaceæ, the Cucurbitaceæ, and the Begoniaceæ for Oliver's *Flora of Tropical Africa*.

The Genera of South African Plants, &c. By W. H. Harvey, 1838. A second edition by J. D. Hooker appeared in 1868.

In 1871 Sir Joseph, accompanied by Mr. George Maw, of Crocus fame, and Mr. John Ball, the celebrated Alpinist, visited Morocco, and ascended the Great Atlas. An account of the journey is embodied in two letters by Sir Joseph to Sir R. I. Murchison, in the *Proceedings of the Royal Geographical Society of London*, 1871. There is also a reprint of the same, and a detailed, joint narrative.

Journal of a Tour in Morocco and the Great Atlas, by Sir Joseph Dalton Hooker and John Ball, 1878, octavo, pp. xvi. to 489, with illustrations and several appendices. This book of travel, giving the results of the observations of the authors and their companion, George Maw, was mainly written by Ball, and it is worth reading again in the light of recent events. Hooker contributes three appendices, namely, on "Some Economic Plants of Morocco," and "Comparisons of the Flora with that of the Canary Islands," and that of "The Mountains of Tropical Africa." Ball worked out the systematic account of the plants, which was published under the title, "Spicilegium Floræ Marocanæ," *Journal of the Linnean Society*, vol. xvi. (1877-1878), pp. 281 to 742, plates 9 to 28. The enumeration contains 1,627 species, of which 165 are peculiar, and many are described for the first time. No new genus was discovered. A separately-paged reprint (pp. 41) of the appendices was issued. W. Botting Hemsley.

(To be continued.)

VEGETABLES.

TREATMENT OF ASPARAGUS BEDS.

THERE is a great diversity of opinion amongst gardeners as to the best way of treating partially-exhausted Asparagus beds. I take the liberty of stating how we treat the beds here, which are very old, perhaps from 20 to 30 years, but still bear heavy crops of first-rate Asparagus. I will begin by saying that we give no manure whatever of any kind in autumn, as is very often done. I remember, as a lad, often seeing heavy coats of manure placed on the top of the beds at the beginning of winter, and this again covered with soil. Such applications on heavy, retentive soils were washed down to the crowns by heavy downpours of cold rain, and caused the death of a great many of the weaker stools. Owing to the mildness of the climate here, we use no covering when the plants are resting. About the end of February, all the soil is carefully forked off the beds into the alleys, going as near as possible to the crowns of the plants. A heavy dressing of dung and decayed seaweed is then spread over the beds, which are marked off and the soil from the alleys shovelled over the dung on the beds. The subsequent treatment consists in keeping the beds free from weeds, and giving one or two applications of common salt, which, besides acting as a stimulant to the Asparagus, helps to keep the beds clean. In districts where severe frosts occur, a good dressing of light stable manure spread over the beds in winter would, in my opinion, be better than heavy applications of manure. Heavy manuring when the plants are at rest is something like waking up a sleeping ox to be crammed. D. Calthorpe, *The Gardens, Ballyheigue Castle, Ballyheigue, Co. Kerry*.

FIG. 189.—BEGONIA "GLORY OF CINCINNATI": COLOUR OF FLOWERS, PINK.
(This variety obtained the R.H.S. Award of Merit at a meeting held on December 5, see p. 421 ante.)

Africa," *Transactions of the Linnean Society*, vol. xxv. (1865), pp. 185-187, t. 14. Three species are described, including the gigantic and striking *A. Goldieana*, which has flowers about 2 feet long and 1 foot across.

"On the Sub-alpine Vegetation of Kilimijaro," *Journal of the Linnean Society*, vol. xiv. (1874), pp. 141-146. This is an account of a very small collection of dried plants made by the Rev. Charles New at the instigation of Sir John Kirk, and it was the first consignment from any snow-clad mountain in tropical Africa. The general affinities of the plants were considered to be South African, but two or three species were identified with Cameroon species and four with Abyssinian. A much larger collection from the same mountains is dealt with by Prof. D. Oliver in the *Trans-*

witsch, and sent excellent drawings to Kew, and Hooker, suspecting it might be a second species, provisionally named it *Welwitschia Bainesii* in the *Gardeners' Chronicle*, 1861, p. 1,008. Then Welwitsch's full name, *Tumboa strobilifera*, followed in the same publication, 1862, p. 71. Soon complete materials were received, and there was no difficulty in deciding that only one species was represented. The floral structure of *Tumboa* has been differently interpreted by botanists. Hooker was of opinion that the ovule was included in a double integument, whereas other investigators held that the outer integument was of the nature of an ovary, of which it has all the appearance. Both male and female flowers are provided with a distinct perianth, and the anthers are singular in being three-celled. It is asserted that *Tumboa* is the only living gymno-

The Week's Work.

THE KITCHEN GARDEN.

By JOHN DUNN, Kitchen Garden Foreman, Royal Gardens, Windsor.

A TROUBLESOME SEASON.—The past summer proved the most troublesome season in my experience. The early part of the year was favourable, and at the end of June the rainfall here amounted to 9.36 inches, the average for this district during the same period being 10.38 inches; thus for the first half of the year we were but little more than 1 inch under the average. But by the end of September there was a great deficiency of rain, the rainfall for the nine months up to that period being only 11.80 inches as compared with an average of 17.54 inches. Thus during the time when vegetables should have grown freely, it was a difficult matter to keep the plants alive. It was not until August, however, that they began to show serious effects from want of moisture, when some of them failed completely. Taking vegetables in alphabetical order, as affected by lack of moisture, Broad Beans planted early were a success, but those intended for a succession were a failure. Broad Beans are an important crop in these gardens: the pods are gathered while quite young, as the Beans are not larger than ordinary Peas when served at the Royal table. French Beans were plentiful throughout the season, and this was due in a large measure to having planted them in deeply-trenched ground, and to applying mulches as soon as the plants were large enough to benefit by their application. We grew many of the standard varieties, but by far the best Bean of the season was "The Belfast." This is a new variety, and throughout the season it produced large quantities of the pods of the finest quality. The only variety of Cabbage that was unharmed by the drought was "Glory"; this is a new main-crop variety and the heaviest in proportion to size known to me. Cauliflowers sown in the autumn and planted early in April were a perfect success, and heads were plentiful up to the end of July, when the spring-raised plants usually furnish a succession. But these latter failed, although water was applied almost daily. The best variety to withstand the heat and drought was Halloween Giant, which, as its name indicates, comes in late in the season. Carrots sown in spring were successful, but sowings made in May and June gave only poor results. Those sown in July, however, grew freely during the autumn, and we have now a large quantity of the best Carrots we have had at Frogmore for some years. The varieties are "Monument" and Model. Celery, being a moisture-loving plant, suffered seriously in consequence of the dry season, for although we were most attentive with regard to watering and managed to keep the soil moist about the roots, the atmosphere was too dry for the production of first-class Celery. Clayworth Pink, Veitch's Superb White and Standard Bearer were good, but Major Clark's Red and Early Rose were inferior. Lettuces were good and plentiful until the end of July, when the season proved too hot and dry for them. After that date, Sutton's Mammoth White Cos, Dickson's Iceberg and All-the-year-Round served us well. The plants were grown on a border facing east, and were well supplied with water. Spring-sown Onions are smaller than usual, but the bulbs are keeping well. We did not thin the crop, owing to the dry season, but we have at present about four tons of sound bulbs, which promise to keep good until next year's crop is available. Autumn-sown Onions were the best I have seen at Windsor, and, like those sown in spring, were never watered during the season. Parsley seed sown early germinated badly, owing to insufficient moisture in the soil, but from sowings made late in July we have a very fine crop of this herb. Early-sown Peas were all that could be desired. Our first sowing of the variety Pilot was made on January 4 on a south border, and we gathered the first bushel of pods on June 2. From that date, until August 15, we were enabled to provide a daily supply of pods, but from

the middle of August we had a great difficulty in procuring an occasional dish from Autocrat and Rearguard, although both varieties are to be recommended for autumn supplies. Early varieties of Potatoes gave good returns. Sutton's May Queen is a favourite variety here, and besides being our best early sort, the tubers keep in good condition until the end of February. Late varieties were free from disease, but owing to the drought, the crop was a very light one. Our heaviest and best crops of late Potatoes were procured from Daniel's Sensation and Eclipse. Turnips were plentiful until August, when it became a difficult matter to keep the plants alive. Those sown for a winter supply were burned, but from later sowings, which in ordinary seasons are intended to produce Turnip Greens in spring, we have a very good crop of roots, due to the mild weather in autumn. All green crops are looking well. Winter Cabbage and Savoys are plentiful, also Brussels Sprouts. Broccoli plants are not so large as usual, but we have a very fine lot of Veitch's Autumn Broccoli. This variety does well at Frogmore, and is largely grown for early winter supplies of this vegetable. There should be no scarcity of green vegetables, provided the weather remains mild, but if severe frost sets in many of the plants will be injured. Tomatoes in the open have been a great success, Sutton's Best of All and Dickson's Open Air giving the best results.

THE FLOWER GARDEN.

By R. P. BROTHERSTON, Gardener to the Earl of HADDINGTON, K.T., Tynninghame, East Lothian.

FLOWER-GARDENING IN A DRY SEASON.

In some respects the flower gardening of 1911 was a disappointment. The summer flowers bloomed earlier than usual, but there was a partial failure for two or three weeks in August, at which time the outlook was not encouraging. In September, when slight rain fell, the plants improved, and the autumnal display was beyond expectation. On the whole, the season was of a nature that no one would wish to experience again, yet, in our own case, the only plant that quite failed and had to be replaced was the charming, pink-flowered Godetia Schaminii fl. pl., but Dahlias and Chrysanthemums produced only a few perfect flowers until autumn. Though Antirrhinums suffered severely, they revived in a brief time, but in some gardens they were given up as past recovery; in others the flower-spikes were all removed, leaving the beds green for weeks. Here, every second or third day for about three weeks in August, the flowers that had gone to seed in the intervals were cut off, but always enough remained to make a little show, and soon the secondary spikes came on, these later blooms being finer than the earlier ones. The plants had not all been raised on the same dates, and this helped to continue the bloom. I thought the newer Fire King surpassed Orange King and Apricot in the "Intermediate" section. Lobelia Waverley, notwithstanding the heat and drought, was exceptionally fine, and stood to the last, but surface-dressings and moisture applied had, no doubt, something to do with the result. The selected strain of Lobelia cardinalis grown here was also very fine. Two beds which attracted much attention were planted with Emperor Larkspur (azure-blue), carpeted with a dwarf Ageratum of the same shade. Larkspurs generally suffered from the extreme heat, but they, too, revived, and produced later crops of flowers from the old spikes. Annual Asters were glorious, and of these the large-flowered and common single varieties please many, but for massing the large-flowering Ostrich Plume section is superior to all others. The Quilled varieties also group satisfactorily; Lemon, French White, Modesty, and Purple King being the best of this section. It was a great year for Pelargoniums, Mme. Crousse (Ivyleaf) being particularly refined in colour, and the old Henri Jacoby holding its own with the newer varieties. Of the plants generally to be found in mixed borders the Hollyhock was a great success. Phlox, however, suffered from the intense heat, and, as a result, the mid-season varieties, such as Le Soleil and Le Mahdi, lasted only a few days, but later ones were satisfactory. Boule de Feu is one of the best of the scarlet flowered. E. Campbell, Selma,

G. A. Strohlein, and Gruppen Königin are a few varieties of value for massing. I should like to repeat what I have frequently written about the value of the African Marigold for massing. Not only are the double Orange and Lemon to be commended, but in the singles, when kept apart, we have definite forms of much beauty. The hybrid forms of Gladiolus primulinus, though rather small-flowered, possess a neat habit, whilst the colours are pretty and attractive. I also like Astilbe rutilans and rubens out of several hybrids. Senecio tanguticus pleased very much, and must be reckoned with for grouping, and especially for mixing with other suitable plants, such as Aconitum autumnale, the best of the genus. Helianthus Miss Mellish has also been a great feature in the autumnal borders, producing flowers in succession for several weeks. The perennial Asters associate well with it, and these also have been amongst the flowers of the year. Roses have been exceptionally fine, and at the time of writing (December 16) they are still fairly abundant. Carnations, although short-lived, have seldom been more satisfactory, and the winter-flowering section has firmly established its right to be employed in the summer and autumn garden. The greater number of Montbretias were disappointing, and Violas in general were not a success. Here, John Quartan and Pilgrimage Yellow continued to flower till autumn. The heat favoured the less hardy shrubs; Romneya Coulteri, for instance, flowered continuously, but in general flowering shrubs were less floriferous than in some years. Now, Christmas Roses, Lonicera fragrantissima, Snowdrops, and Narcissus peeping above ground proclaim the near advent of another year.

FRUITS UNDER GLASS.

By E. BECKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Hertfordshire.

A REVIEW OF THE PAST SEASON.—The past season was an ideal one for the majority of fruits grown under glass, although the long spell of tropical weather increased the work in this department, and the dry, hot conditions favoured the increase of red-spider, even where syringings were practised frequently. The value of giving the trees and houses a thorough cleansing in winter is apparent in such a season as the past. Probably no crop is awaited with greater interest than the earliest forced Strawberries, and these were in almost all cases exceptionally fine. The crops of early Peaches and Nectarines were satisfactory, both from pot trees and those planted out. The value of pot trees is recognised more and more each year. In a garden I visited last summer in Oxfordshire was a house containing 40 trees of Peaches and Nectarines, some of them 26 years old, and all in pots. Each tree on an average bore from 40 to 60 fine fruits, and the trees had not been re-potted for six years, but only top-dressed about the middle of October. These trees furnished an almost regular supply of Peaches and Nectarines over a period of three months. What will be the effects of last year's hot weather on next season's crops is more or less conjectural, for, although the value of well-ripened wood is generally recognised, some consider that the over-ripening of Peach wood is not beneficial. The season was suited to the Fig, which enjoys plenty of sun-heat and atmospheric moisture. The fine Fig trees in pots, exhibited by Mr. Hudson, whilst lecturing on "Pot Figs" (at a recent R.H.S. meeting, see p. 343), demonstrated what fine results can be obtained from pot culture. Other kinds of fruit trees in pots, including Apples, Plums and Cherries, promise well for next season, fruit buds being plentiful and the wood thoroughly matured. From the excellent Grapes seen at the exhibitions it is apparent that the season has been suitable for vines. Black Grapes finished splendidly, and the bunches are keeping exceptionally well. The fine weather permitted an abundance of ventilation at the time the berries were ripening, and to this is due, in a great measure, the berries keeping so well. Excellent crops of Melons were obtained from plants in heated frames as well as in houses, the tropical weather suiting this fruit. The weather was very favourable for Pineapples, and the Pine fruits were exceptionally good flavoured. Wasps were never more plentiful, and it was only with the greatest difficulty that they were prevented from eating or spoiling all the fruit in the houses.

THE HARDY FRUIT GARDEN.

By W. HEDLEY WARREN, Aston Clinton Gardens,
Buckinghamshire.

HARDY FRUITS IN 1911: A RETROSPECT.—

In this locality the approximate amount of rain that fell in 1911 was only 19.092 inches. The lightest rainfall occurred in the three months January (1.006 inches), July (0.019 inches), and August (0.067 inches), whilst the heaviest rainfalls were in March, when 1.009 inches fell, November, with 2.085 inches, and the present month up to the 19th, 4.005 inches. The effect of the excessively dry summer on fruit trees in general has been most beneficial, the only hardy fruits that appear to have suffered from the drought being Strawberries and Raspberries, the latter being badly infested with red spider, notwithstanding frequent syringings with the garden engine and the application of insecticides. The infestation of red spider resulted in a premature dropping of the foliage, which will, in all probability have an injurious effect next season. Our soil being a retentive loam, resting on clay, the crops did not suffer from the prolonged drought and heat, as did those on lighter soils. Plums, Damsons, and Prunes are largely grown in this neighbourhood, and on the whole the crops of these were good. Greengages were excellent in flavour, of good colour, and generally the best-matured crop of this fruit for many years past. Pears, Peaches, and Nectarines were all failures, as the blossoms were destroyed by frost, but the trees are healthy and clean. The following varieties of Apples were, in the order given, the best croppers:—*Culinary varieties*: Lane's Prince Albert, New Hawthornden, Lord Grosvenor, Catshead, Bismarck, Schoolmaster, Blenheim Pippin, Ecklinville Seedling, Royal Late Cooking, Hoary Morning, Dumelow's Seedling (Wellington), and Bramley's Seedling. *Dessert varieties*: King of the Pippins, Worcester Pearmain, Cox's Orange Pippin, Fearn's Pippin, Langley Pippin, American Mother, Allington Pippin, Beauty of Bath, Christmas Pearmain, Court-pendù-plat, Lady Sudeley, and Devonshire Quarrenden. Strawberries, although slightly below the average, were good, both in size and flavour. The following varieties gave the best results in the order named:—Pine Apple, Fillbasket, Royal Sovereign, Connoisseur, Laxton's Profit, Givon's Late Prolific, The Queen, and Latest of All. The wood of all kinds of fruit trees has ripened to a remarkable degree, and in most instances the branches are studded with fruit buds. Some trees that have not borne well for several years look remarkably promising for next year.

GENERAL REMARKS.—The pruning, nailing, training and cleansing of the various kinds of fruit trees are operations which we have carried out as opportunities arose, for only by prompt and seasonable attention to these matters can success be ensured. Scions required for grafting have been selected, labelled, and heeled in the ground for use in spring.

PLANTS UNDER GLASS.

By JAMES HUDSON, Gardener to LEOPOLD DE ROTHSCHILD, Esq., Gunnersbury House, Acton, Middlesex.

A TROPICAL SUMMER AND ITS EFFECT ON INDOOR PLANTS.—The summer of 1911 will long be remembered for its extraordinary heat and drought; it carried my memory back to the year 1868, when somewhat similar conditions obtained. Speaking generally, the hot weather suited plants under glass, and the good effects will be the more apparent in 1912. In the case of Chrysanthemums, I noticed that the early varieties did not, in consequence of the great heat, develop their flower-buds at the proper season, being nearly a month late in flowering. The heat had scarcely any effect on varieties that bloom in November, whilst the later sorts were better even than usual. I never remember to have seen for a long time past such healthy or forward shoots on these plants suitable for cuttings. A hot summer is congenial to hard-wooded plants from warm countries, and the shoots ripened well, therefore they may be expected to provide a fine display of bloom in the coming season. Many greenhouse plants that rarely ever fruit in this country have this season developed seeds in profusion. Bulbs also have ripened well, and the fine flowers of the early

kinds give every promise of success in the case of those that are to follow. As early as the autumn I noticed the good resulting from a complete ripening of all kinds of bulbs. Many subjects that are classed as cool-greenhouse plants are, when thoroughly ripened, unharmed by a few degrees of frost. Both Camellias and Indian Azaleas have set their flower-buds in profusion. In the case of the Camellia, it will be advisable to remove some of the flower-buds, where they are more than usually plentiful.

TENDER AQUATICS.—The tropical Nymphaeas flowered extremely well in the past summer, and especially the blue-flowered varieties. I am surprised that these plants are not grown more generally in gardens, as they are easily managed and always attract the notice of visitors. The year 1911 has also been a good season for other tender aquatics.

FORCED PLANTS.—Plants of the several kinds adapted for forcing into flower in the spring are in an excellent condition for the purpose. These may be a little slower in responding to warmth, because their shoots are so well ripened, but undue excitement is strongly to be deprecated. The wood-buds may, in some instances, grow in advance of the flower-buds; if this be noted, the young growths should be pinched at once. Give the plants frequent sprayings with clear water.

STOVE PLANTS.—Tropical plants, such as are grown in a warm stove, found the hot weather of the past summer to their liking, and especially Nepenthes, Ixoras, Dipladenias, and Codiaeums (Crotons). But insect pests as well as the plants enjoyed the heat, and both mealy bug and red spider multiplied rapidly. In this, my last Calendar for the year, I cannot too strongly impress readers with the importance of combating insect pests of all kinds with the aid of the efficient insecticides now on the market.

NEW PLANTS.—The year 1911 has not been remarkable for the great number of new plants introduced, and it is reasonable to expect that many are being specially withheld from the public until the great International Horticultural Exhibition of next year.

THE ORCHID HOUSES.

By H. G. ALEXANDER, Orchid Grower to Lt.-Col. Sir G. L. HOLFORD, K.C.V.O., C.I.E., Westonbirt, Gloucestershire.

A GOOD ORCHID YEAR.—The past season has been an ideal one for most Orchids, as they enjoyed an amount of bright sunshine very rarely experienced in this country. Long practice and observation of numerous Orchid collections in different parts of the country have convinced me that many of the evils which affect Orchids under cultivation are caused by insufficient light and fresh air. The plants are often kept too far from the roof glass; sometimes the houses are not constructed to admit of sufficient light, or, through their being unfavourably situated, the light is intercepted by other objects in the immediate vicinity. I know that when a mixed collection of plants is grown it is much more difficult to give proper shading and ventilation during the growing season than in those cases where the structure can be wholly devoted to one kind of Orchid. Nevertheless, Orchids can only be kept in a healthy and free-flowering state by giving them every possible attention so far as regards these two important factors. This is a subject I have written upon before, but it cannot be referred to too often, and especially the value of a good, clear light, that essential element that will often go far to compensate for other conditions of an adverse nature to which plants may be subjected. The observant cultivator, on looking over his collection at the end of the present year, will note with satisfaction the progress the plants have made as compared with previous years, and if he realises that this result is due to the beneficial effects of the extra light so much the better. The majority of the Cattleyas, Lælias, Lælio-Cattleyas, and Brasso-Cattleyas have made splendid growths, and show, by the hardy or bronzed appearance of the leaves, with the flower sheaths well pushed up, that the chief requirements of the plants have been satisfied. The Mexican Lælias have done remarkably well, and plants of the white varieties of *L. anceps* flowered quite as freely as the ordinary-coloured

type. Calanthes and Dendrobiums all show by their vigorous growths and the clean, hard nature of the pseudo-bulbs how beneficial the tropical heat and sunlight have been to them. The slowest of all the Dendrobiums grown here to ripen their stems is the robust *D. Dalhousieanum*, but it is really unimportant, as usually plenty of flowers are produced by the older ones, and it is seldom indeed that the season's growth is ripened sufficiently to bloom the first year. The liking that such species as *D. Phalaenopsis* and all the distichous race have for light and air is demonstrated in the texture of the growth made during the present season. Cymbidiums, Lycastes, Coelogynes, Oncidiums, Epidendrums, Maxillarias, and other occupants of the cooler divisions all show, by their hard and well-finished growths, the benefit they derived from the long spell of summer weather. Cypripediums, including even the cool-growing kinds, suffered no ill effects from the strong light and tropical heat, but, on the contrary, made that strong, sturdy growth which alone can produce flowers of the finest quality. Certain species such as *Odontoglossums*, *Masdevallias*, and others that require a good deal of shade, and are cultivated in what is termed the cool-house, did not like the excessive heat certainly, but, so far as one may venture to judge at the moment, they have not suffered so much as many feared might be the case. When at length the heat and sunshine gave place to more seasonable weather, with cooler nights and increased atmospheric moisture, this class of Orchid began to look up, and since then the plants have made a truly remarkable recovery.

INSECTS.—During the hot weather thrips were very troublesome, and especially amongst the cool-growing Orchids. At Westonbirt it was almost impossible to keep the *Odontoglossums* free from this pest; at the same time, *Miltonia vexillaria*, occupying the same house, was never attacked.

UNSEASONABLE FLOWERS.—As anticipated in the summer, the tropical weather has brought many Orchids on more rapidly than usual, and many are flowering out of season. Certain of the late winter and even early spring-flowering kinds have already been seen in bloom. The majority of *Odontoglossums* and other occupants of the cool division are more or less in advance of their usual season, though the usual temperatures have been maintained throughout the autumn. I have never seen so many of the *Cattleya* section make secondary growths as they have this season, but here the majority of these have developed, or are developing satisfactorily, and the plants look promising for next season. During the closing weeks of the old year the enthusiastic cultivator daily scans his collection with an anxious eye, as many plants often show they dislike the absence of sunlight and the artificial treatment they receive at this season. However, the weather has not been exceptionally trying; although fogs have been destructive to Orchid flowers within the precincts of London and other large towns. Frosts have not been very severe or long continued, and, owing to the generally mild weather, there has been no need to overheat the water pipes to keep up the temperatures, which ought now to be maintained at their lowest consistent with the safety of the plants.

AN AUTOMATIC WATER FINDER.—Messrs. MANSFIELD & Co., of Liverpool, have devised an automatic water finder, which has been tried by the Bombay Department of Agriculture, with results that, though not absolutely conclusive, indicate—according to the *Agricultural Journal of India*, January, 1911—an almost certain success. It reveals the presence of underground flowing springs as low as 1,000 feet. The instrument works by measuring the strength of the electric currents which are constantly flowing between earth and atmosphere. These currents are always strongest in the vicinity of subterranean water courses, the flowing waters of which are charged to a certain degree with electricity. (*British Journal of Scientific Experiments*, 2, No. 6, 1911.)

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, as well as specimens of plants for naming, should be addressed to the EDITORS, 41, Wellington Street, Covent Garden, London. Communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Local News.—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Illustrations.—The Editors will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c., but they cannot be responsible for loss or injury.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.

SALES FOR THE ENSUING WEEK.

MONDAY AND WEDNESDAY—

Rose Trees, Fruit Trees, Perennials, &c., at 12.30, at Stevens's Auction Rooms, 88, King Street, Covent Garden.

MONDAY AND FRIDAY—

Herbaceous Plants and Hardy Bulbs, Lilioms, &c., at 12; Roses and Fruit Trees, at 1.30; at 67 & 63, Cheapside, E.C., by Protheroe & Morris.

WEDNESDAY—

Lilioms and other Hardy Bulbs, Perennials, &c., at 12; Roses and Fruit Trees, at 1.30; Palms and Plants, at 5; at 67 & 68, Cheapside, E.C., by Protheroe & Morris.

FRIDAY—

Choice Imported Burmese Dendrobies, Established Orchids, &c., at 67 & 68, Cheapside, E.C., at 12.45.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last Fifty Years at Greenwich—88° 3'.

ACTUAL TEMPERATURES:—

LONDON.—Wednesday, December 27 (6 P.M.): Max. 50°; Min. 39°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—Thursday, December 28 (10 A.M.): Bar. 29° 4'; Temp. 52°; Weather—Dull.

PROVINCES.—Wednesday, December 27: Max 53° Ireland S.W.; Min. 39° Lincoln.

Events of the Year.

The closing year will be memorable in these islands for the Coronation of King George V. and the magnificent summer, this latter, unfortunately, attended by one of the most prolonged droughts in recent records. The Coronation in June affected most of our readers in one way or another. The brilliant ceremonies attending it created a great demand for plants and flowers, and for a brief period the market-growers found their resources not more than equal to the requirements of the trade. In some cases it may be feared that this prosperity was counterbalanced by the unusually short duration of the London season, which terminated soon after the completion of the Coronation ceremonies, and by the railway strike and other labour troubles which occurred later in the year. Nevertheless, we have reason to believe that the growers of decorative plants have experienced a better trade than usual and more liberal profits than have characterized recent seasons.

The remarkable summer affected gardeners more than most classes; it was the chief factor that dominated their work, influenced their plans, and in a great measure determined their crops. Whilst the glorious amount of sunshine might in other circumstances have been an unmixed blessing, the deleterious effects of the accom-

panying drought were so obvious, not only in orchard and fields, but also in gardens, that the gloomiest views were entertained in respect to the crops, even among those raised in gardens where the tillage is more perfect and the crops are under greater control than are those on the farm. But misfortunes always appear most serious when they press directly upon us, and such was the case in respect to the drought. At the close of the year we can look back with some satisfaction, in the knowledge that the worst fears were not realised. Take the fruit crops, for instance: such crops as failed, unmistakably owed their loss not to the summer drought, but to the unsuitable weather conditions which prevailed at the season when the trees were in flower or the fruits setting, as in Pears, Peaches, and Nectarines. Apples set a very liberal crop, and the harvest was at least equal to the average yield. Certain varieties contributed to this result in a greater measure than others, and well-tilled soils of good depth showed their superior value as compared with gardens less favourably situated; but, taking varieties and situations collectively, the general crop of Apples was not only plentiful, but the fruits excelled in size the anticipations of fruit-growers. The worst pest that affected the Apple crop was the codlin moth, a scourge that always engages the attention of cultivators in some degree, but which attacked more fruits in the past season than we ever remember. Cox's Orange Pippin, which succeeded unusually well, appeared to be the subject of special attack; in some cases every fruit on a tree was found to contain a maggot. For this visitation the season was partly to blame; for, as was pointed out in these columns in September by *A Southern Fruit Grower*, the great heat caused two broods to be hatched. Concerning the keeping qualities of Apples, the reports we have received are conflicting. In some cases they are said to be keeping well, whilst in many others they exhibit quite an opposite character. Small fruits suffered severely from the drought; in many gardens the fruit actually withered on the bushes.

The Potato crops were lighter than usual, and although it might have been expected that the brilliant summer would prevent the spread of fungous diseases, we received reports which showed that the common disease (*Phytophthora infestans*) caused considerable trouble, and warty disease asserted itself in localities where this malady had not been previously detected.

The most serious effects of the drought were to be seen in the check to all crops of the Cabbage tribe. In August and September there was such a scarcity in the markets as is rarely witnessed, and very high prices were paid in not a few instances where, owing to some local circumstances having compensated for the absence of rain, satisfactory crops were obtained. Later, when the influence of autumn rains made itself felt, the supplies gradually increased; and in December, when the Brussels Sprouts and Savoy became available, the London supply, at any

rate, appeared equal to that of an ordinary season.

The year has not been marked by any horticultural event of outstanding importance, such, for instance, as will characterize the year now about to open, but much work has been done with a view to forwarding the interests of the forthcoming International Exhibition. The Royal Horticultural Society has held two exhibitions, in addition to the fortnightly shows in the Society's Hall at Vincent Square, which appear to be increasingly successful. The first of the special exhibitions was held in the Temple Gardens, as usual, and it attracted crowds of visitors. Queen Alexandra showed the interest Her Majesty is known to have in gardening by visiting this show, and the success of the exhibition, from the popular point of view, was everything that could be desired. At the same time, it must be added that the visitors again experienced the discomforts inseparable from a show of this nature, for which no better arrangements can be made than those possible in the restricted area available on the Thames Embankment.

The summer show in the Olympia building was regarded by most people as something of an experiment, and it is not likely to be repeated. Circumstances were against the success of this exhibition; the Coronation festivities were already over and many people had left London on account of the great heat. Apart from these facts, there was the further disadvantage that the great glass structure was most inappropriate for the tropical conditions that prevailed, though it may be well suited for an exhibition in wet weather. Moreover, those responsible for the arrangements of the exhibition failed to take ordinary measures to adapt the building to the purpose for which it was employed. For these reasons the show was not an unqualified success even as a spectacle, though there were individual exhibits of great taste and wonderful variety, and, as showing the resources of British horticulture, the display was amongst the most exhaustive witnessed for a very long time.

The numerous special societies have held exhibitions of their favourite flowers, chief amongst which were the Rose, Sweet Pea, and Chrysanthemum shows. The National Rose Society has continued its prosperous career, and shown increased activity in various directions. Its shows have been successful, and its publications have met with the appreciation of all Rose cultivators. The National Sweet Pea Society's exhibition was as successful as hitherto, notwithstanding the somewhat sensational show at the Crystal Palace, at which exhibition the proprietors of the *Daily Mail* offered a first prize of £1,000. The National Dahlia Society, though in less prosperous conditions than formerly, has made efforts to revive popular interest in the Dahlia by the holding of a conference and in other ways. The North of England Horticultural Society has been most energetically engaged in its attempts to awaken a greater interest in gardening in the northern counties, and for the

stimulus it has given the industry it deserves every sympathy. Efforts were made early in the year to inaugurate a National Daffodil Society, but the promoters of the scheme eventually agreed to accept certain overtures made by the Royal Horticultural Society for the holding of a competitive Daffodil show in London in 1912. It may be assumed that the results of this exhibition will be awaited before any steps are again considered for carrying out the original project.

The fourth genetic conference was held in Paris in September. The reports, necessarily brief, published in these columns, clearly showed that the event attracted much attention in scientific circles, and there is not the least doubt but that, when the proceedings are published, the papers will contribute to the elucidation of that most important subject, heredity.

In respect to educational subjects, it will be remembered that, early in the year, the Reading University College published a valuable and suggestive report of a deputation which visited America and Canada in 1910 for the purpose of enquiring into the methods of agricultural teaching in those countries. As bearing on a kindred subject, it should be noted that a recent issue of this journal contained the announcement that a committee has been asked by the Royal Horticultural Society to enquire into the question as to the desirability of instituting a National Diploma for gardeners. The result of the deliberations of this committee will be awaited with interest, and we may venture to hope that some way may be found of providing gardeners with increased facilities for acquiring knowledge and of raising their status in the public estimation.

In attempting a review of the events of any particular year there must always be the painful necessity of noticing the losses horticulture has suffered by the hand of Death. The list this year is not lighter than usual. Early in the season occurred the death of Sir Charles Dilke, one of the principal proprietors of this journal, and son of one of the four original founders. Amongst many others who have done good work and furnished brilliant examples are such well-known names as Sir Joseph Hooker, James Douglas, Dr. Harry Bolus, Charles Foster, Victor Lemoine, J. H. Hart (of Trinidad), B. Latour Marliac, Edouard Andre, J. J. Willis, Colonel Beddome, Simon A. de Graaff, A. Weeks, William Earley, George Woodgate, Robert Laird, and the Rev. Alan Cheales. Many of those who have passed from our midst were men whose ripe experience was invaluable, but unfortunately their knowledge, for the most part, is no longer available for the common good, because it has not been committed to paper. Nevertheless, progress is being made, and those who are still capable of useful efforts should be stimulated by the records of the work already accomplished by men who had fewer opportunities of every kind than are now available to those who really desire to take their part in furthering the world's progress.

OUR ALMANAC.—We shall shortly see a *Gardeners' Chronicle* Almanac for the year 1912. In order to make it as useful as possible for reference, we shall be obliged if Secretaries of Horticultural, Botanical and Allied Societies, or any of our correspondents, will send us **IMMEDIATE INFORMATION** of all fixtures for the coming year.

OUR SUPPLEMENTARY ILLUSTRATION.—Concerning the subject of our Supplementary Illustration, *Primula lichiangensis*, Forrest, Mr. GEORGE FORREST writes us as follows:—This species is a handsome rock plant, one of the many forms of that most variable and widely-distributed species, *Primula cortusoides*, L. It is most closely related to *P. Veitchii*, Duthie, from which species it differs in only a few minor details, such as its inflated calyx base, the fewer flowers borne by the umbel, which is usually simple, and in the under-surface of the foliage being less densely tomentose. The species attains a height of 6 to 14 inches, and is a native of the eastern flank of the Lichiang Range, N.W. Yunnan, where it grows amongst dwarf scrub on boulders, and on the ledges of steep limestone cliffs at an altitude of 10,000 to 10,500 feet. The situations are usually dry and shady, with a southern exposure, in a much-enclosed side valley, and, though I found the species was abundant enough in that particular locality, I never discovered it elsewhere on the range, nor in any other part of the province. The flowers are fragrant and vary greatly in the depth of colouring, from light rose to what might almost be called crimson in some specimens, and the eye is greenish-yellow. There is also great variation in the size and form of the foliage.

ROYAL HORTICULTURAL SOCIETY.—The next meeting of the Committees of this Society will take place on Tuesday, January 9. There will be no lecture on this occasion.

BRITISH GARDENERS' ASSOCIATION.—A meeting of this association will be held on Friday, January 5, at 7.30 p.m., in the Technical Institute, Altrincham, Cheshire, when an address upon the "Advantages of Joining the B.G.A." will be given by the general secretary, Mr. J. WEATHERS.

MR. E. F. HAZELTON.—The garden staff at Knowsley Hall, Prescot, have presented Mr. HAZELTON, the gardener, with a silver inkstand and walking stick, on his leaving Knowsley to take up the duties of gardener at North Mymms Park, Hatfield, in succession to Mr. C. R. FIELDER. It will be remembered that Mr. FIELDER was recently appointed gardener to Miss WILLMOTT, at Warley Place, Brentwood.

"JARDINAGE."—We have already remarked on this new gardening publication. The second issue contains a full-page plate of M. VIGER, M. ALBERT TRUFFAUT and M. ABEL CHATENAY, the president, vice-president and secretary of the National Horticultural Society of France. In No. 3 the coloured cover illustration of Blue Hydrangeas is very effective. Some photographic views of the Paris Autumn Show are given. In particular, we notice a photograph of Mr. T. STEVENSON and his group, the best that has yet appeared in the French Press.

SALT AS A FUNGICIDE.—In a contribution to MÖLLER'S *Deutsche Gärtner-Zeitung* the use of common salt as a fungicide is recommended. For cleaning glasshouses a solution of salt and soda in hot water is said to be very effective, and cracks and corners of propagating and other houses may be syringed with a 2 per cent. solution of salt (about 3½ ounces per gallon). Cuttings and plants may be dipped in a solution of half this strength, though for the more tender subjects it is better to use a solution of about 1 ounce of salt to one gallon of water.

RETIREMENT.—Mr. ROBERT DAWES, head gardener and forester for the past 30 years at Templenewsam, Leeds, will resign that position early in the New Year. Mr. DAWES's friends will be gratified to know that his long service is being handsomely acknowledged by his present employer, the Hon. E. F. L. Wood, M.P.

GARDENERS' SOCIAL EVENING.—The 15th annual social gathering of the gardening staff of the Royal Gardens, Kew, will be held at the Boat House, Kew, on Friday, January 12, commencing at 7 p.m. The hon. sec., Mr. G. W. BUTCHER, 34, Alexandra Road, Richmond, will be glad to hear from past Kewites, intending to be present, on or before January 4.

SIR TREVOR LAWRENCE, BART.—The esteemed president of the Royal Horticultural Society attains his 80th birthday on the 30th inst. Our readers will join us in offering him hearty congratulations and good wishes.

SPRAYING FOR THE GOOSEBERRY-MILDEW.—In our report last week of the conference held under the auspices of the North of England Horticultural Society, a printer's error made Mr. EMPTAGE state that the amount of sulphate of copper for spraying in winter should be 11 lbs. to 25 gallons of water. It should have read 1 lb. of copper sulphate to the same quantity of water.

AMERICAN GOOSEBERRY-MILDEW ON RED CURRANT BUSHES.—Although in comparison with the previous year there has been less of this mildew on the shoots of Gooseberry bushes in Cambridgeshire, there has been nevertheless a marked development of the fungus on Red Currant bushes, particularly on the variety known as Raby Castle. In 1908, one case of disease on Red Currants was recorded in this county, but until the present year there was no recurrence of the mildew on this kind of bush. During the past summer no fewer than 59 cases of the disease have been reported on Red Currants, most of which, however, were only slight. The first attack on Red Currants was recorded on July 19, or two months after the appearance of the summer stage of the fungus on Gooseberry bushes. The diseased Currant bushes were in all cases in the vicinity of mildewed Gooseberry bushes. To judge from the absence of the mildew from Red Currants during the two previous years, and from its relatively late appearance this year, it certainly looks as if the fungus had adapted itself to a host which hitherto has been practically immune from attack in this particular area. It is remarkable that, in a season which has been characterised by a decrease in intensity of the disease on Gooseberry bushes, the fungus should have attacked Red Currants much more than in previous years. In the case of Red Currant bushes, the mildew affects the stalks and blades of the leaves more severely than the stems; whereas, on Gooseberry bushes, the reverse more frequently occurs. Perithecia or "winter spores" were abundantly developed on the mildewed leaves of these Red Currants. This adaptation of the fungus to live on another host is of interest in relation to the problem of producing varieties of Gooseberry bushes which shall be immune from the attacks of American mildew. When one considers the question of producing varieties of economic plants which shall be immune from the attacks of certain parasitic diseases, one must bear in mind the power of adaptability possessed by these parasites; thus, knowing that American Gooseberry-mildew may adapt itself, under certain conditions, to live on Red Currants, one recognises that the solution of the problem of breeding varieties which shall be permanently immune from the attacks of the fungus may be fraught with considerable difficulty.

BACK TO THE HILLS.

(Concluded from p. 453.)

AMONG THE PRIMULAS.

My experiences in the Fleimser-Thal taught me not to depreciate my chances of finding the hybrid Primulas. Bitterly did I regret having cravenly renounced in a premature despair, my visit to the district where minima meets spectabilis, and produces the lovely range of hybrids called *P. Facchinii* and *P. Dumoulinii*. Eagerly did I set forth on the needle-in-a-bundle-of-hay adventure, which is the search for *Primula Juribella*, long out of flower. This species dwells with its parents on the limestone Alps under the Cimon della Pala in the Southern Dolomites. And my search opened auspiciously

grey tufts of *Campanula Morettiana*, hanging out of crevices in rock not so wholly unnegotiable as that of the Schlern, and *Potentilla nitida* now approaching the full beauty of its heyday. But still no sign of *Primula minima*, nor any likely place for it. I wandered along the stony ridges up and down, having no notion where to hunt for *P. Juribella*, whether in crevices with its father, or in turf with its mother. Obviously, turf was indicated, but there was at present no turf, and no mother either. The clouds and rain drove fiercely across me, and blotted out the world. Now and again they would lift, and the Cimon della Pala would unfold in all its magnificent horror. It is the most terrible peak in the Dolomites, if not in any range. I do not even except the Viso and the Matterhorn. Five

it, you can tell it at a glance, for its leaves have lost the green and lucent look of minima, and are more dusty grey with the glue-glands, that are its heritage from *tyrolensis* (though, indeed, it has not nearly so many); they are usually a trifle broader than the broadest forms of foliage in minima, and draw out to an oval, more neatly denticulated, instead of ending abruptly with the violent horny jags of minima. In size, it seems pure minima, and is a variable hybrid, even in this, its only recorded station. I found one form much bigger than the rest, with leaves larger, longer, and broader, suggesting a secondary cross with *tyrolensis*. Of the flowers I cannot yet speak; none remained. I can only say that I found the remains on one piece of a two-flowered scape.

FIG. 190.—LÆLIO-CATTLEYA NELLA (L.-C. DOMINIANA LANGLEYENSIS × C. LABIATA).

[Photograph by J. Gregory.]

(Awarded R.H.S. First-class Certificate on December 19.)
(See p. 475.)

in the discovery that all the rock was thickly clustered with *P. tyrolensis*, though of minima I had seen as yet no sign. *P. tyrolensis* does not grow so vast and wide as its cousin *P. Allionii*. It forms, however, dense, serried sheets all up and down the sheer crevices of the rock, each crown separable from the rest, the whole in a flat crowd of rosettes, instead of in the radiating uniform cushions in which *Allionii* depends from the cliffs and grottos of Tenda. The bloom of *tyrolensis* had completely passed by this time. I only succeeded in finding one or two lingering corollas on a cold and northerly cliff. These stemless flowers, large and rosy and ragged, have a rare charm, even though they may not succeed in rivalling, quite, the wide splendours of *P. Allionii*.

There were other treasures here, too; great

thousand feet of absolutely bare, sheer rock, shooting up in a naked needle like the finger of death. Poised among the clouds that day, it looked even higher than it is, and more awful.

I came at last, in the mist, on a grassy slope. In another minute mother minima appeared. I now climbed like an aged crone, conning every leaf I crossed, for there was no longer any sign of flower; and five minutes had not elapsed before I lit on a longer leaf than usual—more oval, darker, more glandular. It was *Primula Juribella*, of course. And after that I had no further difficulty. The hybrid is as common, almost, as its mother; growing with its mother, in and out of tufts of *Silene Pūmilio* (for here occurs a small and sudden outcrop of igneous rock). It is very much nearer to minima than to *tyrolensis*; but when once you have sighted

Much more difficult to find than this are the two named hybrids produced by minima and *hirsuta* in the Brenner district. When blooming time is over, indeed; for while in flower *P. Kellereri*, *P. Forsteri*, and *P. Steinii* are so gorgeous that they could almost be seen from half-a-mile away. In early August, however, the difficulty of finding them is still further complicated by the abundance and the polymorphic luxuriance of *P. minima*. For this is one of the few species belonging to the Eastern Alps and ranging tentatively west. As I know it, *P. minima* becomes more and more abundant, more and more stalwart, as one approaches the centre of its kingdom in the Eastern Alps. In the highest moors of the Brenner it simply makes the turf, and develops foliage so ample and strong as to be barely recognisable for the

meaner minima of its outlying regions—so as in the end, indeed, always to be waking one to suspicions that such-and-such a lush, broad-leaved mass cannot be merely pure minima. Just down below on the rocks by the river, hangs *hirsuta*, but (as in the case of *P. Juribella*) *P. Forsteri* and *P. Kellereri* are only to be sought among the wide tussocks of their mother in the heathery herbage, in and out of the mats of *Azalea alpina*. And though the two species grow so commonly and so close, it was only after an hour's ransacking of countless knolls of minima, varied by a dozen false starts over some specially wide-foliaged form, that at last, as I paused on a slope in despair, I found that my unconscious eyes were resting full on *Primula Kellereri*. Again, as with *Juribella*, there can be no mistake, when once the plant has been sighted. Both *Kellereri* and *Forsteri*, though closer, the one to minima, the other to *hirsuta*, are very like forms of minima on first glance. But as *Kellereri* has its affinities to *hirsuta*, you recognise it clearly at first glimpse among minima. It is larger, with a more ramifying habit. Its leaves are bigger, broader, spatulate, dentate, wholly distinct, and they stand quite apart from the glossy glabrous green of minima's, in being of a darkish grey-green, thanks to their glandular inheritance from *hirsuta*. Very much more difficult to tell is glorious *Forsteri*, which five minutes later I found growing half-a-yard away. For, though this is twice the size of the ordinary type minima, yet among the gigantic minima of these hills it is nothing much out of the common; until a difference in the tone of its green strikes your attention. For this, though quite yellowish, as in minima, glossy-looking and vivid, is somehow not the same. Look closer, and you see the leaves have lost their shine through being slightly glandular, and that they draw gradually to a toothed oval end—two points that finally differentiate the plant from minima. Both these hybrids (though one might do better in flower time) appeared to me to be painfully uncommon. Much search only showed me one colony of *P. Kellereri*, and two of *P. Forsteri*. But I almost dare suspect that secondary hybrids might be found among the extraordinarily fine type of apparent minima that covers all the mountain-side in a rippling mantle of shining verdure.

HIGHER UP AMONG THE PRIMULAS.

Heedless of a herd of four-and-twenty gigantic bulls that capered round me (agricultural friends dispute the probabilities of their having been all bulls, but they were), I pursued exhaustive researches into the distribution of *Primula Kellereri* and *P. Forsteri*, and then continued my upward way in hope of *P. Huteri* and *P. salisburgensis*. As one climbs the mountain, *P. minima* gets more and more abundant, until in the end it literally possesses all the slope. But by this time *P. glutinosa* had almost wholly passed out of flower. And as the *glutinosa* × *minima* hybrids (as distinct from the *minima* × *glutinosa* hybrids) run so very close in foliage to *P. glutinosa*, I felt that the passing of the flowers left me without much chance of success. The climb, too, was not a fertile one: over piles of gaunt granitic debris, in which there was no consoling sign either of *Saxifraga Rudolphiana* or of *Ranunculus Traunfellneri*, both of which I had been led to hope abounded in the Brenner Alps. However, I continued toiling up towards the snow, and as I toiled the few flowers of *Primula glutinosa* became less few, until in the end I came out on a little marsh, where, among the violet beauties of the parent, glowed fiercely the amethystine richness of its children.

I repeat it: the names *P. Huteri* and *P. salisburgensis* are as arbitrary as those of *P. Floerkeana*, etc. There is an enormous differentiable range between the innumerable children of *P. minima* and *P. glutinosa*. One possible drawback of my suggested system for adumbrating by mathematical formulæ the exact relationship of each of these hybrids, under one name, would

be the fearful quadratics that would be required to express precisely the parentage of any given hybrid. (As for the logarithms that would be wanted to express *Epi-Sophro-Lælio-Cattleya*, imagination boggles at them, and no printer would endure them.) But so much I would admit, or suggest: that *P. salisburgensis* does imply *glutinosa* × *minima*; whereas *P. Floerkeana* means *minima* × *glutinosa*: of this latter cross I saw no sign on the Brenner, and of the former none in the Fleimser-Thal. As *P. Floerkeana* can be described as a minima with the height and habit and many-flowered scape of *glutinosa*, so *P. salisburgensis* might be called a diminished *glutinosa* with the colouring of minima. But, of course, even so much differentiation as this would be unfair, if it pretended to be authoritative or rigid.

Primula "Huteri-salisburgensis" is a lovely little plant. It seems to me most especially to affect very wet places—stones and shelves over which water is trickling much more freely than *glutinosa* would like or minima endure. The little leaves are in size and shape reminiscent of *P. glutinosa*, and stand up in the same way: on the other hand, they are of a much lighter green, much less glandular, and more oval, with a fine little denticulation at their rounded tip. The flowers are like those of *glutinosa*, but a trifle larger, fewer on the shorter scape, and usually of a fulminating hot lilac-violet. But all this range of hybrids is endlessly variable: the one called *Huteri* is said to approach nearer to minima, and that called *salisburgensis* to *glutinosa*, and I have a most lovely "*salisburgensis*" whose provenance I do not know, which is, to all appearance, almost pure minima, with two or three *glutinosa* flowers on a stemless scape, and those flowers of a very clear lavender blue. The habit of type *salisburgensis* in these water-runnels is quite intermediate: it forms wide mats of scattered little colonies, ramifying from each other in a way suggestive of *P. minima*, yet collecting into tiny tufts of two or three crowns quite close together, after the style of *P. glutinosa*, but not so densely congregated.

Much less tangled and obscure is the next great range of hybrids produced by *P. minima*. To find it sharing mountains with *P. Clusiana* you have to go far, far east, into the limestone Alps of Austria. And here *P. minima* is even larger, freer, and more universal than on the Brenner chain; its forms are infinite. It shares its limestone ranges (precisely the same limestone ranges as those of Ingleborough, writ thrice as large), with other wonders, too, for in August that whole enormous mountain is one rosy sheet of *Dianthus alpinus*, filling all the grass with the unbroken refulgence of its masses; and only a little earlier the higher moorland blushes with miles of *Primula minima*, interspersed with the celestial little fountains of *Campanula alpina* and the violet stars of the genuine *Viola alpina*. On the cliffs and on their slopes are mats of beautiful *Potentilla Clusiana*, like a pearl-white version of *P. nitida*, and *Primula Auricula* gleams among mats of *P. Clusiana* (but does not interbreed), and *Campanula pulla* disputes the calcareous debris (calcareous, mark it) with *Ranunculus alpestris* and *Thlaspi* and *Viola biflora*, in black humus among blocks of limestone such as that beloved of *Polypodium calcareum* under Ingleborough.

The real domain, however, of *Primula Clusiana* begins higher yet, on the open moorland of the upper grassy slopes. Here it grows exactly like its cousin *spectabilis* on *Rocca Longa*, though not in quite such serried masses. It has a similar, though distinct, splendour, of rich, great, rosy flowers in heads, their lobes so deeply cloven as to give a fringed effect. It was long over, of course, when I saw it, but I suspect it of not being, perhaps, quite so inordinately profuse of blossom as *spectabilis* in nature, though in the garden they neither of them have a fault. At these elevations, however, *Clusiana* reigns supreme, to the overshadowing of the lowlier minima: I had ranged much ground with much care before at last I came on *P. intermedia*, their care before at last I came on *P. intermedia*, their lovely hybrid. *P. intermedia*, at first glance, is a concise, tufty, tiny *Clusiana* of an exquisite neatness like a *Sempervivum*; but in an instant the eye is caught by little, spiny jags round the end of the broad, oval, shiny leaves (it has been

called *P. spinulosa*), which, in real *Clusiana* as in all the arthritica, are invariably entire. However, the toothing of the leaves is almost the whole of minima's contribution to *P. intermedia*, which has *Clusiana*'s enormous flowers above a rosette of half the size of *Clusiana*'s, with something almost more Rose-like and attractive than even the neatness of minima. From what I saw of the hybrid, it is, however, certainly variable: and as it is no less certainly fertile (for I found capsules), there is no doubt that it does, or can, yield secondary crosses. But *P. intermedia* clearly is *Clusiana* × *minima*; I found nothing that suggested to me *minima* × *Clusiana*. Whereas, in all the other minima crosses, minima is usually the obvious mother and pre-potent parent. It seems less powerful, indeed, with arthritica than with erythrodosum: for *Facchinii* and *Dumoulinii* equally suggest the motherhood of *spectabilis*. In habit, *P. intermedia* forms immense loosely-ramified colonies, deriving at once from the densely-ramified habit of minima, and *Clusiana*'s tendency to independent individuality. *Reginald Farrer.*

FLORISTS' FLOWERS.

BORDER CARNATIONS.

CARNATIONS in pots now placed in cold frames will almost certainly, in some varieties, have "spot" on the foliage. Such leaves and others that have turned yellow should be carefully removed, also all kinds of dirt and rubbish about the plants. Even though the soil about the roots may appear to be dry, no water should be given meanwhile, as much moisture is always harmful in winter. The chief value of frames in the case of border Carnations is to ward off rains; even in frosty weather a current of air is beneficial, frost being harmless so long as everything about the plants is dry. Those planted out may also require attention in the matter of cleaning, and, should the plants need support, they should be secured to short sticks. Late-planted layers are apt to become loosened in the ground through frost, and it may be necessary to make the soil firm about each; but those planted early in autumn and now well established will not need this attention. *B.*

SCOTLAND.

EDINBURGH MARKET GARDENERS AND THE WAVERLEY MARKET.

A PROPOSAL made by the Edinburgh Market Gardeners that tickets of admission to the Waverley Market shall be issued to the trade at a charge of 10s. 6d. per annum, this to include the right to admission for a short time previous to that of the general public, has been before the Markets Committee of the Edinburgh Corporation.

Another suggestion is that 2s. 6d. per annum shall entitle the holder of a ticket to early admission only, and that the ordinary charges be paid on entry to the market. The committee recommended that no change be made in the existing practice, and at a meeting of the Town Council on December 19 this recommendation was adopted. *Correspondent.*

LÆLIO-CATTELEYA NELLA.

OUR illustration in fig. 190 represents a finely-formed and brightly-coloured hybrid, obtained by Messrs. James Veitch & Sons from a cross effected between *L.-C. Dominiana langleyensis* and *C. labiata*. The rich colour of *L.-C. Dominiana* is intensified in this hybrid, and the flower exhibits the good shape of the best form of *C. labiata*. The sepals and petals are a bright rose-colour with a silvery veining and a white spot at the base of each segment. The lip is of a glowing ruby-red, with thin, yellow lines from the base. The plant was awarded a First-class Certificate at the Royal Horticultural Society's meeting on December 19 last.

HOMERIA COLLINA.

THIS pretty South African bulb is very rarely met with in gardens. It is curious that the *Homeria* should be so uncommon in cultivation, as it is one of the hardiest of Cape bulbs, being far more vigorous than the *Sparaxis* and increasing much more rapidly, while it is more reliable than the *Ixia* and will prove thoroughly robust in a border in which the *Ixia* will not persist for two seasons. The flowers are charming in colour, of a soft apricot-pink flushed with orange, with a bright-yellow eye surrounded by faint purple pencillings. They are about $2\frac{1}{2}$ inches in diameter, and four or more are carried on an arching stem about 30 inches in length; the leaves are 4 feet in length and rather more than $\frac{1}{2}$ inch in breadth. The flowers close in the evening and remain shut during the night. A large colony, with a hundred or more fully expanded bloom-spikes, furnishes a beautiful picture in the May sunshine. The plant increases very rapidly, a small clump given me a few years ago, and lifted three years later, had made 250 bulbs. The chief drawback in the cultivation of the *Homeria* arises from the fondness of snails for the succulent stems. The snails climb to a height of 18 inches to 2 feet, and then eat the stems through. A nightly watch is necessary when the flower-stems are about a foot in height in order to destroy these pests, as the bed will be flowerless unless their energy is checked. The brilliant *Sparaxis* Fire King (crimson with a golden centre), *S. grandiflora*, and *Freesia refracta alba* are grown in the same border as the *Homeria*, and they associate well. The *Homeria* succeeds best in a light, sandy soil in a raised border in front of a south wall. The species was introduced into this country in 1793. *Wyndham Fitzherbert*.

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

THE PROPOSED GARDENERS' DINNER.—In answer to Mr. Divers (p. 460), I may say that Friday in the first week of the exhibition was at first definitely fixed for the dinner, but it was found that the directors of the exhibition had arranged a banquet in the Horticultural Hall on that day. The Horticultural Hall has been placed at the committee's disposal for the dinner, but this offer has not yet been accepted officially. Then, again, very many gardeners would not be present at the exhibition on the first three days, because of the admission prices, there being no reduction for gardeners' wives. It is hoped to fix the dinner as early as 6 p.m. on the Saturday. *A. Dean*.

THE COLOURING OF APPLES.—Allow me to correct an error in the printing of my article of last week on this subject. The beginning of the second paragraph reads:—"It is not known with certainty whether colouring is affected by influences outside the fruit or exclusively by those acting from within." This makes me say the converse of what I intended. The latter part of the sentence should read thus:—"affected by influences outside the fruit exclusively, or partly by those acting from within." No one can suppose that internal influences alone cause colouring, and such a supposition is inconsistent with statements preceding the erroneous sentence, as well as with what follows. *A Southern Grower*.

—The article on this subject (see page 447) by *Southern Grower* is, like all his writings, most suggestive and instructive. Would he kindly allow me to suggest that colour depends largely on the available supplies of potash in the soil? I am no horticultural chemist, but I have used my own eyes and "picked the brains" of several "old hands," and I consider that *Southern Grower* might give us some interesting information on this point. Burnt-clay soil, for example, produces a rich colour in Apples. *J. Bernard Hall, Rawdon, Leeds*.

THE REMOVAL OF TREE STUMPS.—I was interested in the article on p. 411 on this subject. A great deal of dynamite is used in the gold, iron, copper and manganese mines here, and we use a great deal of Nobel's gelatine dynamite in the gardens and woods, for blasting both rock and wood. Five years ago we made a new herbaceous border, and over 300 detonators were employed, the number of cartridges used with each detonator varied from half a cartridge to five whole ones; generally from one to two will remove a large quantity of rock or wood, provided it has a solid place and too much work is not given to the charge used; in this matter discretion is required. I cannot understand 2 lbs. of 3 lbs. being used for a stump: it would be a very large one for us to use more than 1 lb. For an Oak tree cut into 6 feet lengths and 2 feet in diameter, we should not employ more than $1\frac{1}{2}$ to 2 whole cartridges. In the case of a stump it would often be found that no more than a 6-inch hole can be obtained when half a cartridge will suffice. The work is carried out here by the garden men, and I may say I have never seen more than two misfires, which are

blasted, as it will simply blow out with a tremendous report, and when examined a hole will be found at the weakest point. We find that the explosion is affected by damp; therefore, when working in damp situation, both charge and fuse should be well greased before they are inserted, and it is better to fire as quickly as possible. If used in a bore hole, completely under water, no packing is required. Thoroughly grease, insert the fuse, leave the end just above the water; fire quickly, giving as little time as possible for any water to penetrate and cause misfire. *F. G. Brewer, Bryntirion Gardens, Dolgelly*.

TRAINING YOUNG STANDARDS.—Young standard fruit trees are too often left to take care of themselves after they have been planted and staked, the notion being somewhat prevalent that a standard is a naturally-grown tree, as distinct from a trained dwarf tree. One cannot go far along a country road in most parts of the country without seeing instances of the bad results of this mistaken notion. When a standard is planted just as it arrives from the

FIG. 191.—HOMERIA COLLINA IN A DEVONSHIRE GARDEN.

very dangerous indeed, and should be treated with great care. We never withdraw a charge, it being far better to put another charge above it, after very carefully removing a little packing, taking great care not to venture near the other detonator, as, should a metal tool by chance touch this, it would certainly explode, with fatal results to the operator. Careful packing is the best prevention of misfires. Should the fuse get twisted or crushed, the fire may stop at this point. It must be understood that a licence is necessary for using dynamite, and very stringent precautions against accidents are enforced by law. On a place where an explosive is only required occasionally, I should always use black blasting powder; it can be used with far less danger, and merely requires ramming tightly with an iron rod and hammer. Place the fuse on the powder, then ram a little more powder in, taking care not to crush the fuse, then pack with paper, moss or turf, as in the case with dynamite, and should a misfire occur there is no danger in removing the packing down to the powder and inserting a fresh fuse with a little more powder, when, if no damp is present, it should fire without further trouble. I do not see how an unsound stump could be successfully

nursery, and nothing more is done to it, little growth is usually made the first year, and that of a feeble character, while some of the buds on the previous year's growth become fruit-buds. If these latter produce fruit the following season, the slender branches are weighed down and never regain their proper position. The tree is, to some extent, already injured irretrievably, unless it is taken in hand by a man who knows his business. The vexed question as to the relative merits of pruning a tree at planting or deferring it for a year need not be entered upon here, except so far as to state that one or the other course must be adopted, instead of neither, the first essential being to form a tree that shall be able to support a crop of fruit without injury to itself. If the whole of the growth is left unpruned as it comes from the nursery, on the ground that the amount of root formation is proportionate to the number of buds which break out in the spring, there is, at least, something to be said for the method, but the mistake is made when the branches are not cut back after the first year to one-half or one-third of their original length, so that the vigorous formation of the future framework of the tree may begin the following year.

This cutting back seems a great sacrifice at the time, and many even of those who have heard that it is the right thing to do have not the courage to do it. When, on the other system, the growths of the past season are shortened to one-half or one-third at the time of planting, the pruning, after the first season, will only mean the cutting away of some part of the current year's growth, say, two-thirds of the length of the weaker growths, and one-half that of the stronger ones. No fruit should be allowed until the third year at the earliest, and even then should be restricted to a few specimens, unless the tree be very vigorous. In deciding what growths to leave and what to cut out in subsequent years, some imagination is necessary to enable the pruner to picture the future tree with the young growths of to-day developed into large branches, and if he does this, it will often save him from making mistakes. Fruit spurs forming on the young branches should be left, though it may not be advisable to let them fruit the first year they flower; but any shoots in the interior of the tree, for which there will, obviously, be no room as branches, should be removed in their young state in June, wounds then healing over rapidly, and without a number of young shoots arising from them, while the energy of the tree will be more usefully diverted to the strengthening of the main branches. After two or three years' growth, some branches for which it was thought there would be room will be seen to be superfluous, and these should be cut clean off at the point of origin, just above the collar. A necessary part of the training of young standards consists in keeping them in an upright position. The ties or the supports frequently give way after two or three years, and the effect is seen in the trees leaning at all angles. With most trees, if in a position at all exposed, five to seven years is not too long to keep the trees supported. *Alger Petts.*

THE WEATHER AT LAMBAY ISLAND.—The rainfall registered here during December amounted to 3.28 inches. The heaviest fall occurred on the 14th inst., when 1 inch was registered. Slight frosts were experienced on the 6th, 7th and 9th inst. The wind during the month has been mostly from the south-west, and strong gales have been frequent. At the end of October the ground was too dry for planting; at the present time it is too wet. Fortunately, November was fairly favourable for the work. We have splendid crops of winter Broccoli growing just above high-water mark. Celery also is very good; two rows of plants were inserted in each trench manured with seaweed and dung in equal parts. The plants grew freely during the hot, dry summer, and were not supplied with water in such quantities as were those in other rows, where manure only was used. The seaweed retained moisture. So far as size and quality is concerned, there is little or no difference in the plants grown under both systems. *C. Ruse, Lambay Island, Rush, Co. Dublin.*

GREENGAGES NOT FRUITING.—I am of opinion that Greengage trees grown from suckers are much more fruitful than those raised by budding or grafting. I well remember, when a boy, trees of Greengage in cottage gardens in North Essex which seldom failed to produce satisfactory crops. Many of these grew as spreading bushes, and they received little or no pruning. The trees did not produce any gross, strong shoots, but were annually covered with fruit-buds. I believe Greengages are largely grown at Histon and other districts in Cambridgeshire, and it would be interesting to learn if the trees are raised from suckers. I have had wall-trees of Greengages under my charge (trees raised from buds and grafts), but a good crop has always been an exception, even on a south wall. *C. Ruse, Lambay Island, Rush, Co. Dublin.*

WINTER FLOWERS.—In a situation sheltered by the high west wall of my garden from almost every wind, *Heracleum giganteum* is at present in bloom. This stately, umbelliferous perennial, of massive growth, sometimes attains to a height of 12 feet. It is also gratifying to be able to record, as an illustration of the exceptional mildness of the season in south-western Scotland, that flowers, nearly as large and effective as those of September, adorned the beautiful "Margaret Dickson" Rose and "Christian

Curle" (one of the finest of the *Wichuraianas*) on Christmas Day. Fragrant flowers that bring sweetness to the stern heart of winter are sufficiently rare; but there is one, now flowering in my garden, viz., *Tussilago fragrans*, to which this precious attribute belongs. Very beautiful at the present period is *Jasminum nudiflorum*, which, amid every form of atmospheric adversity, flowers with matchless beauty and marvellous luxuriance on our leafless garden walls. *David R. Williamson, Manse of Kirkmaiden, Wigtownshire, N.B., December 27, 1911.*

HOGG'S "FRUIT MANUAL."—I fear your correspondent *D.* has not understood the purport of my note in your issue of November 11. I suggested these two alternatives, viz., (1) the publication of a short and concise book on the lines of *Guide Pratique*; and (2) a large work, the arrangement of which should follow *Le Verger*, of Mas. This latter work, I was careful to remark, would be the work of a lifetime. It is surely desirable to distinguish carefully between the "expert's" work and the handy list, which, as its advertisement would probably state, "should be in every gardener's hands." The preparation of this work is within the bounds of early achievement, and its cost could probably be kept below 5s. The other work would be, no doubt, a financial failure and would need to be backed up by a wealthy benefactor. The point, however, I wished to raise was not the question of price, but that of the form and arrangement of the work. *Edward A. Bunyard.*

PHENIX PARK, DUBLIN.—The various beds and borders in Phoenix Park were very effective in the past season. The judicious planting of Gunneras, Osmundas, Eucalyptus, Cyperus, Polygonums, Bamboos, Yuccas, and many other kindred subjects on the banks of the lakes, pools, and streams has been charming and most satisfactory. A bed which was worthy of special note and was much admired by visitors contained good standard plants of *Souvenir de Charles Turner* Pelargonium, specimen plants of *Calceolaria amplexicaulis* and tall *Grevillea robusta*, edged with *Iresine*, and *Pelargonium Manglesii*. Excellent standard *Heliotropes* were employed in several of the beds. Another bed which was very bright was composed of scarlet *Begonias*, white *Violas*, and *Iresine*, as carpet plants, with *Kochias*, *Grevilleas*, and *Heliotropes* towering above them. A bed composed entirely of succulent plants contained many plants seldom used for this purpose. *Aloes*, *Agaves*, *Gasteria acinacifolia*, *G. disticha*, *Opuntia monacantha* and *Sempervivum arboreum* were among the taller plants. There were panels of *Kleinia repens*, edged with *Sempervivum aureum*, and *S. tabulæforme*, the latter species planted on a slightly-raised edge, in a manner fully showing its tabular form, and the visitor wondered why such a plant is not more frequently seen as an edging plant. Several *Mammillarias* were flowering, as were also *Opuntia horrida* and *Cotyledon gibbiflora metallica*. One often finds a bed of succulent plants in gardens chiefly composed of odds and ends selected from the greenhouse, and very little care taken in their arrangement. After seeing the bed in Phoenix Park, one realises what can be done with this class of plants, and vows that, in the future, odds and ends shall be kept in the background. Ribbon borders have been much condemned during recent years, but a border of this description planted with the following subjects was very effective. The background was composed of evergreens, and *Calceolaria amplexicaulis* formed the back row, the next being *Pelargonium Paul Crampel*, with the following *Violas* in rotation, *Queen Alexandra*, *Royal Scot*, *Favourite*, *Lord Elcho*, *J. B. Riding*, *Jackanapes*, and *Queen of the Year*, edged with *Violetta*. *C. Ruse, Lambay Island, Dublin.*

GARDENING APPOINTMENTS.

Mr. H. LINFOOT, for the past 3 years Foreman at High Leigh Hall Gardens, Knutsford, as Gardener to BEVILLE STANIER, Esq., M.P., Peplow Hall, Market Drayton, Shropshire.

Mr. FRANK MAXEY, from Drumlanrig Gardens, Thornhill, Dumfriesshire, as Gardener to HAROLD WRIGLEY, Esq., Ganton Hall, Yorkshire. (Thanks for 2s. which has been placed in R.G.O.F. box.)

MARKETS.

COVENT GARDEN, December 27.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—Eds.]

REMARKS.—Consignments of fruits per ss. "Minnetonka" and ss. "Tremona" amounted to about 15,000 packages, principally Apples, English Apples, including Benheim Pippin, Bramley's Seedling, and Dumelow's Seedling (Wellington), are a fairly good supply, but Cox's Orange Pippins are scarce. Pears are fairly plentiful, the varieties being Winter Nelis, Glou Morceau and Easter Beurre. There are also a few fruits of Doyenné du Comice from France. Grapes still remain a good supply, and show a slight increase in value. English Tomatoes are finished: Tenerife Tomatoes are a limited supply, consequently their prices have hardened. The first shipment of Cape Fruit to hand this week consisted of Apricots, Plums and Peaches. The prevailing mild weather limits the demand for vegetables.—E. H. R., Covent Garden, December 27, 1911.

REMARKS.—Trade is very quiet owing to the holidays. With colder weather business may be expected to improve, but it is not anticipated that prices will rise. Stocks in London are still very heavy. Edward J. Newborn, Covent Garden and St. Pancras, December 27, 1911.

THE WEATHER.

THE WEATHER IN WEST HERTS.

Week ending December 27.

Another exceptionally wet week.—Throughout the past 19 days there has not occurred a single unseasonably cold day or night. On the warmest day of the past week the highest reading in the thermometer screen was 51°, while on no night did the exposed thermometer register more than 7° of frost. Both at 1 and 2 feet deep the ground is now about 2° warmer than is seasonable. Rain has fallen on all but one day of the week, and to the total depth of more than 2 inches. During the last 25 days there have occurred only 2 days without rain, the total measurement for that period being no less than 6½ inches, or as much as 8½ inches in excess of the average fall for the whole of the month; 9½ gallons of rainwater have passed through the percolation gauge on which short grass is growing during the week, and 10 gallons through the bare soil gauge. The sun shone on an average for 46 minutes a day, which is half-an-hour a day short of the usual duration at the end of December. The winds were again moderately high, and in the windiest hour the mean velocity reached 21 miles—direction W.N.W. There was about a seasonable amount of moisture in the air at 3 p.m. E. M., Berkhamsted, December 27, 1911.

MISCELLANEOUS.

WM. CUTBUSH & SONS, Highgate, London.—Bulbous plants.

ACETYLENE GAS REFUSE: V., Cape Colony. You will find several notes on the value of this substance as a manure, also the best methods of using it in vol. xiv. Mr. Staddon, in a note published in *Gardeners' Chronicle*, May 8, 1909, p. 299, states that it is best applied to vacant land, where it should be dug in, and no plant should be placed on the land for at least two months after the gas lime is applied. The best time for the application is autumn or spring. Do not put it on fresh from the generator when wet, but in some out-of-the-way corner of the garden, where it can stay until it is well drained and nearly dry.

DULBS GROWN IN MOSS FIBRE: V., Cape Colony. The reply to your query was published in the issue for November 4, p. 329.

CHRYSANTHEMUMS SUITABLE FOR MARKET: A Constant Reader. The following varieties of Chrysanthemums flower during September and October, and are suitable for market culture:—Mme. Desgrange (both the white and the yellow varieties), Goacher's Crimson, Sunshine, Pollie, Cranford White, White Countess, Cranford Pink, Diana, Ryecroft Glory, Roi des Blancs, and Market Red. The following varieties flower in November: Soleil d'Octobre (both the bronze and the golden sorts), Source d'Or (bronze or yellow), Emblème Poitevine, R. F. Felton, Mrs. Roots, Mrs. J. Thompson (golden), Money-maker and Bonnie Dundee. December flowering varieties: Miss Wilcox, Mme. R. Oberthur, Sarah Owen (creamy-white), Heston White, Golden Age, Heston Bronze, Framfield Pink, Winter Cheer, Tuxedo, Queen of the Exe, Mabel Morgan, and Bessie Evans.

GARDENING EMPLOYMENT IN AMERICA: Hortus. A correspondent writing from America in the issue for February 10, 1906, stated that young, well-trained gardeners have no difficulty in obtaining good situations in the United States of America. Head gardeners and superintendents generally have trouble in getting good men, and New York seedsmen are always glad to hear of men coming from England, and although they offer no temporary employment, they are ready to answer all enquiries. March and April are generally supposed to be the best months to arrive. The wages for journeymen or assistants, as they are termed, is

about \$50 to \$55 per month, without board, or \$30 to \$35 with board; board and lodging being worth about \$20 per month. It is contrary to the law of the U.S.A. for anyone to become engaged before landing by advertising in the American papers, and the parties who do so are subject to a heavy fine, and are liable to be deported.

HOOF PARINGS AS MANURE: F. R., Havant. Hoof parings provide a valuable manure, being one of the best organic sources of nitrogen. Hoof, like horn and bone, is slow in its action, and yields up food over a long period. It is very suitable for manuring all kinds of fruits and flowers, also for mixing with potting soil. The hoof parings should be mixed with horse dropping, covered with soil and allowed to stand for a few months. One barrowful of the mixture is sufficient dressing for 10 square yards.

INARCHING VINES: Enquirer. You can inarch Muscat of Alexandria on your established vines of Mrs. Pince and Madresfield Court with every prospect of success, as both these varieties produce Muscat-flavoured Grapes of excellent quality. It is probable that vines of Muscat of Alexandria inarched on established vines of Lady Hutt and Lady Downe's would produce Grapes of inferior flavour. You could train and extend the vines of Muscat of Alexandria under the apex of the roof and down the trellis under the other half of the span-roof house, so as to take the place of the four vines which you propose inarching, cutting these back annually to make room for the growths of the Muscats. By this system you would furnish the trellis under that half of the roof with fruit-bearing wood in two or three years' time. By extending the Muscat vines as indicated, you would not only prevent loss of crop owing to unoccupied trellis space on the side of the house, but new vigour would be imparted into the vines, and this would result in an increased weight and better quality of the bunches.

LOBELIA DAMPING OFF: G. W. F. The plants are attacked by a fungus *Thielavia basicola*. Your best plan is to water the soil thoroughly, three weeks before it is used, with a solution of formalin, using one part in 100 parts of water.

NAMES OF FRUITS: A. S., Morpeth. The Apple is decayed; send another season before the fruits are over-ripe.

NAMES OF PLANTS: W. T. & Co. *Colutea arborescens* (Bladder Senna).

SITE FOR SPAN-ROOFED ORCHARD HOUSE. Constant Reader. Your proposed span-roofed house should run north and south, or as near to this position as circumstances will permit, and the structure should occupy a site where surface water is not likely to accumulate. A suitable-sized house would be one 20 feet wide inside the walls, which should rise 1 foot above the ground line. Front ventilating sashes 18 inches deep and about 3 feet wide should be included on either side. The rafters should be 14 feet long and fixed at 18 inches apart. These dimensions will afford a clear space of nearly 10 feet between the pathway and the bottom of the ridge, and give an angle of about 30° to the roof. The ventilating sashes should be regulated by Wolland's or some other continuous opening gear hung from the ridge on either side at intervals of four bays, and the ventilators on one side should be fixed angle-wise to those on the other side. The following 12 varieties of Peaches and six varieties of Nectarines are suitable for cultivating in an orchard house:—*Peaches*: Alexander, Hale's Early, Early Grosse Mignonne, Crimson Galande, Dagmar, Dymond, Barrington, Violette Hâtive, Prince of Wales, Princess of Wales, Sea Eagle, and Walburton Admirable; *Nectarines*: Cardinal, Rivers' Early, Lord Napier, Dryden, Pineapple and Humboldt. The names of the varieties of both kinds of fruits are given generally in the order in which they ripen.
